MVS System Messages
Volume 7 (IEB - IEE)
The information in this document is intended to provide useful data for the reader. However, because IBM is constantly working to improve its products, IBM reserves the right to make changes to the products described in this document without notice. Before using this information and the product it supports, be sure to read the general information under “Notices” on page B-1.

**Note**

The information in this document is likely to have been updated since it was initially published. For the most current version, please refer to the official IBM documentation or directly contact IBM.

This document supports z/OS® (5694-A01).

The MVS™ System Messages documents primarily describe messages that are issued to the system operator at the system console and system messages that are logged. These include the following messages:

- Operator messages issued by the BCP and DFSMS/MVS™.
- Log messages issued by the BCP and DFSMS/MVS.
- Some SYSOUT messages issued by the BCP and DFSMS/MVS. SYSOUT messages are issued by utilities that normally run in batch, such as SPZAP.
- Batch job messages issued by the BCP. Messages issued by JES2 or JES3 for batch jobs are in the JES messages documents.

For the most part, messages issued at interactive terminals (like TSO/E and CICS® terminals) are documented by the specific elements and products that support those terminals.

The titles of the MVS System Messages documents indicate the range of message prefixes in the documents:

- z/OS MVS System Messages, Vol 1 (ABA-AOM), SA22-7631
- z/OS MVS System Messages, Vol 2 (ARC-ASA), SA22-7632
- z/OS MVS System Messages, Vol 3 (ASB-AXA), SA22-7633
- z/OS MVS System Messages, Vol 4 (CBD-DMO), SA22-7634
- z/OS MVS System Messages, Vol 5 (EDG-GFS), SA22-7635
- z/OS MVS System Messages, Vol 6 (GOS-IET), SA22-7636
- z/OS MVS System Messages, Vol 7 (IEB-IEE), SA22-7637
- z/OS MVS System Messages, Vol 8 (IEF-IGD), SA22-7638
- z/OS MVS System Messages, Vol 9 (IGF-IWM), SA22-7639
- z/OS MVS System Messages, Vol 10 (IXC-IZP), SA22-7640

If you do not know which document describes a particular message, try using LookAt (see "Using LookAt to look up message explanations" on page vii). Here are some of the documents on that bookshelf:

- The MVS System Messages documents
- z/OS MVS Dump Output Messages, SA22-7590
- z/OS MVS System Codes, SA22-7626
- z/OS and z/VM HCD Messages, SC33-7986
- z/OS JES2 Messages, SA22-7537
- z/OS JES3 Messages, SA22-7552
- z/OS TSO/E Messages, SA22-7786
- z/OS UNIX System Services Messages and Codes, SA22-7807

For a list of message documents sorted by message prefix, see "Message directory" on page 1-15.

This document also contains the routing and descriptor codes that IBM assigns to the messages that z/OS components, subsystems, and products issue. Routing and descriptor codes are specified by the ROUTCDE and DESC keyword parameters on WTO and WTOR macros, which are the primary methods that programs use to issue messages. The routing code identifies where a message will be displayed. The descriptor code identifies the significance of the message and the color of the message on operator consoles with color.
Who should use these MVS System Messages documents

The system messages documents are for people who receive messages from the system. Usually, these people are system operators, system programmers, and application programmers who do any of the following tasks:

- Initialize the operating system and its subsystems
- Monitor system activity
- Keep the system running correctly
- Diagnose and correct system problems
- Diagnose and correct errors in problem programs

How to use these documents

The system messages documents contain descriptions of messages, along with the following topics:

- "Building your own message library" on page 1-25 tells how to create a customized message library.
- "Message directory" on page 1-15 lists all message prefixes and the documents containing the message descriptions.
- Chapter 1, "Introduction," on page 1-1 describes how the system issues messages, where it places them, and their formats.
- "Routing codes" on page 1-9 and "Descriptor codes" on page 1-12 contain an introduction to routing and descriptor codes. These sections describe:
  - The meaning of each code
  - How to specify these codes
  - How the system uses these codes

For information on using routing and descriptor codes to route messages, see z/OS MVS Planning: Operations.

Message Explanations: Message chapters are arranged alphabetically by the message prefixes. In each chapter, the messages are arranged numerically by the numbers following the prefix. For a general description of message explanations, see "Message description" on page 1-8.

Where to find more information

Where necessary, the message documents reference information in other books, using shortened versions of the book title. For complete titles and order numbers of the books for all products that are part of z/OS, see z/OS Information Roadmap.

Many message descriptions refer to the following terms. You need to consult the reference listed below for more information:

- **Data areas and control blocks**: See z/OS MVS Data Areas, Vol 1 (ABEP-DALT), z/OS MVS Data Areas, Vol 2 (DCCB-ITZYRETC), z/OS MVS Data Areas, Vol 3 (IVT-RCWK), z/OS MVS Data Areas, Vol 4 (RD-SRRA), and z/OS MVS Data Areas, Vol 5 (SSAG-XTLST).
- **Dumps**: For examples of ABEND, stand-alone, and SVC dumps and how to read them, see z/OS MVS Diagnosis: Tools and Service Aids. For examples of component output from dumps and how to read and request it, see z/OS MVS Diagnosis: Reference.
- **Identification of a component, subsystem, or product**: See z/OS MVS Diagnosis: Reference to identify the component, subsystem, or product from the name of an IBM® module or for a macro. The module prefix and macro tables give the program identifier to be used in a PIDS symptom in a search argument.
- **System completion and wait state codes**: See z/OS MVS System Codes
- **Logrec data set error records**: For the formatted records, see z/OS MVS Diagnosis: Reference.
**Trace output**: For the formats and the meaning of the information in the generalized trace facility (GTF) trace, instruction address trace, master trace, system trace, and component trace, see *z/OS MVS Diagnosis: Tools and Service Aids*.

**Hardware**: Use the appropriate *Principles of Operation* document for the hardware you have installed.

**Where to find the most current message information**

The MVS System Messages documents are cumulative. As messages are added to the system they are added to the documents. Similarly, when messages are changed on the system, they are changed in the documents. However, when a message is deleted from the system (no longer issued), the message is *not* deleted from the document. This means that users can look in the most recent message documents for the most current descriptions of system messages.

To find the most current edition of a document, you can look on the Web. Point your browser to the z/OS home page and click on Library:

When you are in the z/OS library area, use the messages and codes database to search for the message ID you are interested in.

**Information updates on the web**

For the latest information updates that have been provided in PTF cover letters and Documentation APARs for z/OS, see the online document at:

This document is updated weekly and lists documentation changes before they are incorporated into z/OS publications.

**Using LookAt to look up message explanations**

LookAt is an online facility that lets you look up explanations for most of the IBM messages you encounter, as well as for some system abends and codes. Using LookAt to find information is faster than a conventional search because in most cases LookAt goes directly to the message explanation.

You can use LookAt from these locations to find IBM message explanations for z/OS elements and features, z/VM®, z/VSE™, and Clusters for AIX® and Linux®:

- **The Internet**. You can access IBM message explanations directly from the LookAt Web site at [www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/](http://www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/).
- **Your z/OS TSO/E host system**. You can install code on your z/OS system to access IBM message explanations using LookAt from a TSO/E command line (for example: TSO/E prompt, ISPF, or z/OS UNIX® System Services).
- **Your Microsoft® Windows® workstation**. You can install LookAt directly from the z/OS Collection (SK3T-4269) or the z/OS and Software Products DVD Collection (SK3T-4271) and use it from the resulting Windows graphical user interface (GUI). The command prompt (also known as the DOS > command line) version can still be used from the directory in which you install the Windows version of LookAt.
- **Your wireless handheld device**. You can use the LookAt Mobile Edition from [www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/lookatm.html](http://www.ibm.com/servers/eserver/zseries/zos/bkserv/lookat/lookatm.html) with a handheld device that has wireless access and an Internet browser.

You can obtain code to install LookAt on your host system or Microsoft Windows workstation from:

- A CD in the *z/OS Collection* (SK3T-4269).
- The *z/OS and Software Products DVD Collection* (SK3T-4271).
• The LookAt Web site (click Download and then select the platform, release, collection, and location that suit your needs). More information is available in the LOOKAT.ME files available during the download process.

The z/OS Basic Skills Information Center
The z/OS Basic Skills Information Center is a Web-based information resource intended to help users learn the basic concepts of z/OS, the operating system that runs most of the IBM mainframe computers in use today. The Information Center is designed to introduce a new generation of Information Technology professionals to basic concepts and help them prepare for a career as a z/OS professional, such as a z/OS system programmer.

Specifically, the z/OS Basic Skills Information Center is intended to achieve the following objectives:
• Provide basic education and information about z/OS without charge
• Shorten the time it takes for people to become productive on the mainframe
• Make it easier for new people to learn z/OS.

To access the z/OS Basic Skills Information Center, open your Web browser to the following Web site, which is available to all users (no login required): [http://publib.boulder.ibm.com/infocenter/zoslnctr/v1r7/index.jsp](http://publib.boulder.ibm.com/infocenter/zoslnctr/v1r7/index.jsp)
Summary of changes

New, changed, or deleted messages can affect your system's automation routines. To ensure that your installation's automation routines are current, review the new, changed, and deleted messages listed in [z/OS Summary of Message and Interface Changes](http://www.ibm.com/servers/eserver/zseries/zos/bkserv/). z/OS Summary of Message and Interface Changes is available on the z/OS Collection, SK3T-4269 and in the z/OS Internet library at:

Summary of changes
for SA22-7637-18
z/OS Version 1 Release 11

This document contains information previously presented in z/OS MVS System Messages, Vol 7 (IEB-IEE), SA22-7637-17, which supports z/OS Version 1 Release 10.

You may notice changes in the style and structure of some content in this document—for example, headings that use uppercase for the first letter of initial words only, and procedures that have a different look and format. The changes are ongoing improvements to the consistency and retrievability of information in our documents.

This document contains terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

Summary of changes
for SA22-7637-17
z/OS Version 1 Release 10
as updated April 2009

This document contains information previously presented in z/OS MVS System Messages, Vol 7 (IEB-IEE), SA22-7637-16, which supports z/OS Version 1 Release 10.

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.

Summary of changes
for SA22-7637-16
z/OS Version 1 Release 10

This document contains information previously presented in z/OS MVS System Messages, Vol 7 (IEB-IEE), SA22-7637-15, which supports z/OS Version 1 Release 9.

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.

Summary of changes
for SA22-7637-15
z/OS Version 1 Release 9
as updated April 2008

This document contains information previously presented in z/OS MVS System Messages, Vol 7 (IEB-IEE), SA22-7637-14, which supports z/OS Version 1 Release 9.

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.
Summary of changes
for SA22-7637-14
z/OS Version 1 Release 9

This document contains information previously presented in z/OS MVS System Messages, Vol 7 (IEB-IEE), SA22-7637-13, which supports z/OS Version 1 Release 8.

This document contains terminology, maintenance, and editorial changes, including changes to improve consistency and retrievability.
Chapter 1. Introduction

The z/OS operating system issues messages from z/OS elements and features, and from program products and application programs running on the system. The system issues messages in different ways and to different locations:

- **WTO and WTOR macros**: Most messages are issued through WTO and WTOR macros to one of the following locations:
  - Console
  - Operations log (OPERLOG)
  - System log (SYSLOG)
  - Job log
  - SYSOUT data set

Routing codes determine where the messages are displayed or printed. The routing codes for messages issued by the operating system are included with each message.

- **WTL macro or the LOG operator command**: Some messages are issued through the WTL macro or the LOG operator command to the system log (SYSLOG).

- **Dumping services routines**: Dump messages are issued through the Dumping services routines and can appear in one of the following locations:
  - SVC dumps, stand-alone dumps, or SYSMDUMP ABEND dumps formatted by the interactive problem control system (IPCS)
  - Trace data sets formatted by the interactive problem control system (IPCS)
  - ABEND dumps or SNAP dumps produced by the dumping services

In dump or trace data sets formatted by IPCS, the messages appear interactively on a terminal or in a printed dump.

- **DFSM/MVS access methods**: Some messages are issued through DFSMS/MVS access methods directly to one of the following locations:
  - Output data set
  - Display terminal

Messages are sent to different locations to meet some specific needs. For example, messages routed to a console usually show the result of an operator command and sometimes require an operator reply, while messages recorded in the hardcopy log permanently are often used for auditing. Understanding the locations where you receive messages can help you manage your message flow.

**Console**

Messages sent to a multiple console support (MCS) console, an SNA multiple console support (SMCS) console, or an extended MCS (EMCS) console are intended for the operators. Operations can control which messages are displayed. See [z/OS MVS Planning: Operations](https://www.ibm.com/support/knowledgecenter/SSLTBW_AIX_7.1.0/com.ibm.aix.security.mvs.doc/aix81/IBM_AIXelocity_Security_aix81_1.html) for information about controlling message display.

The system writes in the hard-copy log all messages sent to a console, whether the message is displayed or not.

**Operations log**

The operations log (OPERLOG) records all message traffic from each system in a sysplex that activates the OPERLOG. The operations log consists of the following data:

- Messages to and from all consoles
- Commands and replies entered by the operator

**System log**

The system log (SYSLOG) is a SYSOUT data set that stores the messages and commands from the current system. SYSOUT data sets are output spool data sets on direct access storage devices (DASD) provided by the job entry subsystem (either JES2 or JES3). An installation usually prints the system log periodically. The system log consists of:
- All messages issued through WTL macros
- All messages entered by operator LOG commands
- Usually, the hard-copy log
- Any messages routed to the system log from any system component or program

**Job log**
Messages sent to the job log are intended for the programmer who submitted a job. The job log is specified in the system output class on the MSGCLASS parameter of the JCL JOB statement.

**SYSOUT data set**
Messages sent to a SYSOUT data set are intended for a programmer. These messages are issued by an assembler or compiler, the linkage editor and loader, and an application program. If the SYSOUT data set and the MSGCLASS parameter on the JCL JOB statement specify the same class, all messages about a program will appear in the same SYSOUT listing.

---

**Message format**
A displayed or printed message can appear by itself or with other information, such as a time stamp. The following topics show the format of the message body and the formats of accompanying information when the message is sent to various locations.

**Format of the message body**
The message body consists of three parts: the reply identifier (optional), the message identifier, and the message text. The following formats are possible:

<table>
<thead>
<tr>
<th>id</th>
<th>CCCnnn text</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>CCCnnns text</td>
</tr>
<tr>
<td>id</td>
<td>CCCnnnnns text</td>
</tr>
<tr>
<td>id</td>
<td>CCCSnnns text</td>
</tr>
</tbody>
</table>

**id** Reply identifier: It is optional. It appears if an operator reply is required. The operator specifies it in the reply.

**CCCnnn, CCCnnns, CCCnnnnns, CCCSnnns**
Message identifier.

**CCC**
A prefix to identify the component, subsystem, or product that produced the message. The prefix is three characters.

**S** The subcomponent identifier, which is an optional addition to the prefix to identify the subcomponent that produced the message. The subcomponent identifier is one character.

**nnn, nnnn, nnnnn**
A serial number to identify the individual message. The serial number is three, four, or five decimal digits.

**s** An optional type code, which is one of the following:

- **A** Action: The operator must perform a specific action.
- **D** Decision: The operator must choose an alternative.
- **E** Eventual action: The operator must perform action when time is available.
- **I** Information: No operator action is required.
- **S** Severe error: Severe error messages are for a system programmer.
- **W** Wait: Processing stops until the operator performs a required action.
**text**

Text: The text provides information, describes an error, or requests an operator action.

**Note:** The following messages have special format for the message body. Refer to the specific message chapters for details.

- ADR messages
- CNL messages
- EWX messages
- IDA messages
- IEW messages
- IGW01 messages

**Messages sent to MCS/SMCS consoles**

Messages sent to MCS/SMCS consoles appear in one of the following formats:

<table>
<thead>
<tr>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>f hh.mm.ss sysname jobname message</td>
</tr>
<tr>
<td>f hh.mm.ss sysname message</td>
</tr>
<tr>
<td>f hh.mm.ss jobname message</td>
</tr>
<tr>
<td>f hh.mm.ss message</td>
</tr>
<tr>
<td>f sysname jobname message</td>
</tr>
<tr>
<td>f sysname message</td>
</tr>
<tr>
<td>f jobname message</td>
</tr>
<tr>
<td>f message</td>
</tr>
</tbody>
</table>

f A screen character to indicate the status of certain messages, as follows:

- The operator has performed the action required for the message. The message has been deleted.
- The message is for information only; no operator action is required. The message was issued by the system or by a problem program.
* The message requires specific operator action and was issued by a WTOR or by an authorized program. The message has a descriptor code of 1, 2, or 11.
@ The message requires specific operator action and was issued by a WTOR or by a problem program. The message has a descriptor code of 1, 2, or 11.
+ The message requires no specific operator action and was issued by a problem program using a WTO macro.
blank The message requires no specific operator action.

**hh.mm.ss**

Time stamp: the hour (00-23), minute (00-59), and second (00-59).

**sysname**

System name for the system that issued the message.

**jobname**

Job name for the task that issued the message. This field is blank if a job did not issue the message.

**message**

Reply identifier, message identifier, and text.

**Messages sent to hardcopy log in JES2 system**

Multiple console support (MCS) handles message processing in:

- A JES2 system
- A JES3 system on a local processor
A JES3 system on a global processor, if JES3 has failed

MCS sends messages with routing codes 1, 2, 3, 4, 7, 8, and 10 to the hardcopy log when display consoles are used or more than one console is active. All other messages can be routed to the hard-copy log by a system option or a VARY HARDCPY operator command.

Messages sent to the hardcopy log appear in the format:

```
tcrrrrrr sysname yyddd ident msgflags message
t t lid message
```

- **t** The first character on the line indicates the record type:
  - **D** Data line of a multiple-line message; this line may be the last line of the message.
  - **E** End line or data-end line of a multiple-line message.
  - **L** Label line of a multiple-line message.
  - **M** First line of a multiple-line message.
  - **N** Single-line message that does not require a reply.
  - **O** Operator LOG command.
  - **S** Continuation of a single-line message or a continuation of the first line of a multi-line message. This continuation may be required because of the record length for the output device.
  - **W** A message that requires a reply.
  - **X** A log entry that did not originate with a LOG command or a system message.

- **c** The second character on the line indicates whether the line was generated because of a command:
  - **C** Command input.
  - **R** Command response.
  - **I** Command issued internally. The job identifier contains the name of the internal issuer.
  - **blank** Neither command input nor command response.

- **rrrrrr** Hexadecimal representation of the routing codes 1 through 28. To understand this hexadecimal number, convert it to binary; each binary 1 represents a routing code. For example, X'420C' represents routing codes 2, 7, 13, and 14 as shown here:

<table>
<thead>
<tr>
<th>Hexadecimal</th>
<th>Binary</th>
<th>Routing Codes</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>0 1 0 0</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>0 0 1 0</td>
<td>7</td>
</tr>
<tr>
<td>0</td>
<td>0 0 0 0</td>
<td>13</td>
</tr>
<tr>
<td>C</td>
<td>1 1 0 0</td>
<td>14</td>
</tr>
<tr>
<td></td>
<td></td>
<td>15</td>
</tr>
<tr>
<td></td>
<td></td>
<td>16</td>
</tr>
</tbody>
</table>

- **sysname** The system name from the SYSNAME parameter in parmlib.

- **yyddd** The Julian date, given as the year (00-99) and the day of the year (000-366).

  **Note:** If HCFORMAT(CENTURY) is specified in the CONSOLxx parmlib member, the Julian date appears as yyyyddd.

- **hh:mm:ss.th** Time stamp, given as the hour (00-23), minute (00-59), second (00-59), and hundredths of a second (00-99).
ident
The job identifier for the task that issued the message, if the second character on the line is blank.
If the second character on the line is C or R, this field contains one of the following:

jobid The job identifier of the task that issued the message, if it was issued by a job.
conname Console name of the console which issued the command or received the message.
INTERNAL For a command generated by a problem program or the system.
INSTREAM For a command read from the input stream.
blank If MCS could not determine the source or destination for the message.

lid Multiple-line identifier for the second and succeeding lines of a multiple-line message. This field appears after the message text (1) on the first line or (2) in the message area and is not followed by text on a continuation of the first line. The identifier appears on all lines of the same message.

msgflags Installation exit and message suppression flags. For information about the description of the hardcopy log message flags, see HCL in z/OS MVS Data Areas, Vol 2 (DCCB-ITZYRETC).

message Reply identifier, message identifier, and text. The reply identifier and message identifier appear only on the first line of a multiple-line message.

Messages sent to hardcopy log in JES3 system
Messages sent to the JESMSG hardcopy log in a JES3 system appear in the format:

```
hh:mm:ss t message
```

Messages sent to the MLOG/DLOG hardcopy log appear in the format:

```
dest console yyddd hhmmss tia[pr efix] message
```

dest
JES3 destination class, which corresponds to the MVS routing code.

console
JES3 or MVS console name, as follows:

blank For a message issued without a console name.
nnnnn The JES3 console name (JNAME) from the JES3 initialization stream. This applies to remote consoles only.
cnname The MCS console name, as specified on the NAME(cnname) parameter under the CONSOLE definition in SYS1.PARMLIB(CONSOLxx).
INTERNAL For a command generated by a problem program or operating system routine.
NETWORK For a message issued to the network job entry (NJE) console.

yyddd
The Julian date, given as the year (00-99) and the day of the year (000-366).

Note: If HCFORMAT(CENTURY) is specified in the CONSOLxx parmlib member, the Julian date appears as yyyyddd.
hhmmsst
Time stamp, given as the hour (00-23), minute (00-59), second (00-59), and tenth of a second (0-9).

i Attention indicator for JES3 space constraints, as follows:

blank Normal output or no action required.
# The message is rerouted automatically or by a command from another console.
% Minimum space (track) situation (JSAM).
= Marginal space (track) situation (JSAM).
< Minimum buffer situation (JSAM).

Note: The above four symbols can be changed by a CONSTD statement in the JES3 initialization stream.

a Action prefix character, as follows:

blank Normal message.
+ JES3 input command, issued on the global processor.
- MVS input command, issued on the global processor.
Operator action required.

prefix sysname R=jobname
Optional prefix for messages issued outside the JES3 address space or on a local processor, as follows:

sysname The name of the system where the issuing program is running. JES3 determines the name from the ID parameter on the MAINPROC statement in the JES3 initialization stream.

jobname The job name of the issuing program. It is all blanks for an system routine.

message Reply identifier, message identifier, and text.

Messages sent to the job log, to other data sets, and to display terminals
Messages sent to the job log, to other data sets, and to display terminals appear in the format designed by the program that issued them.

Truncated data in multi-line messages
Under any one of the following conditions, the system might need to truncate a multi-line message:

• When a message is being transported from one system to another in a sysplex, the sending or receiving system might encounter an error that prevents some or all of the message text from appearing. This can be caused by any of the following:
  – The issuing system is stopped or quiesced.
  – The issuing system fails to end a multi-line message.
  – The issuing system has an XCF buffer shortage.
  – A disruption occurs in sysplex communication.
  – An error occurs on the receiving system.

When one of the above conditions occurs, one of the following messages can appear within the message text, indicating such an error:
• When no data line or endline has been issued for a multi-line message after an interval of thirty seconds, the system issues the following endline:
  MESSAGE TIMED OUT - MESSAGE COMPLETION FORCED

• When a connect request exceeds the limit of 65533 lines, the system truncates the message with the following text:
  EXCEEDED LINE LIMIT - MESSAGE COMPLETION FORCED

• When a multi-line message is issued with no end line, and it is not possible for the system to obtain space to temporarily store the message, the system truncates the message with the following text:
  CONNECT UNAVAILABLE - MESSAGE COMPLETION FORCED

• When a multi-line connect request is issued, and the system is unable to obtain space to store the connecting lines, the system truncates the message with the following text:
  CONNECT UNSUCCESSFUL - MESSAGE COMPLETION FORCED

• When a message is too long to fit into 80% of the Console message cache, the system truncates the message with the following text:
  MESSAGE TRUNCATED FOR CONSOLE MESSAGE CACHE

• When there is a shortage of WTO buffers for display on MCS consoles, the screen display may be truncated with one of the following lines of text:
  NUMBER OF LINES EXCEEDED MLIM - MESSAGE TRUNCATED
  STORAGE CONSTRAINT - MESSAGE TRUNCATED
Message description

The following topics describes the different message description items, and in particular, the routing and descriptor codes.

Description items

The message explanation information is presented by the following items:

**Explanation**

The meaning of the message, including why the system issued the message.

**System Action**

- What the system did as a result of the system condition reported by the message. A system condition could include running out of storage, a hardware or software failure, an abend, a wait state.
- What the system did as a result of user input. User input can include a system command, a job running on the system, a transaction, a query, or another user-system interaction.

**Operator Response**

Instructions for the system operator, including, as appropriate, decisions to make and actions to take.

Only provided for messages that could appear at the operator console.

**User Response**

Instructions for the end user.

Only provided for messages that could appear at an interactive interface such as a TSO/E terminal or ISPF application.

*Note:* Most user messages are explained in other message books, such as [z/OS TSO/E Messages](#).

**Application Programmer Response**

Instructions for an application programmer.

Only provided for messages that could appear in SYSOUT produced by a job, for example SPZAP.

**System Programmer Response**

Instructions for the system programmer.

Only provided for messages that require additional action beyond the operator response, user response, or application programmer response.

**Storage Administrator Response**

Instructions for the DFSMSdftp™ storage administrator.

**Security Administrator Response**

Instructions for the security administrator.

Only provided for security-related messages.

**Problem Determination**

Additional instructions for determining the cause of the problem, searching problem databases, and, if necessary, reporting the problem to the IBM support center. These instructions are for a customer support person who can troubleshoot problems, such as the system programmer or system administrator, an experienced security administrator, or an experienced storage administrator.
For additional information on performing problem determination procedures, see [z/OS Problem Management](#) and the appropriate diagnosis guide for the product or element issuing the message, such as:

- DFSMS/MVS diagnosis guides and references
- [z/OS JES2 Diagnosis](#)
- [z/OS JES3 Diagnosis](#)

**Source**
Element, product, or component that issued the message.

**Detecting Module**
Name of the module or modules that detected the condition that caused the message to be issued.

**Routing Code**
For WTO or WTOR messages, the routing code of the message. See [Routing codes](#) for more information about the code meaning.

**Descriptor Code**
For WTO or WTOR messages, the descriptor code of the message. See [Descriptor codes](#) on page 1-12 for more information about the code meaning.

**Routing codes**
Routing codes send system messages to the consoles where they are to be displayed. More than one routing code can be assigned to a message to send it to more than one console. For more information on message routing, see the following books:

- [z/OS MVS Programming: Authorized Assembler Services Guide](#)
- [z/OS MVS Programming: Authorized Assembler Services Reference SET-WTO](#)
- [z/OS MVS Installation Exits](#)
- [z/OS MVS Initialization and Tuning Reference](#)

**Specification**
The routing codes are specified in the ROUTCDE parameter of the WTO or WTOR macro. If you specify a message which contains no routing codes, MVS may provide one or more default routing codes, based upon the presence or lack of other queuing specifications.

If you specify a message containing descriptor codes but no routing codes and no target console, MVS will not assign any routing codes and will write the message to the hardcopy log.

If you specify a message containing no routing codes, no descriptor codes, and no target console, MVS will assign a default set of routing codes. This set of default routing codes is specified at MVS initialization on the DEFAULT statement in your CONSOLxx parmlib member. If a set of default routing codes was not provided on the DEFAULT statement, MVS will assign routing codes 1 through 16.

**Routing code meaning**
Routing codes appear within the associated message. The routing code field can contain the following numeric values, special characters, or notes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| 1    | Operator Action  
The message indicates a change in the system status. It demands action by a primary operator. |
| 2    | Operator Information  
The message indicates a change in system status. It does not demand action; rather, it alerts a primary operator to a condition that might require action. |
This routing code is used for any message that indicates job status when the status is not requested specifically by an operator inquiry. It is also used to route processor and problem program messages to the system operator.

3 **Tape Pool**

The message gives information about tape devices, such as the status of a tape unit or reel, the disposition of a tape reel, or a request to mount a tape.

4 **Direct Access Pool**

The message gives information about direct access storage devices (DASD), such as the status of a direct access unit or volume, the disposition of a volume, or a request to mount a volume.

5 **Tape Library**

The message gives tape library information, such as a request by volume serial numbers for tapes for system or problem program use.

6 **Disk Library**

The message gives disk library information, such as a request by volume serial numbers for volumes for system or problem program use.

7 **Unit Record Pool**

The message gives information about unit record equipment, such as a request to mount a printer train.

8 **Teleprocessing Control**

The message gives the status or disposition of teleprocessing equipment, such as a message that describes line errors.

9 **System Security**

The message gives information about security checking, such as a request for a password.

10 **System/Error Maintenance**

The message gives problem information for the system programmer, such as a system error, an uncorrectable I/O error, or information about system maintenance.

11 **Programmer Information**

This is commonly referred to as write to programmer (WTP). The message is intended for the problem programmer. This routing code is used when the program issuing the message cannot route the message to the programmer through a system output (SYSOUT) data set. The message appears in the JESYMSG data set.

12 **Emulation**

The message gives information about emulation. (These message identifiers are not included in this publication.)

13-20 For customer use only.

21-28 For subsystem use only.

29 Disaster recovery.

30-40 For IBM use only.

41 The message gives information about JES3 job status.

42 The message gives general information about JES2 or JES3.
43-64        For JES use only.
65-96        Messages associated with particular processors.
97-128       Messages associated with particular devices.
*            The message will be routed back to the consoles that initiated the associated requests.
/            The message will be routed to different locations according to the task issuing it. For example, */2/3 means the message is routed back to the console that initiated the request, to a primary operator, or to the tape pool.
#            The message will be routed in one of the following ways:
             • According to the routing indicators specified by the operator
             • According to the default routing instructions previously specified by the operator
             • Back to the console that initiated the associated request
---          The message has no routing code.
N/A          A routing code is not applicable for the message.
Note 2      The message is issued by a WTO or WTOR macro, but has no routing or descriptor codes (old format WTO or WTOR macro).
Note 3      The message has a routing code of 1, which sends the message to a primary operator, and the message is also routed to the console that it describes.
Note 4      The message is sent to all active consoles; this is a broadcast message.
Note 5      The message has a routing code of 2, which sends the message to a primary operator.
Note 6      The message is routed only to non-printer consoles. This message is not issued by a WTO or WTOR macro.
Note 7      The message is routed to consoles where one or more of the following are active:
             • MONITOR JOBNAMES
             • MONITOR SESSIONS
             • MONITOR STATUS
Note 9      The message is issued during the nucleus initialization program (NIP) processing.
Note 10     The message is issued by the WTL macro.
Note 11     The message is routed to a SYSPRINT data set by data management.
Note 12     The message is issued by a WTO or WTOR macro with SYNCH=YES. See z/OS MVS Initialization and Tuning Reference for more information.
Note 13     The message is routed only to receivers of the hardcopy message set.
Note 14     The message is routed back to the console that initiated the request and to all associated consoles.
Note 16     The message is routed to the IPCS print file IPCSPRNT.
Note 17     The message is issued by JES3. A JES3 destination class is specified either by the initialization stream or by operator commands.
Note 18     The message is sent in response to a command to the console where the command was entered.
Note 19     The message is written to a data set. If routing and descriptor codes are also included for the message, the message might also be displayed according to the specified routing and descriptor codes. (The descriptor code does not apply to writing the message to the data set.)
Note 20  JES3 does not issue the message. JES3 sends the message to another subsystem for processing.

Note 21  This message is a trailer attached to multiple messages previously issued. It has the same routing and descriptor codes as the first line of the conglomerate.

Note 22  This message is routed to the transaction program (TP) message log.

Note 23  This message is issued by the device controller. The routing code will vary according to the device controller’s task.

Note 24  This message is routed to the assembly listing.

Note 25  When this message is issued during IPL, the routing codes are 2 and 10 and the descriptor code is 12. When it is issued after IPL, it has no routing code and the descriptor code is 5.

Note 26  When this message is issued during NIP processing, the descriptor code is 12. When it is issued after NIP processing, the descriptor code is 4.

Note 27  The indicated route codes are used only if this message is issued in response to a reply of CKPTDEF during a JES2 checkpoint reconfiguration. This message might be issued to a specific console rather than directed by route code. For further information concerning the routing of JES2 messages issued during a reconfiguration, see z/OS JES2 Initialization and Tuning Guide.

Note 28  These routing and descriptor codes apply only when SMS issues the message. If SMS returns the message to its caller and the caller issues the message, the codes do not apply.

Note 29  This message is written to the JES3OUT data set.

Note 30  This message is issued by JES3. The message is written to the *MODIFY CONFIG (*F MODIFY) log and/or the issuer of the *F CONFIG command.

Note 31  The routing and descriptor codes for this message are dependent on the setting of indicator bits within the S99EEOPTS field in the SVC 99 Request Block Extension (S99RBX). See the z/OS MVS Programming: Authorized Assembler Services Guide, Processing Messages and Reason Codes from Dynamic Allocation for additional information.

Note 32  Routing code 2 is only applicable if message IYP050D was issued.

Note 33  Routing code 2 is only applicable if message IZP050D was issued.

Note 34  This message is only displayed on the SMCS Console Selection screen, and is not issued via WTO support.

Note 35  By default, IBM Health Checker for z/OS messages does not use routing codes, but the installation can override the default to use routing codes using either the MODIFY hzsproc command or in the HZSPRMxx parmlib member. See IBM Health Checker for z/OS: User's Guide for more information.

Note 36  This message is written to the JESYSMSG data set.

Descriptor codes
Descriptor codes describe the significance of messages. They indicate whether the system or a task stops processing, waits until some action is completed, or continues. This code also determines how the system will display and delete the message.

Association with message type code
Descriptor codes are associated with message type codes, specified by a letter following the message serial number, as follows:
<table>
<thead>
<tr>
<th>Descriptor Code</th>
<th>Type Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>W (wait)</td>
</tr>
<tr>
<td>2</td>
<td>A (action) or D (decision)</td>
</tr>
<tr>
<td>3</td>
<td>E (eventual action)</td>
</tr>
<tr>
<td>4 through 10</td>
<td>I (information)</td>
</tr>
<tr>
<td>11</td>
<td>E (critical eventual action)</td>
</tr>
<tr>
<td>12 and 13</td>
<td>I (information)</td>
</tr>
</tbody>
</table>

**Valid combinations and restrictions for descriptor codes**

Descriptor codes are specified in the DESC parameter of the WTO or WTOR macro. The following restrictions apply when specifying descriptor codes:

- Descriptor codes 1 through 6, 11, and 12 are mutually exclusive. Assign only one of these codes to a message. If you assign two mutually exclusive codes to one message, the system uses the most important code and ignores the other.
- Descriptor codes 7 through 10 and 13 can be assigned in combination with any of the mutually exclusive codes.
- Descriptor code 9 can be used only with descriptor code 8.

Under certain conditions, the system uses a descriptor code other than that specified in the macro as follows:

- The system assigns descriptor code 6 if the macro specifies a ROUTCDE parameter, but no DESC parameter.
- The system assigns descriptor code 7 if all of the following are true:
  1. A problem program issued the macro.
  2. The macro omits both DESC and ROUTCDE parameters, or specifies descriptor codes 1 or 2.
  3. The message is not a multiple-line WTO message.
- The system assigns no descriptor code if all of the following are true:
  1. An authorized program issued the macro.
  2. The macro omits both DESC and ROUTCDE parameters.
  3. The message is not a multiple-line WTO message.

**Note:** An authorized program has at least one of these characteristics:
- Authorized by the authorized program facility (APF)
- Runs in supervisor state
- Runs under PSW key 0 through 7

**Message deletion**

With multiple console support (MCS), action messages with descriptor code 1 or 2 issued by problem programs are assigned descriptor code 7; thus, they are automatically deleted from the system at task or address space ending.

The system deletes messages issued by any program when that program issues the DOM macro for a message.

The operator can manually remove all messages from a display console screen or can set the console to roll messages off the screen.
Message Color
On operator consoles with color, the descriptor code determines the color of the message. The use of color is explained in [z/OS MVS System Commands]. Also see the descriptions of the CONSOLxx and MPFLSTxx parmlib members in [z/OS MVS Initialization and Tuning Reference].

Descriptor code meaning
Descriptor codes appear within the associated message. The descriptor code field can contain the following numeric values, special characters or note.

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>System Failure</td>
</tr>
<tr>
<td></td>
<td>The message indicates an error that disrupts system operations. To continue, the operator must re IPL the system or restart a major subsystem. This causes the audible alarm to be sounded.</td>
</tr>
<tr>
<td>2</td>
<td>Immediate Action Required</td>
</tr>
<tr>
<td></td>
<td>The message indicates that the operator must perform an action immediately. The message issuer could be in a wait state until the action is performed or the system needs the action as soon as possible to improve performance. The task waits for the operator to complete the action. This causes the audible alarm to be sounded.</td>
</tr>
<tr>
<td></td>
<td>Note: When an authorized program issues a message with descriptor code 2, a DOM macro must be issued to delete the message after the requested action is performed.</td>
</tr>
<tr>
<td>3</td>
<td>Eventual Action Required</td>
</tr>
<tr>
<td></td>
<td>The message indicates that the operator must perform an action eventually. The task does not wait for the operator to complete the action.</td>
</tr>
<tr>
<td></td>
<td>If the task can determine when the operator has performed the action, the task should issue a DOM macro to delete the message when the action is complete.</td>
</tr>
<tr>
<td>4</td>
<td>System Status</td>
</tr>
<tr>
<td></td>
<td>The message indicates the status of a system task or of a hardware unit.</td>
</tr>
<tr>
<td>5</td>
<td>Immediate Command Response</td>
</tr>
<tr>
<td></td>
<td>The message is issued as an immediate response to a system command. The response does not depend on another system action or task.</td>
</tr>
<tr>
<td>6</td>
<td>Job Status</td>
</tr>
<tr>
<td></td>
<td>The message indicates the status of a job or job step.</td>
</tr>
<tr>
<td>7</td>
<td>Task-Related</td>
</tr>
<tr>
<td></td>
<td>The message is issued by an application or system program. Messages with this descriptor code are deleted when the job step that issued them ends.</td>
</tr>
<tr>
<td>8</td>
<td>Out-of-Line</td>
</tr>
<tr>
<td></td>
<td>The message, which is one line of a group of one or more lines, is to be displayed out-of-line. If a message cannot be displayed out-of-line because of the device being used, descriptor code 8 is ignored, and the message is displayed in-line with the other messages.</td>
</tr>
<tr>
<td>9</td>
<td>Operator’s Request</td>
</tr>
<tr>
<td></td>
<td>The message is written in response to an operator’s request for information by a DEVSERV, DISPLAY, or MONITOR command.</td>
</tr>
</tbody>
</table>
10  **Not defined**

Descriptor code 10 is not currently in use.

11  **Critical Eventual Action Required**

The message indicates that the operator must perform an action eventually, and the action is important enough for the message to remain on the display screen until the action is completed. The task does not wait for the operator to complete the action. This causes the audible alarm to be sounded.

Avoid using this descriptor code for non-critical messages because the display screen could become filled.

If the task can determine when the operator has performed the action, the task should issue a DOM macro to delete the message when the action is complete.

12  **Important Information**

The message contains important information that must be displayed at a console, but does not require any action in response.

13  **Automation Information**

Indicates that this message was previously automated.

14-16  Reserved for future use.

/  The message will have different descriptor codes according to the task issuing it. For example, 4/6 means the message can describe system status or job status.

—  The message has no descriptor code.

N/A  A descriptor code is not applicable for the message.

**Note 1**  The descriptor code for an IBM Health Checker for z/OS check exception message might vary, because the installation can override the descriptor code either using the MODIFY hzsproc command or in the HZSPRMxx parmlib member. See [IBM Health Checker for z/OS: User's Guide](https://www.ibm.com) for more information. In addition to the descriptor code selected by the installation, one of the following descriptor codes is also included based on the severity of the check:

- High severity checks use a descriptor code of 11.
- Medium severity checks use a descriptor code of 3.
- Low severity checks use a descriptor code of 12.

---

**Message directory**

To use a message prefix to locate the document containing a specific message, see the following table.

### Building your own message library

If you are operators or programmers in an installation, you can build your own libraries of the message and code information that fits your specific needs. You can place into binders the chapters and documents containing only the messages and codes you receive.

Basic documents

Each installation requires at least one copy of each of the MVS System Messages documents and of z/OS MVS Dump Output Messages. Regardless of the specific options of your system, you will receive at the console or in listings some subset of the messages in these documents.

Each installation also requires at least one copy of z/OS MVS System Codes, which contains the 3-digit hexadecimal system completion codes (abend codes) and the wait state codes produced by all the components of the system.

Note: 4-digit decimal user completion codes appear in documents for the component, subsystem, or product that produces the codes. Codes produced by installation-provided programs do not appear in IBM documents.

All programming and operations personnel need access to the basic documents, although application programmers might not need to have their own copies.

Optional documents

For information about message changes for multiple z/OS elements including JES2, JES3, RACF, TCP/IP, and others, see z/OS Summary of Message and Interface Changes.

CD-ROM collection

A comprehensive source of messages for IBM products is contained in the IBM Online Library Productivity Edition: Messages and Codes Collection, SK2T-2068.

Translating messages

Using the MVS message service (MMS), you can translate MVS system messages into other languages. The following messages cannot be translated:

- Initialization messages
- DFSMS/MVS messages
- JES3 messages
- Some complicated multiple-line messages

See z/OS MVS Planning: Operations and z/OS MVS Programming: Assembler Services Guide for information about using the MMS.

Finding changes to system message texts

Automation routines are sensitive to message text changes between releases. So before migrating from your current release to another one, you might need to check out the message changes. The summary of changes of the related messages books can be a helpful reference; an alternative can identify changes to message texts more accurately: comparing the SYS1.MSGENU data set.

IBM supplies a data set containing the text of system messages that are translated. This data set, called SYS1.MSGENU, contains the text of system messages in the form of message skeletons.

Note that this method will not show changes to messages that are not translated:

- MVS system messages that are not translated, such as IPL and NIP messages (which are issued before the MVS message service is available)
- Other product messages that are not translated, such as DFSMS/MVS messages, and JES3 messages.

You can compare the new data set with the data set on the system from which you are migrating. Depending on how you do the comparison, you can get output like the following.
For new messages, the output might show an I (for Insert) on the left:
I - IEA403I  VALUE OF RMAX HAS BEEN CHANGED TO 99

For messages with changed text, the output might show both an I and a D, indicating that a record in the message file has been replaced:
I - IEE162I 46 &NNN. ROLL &A. MESSAGES (DEL=R OR RD)
D - IEE162I 46 &NNN. ROLL &A. MESSAGES (DEL=R, RD)

This means that, in message IEE162I, (DEL=R, RD) was replaced by (DEL=R OR RD).

Using this information, you can decide if your automation routines need to be changed.
Chapter 2. IEB Messages

IEBA01I IEBIMAGE UTILITY COMPLETE.
RETURN CODE = return-code

Explanation: The utility has completed processing. The return code indicates the greatest severity of error found in any of the requested operations:

00 Successful completion, operation(s) performed as requested.
04 Operation(s) performed, investigate messages for exceptional circumstances.
08 Operation(s) not performed. Investigate messages.
12 Severe exception. Utility may end.
16 Catastrophic exception. Utility ended.
20 SYSPRINT data set could not be opened. Utility ended.
24 User parameter list incorrect. Utility ended.

In the message text:

return-code The return code.

System action: IEBIMAGE processing is ended.

Application Programmer Response: Examine the return code to determine the degree of successful processing. If the return code is '08' or greater, the preceding messages must be investigated and resolved and the job rerun.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, and the source input for the job.

Source: DFSMSdfp

IEBA02I MEMBER (mem) {ADDED|REPLACED} IN DIRECTORY

Explanation: The specified member has been placed into the library and a directory entry added or replaced in the PDS directory.

In the message text:

mem The member name.

System action: The IEBIMAGE program continues processing the next control statement.

Source: DFSMSdfp

IEBA03I NO SPACE IN DIRECTORY.

Explanation: A STOW macro has been issued but all directory blocks for the data set specified by the SYSUT1 DD statement have been used.

System action: The IEBIMAGE program continues processing the next control statement, but subsequent writing to the library data set is inhibited.

Application Programmer Response: Using utility programs such as IEBCOPY and IEHPROGM the data set may be recreated, allowing for more directory entries.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, and the source input for the job.

Source: DFSMSdfp

IEBA04I PERMANENT I/O ERROR IN [DIRECTORY] devnum, devtyp, ddname, op, errdes, lastskad, accmeth

Explanation: During writing to the specified library an I/O error occurred.

In the message text:

devnum The device number.
devtyp The device type.
ddname The DDNAME specified.
op The operation.
erdes A description of the error.
lastskad The last seek address.
accmeth The access method.

System action: IEBIMAGE processing is ended.

Application Programmer Response: Rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information.

Source: DFSMSdfp

IEBA05I FCB SPECIFICATION BEYOND RANGE OF FORM.
IEBA06I  •  IEBA09I

Explanation: The keywords supplied on the FCB control statement have specified channel controls beyond the last byte of the FCB image.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the FCB control statement and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA06I  PARAMETERS SPECIFIED IN (LOC) KEYWORD RESULT IN X(FF), AN UNPRINTABLE CHARACTER.

Explanation: During processing of a TABLE operation, the LOC keyword contained a parameter group in the following specification (23, 3F, 03). The ‘3F’ index into WCGM ‘03’ is specifically reserved to represent an unprintable character. The message does not inhibit the construction of the character arrangement table, but this character will not be printed.

System action: The IEBIMAGE program continues processing the next control statement.

Application Programmer Response: If an unprintable character is desired, specify only the character arrangement table location, that is (LOC=23). To specify a printable character the WCGM or the CGMID reference must be changed and the job rerun.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA08I  NO MEMBER NAME SPECIFIED.

Explanation: No NAME control statement or no name was specified on the NAME or INCLUDE statement.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Supply the missing 1- to 4-character name and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA09I  DUPLICATE MEMBER NAME FOR (mem), MEMBER NOT ADDED.

Explanation: A request was made to add a member to the specified library whose directory currently contains the name of a member equal to that of the name of the member to be added.

In the message text:

mem  The member name.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Change the name of the member to be added or if the member currently on the library is no longer needed, specify the replace option (R) on the NAME control statement.

System programmer response: If the error recurs and the program is not in error, search problem
IEBA10I MEMBER (mem) NOT FOUND.

**Explanation:** While processing the utility control statements, the name specified could not be found on the library directory. If this message precedes message IEBA42I, control card specifications are erroneous; otherwise it is an attention only message.

In the message text:

`mem` The member name.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Ensure that the name specified is correct and resubmit the job if necessary.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

IEBA12I CONTINUATION INVALID.

**Explanation:** A control statement was found that is not in proper format for a continuation statement. Columns 1 through 15 must be blank and the continuation information must start in column 16.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Change either the control statement that indicates continuation (it is non-blank in column 72), or ensure that the subsequent control statement is specified properly.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

IEBA13I PREVIOUS INCLUDE STATEMENT INVALID FOR THIS OPERATION, IT IS IGNORED.

**Explanation:** If an INCLUDE control statement precedes a FCB control statement or a print-only request, it is incorrect and is ignored. If multiple INCLUDE statements are present, only the last INCLUDE statement is used.

**System action:** The IEBIMAGE program continues processing the next control statement.

**Application Programmer Response:** Remove unnecessary INCLUDE statements and rerun job, if necessary.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

IEBA14I PARAMETER(S) INVALID FOR KEYWORD (keyw).

**Explanation:** Parameters for the indicated keyword have been incorrectly specified. There are too many characters, or too many parameters, or incorrect parameter specification. It may also mean that the number of lines described by the LPI keyword exceeds the length of the form as described by LINES or SIZE.

In the message text:
keywd  The specified keyword.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Correct the parameter specifications and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA15I**  KEYWORD (keywd) INVALID FOR THIS OPERATION.

**Explanation:** The indicated keyword is not valid for the current operation.

In the message text:

keywd  The specified keyword.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Correct the control statement and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA16I**  OPERATION INVALID - op

**Explanation:** The indicated operation is incorrectly specified, is not in the proper sequence, or is missing a name statement.

In the message text:

op  The operation.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Correct the indicated control statement and rerun the job.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA17I**  INVALID CONTROL CARD FORMAT.

**Explanation:** Either the control statement has an incorrect label, or it is a blank card image.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Correct the control statement and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA18I**  INVALID SEQUENCE FOR INITIAL COPY NUMBER, IN SEGMENT segnum.

**Explanation:** In an existing module that was either built or modified by other than the IEBIMAGE utility, the indicated segment has an initial copy member that is lower than the previous segment.

In the message text:

segnum  The segment number.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Using the INCLUDE with the DELSEG keyword, delete the appropriate segments.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA19I**  DATA SET NOT FOUND, DSNAME = dsname

**Explanation:** The indicated data set could not be found during the issuance of an OPEN macro.

In the message text:
dsname

The specified dsname.

System action: IEBIMAGE processing is ended.

Application Programmer Response: Ensure that the DD statement is correctly specified. Rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA20I

FAILURE DURING OPEN FOR DD = ddname

Explanation: The indicated DDNAME statement was incorrectly specified or not included in the JCL for this job step. If the DDNAME=SYSIN, the LRECL of the data set is probably not 80.

System action: IEBIMAGE processing is ended.

Application Programmer Response: Correct the DD statement error and rerun the job. For SYSIN DD, also ensure that the data set is allocated with LRECL=80.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA21I

INSUFFICIENT SPACE IN DATA SET - dsname

Explanation: The indicated data set is full. A D37 ABEND which has been suppressed by the utility has occurred.

In the message text:

d pname  The specified dsname.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Using utility programs such as IEBCOPY and IEHPROGM, the data set may be recreated, allowing for more space.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA23I

DUPLICATE OR MUTUALLY EXCLUSIVE KEYWORD (keywd) FOR OPERATION.

Explanation: The indicated keyword has been specified more than once on this control statement, or conflicts with other keywords or with the operation.

In the message text:

keywd  The specified keyword.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the control statement and resubmit the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp
IEBA24I SEGMENT NUMBER (segnum) NONEXISTENT.

Explanation: The indicated segment number is greater than the number of segments in the module referenced.

In the message text:

segnum The indicated segment number.

System action: The IEBAIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the segment number specification in the DELSEG or the REF keyword and rerun the job.

System programmer response: Run the IEBAIMAGE utility to print the applicable member. If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdtp

IEBA25I INSUFFICIENT KEYWORD INFORMATION TO COMPLETE OPERATION.

Explanation: Necessary keywords have not been specified, preventing the requested operation from completing successfully.

System action: The IEBAIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Specify the necessary keywords and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdtp

IEBA26I INVALID USE OF DELIMITER IN KEYWORD (keywd).

Explanation: A comma or a parenthesis has been encountered on a control statement which does not have the proper relationship to other delimiters within the indicated keyword.

In the message text:

keywd The specified keyword.

System action: The IEBAIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the control statement and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdtp

IEBA27I NO OPERATION DEFINED.

Explanation: A NAME control statement has been encountered that does not immediately follow an operation control statement (that is, FCB, COPYMOD, CHARSET, TABLE, or GRAPHIC).

System action: The IEBAIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the control statement sequence and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdtp

IEBA28I INVALID DATA SEQUENCE NUMBER.

Explanation: The sequence number on a data card (column 29 and 30) for a GRAPHIC or CHARSET operation is incorrect. The sequence number must be a 2-digit decimal number, between 1 and 24 (if the device being used is an IBM 3800 Model 1) or between 1 and 40 (if the device being used is an IBM 3800 Model 3 or Model 6).

System action: The IEBAIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the sequence number and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdtp
IEBA29I  MEMBER NAME OR REPLACE OPTION INVALID.

Explanation: The name specified exceeds four characters or the replace option (R) was incorrectly specified.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the error and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA30I  (GRAPHIC|CHARSET) DATA EXCEEDS RANGE OF PITCH IN SEGMENT segnum

Explanation: Data specified on the GRAPHIC or CHARSET data cards requires a character be built which has bits outside the allowable limits of the pitch specified in the ASSIGN keyword. In the formatted print of that character the erroneous bit(s) will be printed as a dollar sign ($).

In the message text:

segnum  The indicated segment number.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the error and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA31I  NO VALID INPUT DATA FOR (GRAPHIC|CHARSET) ASSIGN.

Explanation: The GRAPHIC or CHARSET operation with an ASSIGN keyword is not followed by a data card which has the data ‘SEQ=’ in column 25 through 28.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Supply appropriate data cards and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA32I  SIZE OF FORM IS nn.n INCHES (xxxx.xx MM).

Explanation: The FCB form size is printed as a number in inches and in millimeters (MM). This size was specified or defaulted with the SIZE parameter.

In the message text:

nn.n  The size of the form in inches.

xxxx.xx  The size of the form in millimeters.

System action: The IEBIMAGE program continues processing the next control statement.

Application Programmer Response: None

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEBA33I  SEGMENT segno COPY copynum LINE linenum MAY CREATE A LINE OVERRUN CONDITION IF PREVIOUS LINE IS PRINTED AT {6|8|10|12} LINES PER INCH.

Explanation: The segment with segment number segno, in combination with all the previous segments, may cause a line overrun condition to occur when this copy modification module is used. If the message specifies 12 lines per inch, the segment can be printed at 6, 8, or (for 3800-3) 10 lines per inch. If the message specifies 10 lines per inch, the segment can be printed at 6 or 8 lines per inch. If the message specifies 8 lines...
per inch, the segment can be printed only at 6 lines per inch.

In the message text:

**segnum**
The indicated segment number.

**copynum**
The number of the copy in which the line overrun condition may occur.

**linenum**
The line number in that copy.

The corresponding segment in the formatted listing is flagged with the designation “NOTE (n)”. If “n” is 0 (for 3800-3), 2, or 3, it indicates at least one overrun condition for 12, 8, or 6 lines per inch respectively. If “n” is 1, it indicates at least one overrun condition for 12 lines per inch (for 3800-1), or 10 lines per inch (for 3800-3).

**System action:** The IEBIMAGE program continues processing the next control statement.

**Application Programmer Response:** Respecify COPYMOD statements such that each segment in combination with preceding segments does not create a line overrun condition when the copy modification module is used. The OPTION statement with the OVERRUN parameter can be used to suppress this message.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA36I**

**DUPLICATE CHANNEL SPECIFICATION FOR PRINT LINE **

**prtlnnum**
The print line number specified.

**Explanation:** More than one channel specification has been requested for the same print line (for example, CH1=10, CH2=10).

In the message text:

**prtlnnum**
The print line number specified.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Correct the control statement and rerun the job.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp
IEBA37I REFERENCES TO NONEXISTENT CGMID WITHIN TABLE.

Explanation: One or more locations in the character arrangement table reference a CGMID that has not been defined in the trailer portion of the table.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the control statement and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdftp

IEBA38I TABLE REFERENCES NO PRINTABLE CHARACTERS.

Explanation: A character arrangement table has been constructed or modified such that the resulting table has all 256 locations referencing the non-printable character (FF).

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Correct the control statement and rerun the job.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdftp

IEBA39I INVALID PARITY IN SEGMENT segnum

Explanation: In a graphic character modification module that was either created or modified by other than the IEBIMAGE utility, the indicated segment was found to have incorrect parity.

In the message text:

segnum The indicated segment number.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Use SPZAP to correct the error, or rebuild the module using an INCLUDE control statement with the DELSEG keyword, and a GRAPHIC or CHARSET control statement with the ASSIGN keyword and appropriate data cards.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdftp

IEBA40I INCONSISTENT PITCH WITHIN SEGMENT segnum

Explanation: In a graphic character modification module that was either created or modified by other than the IEBIMAGE utility, the indicated segment was found to have inconsistent pitch.

In the message text:

segnum The indicated segment number.

System action: The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

Application Programmer Response: Use SPZAP to correct the error, or rebuild the modules using an INCLUDE control statement with the DELSEG keyword, and a GRAPHIC or CHARSET control statement with the ASSIGN keyword and the appropriate data cards.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdftp

IEBA41I PREVIOUSLY USED (EBCDIC|WCGM) ASSIGNMENT IN SEGMENT segnum

Explanation: A segment was found to have an assignment value equal to that of one previously used in the module. This error does not prohibit completion of the operation. For GRAPHIC operations all segments are built, but only the last one will take effect should it be loaded into the printer. For CHARSET operations only the last of the duplicated assignments is built. All previous library character set segments are ignored.

In the message text:

segnum The indicated segment number.

System action: The IEBIMAGE program continues
processing the next control statement.

**Application Programmer Response:** For GRAPHIC operations the unwanted duplicate segments can be deleted by using an INCLUDE control statement with the DELSEG keyword. An assignment value can be changed by using the GRAPHIC control statement with the REF keyword to change the EBCDIC assignment value. For CHARSET operations the INCLUDE control statement with the DELSEG keyword can be used to delete any unwanted segments. An assignment value can be inserted by using the CHARSET control statement with the REF or ASSIGN keywords.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA42I** MEMBER NOT ADDED TO LIBRARY, ERROR(S) LISTED.

**Explanation:** Errors previous to this statement have prevented the utility from updating the library with the module specified in the current operation.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Correct the errors and rerun the job.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA43I** IN SEGMENT segnum, (COPY|LINE|TEXT) SPECIFICATION BEYOND RANGE OF MAXIMUM VALUE.

**Explanation:** One of the following values has been exceeded:

- COPY - 256
- LINE - 133
- TEXT - 205

The IEBIMAGE utility does not allow number of copies, number of lines, or number of text characters per line specifications to exceed certain values.

**COPY**—The number of the copy at which additional printing is to begin, plus the number of copies, cannot exceed 256.

**LINE**—The number of the line at which additional printing is to begin, plus the number of lines, cannot exceed 133. The IEBIMAGE utility allows the sum to be 133, which is valid for a 3800 using International Standards Organization (ISO) paper sizes. If this value is greater than 120 for a 3800 that uses common-use paper sizes, the entry is never used.

**TEXT**—The number of the character at which additional printing is to begin, plus the number of characters, cannot exceed 205.

In the message text:

segnum

The indicated segment number.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Correct the error and rerun the job.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEBA44I** SEQUENCE NUMBER INVALID OR PREVIOUSLY USED.

**Explanation:** A data card sequence number of less than 1, or one that has been used previously, has been encountered.

**System action:** The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

**Application Programmer Response:** Correct the data card and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp
IEBA45I LIBRARY SPACE INCREASED TO \textit{nn} EXTENTS.

\textbf{Explanation:} After updating the library specified by the SYSUT1 DD statement, it was found that the last record was written on a different extent than the previous update. The SYS1.IMAGELIB system data set can have up to 16 extents.

In the message text:

\textit{nn} The number of extents.

\textbf{System action:} The IEBIMAGE program continues processing the next control statement.

\textbf{Application Programmer Response:} Programs that have the library open while IEBIMAGE is processing may not be able to access new or updated members unless they close and reopen it.

\textbf{System programmer response:} If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

\textbf{Source:} DFSMSdfp

IEBA46I REQUEST TO UPDATE LIBRARY DENIED, DSNAMES = \textit{dsname}.

\textbf{Explanation:} The OPEN macro has caused a message to be sent to the operator requesting an update to a library whose expiration has not been exceeded. The operator replied M, denying the request.

In the message text:

\textit{dsname} The data set name.

\textbf{System action:} IEBIMAGE processing continues with the next control statement but updating of the library data set is inhibited.

\textbf{Application Programmer Response:} Specify a different volume and/or obtain authorization to update the subject data set.

\textbf{System programmer response:} If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

\textbf{Source:} DFSMSdfp

IEBA47I INSUFFICIENT VIRTUAL STORAGE TO PERFORM STOW FUNCTION.

\textbf{Explanation:} A STOW SVC was issued and its function was prohibited due to lack of virtual storage.

\textbf{System action:} The IEBIMAGE program continues processing the next control statement, but subsequent writing to the library data set is inhibited.

\textbf{Application Programmer Response:} Rerun the job. The error may be a temporary one caused by fragmentation of virtual storage.

\textbf{System programmer response:} If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

\textbf{Source:} DFSMSdfp

IEBA48I DUPLICATE TABLE REFERENCE FOR LOCATION (\textit{loc}).

\textbf{Explanation:} Specification for the same location in a character arrangement table occurred more than once. Each reference must be unique.

In the message text:

\textit{loc} The indicated location.

\textbf{System action:} The IEBIMAGE program continues processing the next control statement, but writing to the library data set for the current operation is inhibited.

\textbf{Application Programmer Response:} Correct the control statement and rerun the job.

\textbf{System programmer response:} If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the source input for the job, and all printed output and output data sets related to the problem.

\textbf{Source:} DFSMSdfp

IEBA49I NO CHANNEL 1 CODE HAS BEEN SPECIFIED.

\textbf{Explanation:} The FCB does not contain a channel 1 code. Be careful when using this FCB, because a skip command will cause a unit check at the printer if the FCB does not contain the required channel code.

\textbf{System action:} The IEBIMAGE program continues processing the next control statement.

\textbf{System programmer response:} If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the
SYSOUT output, the source input for the job, and all
printed output and output data sets related to the
problem.

Source: DFSMSdfp

IEBA50I CLOC PARAMETER NOT SPECIFIED
FOR REFERENCED GCM SEGMENT

Explanation: When building a library character set
using the REF keyword of the CHARSET operation, no
character location (CLOC) assignment was specified for
the graphic character module (GCM).

In the message text:

segnum

The indicated segment number.

System action: The IEBIMAGE program continues
processing the next control statement, but writing to the
library data set for the current operation is inhibited.

Application Programmer Response: Specify a
WCGM location in the second parameter of the REF
keyword for the CHARSET operation. All library
character set segments require a WCGM location
assignment between '00-3F'.

System programmer response: If the error recurs
and the program is not in error, search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the
SYSOUT output, the source input for the job, and all
printed output and output data sets related to the
problem.

Source: DFSMSdfp

IEBA50I LIBRARY NOT UPDATED: MODULE
CONTAINS NO DATA

Explanation: The module being created contains no
data. This may have been caused by a DELSEG
parameter on an INCLUDE statement which deleted all
the segments of the module.

System action: The IEBIMAGE program continues
processing the next control statement, but writing to the
library data set for the current operation is inhibited.

Application Programmer Response: Correct the
control statement and rerun the job.

System programmer response: If the error recurs
and the program is not in error, search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the
SYSOUT output, the source input for the job, and all
printed output and output data sets related to the
problem.

Source: DFSMSdfp

IEB008I INVALID NAME FIELD

Explanation: The name field is incorrect in the EDIT
statement preceding this message. Possibly, the name
field consists of more than 8 characters or contains an
incorrect character.

System action: Processing continues with the next
EDIT statement. The return code is 4.

**Application Programmer Response:** Probable user error. Correct the name field on the preceding statement. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB009I**  
**INVALID STATEMENT SYNTAX**  
**Explanation:** The EDIT statement preceding this message is coded incorrectly.

**System action:** Processing continues with the next EDIT statement. The return code is 4.

**Application Programmer Response:** Probable user error. Correct the preceding statement. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB010I**  
**INVALID OPERATION CODE**  
**Explanation:** The preceding statement is not an EDIT utility control statement. Possibly, EDIT is misspelled.

**System action:** Processing continues with the next EDIT statement. The return code is 4.

**Application Programmer Response:** Probable user error. Correct the operation on the preceding control statement to EDIT. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB011I**  
**INVALID OPERAND**  
**Explanation:** The operand is incorrect in the EDIT statement preceding this message. Possibly, a parameter is misspelled or incompatible parameters are specified.

**System action:** Processing continues with the next EDIT statement. The return code is 4.

**Application Programmer Response:** Probable user error. Correct the operands on the preceding control statement. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB014I**  
**INVALID DELIMITER**  
**Explanation:** A delimiter is incorrect in the EDIT statement preceding this message.

**System action:** Processing continues with the next EDIT statement. The return code is 4.

**Application Programmer Response:** Correct the delimiters on the preceding control statement. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB020I**  
**INVALID CONTINUATION CARD**  
**Explanation:** The continuation does not begin at column 16 in the statement preceding this message.

**System action:** Processing continues with the next EDIT statement. The return code is 4.

**Application Programmer Response:** Probable user error. Begin the continuation statement in column 16 or, if no continuation is desired, correct the statement that indicated a continuation. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp
IEB021I INVALID CHARACTER

Explanation: A character is incorrect in the EDIT statement preceding this message.

System action: Processing continues with the next EDIT statement. The return code is 4.

Application Programmer Response: Probable user error. Correct the error in the control statement. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB022I JOB NAME NOT FOUND BEFORE END OF FILE

Explanation: Either no JOB statement was found in the input data set, or the specified job could not be found.

System action: The job step is ended. The return code is 4.

Application Programmer Response: Probable user error. Insert the missing JOB statement into the input stream or correct the control information on the associated EDIT statement. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB023I sss STEP COULD NOT BE FOUND

Explanation: The step could not be found in the input data set. Possibly, the step name was misspelled.

In the message text:

sss The indicated step.

System action: Processing continues with the next EDIT statement. The return code is 4.

Application Programmer Response: Probable user error. Insert the missing step into the input stream or correct the control information on the associated EDIT statement. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB024I high WAS HIGHEST SEVERITY CODE

Explanation: The return code was the highest return code generated during processing of the IEBEDIT program.

In the message text:

high The highest return code generated.

Application Programmer Response: For other than successful job completion (severity code= 0), resubmit the job to process either the entire input stream or the unedited portion of the input stream.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB027I I/O ERROR dsname, jji, sss, ddd, devtyp, ddname, op, err, xxxx, acc

Explanation: A permanent input/output error occurred while processing on the device.

In the message text, the error analysis information provided by the SYNADAF data management macro issued by the SYNAD routine was:

dsname Data set name.

jji Job name.

sss Step name.

ddd Device number of the device.

devtyp Device type.

ddname Data definition name.
Operation attempted.

Error description.

Last seek address or block count.

Access method.

System action: The program is ended. The return code is 8.

Application Programmer Response: Correct the error condition indicated in the message text according to the error analysis information provided by the SYNADAF data management macro instruction. Resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB030I  {SYSUT1|SYSIN} BLKSIZE INVALID

Explanation: The block size of the SYSUT1 or SYSIN data set, as indicated in the message text, is not a multiple of 80 bytes.

System action: The program is ended. The return code is 8.

Application Programmer Response: Probable user error. Correct the block size of the indicated data set and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB032I  SYSUT2 BLKSIZE INVALID - SYSUT1 ASSUMED

Explanation: The block size of the SYSUT2 data set is not a multiple of 80 bytes.

System action: The SYSUT1 block size attributes are assumed for the SYSUT2 data set. Processing continues. The return code is 4.

Application Programmer Response: Probable user error. If the block size for SYSUT1 is undesirable for SYSUT2, correct the block size for SYSUT2 and resubmit the job; otherwise, disregard this message.

Source: DFSMSdfp

IEB033I  STATEMENT NOT PROCESSED EOF ON SYSUT1

Explanation: An end-of-file condition was encountered on the SYSUT1 data set. The preceding EDIT statement was not processed.

System action: The job step is ended. The return code is 4.

Application Programmer Response: Probable user error. Restructure the EDIT statements if the edited output is not as desired and resubmit the job; otherwise, disregard the unprocessed EDIT statements.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB034I  STEPNAME REQUIRED WITH TYPE= {INCLUDE|EXCLUDE}

Explanation: No step name was specified with a TYPE=INCLUDE or TYPE=EXCLUDE operation, as indicated in the message text.

System action: Processing continues with the next EDIT statement. The return code is 4.

Application Programmer Response: Probable user error. Correct the condition indicated in the message text. Resubmit the job to process either the entire input stream or the unedited portion of the input stream.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp
IEB100I  I/O ERROR READING MEMBER

Explanation: An I/O error was encountered while reading the specified member. Message IEB139I, which gives detailed information regarding the location of the error record, is always issued previous to this message.

In the message text:

```
memname
```

The specified member name.

System action: The next COPY control statement is sought unless a data check occupies the key or data portion. In this case, the error is ignored and data is copied as it came into main storage. If the copy is performed, the return code is 4; if not, the return code is 8.

Application Programmer Response: Depending on the type of error, rerun the COPY operation with the data set in error allocated:
- At a different physical location on the volume.
- On a different device.
- On a different channel.

If the error is on an input data set, it may be necessary to re-create the data set.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

IEB102I  MEMBER member NOT (COPIED | LOADED | UNLOADED) DUE TO I/O ERROR

Explanation: An I/O error on the SYSUT3 work file has made processing of the member impossible. If ******** replaces the member name in the above message, the error was found reading from SYSUT3.

In the message text:

```
member
```

The name of the member.

The severity is 8.

System action: Processing continues with the next member to be copied.

Application Programmer Response: Retry the failing operation, and either:
- Remove the SYSUT3 DD statement and increase the work area size as previously indicated in previously message IEB1051I.
- Use a different SYSUT3 data set. Place the SYSUT3 data set on a different physical location on the volume, on a different device, or on a different channel.

System programmer response: Use the IEHLIST utility to investigate the output directory and determine which member(s) were not copied.

Descriptor Code: -

IEB103I  MEMBERS member THRU END OF DATASET ARE NOT ACCESSIBLE DUE TO I/O ERROR

Explanation: Due to an I/O error while updating the output data set's directory, members starting from the named member, member, through the end of the data set (in alphameric order) have become inaccessible.

In the message text:
member

The name of the member.

The severity is 12.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Retry the failing operation. Use a different output data set. Place the data set on a different physical location on the volume, on a different device, or on a different channel.

System programmer response: Verify that the output data set directory is large enough. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

IEB116I MIXING CONTROL STATEMENTS FROM OLD AND NEW VERSION OF IEBCOPY

Explanation: Both types of statements were contained within the same copy step, or multiple operations were attempted using IEBCOPY control statements from a release prior to OS Release 20.

The severity is 8.

System action: IEBCOPY ends, leaving control statements unprocessed.

If a complete set of valid statements (that is, all old format or all new format) occurred together, then the operation was performed. If the statements were intermixed, no operation was performed after the point where the change in format was detected.

Application Programmer Response: Convert the old format control statements to new format.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**IEB1162W ESTAE SYSTEM MACRO INVOCATION FAILED**

**Explanation:** This message is issued if there is a non-zero return code from ESTAE invocation in IEBESTIN.

**System action:** The copy operation continues.

**User response:** None.

**Source:** DFSMSdfp
**Detecting Module:** IEBESTIN
**Routing Code:** Note 11
**Descriptor Code:** -

---

**IEB1163E SYSTEM ABEND code OCCURRED, TERMINATING IEBCOPY.**

**Explanation:** When one of the system ABENDs, S213, S913, S80A, or S878 occurs, the ESTAE recovery routine issues this message.

**System action:** The copy operation terminates after freeing all obtained storage.

**User response:** See [z/OS MVS System Codes](#) for an explanation of this abend code.

**Source:** DFSMSdfp
**Detecting Module:** IEBESTTM
**Routing Code:** Note 11
**Descriptor Code:** -

---

**IEB117I TABLES EXCEED ALLOCATED STORAGE -- INCREASE WORK= VALUE IN PARM FIELD**

**Explanation:** The number of names from {INDD} and {SELECT} or {EXCLUDE} statements have grown too large. The virtual storage available for saving the names has been exceeded.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Do either of the following:
- Make more virtual storage available to IEBCOPY.
- Make more virtual storage available to IEBCOPY.
  
  See message IEB1055I.

• Split the operation into multiple operations to decrease the maximum number of DDNAMEs and member names in any one operation.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Routing Code:** Note 11
**Descriptor Code:** -

---

**IEB118I CONTROL STATEMENT ERROR**

**Explanation:** The statement just listed has an incorrect command, keyword, or parameter.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Check for multiple INDD= keywords on the same statement, or statements that mix old and new format keywords.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** Data Facility Product (DFP)
**Routing Code:** Note 11
**Descriptor Code:** -

---

**IEB119I STATEMENT SEQUENCE ERROR**

**Explanation:** The error is one of the following:

- The first COPY statement, in a contiguous series of COPY statements, is either incomplete or out of sequence.
- The first COPYMOD statement, in a contiguous series of COPYMOD statements, is either incomplete or out of sequence.
- IEBCOPY control statements from a release prior to OS Release 20 are not in the correct sequence.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

If old format statements were used then IEBCOPY ends.

**Application Programmer Response:** Correct the control statements.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Descriptor Code: -

**IEB120I**

`ddname` VALIDATION ERROR

Explanation: The data set cannot be used. The next message(s) explain the error encountered while opening or validating the data set.

The DD statement may be missing, or the identified data set may be missing, or the data set may have DCB attributes which are not permitted, or the data set attributes may conflict among the data sets required to perform the current operation.

In the message text:

`ddname` The DDNAME.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Correct any errors diagnosed by accompanying messages.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

**IEB121I**

OPEN ERROR ON DDNAME `ddname`

Explanation: The data set could not be opened.

In the message text:

`ddname` The DDNAME.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Correct any incorrect DD statement parameters.

System programmer response: Check for accompanying IEBCOPY and IEC, IGD, IGW, and IOS prefix messages.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

**IEB122I**

DSCB COULD NOT BE OBTAINED.

OBTAIN RC=`return-code`

REASON CODE=`reason`

Explanation: The data set associated with the DD statement named in accompanying message IEB120I was not on the volume (taken from the catalog or the DD statement), or the volume could not be mounted.

In the message text:

`return-code` The OBTAIN macro return code.

`reason` The OBTAIN macro reason code.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Verify that the named volume is the correct volume, and if it is, verify that it does contain the data set. In a system with System Managed Storage (SMS) active, it is possible that SMS will assign a data set to a different volume than the one coded on a DD statement.

Refer to IGD and IEF prefix messages in the JCL message data set to verify which volume contains a SMS managed data set.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Problem determination: The IDCAMS utility may be used to display the volume on which a cataloged data set is supposed to reside. The IEHLIST utility may be used to display the names of data sets which resident on a specific volume.

Routing Code: Note 11
Descriptor Code: -

**IEB123I**

INVALID DSORG (X'hhhh')

Explanation: The data set associated with the DD statement named in accompanying message IEB120I does not have partitioned or physical sequential organization.

One of the following may have occurred:
1. The data set has never been opened for output, therefore the DSORG field in the data set label is uninitialized.
2. A data set intended for output is being used for input because of incorrect control statements.
3. The data set is not a PDS, but a VSAM, or SYSOUT data set, etc.
4. DSORG has been incorrectly coded in the JCL.

In the message text:

```
hhhh  The data set organization code.
```

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Verify the IEBCOPY control statements. Verify that the job which created the data set was successful. Verify the DSORG used when allocating the data set.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** Data Facility Product (DFP)

---

IEB125I  INVALID BLOCK SIZE (nnnnn)

**Explanation:** The block size of the data set identified by message IEB120I is not valid. It may be zero, or it may exceed the hardware track length (unless the data set uses the hardware track overflow feature).

One of the following may have occurred:
1. The data set has never been opened for output, therefore the BLKSIZE and LRECL fields in the data set label are uninitialized.
2. A data set intended for output is being used for input because of incorrect control statements.
3. The data set is not a PDS, but a VSAM, or SYSOUT data set, etc.
4. DSORG or RECFM has been incorrectly coded in the JCL.

In the message text:

```
nnnn  The actual block size.
```

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Verify the IEBCOPY control statements. Verify that the job which created the data set was successful. Verify the BLKSIZE and LRECL used when allocating the data set.

**System programmer response:** The IEHLIST utility may be used to display the block size in the data set label. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** Data Facility Product (DFP)

---

IEB124I  INVALID LRECL (nnnnn)

**Explanation:** The logical record length of the data set identified by message IEB120I is not valid. It may be zero, or exceed the maximum allowed by the data set block size (DCBBLKSI).

One of the following may have occurred:
1. The data set has never been opened for output, therefore the BLKSIZE and LRECL fields in the data set label are uninitialized.
2. A data set intended for output is being used for input because of incorrect control statements.
3. The data set is not a PDS, but a VSAM, or SYSOUT data set, etc.
4. RECFM has been incorrectly coded in the JCL.

In the message text:

```
nnnn  The record length tested.
```

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Verify the IEBCOPY control statements. Verify that the job which created the data set was successful. Verify the BLKSIZE and LRECL used when allocating the data set.

**System programmer response:** The IEHLIST utility may be used to display the logical record length in the data set label. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** Data Facility Product (DFP)

---
### IEB126I  ddname REFERENCES AN UNMOVABLE DATA SET

**Explanation:** The input data set is flagged as unmovable in its DSORG. An unmovable data set cannot be compressed in place or copied because it may contain location dependent data.

In the message text:

`ddname`  
The DDNAME.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Verify the DDNAME `ddname` references an unmovable data set. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** Data Facility Product (DFP)

**Routing Code:** Note 11

**Descriptor Code:** -

---

### IEB127I  RECFM INCOMPATIBLE -- INPUT RECFM=iii OUTPUT RECFM=oooo

**Explanation:** The record format of the input data set is incompatible with that of the output data set.

IEBCOPY can not copy from fixed-length record format to variable-length record format or the reverse.

In the message text:

`iii`  
The input record format.

`oooo`  
The output record format.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Verify the RECFM of each data set. If they are correct, then IEBCOPY can not be used to copy the data set.

**System programmer response:** The IEHLIST utility may be used to display the RECFM in the data set label. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** Data Facility Product (DFP)

**Routing Code:** Note 11

**Descriptor Code:** -

---

### IEB129I  CANNOT REBLOCK KEYED DATA SETS

**Explanation:** The input and/or the output data set(s) have keyed records. Reblocking operations can not be done.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Reallocate the output data set so that it has a block size that is consistent with the input data set block size (so that reblocking will not be done).

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** Data Facility Product (DFP)

**Routing Code:** Note 11

**Descriptor Code:** -
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

#### IEB130I

**KEY LENGTHS UNEQUAL. INPUT KEY LENGTH IS** *inlen*, **OUTPUT KEY LENGTH IS** *outlen*.

**Explanation:** The key length of the input data set and key length of the output data set are not equal.

In the message text:

*inlen* The input key length.

*outlen* The output key length.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Reallocate the output data set so that it has the same key length as the input data set key length.

**System programmer response:** The IEHLIST utility may be used to display the key length in the data set label. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: MNote 11
Descriptor Code: -

#### IEB131I

**CANNOT COMPRESS OR COPY WITHIN SAME KEYED DATA SET**

**Explanation:** A compress-in-place operation or copying of members within same PDS, was requested, but the data set contains keyed records. IEBCOPY does not copy members within or compress keyed data sets in place.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Make a full copy to a new data set. Substitute this

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

#### IEB132I

**INVALID RE/DE-BLOCKING. INPUT BLKSIZE IS** *inblksz*, **OUTPUT BLKSIZE IS** *outblksz*.

**Explanation:** The input data set block size is incompatible with the output data set block size.

For fixed length records, the size of each block must be a multiple of the logical record length.

For variable length records the output block size must be equal to or greater than the input logical record length.

For undefined length records the output block size must be equal to or greater than the input block size.

In the message text:

*inblksz* The input block size.

*outblksz* The output block size.

The severity is 8.

**System action:** For RECFM=U data sets, the copy operation continues. For all other RECFM, the copy operation ends.

**Application Programmer Response:** Respecify the output block size to allow this member to be properly copied. Copying a larger block size to a small block size can create "fat" blocks, which cause I/O errors when other programs try to read them. Use COPYMOD instead of COPY to reblock load modules.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -
IEB133I  MINIMUM REQUESTED STORAGE (amount) NOT AVAILABLE

Explanation:  IEBCOPY could not obtain a work area of even minimum size.

In the message text:

amount  The number of bytes of virtual storage that must be available to IEBCOPY for use as a work area.

The severity is 16.

System action:  IEBCOPY ends processing.

Application Programmer Response:  Make more virtual storage available to IEBCOPY. Make more virtual storage available to IEBCOPY. See message IEB1055I.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source:  Data Facility Product (DFP)

Routing Code:  11

Descriptor Code:  7

IEB134I  CANNOT COMPRESS WITH SELECT OR EXCLUDE

Explanation:  The input and output data set are the same data set, which implies a compress-in-place. A SELECT or EXCLUDE statement is also present, which is not allowed for a compress-in-place operation.

The severity is 8.

System action:  The operation is ended and the next control statement is sought.

Application Programmer Response:  Make a full copy to a new data set. Substitute this

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source:  Data Facility Product (DFP)

Routing Code:  Note 11

Descriptor Code:  -

IEB135I  MINIMUM I/O BUFFER NOT ALLOCATABLE

Explanation:  IEBCOPY obtained the largest size work area available from virtual storage. It was not large enough to contain two minimum size I/O buffers and the tables built from INDD=, SELECT, and/or EXCLUDE statements.

The severity is 8.

System action:  The operation is ended and the next control statement is sought.

Application Programmer Response:  Perform one of the following actions:

- Make more virtual storage available to IEBCOPY. Make more virtual storage available to IEBCOPY. See message IEB1055I.
- Divide the operation into several operations with each operation using fewer members.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source:  Data Facility Product (DFP)

Routing Code:  Note 11

Descriptor Code:  -

IEB136I  CANNOT ALLOCATE TWO TRACKS OF I/O BUFFERS FOR COMPRESS

Explanation:  There is not enough unallocated virtual storage available to contain 2 buffers, each the (device dependent) track size. COMPRESS operations must have this much I/O buffer space for full track I/O and synchronization.

The severity is 8.

System action:  The operation is ended and the next control statement is sought.

Application Programmer Response:  Perform one of the following actions:

- Make more virtual storage available to IEBCOPY. Make more virtual storage available to IEBCOPY. See message IEB1055I.
- Make a full copy to a new data set. Substitute this

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source:  Data Facility Product (DFP)

Routing Code:  Note 11
Descriptor Code: -

IEB137I  CANNOT SPECIFY DUPLICATE MEMBER NAMES FOR SELECT/EXCLUDE/RENAME - DUPLICATE IS member

Explanation: The member name appears more than once in the SELECT or EXCLUDE statements for this operation. It may be both an old name and a new name.

All names on SELECT or EXCLUDE statements in one operation must be unique, even if the name is used once as a old name and once as a new name.

In the message text:

member
The specified member name.

The severity is 4.

System action: The operation is not performed for the named members. Processing continues for the uniquely-named members.

Application Programmer Response: If duplicate names must be specified, create additional operations.

System programmer response: Check for duplicate renamed old names, duplicate old names that were not renamed, duplicate new names, or a combination of these.

If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: Data Facility Product (DFP)

Routing Code: Note 11

Descriptor Code: -

IEB139I  I/O ERROR activity synad_text

Explanation: An I/O error has occurred, the SYNADAF macro was issued, and SYNAD text was generated by the SYNADAF macro.

In the message text:

activity The activity taken, as follows:
• READING PDS
• WRITING PDS
• READING UNLOADED PDS
• WRITING UNLOADED PDS
• GET FROM CONTROL STMT FILE
• PUT TO MESSAGE FILE
• DURING ERASE
• DURING READBACK CHECK
• DURING READ
• DURING WRITE
• DURING LOAD
• DURING UNLOAD

synad_text The text issued by the SYNAD macro.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Depending on the type of error, retry the operation with the data set in error allocated:
• At a different physical location on the volume.
• On a different device.
• On a different channel.

If the error is on an input data set, it may be necessary to re-create the data set.

If the operation is compress-in-place and the error is NO RECORD FOUND, restore the backup and copy the data set to a different physical location.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
IEB140I  ddname REFERENCES A NULL INPUT DATA SET

Explanation: The data set contains no members.

In the message text:

ddname

The DDNAME.

The severity is 0.

System action: The next input data set or control statement is sought.

Application Programmer Response: Check the operation which created the input data set.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB142I  CANNOT CONTINUE TO BUILD CTLTAB

Explanation: More virtual storage is required to build the required control table to process the current operation.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Perform one of the following actions:

• Make more virtual storage available to IEBCOPY. Make more virtual storage available to IEBCOPY. See message IEB1055I.

• If the operation is not already a selective copy, then obtain a list of all members in the data set using the IEHLIST utility. Divide the operation into multiple selective copy operations. Each one should copy approximately the same number of members.

• If the operation is already a selective copy, then divide the operation into several operations each specifying fewer members.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. Provide the JCL and the program listing for the job.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB143I  ALL SELECTED MEMBERS (COPIED | LOADED | UNLOADED) DID NOT USE ALL SPECIFIED INDD'S

Explanation: All specified (selected) members have been successfully copied, and there are still data sets in the INDD list which have not yet been examined. It was not necessary to use all specified input data sets in order to locate all the selected members.

The severity is 0.

System action: The next control statement is sought.
Application Programmer Response: See messages IEB154I, IEB155I, and IEB167I. Verify that each member copied came from the expected data set.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB144I THERE ARE nnnnn UNUSED TRACKS IN OUTPUT DATASET REFERENCED BY ddname

Explanation: This message is issued after completing the operation to the output partitioned data set.

If an error has occurred, the number of tracks given in this message may be incorrect.

In the message text:

nnnnn  The number of tracks available in the data set.

ddname  The DDNAME.

The severity is 0.

System action: The next control statement is sought.

Application Programmer Response: If not enough space remains available, adding a compress-in-place operation may make additional space available.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB145I CANNOT COMPRESS OR COPY WITHIN SAME DATA SET WITH RE/DE-BLOCKING

Explanation: The compress-in-place operation or copying members within same PDS, can not alter the block size or record length of a data set. The data set to be compressed is identified by two different DD statements, and the input data set attributes are different from the output data set attributes. The different attributes imply reblocking, which can not be done during a compress-in-place operation or while copying members within same PDS.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Perform one of the following actions:

- Avoid reblocking by specify the same DD statement for both INDD= and OUTDD=.
- Make a full copy to a new data set. Substitute this

System programmer response: Check that the same DCB parameters are specified on each DD statement. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB147I END OF JOB - return-code WAS HIGHEST SEVERITY CODE

Explanation: This message is issued after all operations have been finished.

In the message text:

return-code  The highest return code from any operation.
IEB148I  NO SPACE IN OUTPUT DIRECTORY FOR DIRECTORY ENTRIES FROM INPUT DATA SET ddname

Explanation: While building an updated output directory (to reflect members copied from the input data set) IEBCOPY has determined that the amount of directory space allocated to the output data set is insufficient.

In the message text:

ddname  The DDNAME.

The severity is 0.

System action: IEBCOPY ends. When the severity code is other than 0, message IEB151I will also be issued.

Application Programmer Response: Verify that all operations completed as expected.

System programmer response: Consult message IEB151I if issued.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB149I  THERE ARE nnnnn UNUSED DIRECTORY BLOCKS IN OUTPUT DIRECTORY

Explanation: This message is issued after completing the operation to the output partitioned data set identified in message IEB144I.

If an error has occurred, the number of blocks given in this message may be incorrect.

In the message text:

nnnnn  The number of whole 256 byte directory blocks available for additional member name.

The severity is 0.

System action: The next control statement is sought.

Application Programmer Response: If not enough space remains available, a new data set with a larger directory must be allocated and the smaller data set copied to it.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB150I  **WARNING** THE OUTPUT DATASET REF BY ddname CONTAINS TOO MANY DIRECTORY BLOCKS PER TRACK

Explanation: Because of short or damaged directory blocks, more blocks were encountered than were expected. Errors will probably result if the is accessed by other programs. The BLDL and STOW functions are particularly vulnerable.

In the message text:

ddname  The DDNAME.

The severity is 4.

System action: IEBCOPY attempts to write the output directory in a structure identical to that of the input data set directory. This concludes the current operation and the next control statement is sought.

Application Programmer Response: The data may be recovered with this procedure: Allocate a new data set. Perform a selective copy to move approximately half of the members from the broken data set to the new data set. Repeat a separate selective copy operation to move the remaining members.

Routing Code: Note 11
Descriptor Code: -
IEB151I - IEB155I

Descriptor Code: 7

IEB151I JOB HAS TERMINATED WITH ERROR(S)

Explanation: IEBCOPY issued a message of severity 4 or greater. One or more operations were not completed successfully.

The severity is 0.

System action: IEBCOPY is finished operating and will end.

Application Programmer Response: Correct the errors indicated by preceding error messages, and retry the operations not successfully completed.

System programmer response: Look up the severity code of each issued message. Many IEBCOPY suffix I messages have a severity code greater than zero. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)

Routing Code: Note 11

Descriptor Code: -

IEB152I member COMPRESSED - WAS ALREADY IN PLACE AND NOT MOVED

Explanation: The member did not need to be physically moved during the compress-in-place operation.

In the message text:

member

The specified member name.

The severity is 0.

System action: Normal processing continues.

Source: Data Facility Product (DFP)

Routing Code: Note 11

Descriptor Code: -

IEB153I ALL MEMBERS COMPRESSED - ALL WERE ORIGINALLY COMPRESSED

Explanation: The data set was not in need of being compressed because all member data is contiguous at the front of the data set. No members from this data set were physically moved.

The severity is 0.

System action: Normal processing continues.

Source: Data Facility Product (DFP)

Routing Code: Note 11

Descriptor Code: -

IEB154I member HAS BEEN SUCCESSFULLY {COPIED | LOADED | UNLOADED | ALTERED}

Explanation: The member has been successfully copied, loaded, or unloaded from the input data set to the output data set, or altered in the output data set.

In a compress-in-place operation, this message may be issued for members not actually moved (as identified in message IEB152I).

In the message text:

member

The specified member name.

The severity is 0.

System action: Normal processing continues.

Source: Data Facility Product (DFP)

Routing Code: Note 11

Descriptor Code: -

IEB155I member HAS BEEN SUCCESSFULLY {COPIED | LOADED | UNLOADED | ALTERED} AND IS A NEW NAME

Explanation: The member, which is a new name, has been successfully copied, loaded, or unloaded from the input data set to the output data set, or altered in the output data set.

The old name of this member can be determined by checking the IEBCOPY control statement(s) listed at the beginning of the operation which issued this message.

In the message text:

member

The specified member name.

The severity is 0.

System action: Normal processing continues.

Routing Code: Note 11

Descriptor Code: -
IEB156I  NOT A DIRECT ACCESS DATA SET

**Explanation:** The data set referred to by the DDNAME in preceding message IEB120I is not on a direct access device. The data set is identified as a PDS or PDSE which must always reside on a direct access device.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Check that the data set is on a direct access volume.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.  

**Source:** Data Facility Product (DFP)  
**Routing Code:** Note 11  
**Descriptor Code:** -

IEB157I  ddname DD STATEMENT NOT FOUND

**Explanation:** The DDNAME DD statement was not supplied either in the JCL or by dynamic allocation before IEBCOPY was invoked.

In the message text:

```
  ddname
```

The DDNAME.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Check the spelling of *ddname* in the control statement. If it is spelled correctly then include the missing DD statement, or allocate a *DDNAME* file before invoking IEBCOPY.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** Data Facility Product (DFP)  
**Routing Code:** Note 11  
**Descriptor Code:** -

IEB158I  PARM=COMPRESS NOT VALID

**Explanation:** PARM=COMPRESS was specified on the JCL EXEC statement, and new format control statements are being used. New format statements do not use PARM=COMPRESS to request a compress.

**System action:** Processing continues. Compress-in-place will be done only if it is requested in a subsequent COPY statement.

**Application Programmer Response:** This message is informational only. It indicates that the PARM=COMPRESS parameter from the EXEC statement is ignored. Remove this parameter from the JCL to avoid further occurrences of this message.

If IEBCOPY is dynamically invoked then PARM=COMPRESS is in the parameters passed to IEBCOPY by the caller.

**Source:** Data Facility Product (DFP)  
**Routing Code:** Note 11  
**Descriptor Code:** -

IEB159I  NO MEMBERS (COPIED | LOADED) FROM INPUT DATA SET REFERENCED BY DDNAME

**Explanation:** The input data set was not used for one of the following reasons:

- A selective copy was specified, but none of the members to be copied were on this data set.
- All of the members which should have been copied from this input data set had names which were duplicates of member names on the output data set and replace was not specified.
- An I/O error (indicated by a previous message) has precluded use of members from this input data set.
- Either the input or the output data set contains duplicate or out-of-sequence members (indicated by a previous message).

In the message text:

```
  ddname
```

The DDNAME.

The severity is 0.

**System action:** The next input data set will be processed unless an error has occurred.

If an I/O error has occurred, or if there are duplicate or out-of-sequence members, actions taken are indicated by previous message(s).

**Application Programmer Response:** If an error occurred, correct it as indicated in the above explanation.

If no error occurred, verify that the processed members were found in the data sets expected to contain them.
System programmer response: Examine messages IEB154I, IEB155I, and IEB167I to verify that each member came from the expected data set. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)

Routing Code: Note 11

Descriptor Code: -

IEB160I  CONCULENATED DATA SETS

Explanation: The DDNAME identified in message IEB120I is a concatenation of data sets. IEBCOPY does not process concatenated data sets.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: If more than one input data set is to be used in the copy step, provide a separate DD statement for each, and include all the DDNAMEs in an INDD= utility control statement parameter.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)

Routing Code: Note 11

Descriptor Code: -

IEB162I  PARM=COMPRESS IGNORED

Explanation: PARM=COMPRESS is specified, but the input and output data sets are not the same data set, or an unload or load operation has been requested.

System action: PARM=COMPRESS is ignored.

Application Programmer Response: This message is informational only. Remove the PARM=COMPRESS parameter from the JCL to avoid further occurrences of this message. If a COMPRESS is desired, correct the DD statements or the INDD= and OUTDD= control statement parameters.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)

Routing Code: Note 11

Descriptor Code: -

IEB163I  NO MEMBER NAMES FOR PARTIAL COPY, WILL NOT COPY

Explanation: The version of IEBCOPY statement from a release prior to OS Release 20 specified TYPCOPY=I, but it was not followed by any MEMBER= statements.

The severity is 8.

System action: The job step is ended.

Application Programmer Response: Correct and convert the control statement to new format.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.
**IEB164I** TOTAL COPY ASSUMED

**Explanation:** The version of IEBCOPY statement from a release prior to OS Release 20 specified TYPCOPY=E, but it was not followed by any MEMBER= statements.

The severity is 4.

**System action:** A full copy is done.

**Application Programmer Response:** Correct and convert the control statement to new format.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** Data Facility Product (DFP)

---

**IEB164I**

**Explanation:** The member indicated was found in the current input data set directory before the I/O error occurred. The member was not processed because processing in the data set had not reached the data for the member.

In the message text:

- *member*  The specified member.

The severity is 12.

**System action:** The member is not processed.

**Application Programmer Response:** Retry the operation. If the operation fails a second time, suspect that a hardware error has occurred. The data set may have to be restored. Contact your systems programmer or hardware support personnel.

**Source:** Data Facility Product (DFP)

---

**IEB166I**

**Explanation:** Due to the validation error described in a previous message, the operation did not take place. The data set was not changed.

In the message text:

- *ddname*  The DDNAME.

The severity is 8.

**System action:** The next control statement is sought.

**Application Programmer Response:** Refer previously issued messages for the reason.

**Source:** Data Facility Product (DFP)

---

**IEB167I**

**Explanation:** Following messages identify the members input from the data set.

This message assists in tracing the data sets which were used, and which members they contributed.

In the message text:

- *ddname*  The DDNAME.

The severity is 0.

**System action:** Messages IEB154I and IEB155I follow.

**Source:** Data Facility Product (DFP)

---

**IEB168I**

**Explanation:** If preceded by message IEB148I, the output directory has been truncated. Otherwise, the output directory may be incomplete.

The severity is 12.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Depending on
the type of error, retry the operation with the data set in error allocated:
• At a different physical location on the volume.
• On a different device.
• On a different channel.

If the error is on an input data set, it may be necessary to re-create the data set.

System programmer response: Dump the directory with IEHLIST or SPZAP to determine the final status of the output directory. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: Note 11/11
Descriptor Code: -/7

IEB169I **WARNING** DUE TO I/O ERROR ON SYSUT4, OUTPUT DIRECTORY MAY NOT BE COMPLETE

Explanation: The SYSUT4 spill file holds the directory for the output data set until the operation is complete. Because an I/O error occurred on the SYSUT4 spill file, a portion of the output directory was lost before it could be written to the output data set.

The severity is 0.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Retry the failing operation, and either:
• Remove the SYSUT4 DD statement and increase the work area size. See message IEB1052I previously issued.
• Use a different SYSUT4 data set. Place the SYSUT4 data set on a different physical location on the volume, on a different device, or on a different channel.

System programmer response: Use the IEHLIST utility to investigate the output directory and determine which member(s) were lost. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB170I **WARNING** DUE TO SYSUT3 I/O ERROR, COMPRESS IN-PLACE NOT DONE AND COPY OPERATION TERMINATED

Explanation: An I/O error has occurred while using the spill data set. None of the members were physically moved, so the data set remains as it was prior to processing.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: Retry the failing operation, and either:
• Remove the SYSUT3 DD statement and increase the work area size. See message IEB1051I previously issued.
• Use a different SYSUT3 data set. Place the SYSUT3 data set on a different physical location on the volume, on a different device, or on a different channel.

System programmer response: Use the IEHLIST utility to investigate the output directory and determine which member(s) were not copied. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)
Routing Code: Note 11
Descriptor Code: -

IEB171I **WARNING** DIRECTORY MIGHT NOT REFLECT VALID LOCATION OF MEMBER DATA

Explanation: An I/O error during a compress-in-place operation may have affected the validity of the data set directory.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: The data set in question should be checked for valid information and re-created or restored if necessary.

System programmer response: Use the IEHLIST utility to investigate the output directory. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide
the JCL and all printed output and output data sets related to the problem.

**Warning** **Input Record is a Short Length Record**

**Routing Code:** Note 11
**Descriptor Code:** -

IEB172I  

**ddname COULD NOT BE OPENED**

**Explanation:** The data set could not be opened. This is normally the SYSPRINT data set.

In the message text:

**ddname**  
The DDNAME.

The severity is 4.

**System action:** Normal processing continues. If this is the SYSPRINT data set then only I/O error messages and an end-of-job message are issued, and they are directed to the system console.

**Application Programmer Response:** Use the IEHLIST utility to investigate the output data sets and verify the ending status of each operation performed.

**System programmer response:** Look for a missing SYSPRINT DD statement.

Source: Data Facility Product (DFP)
Routing Code:  Note 11
Descriptor Code: -/7

IEB173I  

**ddname -- INVALID BLOCK SIZE**

**Explanation:** An incorrect block size associated with the indicated data set DD statement was detected. This is probably the SYSPRINT data set.

In the message text:

**ddname**  
The DDNAME.

**System action:** This data set cannot be used. If this is the SYSPRINT data set then only I/O error messages and an end-of-job message are issued, and they are directed to the system console.

**Application Programmer Response:** Use the IEHLIST utility to investigate the output data sets and verify the ending status of each operation performed.

**System programmer response:** Check the DD statement for incorrect DCB information, such as block size. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: Data Facility Product (DFP)

IEB175I  

**Warning** **Input Record is Greater than Output Blksize**

**Routing Code:** Note 11
**Descriptor Code:** -

IEB174I  

**Warning** **Input Record is a Short Length Record**

**Routing Code:** Note 11
**Descriptor Code:** -

IEB175I  

**Warning** **Input Record is Greater than Output Blksize**

**Routing Code:** Note 11
**Descriptor Code:** -
data set whose length is greater than the output block size has been processed. If the record length is less than or equal to the output device track capacity, then it was copied from the member to the output data set at the logical disk address specified exactly as it was read (no truncation). Otherwise, the record is discarded.

In the message text:

ddname
   The DDNAME.

member
   The specified member.

trtn
   The logical disk address.

The severity is 4.

System action: In the case of records greater than the output track capacity, the operation ends and the next control statement is sought. Otherwise, the error is ignored.

Application Programmer Response: If the output data set is to be updated or compressed, retry the operation specifying a larger block size, by JCL, on the output data set. If using full track blocking on input, be sure not to use an output device with a smaller track size than the data set block size.

Note: The stored load module will be executable, but it will not be usable as input to either the program management binder or the linkage editor. Before including it as input to either utility, copy the load module to a data set with a block size greater than the length of the largest text record. (The system's maximum block size, 32760 bytes, will always be large enough to contain any text record.)

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

IEB188I  MEMBER member IN DATASET ‘REFERENCED’ BY DDNAME HAS RECORDS GREATER THAN BLKSIZE

Explanation: While reading the member from the data set, a record longer than the data set block size was read.

In the message text:

member
    The specified member.

ddname
    The DDNAME.

The severity is 8.

System action: The operation is ended and the next control statement is sought.

Application Programmer Response: If the DCB parameters have been overridden, respecify the correct block size and key length.

System programmer response: The IEHLIST utility may be used to display the block size in the data set label. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Routing Code: Note 11
IEB189I • IEB19CI

Descriptor Code: -

IEB189I DIRECTORY ENTRY member IN BLOCK READ FROM DDNAME DDNAME AT MBBCCCHHR mbbccchhr TTRN ttrn IS OUT OF SEQUENCE OR DUPLICATE

Explanation: The directory of the data set contains two entries with the same name, or the entries are not in ascending sequence by name. The duplicate or out of place entry is for the member. The directory block is at the physical disk address indicated, and the logical disk address indicated. This is an attention message.

In the message text:

member The specified member.

ddname The DDNAME.

mbbcchhr The physical disk address.

ttrn The logical disk address.

The severity is 4.

System action: Processing continues.

Source: Data Facility Product (DFP)

IEB19BI MEMBER member (COPIED | LOADED), (REBLOCKED | ALTERED), AND IS A NEW NAME

Explanation: The member is a renamed load module which has been successfully copied (or loaded) and reblocked (or altered) to the output data set. The RLD counts have been updated or were already correct.

The old name of this member can be determined by checking the IEBCOPY control statements printed at the beginning of the copy step in which this message occurred.

In the message text:

member The specified member.

text One of the following:
- AS IS THEN ALTERED, MODULE IS PAGE-ALIGNED
- AS IS WITHOUT REBLOCKING FORMAT IS SCATTER-LOAD
- AS IS WITHOUT REBLOCKING MODULE IS NON-EDITABLE

The severity is 0.

System action: Processing continues.

Source: Data Facility Product (DFP)

IEB19CI MEMBER member (COPIED | LOADED), text

Explanation: COPYMOD has been specified. The member is a load module which has been copied to the output data set with no change in block size or content. The link edit attributes of the member make it ineligible for processing by COPYMOD.

In the message text:

member The specified member.

text One of the following:

System action: The member was copied unaltered.

Application Programmer Response: Process the module using the link editor.

System programmer response: The AMBLIST utility may be used to check the link edit attributes of member.

Source: Data Facility Product (DFP)
IEB19DI  MEMBER member {COPIED | LOADED},
              FORMAT IS SCATTER-LOAD I, AND IS A NEW NAME

Explanation: COPYMOD has been specified. The member is a renamed load module which has been copied to the output data set with no change in block size or content. The link edit attributes of the member make it ineligible for processing by COPYMOD.

The old name of this member can be determined by checking the IEBCOPY control statements printed at the beginning of the copy step in which this message occurred.

In the message text:

member

The specified member.

The severity is 4.

System action: The member was copied unaltered.

Application Programmer Response: Process the module using the link editor.

System programmer response: The AMBLIST utility may be used to check the link edit attributes of member.

Source: Data Facility Product (DFP)

IEB19FI  MEMBER member {COPIED | LOADED},
              {NOT A LOAD MODULE | INCOMPATIBLE OR INELIGIBLE},
              AND IS A NEW NAME

Explanation: COPYMOD has been specified. The member is a renamed load module which does not contain records in the format or with the content required of load modules.

The old name of this member can be determined by checking the IEBCOPY control statements printed at the beginning of the copy step in which this member occurred.

In the message text:

member

The specified member.

NOT A LOAD MODULE

The member is not a load module. A PDS may contain both load modules and non-load module members. There is no error if the member is indeed not a load module.

INCOMPATIBLE OR INELIGIBLE

COPYMOD cannot unblock the module because the common sections for the module are not at the end of the module where the link editor usually places them. The system issues message IEB1142W with more information about this error.

The severity is 4.

System action: The member was copied to the output data set with no change in block size or content.

If the member was partially copied before it was recognized that it was not a load module, the copy was started again from the beginning of the member.

The system issues accompanying message IEB1142W when INCOMPATIBLE OR INELIGIBLE is displayed.

System programmer response: The AMBLIST utility may be used to verify that the member is not a load module.

Source: Data Facility Product (DFP)
The system issues accompanying message IEB1142W when INCOMPATIBLE OR INELIGIBLE is displayed.

**Application Programmer Response:** Evaluate the member to see if it was processed as expected.

**System programmer response:** The AMBLIST utility may be used to verify that the member is not a load module.

**Source:** Data Facility Product (DFP)

---

**IEB19GI MEMBERS**

**Explanation:** The Relocation Dictionary (RLD) counts for the member have been inserted or updated.

In the message text:

*member*

The specified member.

The severity is 0.

**System action:** Processing continues.

**Source:** Data Facility Product (DFP)

---

**IEB19HI MEMBERS**

**Explanation:** No change has been made to the member because the Relocation Dictionary (RLD) counts were already correct.

In the message text:

*member*

The specified member.

The severity is 0.

**System action:** Processing continues.

**Source:** Data Facility Product (DFP)

---

**IEB19JI MEMBERS**

**Explanation:** ALTERMOD has been specified. The member is a load module which was not altered. The link edit attributes of the member make it ineligible for processing by ALTERMOD.

In the message text:

*member*

The specified member.

The severity is 4.

**System action:** The member is not processed.

**Application Programmer Response:** Evaluate the member to see if it should have been processed.

**System programmer response:** The AMBLIST utility may be used to check the link edit attributes of the member.

**Source:** Data Facility Product (DFP)

---

**IEB19KI MEMBERS**

**Explanation:** ALTERMOD has been specified. The member does not contain records in the format or with the content required of load modules.

A PDS may contain both load modules and non-load module members. There is no error if the member is indeed not a load module.

In the message text:

*member*

The specified member.

The severity is 0.

**System action:** The member is not processed.

**Application Programmer Response:** Evaluate the member to see if it should have been processed.

**System programmer response:** The AMBLIST utility may be used to verify that the member is not a load module.

**Source:** Data Facility Product (DFP)

---

**IEB190I MAXIMUM BLOCK SIZE IS**

**Explanation:** The COPYMOD operation will copy or reblock load modules.

In the message text:

*maximum*

The maximum block size that will be written.

*minimum*

The minimum block size that will be written specifically to optimize track space.

The severity is 0.

**System action:** Processing continues.

**Application Programmer Response:** If different parameters are required, specify the MAXBLK= and/or MINBLK= parameters.

**Source:** Data Facility Product (DFP)

**Routing Code:** Note 11

**Descriptor Code:** -
IEB191I  MAXBLK DEFAULTS TO maximum
Explanation:  The MAXBLK= parameter specifies a value that is greater than the track size, greater than 32 kilobyte-8 (32760), less than 1 kilobyte (1024), or not a number.
In the message text:

maximum  The maximum block size.
The severity is 4.
System action:  IEBCOPY uses the maximum value as the maximum block size. Processing continues.
Application Programmer Response:  If a smaller maximum block size is required, specify or correct the MAXBLK= parameter.
Source:  Data Facility Product (DFP)
Routing Code:  Note 11
Descriptor Code:  -

IEB192I  MINBLK DEFAULTS TO minimum
Explanation:  The MINBLK= parameter specifies a value that is greater than the output data set block size, greater than MAXBLK= parameter, less than 1 kilobyte (1024), or not a number.
In the message text:

minimum  The minimum block size.
The severity is 4.
System action:  IEBCOPY uses the minimum value as the minimum block size. Processing continues.
Application Programmer Response:  If a different minimum block size is required, specify or correct the MINBLK= parameter.
Source:  Data Facility Product (DFP)
Routing Code:  Note 11
Descriptor Code:  -

IEB193I  (MAXBLK | MINBLK)IS SPECIFIED ON OTHER THAN A COPYMOD STATEMENT
Explanation:  A MAXBLK or MINBLK parameter is found with a statement other than COPYMOD.
The severity is 8.
System action:  The operation is ended and the next control statement is sought.
Application Programmer Response:  Change the operation to COPYMOD or remove the MAXBLK= and/or MINBLK= operands.
Source:  Data Facility Product (DFP)
Routing Code:  Note 11
Descriptor Code:  -

IEB194I  CANNOT ALLOCATE ENOUGH STORAGE FOR ALTERMOD/COPYMOD
-- INCREASE WORK= VALUE IN PARM FIELD
Explanation:  There is not enough unallocated virtual storage available to reblock the records.
Virtual storage requirements vary with the input block size, the output block size, and the maximum number of RLD records that follow a block of text.
The severity is 8.
System action:  The operation is ended and the next control statement is sought.
Application Programmer Response:  Make more virtual storage available to IEBCOPY. Make more virtual storage available to IEBCOPY. See message IEB1055I.
Source:  Data Facility Product (DFP)
Routing Code:  Note 11
Descriptor Code:  -

IEB195I  RENAME/REPLACE NOT VALID WITH ALTERMOD
Explanation:  ALTERMOD has been specified. A SELECT statement MEMBER= operand contains a new name and/or the replace indicator, which is not allowed. ALTERMOD is an update-in-place operation does not replace nor rename members.
The severity is 8.
System action:  The operation is ended and the next control statement is sought.
Application Programmer Response:  Remove the rename or replace specification from the ALTERMOD statement.
Source:  Data Facility Product (DFP)
Routing Code:  Note 11
Descriptor Code:  -

IEB196I  INDD CANNOT EQUAL OUTDD WITH COPYMOD
Explanation:  COPYMOD is not an update-in-place operation, so two different data sets must be used. Therefore, INDD= and OUTDD= must specify different DNAMEs.
The severity is 8.
**IEB197I**  
**DSORG ‘PO’ REQUIRED WITH (COPYMOD | ALTERMOD) FOR DDNAME ddname**

**Explanation:** The data set associated with the ddname DD statement is not a partitioned data set, so it can not contain any load modules for a COPYMOD or ALTERMOD operation.

In the message text:

```
  ddname
```

The DDNAME.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Correct the DD statement.

**System programmer response:** The IEHLIST utility may be used to display the DSORG in the data set label. Look for an override on the DD statement.

**Source:** Data Facility Product (DFP)

**Routing Code:** Note 11

**Descriptor Code:** -

---

**IEB198I**  
**RECFM ‘U’ REQUIRED WITH (COPYMOD | ALTERMOD) FOR DDNAME ddname**

**Explanation:** The data set associated with the ddname DD statement does not have undefined format records, so it can not contain any load modules for a COPYMOD or ALTERMOD operation.

In the message text:

```
  ddname
```

The DDNAME.

The severity is 8.

**System action:** The operation is ended and the next control statement is sought.

**Application Programmer Response:** Correct the ddname DD statement.

**System programmer response:** The IEHLIST utility may be used to display the RECFM in the data set label. Look for an override on the ddnameDD statement.

**Source:** Data Facility Product (DFP)

**Routing Code:** Note 11

**Descriptor Code:** -

**IEB201I**  
**INVALID CONTROL STATEMENT**

**Explanation:** The syntax of the control statement preceding this message is incorrect.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the syntax of the preceding statement and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

**Routing Code:** -

**Descriptor Code:** -

---

**IEB202I**  
**INVALID DIRECTORY BLOCK SIZE**

**Explanation:** The length of the partitioned data set directory entry is less than 14 or greater than 256 bytes.

**System action:** The job step is ended. The return code is 12.

**Application Programmer Response:** Ensure that the specified data set is a PDS. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem
IEB203I  ALIAS/TRUE NAME FAILURE
Explanation: A true name and an alias name were the same for SYSUT1 and SYSUT2 data sets.
System action: The name that is a member in one data set and an alias in the other data set is printed. Processing continues with the comparison of user data. The return code is 8.
Source: DFSMSdfp

IEB205I  USER DATA FIELDS UNEQUAL
Explanation: The user data fields or TTRs of the SYSUT1 and SYSUT2 data sets are not identical.
System action: The fields are listed and processing continues. The return code is 8.
Source: DFSMSdfp

IEB210I  TRUE NAMES MISSING FROM BOTH SETS
Explanation: Not all the names in one directory have counterpart names in the other directory.
System action: The program is ended. The return code is 12.
Application Programmer Response: Make sure that at least one partitioned data set has true names associated with every member in the partitioned data set. Resubmit the job.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and input and output data sets related to the problem.
Source: DFSMSdfp

IEB211I  KEY LENGTHS ARE NOT EQUAL.
Explanation: The key lengths of the SYSUT1 and SYSUT2 data sets are not equal.
System action: The program is ended. The return code is 12.
Application Programmer Response: Probable user error. Make sure that both input data sets contain keys with the same length. Resubmit the job.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and input and output data sets related to the problem.
Source: DFSMSdfp

IEB212I  INVALID DCB PARAMETER
Explanation: Either the record formats are not standard, or the BLKSIZE/LRECL is omitted from either the input or output DD statement.
System action: The program is ended. The return code is 12.
Application Programmer Response: Make sure that a valid RECFM was specified in the DCB, and that the BLKSIZE/LRECL parameter was included in the input or output DD statement. If the data set resides on an unlabeled tape, make sure that a valid RECFM was included in the DCB parameter in the DD statement. After making corrections, resubmit the job.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and input and output data sets related to the problem.
Source: DFSMSdfp

IEB213I  REPETITIOUS CARD INVALID
Explanation: A second COMPARE or LABELS statement has been encountered.
System action: The job is ended at the end of the control statement scan. The return code is 12.
Application Programmer Response: Probable user error. Remove the extra command statement and resubmit the job.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
Source: DFSMSdfp

IEB214I  FIXED RECORD LENGTHS UNEQUAL
Explanation: The record lengths of the SYSUT1 and SYSUT2 data sets are not the same.
System action: The program is ended. The return code is 12.
Application Programmer Response: Probable user error. Make sure that the logical records in both data sets are of the same length, and that the LRECL parameter in both DCBs are correctly specified. Resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB215I RECORD FORMATS DIFFERENT

Explanation: The record characteristics of the SYSUT1 and SYSUT2 data sets are not the same.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Make sure that the record characteristics of the two data sets are compatible.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB216I ILLEGAL CONTROL CARD SEQUENCE

Explanation: The COMPARE statement was not the first utility control statement, or two COMPARE statements were encountered.

System action: The job is ended at the end of the control statement scan. The return code is 12.

Application Programmer Response: Probable user error. Make sure that there is only one COMPARE statement in the input stream. Resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB217I INVALID LRECL FOR V/VS RECORD

Explanation: The LL field of a variable-length record is less than 5, is greater than 32,756, or is greater than remaining size of the block.

System action: The job step is ended. The return code is 12.

Application Programmer Response: Make sure that the input data sets are valid. Resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem. Have the input data sets available.

Source: DFSMSdfp

IEB218I PERMANENT INPUT ERROR - FIND MACRO

Explanation: A permanent input error was found by the FIND macro instruction during a partitioned data set directory search.

System action: The job step is ended. The return code is 12.

Application Programmer Response: See Problem Determination, below.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB219I INVALID BLKSIZE FOR V/VS RECORD

Explanation: The LL field of a variable-length block is less than 9 or greater than 32,760.

System action: The job step is ended. The return code is 12.

Application Programmer Response: Make sure that the input data sets are valid. Resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem. Have the input data sets available.

Source: DFSMSdfp
IEB221I  RECORDS ARE NOT EQUAL
Explanation: Two corresponding records do not contain the same data, or the second part of the record descriptor word is not equal (00).
System action: The records are printed and processing continues. The return code is 8.
Source: DFSMSdfp

IEB222I  KEYS ARE NOT EQUAL
Explanation: Two corresponding keys do not contain the same data.
System action: The records are printed and processing continues. The return code is 8.
Source: DFSMSdfp

IEB223I  EXTRA RECORD ON SYSUT2
Explanation: The SYSUT2 data set contains more records than the SYSUT1 data set.
System action: The records are printed and processing continues. The return code is 8.
Source: DFSMSdfp

IEB224I  EXTRA RECORD ON SYSUT1
Explanation: The SYSUT1 data set contains more records than the SYSUT2 data set.
System action: The records are printed and processing continues. The return code is 8.
Source: DFSMSdfp

IEB225I  JOB TERMINATED AFTER EXIT
Explanation: The return code from an exit routine indicated that the job should be ended.
System action: The job is ended. The return code is 12 or 16, as determined by the exit routine.
Source: DFSMSdfp

IEB226I  WARNING - INVALID NAME
Explanation: The statement label either is longer than eight characters or contains an incorrect character.
System action: Processing continues normally.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
Source: DFSMSdfp

IEB227I  TEN CONSECUTIVE ERRORS
Explanation: Ten successive unequal comparisons have occurred, and an error routine was not specified.
System action: If the input data sets are sequential, the program is ended. The return code is 12. If the input data sets are partitioned, processing continues with the next member. If the current member is the last member, the program is ended. The return code is 8.
Source: DFSMSdfp

IEB229I  DDNAME ddname CANNOT BE OPENED
Explanation: The named DD statement does not exist.
In the message text:
ddname The DDNAME.
System action: The program is ended. The return code is 12.
Application Programmer Response: Either correct the DDNAME if it is misspelled in the DD statement or the DDLIST, or insert a new DD statement with the correct name.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
Source: DFSMSdfp

IEB230I  SYSIN BLOCKSIZE ERROR
Explanation: The SYSIN DD statement specifies a block size that is not a multiple of the specified logical record length.
System action: The program is ended. The return code is 12.
Application Programmer Response: Make sure that the block size is a multiple of the specified logical record length. Resubmit the job.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL
and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB231I EXTRA USER INPUT HEADER LABELS ON SYSUT1

Explanation: The SYSUT1 data set contains more user input header labels than the SYSUT2 data set.

System action: The extra labels are printed and processing continues. The return code is 8.

Source: DFSMSdfp

IEB237I BOTH INPUT DATA SETS CONTAIN NO USER HEADER LABELS

Explanation: The programmer requested the INHDR exit and/or label comparison, but there were no input header labels on the SYSUT1 and SYSUT2 data sets.

System action: Processing continues. The return code is 8.

Source: DFSMSdfp

IEB232I EXTRA USER INPUT HEADER LABELS ON SYSUT2

Explanation: The SYSUT2 data set contains more user input header labels than the SYSUT1 data set.

System action: The extra labels are printed and processing continues. The return code is 8.

Source: DFSMSdfp

IEB238I SYSUT1 CONTAINS NO USER INPUT TRAILER LABELS

Explanation: The programmer requested the INTLR exit and/or label comparison, but there was no input trailer label on the SYSUT1 data set.

System action: Message IEB234I is also issued.

Source: DFSMSdfp

IEB233I EXTRA USER INPUT TRAILER LABELS ON SYSUT1

Explanation: The SYSUT1 data set contains more user input trailer labels than the SYSUT2 data set.

System action: The extra labels are printed and processing continues. The return code is 8.

Source: DFSMSdfp

IEB239I SYSUT2 CONTAINS NO USER INPUT TRAILER LABELS

Explanation: The programmer requested the INTLR exit and/or label comparison, but there was no input trailer label on the SYSUT2 data set.

System action: Message IEB233I is also issued.

Source: DFSMSdfp

IEB234I EXTRA USER INPUT TRAILER LABELS ON SYSUT2

Explanation: The SYSUT2 data set contains more user input trailer labels than the SYSUT1 data set.

System action: The extra labels are printed and processing continues. The return code is 8.

Source: DFSMSdfp

IEB240I BOTH INPUT DATA SETS CONTAIN NO USER TRAILER LABELS

Explanation: The programmer requested the INTLR exit and/or label comparison, but there were no input trailer labels on the SYSUT1 and SYSUT2 data sets.

System action: Processing continues. The return code is 8.

Source: DFSMSdfp

IEB235I SYSUT1 CONTAINS NO USER INPUT HEADER LABELS

Explanation: The programmer requested the INHDR exit and/or label comparison, but there was no input header label on the SYSUT1 data set.

System action: Message IEB232I will be issued.

Source: DFSMSdfp

IEB241I INPUT HEADER LABELS ARE NOT EQUAL

Explanation: Corresponding input header labels are not the same.

System action: The SYSUT1 label is listed first, followed by the SYSUT2 label. Processing continues. The return code is 8.

Source: DFSMSdfp

IEB236I SYSUT2 CONTAINS NO USER INPUT HEADER LABELS

Explanation: The programmer requested the INHDR exit and/or label comparison, but there was no input header label on the SYSUT2 data set.
IEB242I INPUT TRAILER LABELS ARE NOT EQUAL
Explanation: Corresponding input trailer labels are not the same.
System action: The SYSUT1 label is listed first, followed by the SYSUT2 label. Processing continues. The return code is 8.
Source: DFSMSdfp

IEB243I ERROR WHILE READING USER INPUT HEADER LABEL ON SYSUT1
Explanation: An uncorrectable input/output error occurred while reading the user input header labels on the SYSUT1 data set.
System action: The program is ended. The return code is 12.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
Source: DFSMSdfp

IEB244I I/O ERROR WHILE READING USER INPUT HEADER LABEL ON SYSUT2
Explanation: An uncorrectable input/output error occurred while reading the user input header label on the SYSUT2 data set.
System action: The program is ended. The return code is 12.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
Source: DFSMSdfp

IEB245I I/O ERROR WHILE READING USER INPUT TRAILER LABEL ON SYSUT1
Explanation: An uncorrectable input/output error occurred while reading the user input trailer label on the SYSUT1 data set.
System action: The program is ended. The return code is 12.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
Source: DFSMSdfp

IEB246I I/O ERROR WHILE READING USER INPUT TRAILER LABEL ON SYSUT2
Explanation: An uncorrectable input/output error occurred while reading the user input trailer label on the SYSUT2 data set.
System action: The program is ended. The return code is 12.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
Source: DFSMSdfp

IEB247I xxx INPUT [HEADER|TRAILER] LABELS FROM BOTH DATA SETS ARE COMPARED
Explanation: At the programmer’s request, the indicated number of user input header or trailer labels were compared.
In the message text:
xxx The indicated number of user input header or trailer labels.
System action: If the return code from the user exit routine is 16, message IEB225I is also issued. Otherwise, processing continues normally.
Source: DFSMSdfp

IEB248I xxx EXITS TO routine IS MADE FOR {SYSUT1|SYSUT2} RETURN CODE FROM USER ROUTINE IS return-code
Explanation: The user label processing routine has been entered the indicated number of times for the SYSUT1 or SYSUT2 data set, as indicated in the message text. The routine returned a return code, indicating that no more labels will be processed.
In the message text:
xxx The number of times the user label processing routine has been entered.
routine The user label processing routine.
return-code The return code.
System action: If the return code from the user routine is 16, message IEB225I is also issued.
### IEB249I - NO RECORDS ARE COMPAED, DATA=ONLY

**Explanation:** The programmer specified DATA=ONLY. Therefore, only user header labels are processed.

**System action:** The program is ended. The return code is 0.

**Source:** DFSMSdfp

### IEB250I - USER LABEL IS NOT SUPPORTED BY PARTITIONED DATA SET

**Explanation:** The programmer requested the INHDR or INTLR exit, but user labels are incorrect for partitioned data sets.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Specify the keyword parameter in the COMPARE statement if the data sets are indeed physical sequential. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

### IEB251I - INCOMPATIBLE MAXIMUM LOGICAL RECORD LENGTH

**Explanation:** One of the input data sets contains logical records greater than 32 kilobytes. The other one does not.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Make sure that both data sets contain records of compatible logical record length. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

### IEB252I - KEYED DATA SETS. ONE CONTAINS SPANNED RECORD, THE OTHER ONE DOES NOT

**Explanation:** Both input data sets contain keyed records. One data set has variable spanned records. The other one does not.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Make sure that the input data sets are of compatible characteristics. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

### IEB253I - RECORDS ARE COMPARED AT PHYSICAL BLOCK LEVEL

**Explanation:** Since both data sets contain keyed spanned records or logical records greater than 32K bytes, the comparison is made at the block level.

**System action:** Processing continues normally.

**Source:** DFSMSdfp

### IEB254I - CORRESPONDING BLOCK LENGTHS ARE NOT EQUAL

**Explanation:** Corresponding block lengths are not the same.

**System action:** The blocks are printed, and processing continues. The return code is 8.

**Source:** DFSMSdfp

### IEB255I - CORRESPONDING RECORD LENGTHS ARE NOT EQUAL

**Explanation:** Corresponding lengths of variable or variable spanned records are not the same.

**System action:** The records are printed and processing continues. The return code is 8.

**Source:** DFSMSdfp

### IEB256I - IEBCOMPR DOES NOT COMPARE PARTITIONED DATA SETS WITH VS RECFM

**Explanation:** The programmer requested that partitioned data sets containing variable spanned (VS)
records be compared. IEBCOMPR does not support this function.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Specify TYPORG=PS in the COMPARE statement if the input data sets are indeed physical sequential. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

IEB257I  
**JOB TERMINATED AFTER EXIT FOR USER VOLUME SWITCH LABEL PROCESS**

**Explanation:** The programmer requested that processing be ended after the volume switch input header/trailer labels were examined in the labels exit routine.

**System action:** The program is ended. The return code is 16.

**Source:** DFSMSdfp

---

IEB258I  
**USER LABELS NOT COMPARED, UNABLE TO TAKE EXIT FOR ONE DATA SET**

**Explanation:** The programmer wishes to process the input header/trailer labels as data, but the utility program is unable to take the input header/trailer label exit for one of the data sets. Probably, the SUL subparameter is missing from the SYSUT1 or SYSUT2 DD statement.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Make sure that both the SYSUT1 and SYSUT2 DD statements specify SUL in the LABEL parameter. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

IEB260I  
**MISSING COMMAND IN OR BEFORE COLUMN dd**

**Explanation:** In the statement preceding this message, a command that should appear in or before the column is omitted. Possibly, the previous statement indicated a continuation, but the continuation indicator was not recognized, and the scan routine looked for a command on the preceding statement.

In the message text:

*dd* The indicated column.

**System action:** The job is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

IEB261I  
**INVALID PARAMETER IN OR BEFORE COLUMN dd**

**Explanation:** In the statement preceding this message, a keyword beginning in or before the column is either incorrect or not applicable to the command for which it was specified.

In the message text:

*dd* The indicated column.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

IEB259I  
**INVALID KEYWORD IN OR BEFORE COLUMN dd**

**Explanation:** In the statement preceding this message, a keyword beginning in or before the column is either incorrect or not applicable to the command for which it was specified.

In the message text:

*dd* The indicated column.
• The parameter is not immediately preceded by an equals sign.
• The parameter is misspelled.

**System action:** The job is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB262I**  
**MISSING KEYWORD IN OR BEFORE COLUMN dd**

**Explanation:** In the statement preceding this message, a required keyword that should appear in or before the column is omitted, or a blank immediately preceded an equals sign.

In the message text:

```
    dd     The indicated column.
```

**System action:** The job is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB263I**  
**MISSING PARAMETER IN OR BEFORE COLUMN dd**

**Explanation:** In the statement preceding this message, a required parameter that should appear in or before the column is omitted.

In the message text:

```
    dd     The indicated column.
```

**System action:** The job is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB264I**  
**FIRST CONTROL CARD IS NOT COMPARE**

**Explanation:** The COMPARE statement was not the first utility control statement.

**System action:** The job is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB265I**  
**INVALID COMMAND IN OR BEFORE COLUMN dd**

**Explanation:** In the statement preceding this message, the command beginning in or before the column is either misspelled or not immediately preceded or followed by a blank.

In the message text:

```
    dd     The indicated column.
```

**System action:** The job is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB266I**  
**CONTINUATION CARD BEGINS IN WRONG COLUMN**

**Explanation:** The continuation statement preceding this message does not begin in columns 4-16.

**System action:** The job is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp
Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB267I  I/O ERROR  jji, sss, ddd, devtyp, ddbname, op, err, xxxx, acc

Explanation: A permanent input/output error occurred while processing on the device indicated.

In the message text, the error analysis information provided by the SYNADAF data management macro instruction issued by the SYNAD routine was:

  jji  Job name.

  sss  Step name.

  ddd  Device number of the device.

  devtyp  Device type.

  ddbname  Data definition name.

  op  Operation attempted.

  err  Error description.

  xxxx  Last seek address of block count.

  acc  Access method.

System action: The program is ended. The return code is 12.

Application Programmer Response: Ensure that the DCB information was valid. Resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB302I  INVALID PARAMETER LIST

Explanation: The parameter list supplied by the programmer is incorrect; that is, the halfword pointed to by the first word of the three-word parameter list contains a negative number.

System action: The program step is ended. The return code is 12.

Application Programmer Response: Probable user error. Make sure that the length of the parameter list specified is not a negative number.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB303I  INVALID CONTROL STATEMENT

Explanation: The syntax of the control statement preceding this message is incorrect, or a parameter value that is inconsistent with the data set content has been specified.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB304I  CONTROL STATEMENT INPUT ERROR

Explanation: A permanent input/output error was detected while reading the SYSIN data set.

System action: The program is ended. The return code is 12.

Application Programmer Response: Retry the operation. If the operation fails a second time with this same message, then in all probability a hardware error has occurred. Ensure the quality of the hardware medium on which the data set referenced by the SYSIN DD statement resides. Resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp
exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB305I  JOB TERMINATED AFTER LABEL EXIT

Explanation: A return code of 16 was returned by a LABEL exit routine, indicating that processing is ended.

System action: The job is ended. The return code is 16.

Source: DFSMSdfp

IEB306I  JOB TERMINATED AFTER KEY EXIT

Explanation: A return code of 12 or 16 was returned by a KEY exit routine, indicating that processing is ended.

System action: The program is ended. The return code is 12 or 16, as determined by the exit routine.

Source: DFSMSdfp

IEB307I  JOB TERMINATED AFTER DATA EXIT

Explanation: A return code of 12 or 16 was returned by a DATA exit routine, indicating that processing is ended.

System action: The job is ended. The return code is 12 or 16, as determined by the exit routine.

Source: DFSMSdfp

IEB308I  PERMANENT INPUT ERROR

Explanation: A permanent input/output error was detected while reading the SYSUT1 data set.

For example, two situations that cause this message to appear are:

- fixed records with an LRECL or BLKSIZE of zero; or
- variable records with incorrect block or record descriptor words.

System action: The program is ended. The return code is 12.

Application Programmer Response: Make sure that the DCB values are correct for the data set being processed.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB309I  PERMANENT OUTPUT ERROR

Explanation: A permanent input/output error was detected while writing the SYSUT2 data set.

System action: The program is ended. The return code is 12.

Application Programmer Response: Make sure that the output DCB values are compatible with input DCB values, considering any record editing that was requested.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB310I  STOW ERROR IN OUTPUT DATA SET

Explanation: A permanent error occurred while writing the directory of the SYSUT2 data set. Possibly:

- The SYSUT2 data set is not partitioned.
- A member name was specified more than once in MEMBER statements.
- A member name was specified in a MEMBER statement, and a member of the same name already exists in the partitioned data set.
- Insufficient space was allocated for the directory.

System action: The program is ended. The return code is 12.

Application Programmer Response: Make sure that the SYSUT2 data set is partitioned, a member name is not specified more than once, and sufficient space is allocated for the directory, as necessary.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB311I  CONFLICTING DCB PARAMETERS

Explanation: The DCB parameters in the SYSUT2 DD statement are not compatible with those specified in the SYSUT1 DD statement. The reason for incompatibility could be one of the following:

1. The I/O blocksize is inconsistent with the I/O logical record length when the record format is FB or F
2. The I/O blocksize is not at least 4 bytes larger than
   the I/O logical record length when the record format
   is VB or V.

3. The output logical record length is different from the
   input logic record length or the input record format is
   variable and the output record format is fixed when
   editing is not specified. Refer to [z/OS DFSMSdfp]
   Utilities, SC26-7414 section "Changing Logical
   Record Length" under IEBGENER.

4. The output blocksize is not equal to the input
   blocksize when the input record format is undefined.

**System action:** The job step is ended. The return
   code is 12.

**Application Programmer Response:** Probable user
   error. Make sure that the DCB parameters of the output
   DD statement are compatible with the DCB parameters
   of the input DD statement, considering any editing that
   was requested.

**System programmer response:** If the error recurs
   and the program is not in error, look at the messages in
   the job log for more information. Search problem
   reporting data bases for a fix for the problem. If no fix
   exists, contact the IBM Support Center. Provide the JCL
   and the program listing for the job.

**Source:** DFSMSdfp

---

IEB312I JOB TERMINATED AFTER ERROR EXIT

**Explanation:** A return code of 16 was returned by an
   ERROR exit routine, indicating that processing is ended.

**System action:** The program is ended. The return
   code is 16.

**Source:** DFSMSdfp

---

IEB315I SPACE NOT AVAILABLE

**Explanation:** Insufficient virtual storage space is
   available for the work area, buffers, and save areas.

**System action:** The job is ended. The return code is
   12.

**Application Programmer Response:** Increase virtual
   storage size and resubmit job.

**System programmer response:** If the error recurs
   and the program is not in error, look at the messages in
   the job log for more information. Search problem
   reporting data bases for a fix for the problem. If no fix
   exists, contact the IBM Support Center. Provide the JCL
   and all printed output and output data sets related to
   the problem.

**Source:** DFSMSdfp

---

IEB316I DDNAME ddname CANNOT BE
   OPENED

**Explanation:** The DDNAME indicated on the DD
   statement does not exist. Perhaps a DDNAME is
   misspelled in an existing DD statement or ddlist.

In the message text:

   ddname

   The DDNAME.

**System action:** The job is ended. The return code is
   12.

**Application Programmer Response:** Probable user
   error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs
   and the program is not in error, look at the messages in
   the job log for more information. Search problem
   reporting data bases for a fix for the problem. If no fix
   exists, contact the IBM Support Center. Provide the JCL
   and the program listing for the job.

**Source:** DFSMSdfp

---

IEB317I JOB TERMINATED, NO INPUT
   BLKSIZE/LRECL

**Explanation:** The BLKSIZE/LRECL parameter was
   omitted from the input DD statement for SYSUT1.

**System action:** The program is ended. The return
   code is 12.

**Application Programmer Response:** Probable user
   error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs
   and the program is not in error, look at the messages in
   the job log for more information. Search problem
   reporting data bases for a fix for the problem. If no fix
   exists, contact the IBM Support Center. Provide the JCL
   and the program listing for the job.

**Source:** DFSMSdfp

---

IEB318I JOB TERMINATED, NO OUTPUT
   BLKSIZE/LRECL

**Explanation:** The BLKSIZE/LRECL parameter was
   omitted from the output DD statement for SYSUT2.

**System action:** The program is ended. The return
   code is 12.

**Application Programmer Response:** Probable user
   error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs
   and the program is not in error, look at the messages in
   the job log for more information. Search problem
   reporting data bases for a fix for the problem. If no fix
   exists, contact the IBM Support Center. Provide the JCL
   and the program listing for the job.
IEB319I  INVALID SYSPRINT/SYSIN BLOCKSIZE

**Explanation:** The SYSPRINT/SYSIN DD statement specifies a block size that is not a multiple of the specified logical record length.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB320I  OUTPUT DATA SET WITH KEYS IN VS/VBS PROCESSING

**Explanation:** During processing of other than “straight copy,” the programmer specified keys for a VS or VBS output data set. If a change is required in the data set characteristics, or if editing is to be done, a key cannot be specified.

**System action:** The job is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the data set characteristics (RECFM, BLKSIZE, LRECL) to be equal for the input and output data sets, and do not edit if keys are desired on VS or VBS records.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB321I  INPUT DATA SET WITH KEYS IN VS/VBS PROCESSING

**Explanation:** The input data set contained keys, and either the input or output data set contained VS or VBS records. The other data set did not contain VS or VBS records. If a change is required in the data set characteristics, or if editing is to be done, a key cannot be specified.

**System action:** The job is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the data set characteristics (RECFM, BLKSIZE, LRECL) to be equal for the input and output data sets, and do not edit if keys are desired on VS or VBS records.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB322I  JOB TERMINATED AFTER OPENING OUTPUT DATA SET UPON USER REQUEST

**Explanation:** The input header user label routine requires ending of the job after the output data set is opened.

**System action:** The job is ended. The return code is 16.

Source: DFSMSdfp

IEB323I  JOB TERMINATED AFTER HEADER LABEL PROCESSING

**Explanation:** The programmer specified a LABELS DATA=ONLY statement. Therefore, after the user header labels are processed, the program is ended.

**System action:** The program is ended. The return code is 8.

Source: DFSMSdfp

IEB324I  xxx TIMES TO routine EXIT ROUTINE

**Explanation:** The user label exit routine has received control the indicated number of times.

In the message text:

<table>
<thead>
<tr>
<th>xxx</th>
<th>The number of times the user label exit routine received control.</th>
</tr>
</thead>
<tbody>
<tr>
<td>routine</td>
<td>The user label exit routine.</td>
</tr>
</tbody>
</table>

**System action:** Processing is continued. The return code is 0.

Source: DFSMSdfp

IEB325I  LAST RETURN CODE WAS return-code

**Explanation:** The indicated return code was the last return code issued by the user routine specified in message IEB324I.

In the message text:

| return-code | The return code. |

**System action:** Processing is continued. The return code is 0.

Source: DFSMSdfp
**IEB326I** {SYSUT1|SYSUT2} | {HEADER|TRAILER} LABEL GAVE I/O ERROR

**Explanation:** A permanent input/output error occurred while reading or writing a SYSUT1 or SYSUT2 header or trailer label, as indicated in the message text. If the error occurred while reading or writing a header label, the data set was not opened.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Retry the operation. If the operation fails a second time with this same message, ensure the quality of the hardware medium on which the data set referenced by the SYSUT1 or SYSUT2 DD (see the details of the message) resides. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

**IEB327I** SPECIFIED KEY EXITS ARE NOT TAKEN

**Explanation:** The programmer specified key exits on a job requiring processing of a VS or VBS data set with reformating.

**System action:** Key exits are not taken. Processing continues. The return code is 4.

**Application Programmer Response:** Do not specify key exits.

**Source:** DFSMSdfp

**IEB328I** LRECL EXCEEDS 32K; STRAIGHT COPY NOT SPECIFIED

**Explanation:** A process other than “straight copy” was specified. However:
- The RECFM specified for the input or output DCB was VS or VBS.
- The LRECL specified for the input or output DCB, or both, was greater than 32,756.

**System action:** The job is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Make data set characteristics (RECFM, LRECL, BLKSIZE) equal for input and output data sets. Do not specify editing. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

**IEB329I** PDS NOT ALLOWED WHEN INPUT/OUTPUT DATA SET HAS RECFM=VS/VBS

**Explanation:** The programmer specified that the output data set should be partitioned, but the input and/or output data set has VS or VBS records which are incorrect.

**System action:** The job is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Remove the utility control statements which specify the output data set as being a PDS, and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

**IEB330I** TOTALING EXIT REQUESTS TERMINATION

**Explanation:** A return code of 16 was returned by the programmer’s totaling routine, indicating that processing is ended.

**System action:** The program is ended. The return code is 16.

**Source:** DFSMSdfp

**IEB331I** PROCESSING ENDS UPON REQUEST OF TOTALING EXIT

**Explanation:** A return code of 8 was returned by the programmer’s totaling routine, indicating that processing is ended, but normal end-of-data processing is completed for the output data set.

**System action:** Processing is ended, but normal end-of-data processing is completed for the output data set. The return code is 8.

**Source:** DFSMSdfp

**IEB332I**  TOTALING EXIT DEACTIVATED UPON ITS OWN REQUEST

**Explanation:** A return code of 0 was returned by the programmer's totaling routine, indicating that processing is continued, but no further totaling exits are taken.

**System action:** Processing continues, but no further totaling exits are taken. The return code is 0.

**Source:** DFSMSdfp

---

**IEB333I**  RECORD LABELS=nnn STATEMENTS ARE REQUIRED

**Explanation:** The programmer has specified a LABELS DATA= INPUT statement. Therefore, RECORD LABELS= statements are also required.

In the message text:

*nnn* The number of record labels.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. If user labels are desired, insert a RECORD LABELS= n statement and the associated labels statements in the input stream. If labels are not desired, remove the LABELS DATA=INPUT statement. Resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

---

**IEB334I**  NO EDITING OR CONVERSION WILL BE DONE

**Explanation:** Both data sets contain VS or VBS records, have the same block size, and have the same logical record length. Therefore, no editing or conversion is done.

**System action:** Processing continues. The return code is 0.

**Source:** DFSMSdfp

---

**IEB335I**  INVALID KEYWORD IN COLUMN dd

**Explanation:** In the statement preceding this message, a keyword beginning in the column is either misspelled, incorrect, or not applicable to the command for which it was specified.

In the message text:

*dd* The specified column.

**System action:** The job is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

---

**IEB336I**  INVALID PARAMETER IS COLUMN dd

**Explanation:** In the statement preceding this message, a parameter beginning in the column is incorrect:

- A member name contains more than eight characters.
- In the RECORD statement, the IDENT keyword is followed by more than three parameters.
- In the RECORD statement, the FIELD keyword is followed by more than four parameters.
- In the RECORD statement, the conversion parameters in the FIELD keyword are not HE, PZ, or ZD.

In the message text:

*dd* The specified column.

**System action:** The job is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp
In the RECORD statement, the LABELS keyword is not followed by a number from one to eight.

In the LABELS statement, the parameters in the DATA keyword are not ALL, ONLY, YES, NO, or INPUT.

In the GENERATE statement, the parameter in the MAXFLDS, MAXNAME, MAXGPS or MAXLITS keyword is not within the specified limits.

In the message text:

```
In the statement preceding this message, no operation is specified before the column. Possibly, the preceding statement is a continuation statement, but the previous statement indicating the continuation contained an error and, therefore, the continuation was not recognized.
```

System action: The job is ended. The return code is 12.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

---

### IEB340I

**KEYWORD MISSING PRECEDING COLUMN dd**

Explanation: In the statement preceding this message, a required keyword that should appear before the column is omitted. That is, the NAME keyword is not specified in the MEMBER statement, or the DATA keyword is not specified in the LABELS statement.

In the message text:

```
In the statement preceding this message, a parameter that should appear before the column is omitted. That is, a keyword is not followed by a parameter, or the IDENT keyword in the RECORD statement is not followed by all three parameters.
```

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp
Source: DFSMSdfp

**IEB343I** ALLOWED NO. OF CARDS EXCEEDED

**Explanation:** Three or more LABELS statements were encountered. Two LABELS statements are the maximum number allowed.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

**IEB344I** WARNING: INVALID STATEMENT LABEL

**Explanation:** In the statement preceding this message, the name field is greater than eight characters, or contains an incorrect character.

**System action:** Processing continues.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

Source: DFSMSdfp

**IEB345I** CONTINUATION NOT STARTED IN 4-16

**Explanation:** The statement preceding this message does not contain any characters in columns 4-16, indicating that the statement is not a continuation. However, the previous statement indicated that a continuation statement was to follow.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

**IEB346I** MISSING PARENTHESIS

**Explanation:** In the statement preceding this message, a closing parenthesis is omitted, or an error was encountered in a parameter list before the closing parenthesis.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

**IEB347I** DUPLICATE KEYWORD

**Explanation:** In the EXITS statement preceding this message, a keyword is specified twice.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

**IEB348I** PRECEDING MEMBER REQUIRES 'IDENT'

**Explanation:** Two MEMBER statements were encountered; however, there was no RECORD IDENT statement associated with the first MEMBER statement.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

**IEB349I** INCONSISTENT PARAMETERS IN FIELD OR IDENT

**Explanation:** The first two parameters on an IDENT or FIELD keyword are not consistent with each other.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp
error. Make sure that the length indicator is accurate for the parameter it is describing, and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

---

**IEB350I**  
**LITERAL LENGTH EXCEEDS 40**

**Explanation:** In the RECORD statement preceding this message, the literal specified in the FIELD keyword is greater than 40 bytes.

**System action:** The job is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

---

**IEB351I**  
**I/O ERROR jji, sss, ddd, devtyp, ddname, op, err, xxxx, acc**

**Explanation:** A permanent input/output error occurred while processing on the device indicated.

In the message text, the error analysis information provided by the SYNADAF data management macro instruction issued by the SYNAD routine was:

- **jjj** Job name.
- **sss** Step name.
- **ddd** Device number of the device.
- **devtyp** Device type.
- **ddname** Data definition name.
- **op** Operation attempted.
- **err** Error description.
- **xxxx** Last seek address or block count.
- **acc** Access method.

**System action:** The job step is ended. The return code is 12.

**Application Programmer Response:** If you want to change the output RECFM, BLKSIZE, and LRECL, always specify the RECFM (except for U) and the BLKSIZE on the output DD statement. Also, the LRECL must be present on the output DD statement if editing is required.

**Source:** DFSMSdfp

---

**IEB352I**  
**WARNING: ONE OR MORE OF THE OUTPUT DCB PARMS COPIED FROM INPUT**

**Explanation:** When DCB parameters RECFM, LRECL, and BLKSIZE are not available from the output data set, the IEBGENER program copies these values from the input data set. One or more of the three DCB parameters are copied. See the [z/OS DFSMSdfp Utilities](https://www.ibm.com/support/docview.wss?uid=dfs000100) for a more detailed table.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**Source:** DFSMSdfp

---

**IEB353I**  
**INVALID DBCS CHARACTERS IN RECORD**

**Explanation:** A record in the input data file contains characters that are not valid DBCS characters. Valid DBCS characters are X'4040' and two bytes with values of X'41' through X'FE'.

**System action:** The program continues until all input records have been processed. The return code is 8.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**Source:** DFSMSdfp

---

**IEB354I**  
**INVALID SO AND SI CHARACTERS IN RECORD**

**Explanation:** A record in the input data file contains SO and/or SI characters. SO and/or SI are in the wrong location in the record, or they are unpaired (for every SO, you must have an SI).

**System action:** The program continues until all input records have been processed. The return code is 8.

**Application Programmer Response:** Probable user error.
IEB355I  UNBRACKETED DBCS DATA.

Explanation:   A record in the input data file contains DBCS data that should be bracketed with SO and SI characters but is not.

System action:   The program continues until all input records have been processed. The return code is 8.

Application Programmer Response:   Probable user error. Correct the error and resubmit the job.

Source:   DFSMSdfp

IEB356I  FIELD OUTPUT LOCATIONS OVERLAP

Explanation:   The output location variables in a set of field parameters overlap one another. This will result in questionable results in the output.

System action:   The program is ended. The return code is 8.

Application Programmer Response:   Probable user error. Correct the error and resubmit the job.

Source:   DFSMSdfp

IEB357I  DBCS DATA NOT AN EVEN NUMBER OF BYTES

Explanation:   DBCS data must contain an even number of bytes. This record contains data that is identified as DBCS data, but has an odd number of bytes.

System action:   The program continues until all input records have been processed. The return code is 8.

Application Programmer Response:   Probable user error. Correct the error and resubmit the job.

Source:   DFSMSdfp

IEB358I  DBCS CV CONVERSION AND NO SO/SI BYTES FOUND.

Explanation:   DBCS CV conversion works on mixed DBCS data. Mixed DBCS data must have at least one set of SO and SI bytes.

System action:   The program continues until all input records have been processed. The return code is 8.

Application Programmer Response:   Probable user error. Correct the error and resubmit the job.

Source:   DFSMSdfp

IEB359I  DBCS STRING LENGTH ERROR.

Explanation:   There is a problem with the length of the DBCS string. Most likely the last DBCS character is not followed by an SI byte.

System action:   The program continues until all input records have been processed. The return code is 8.

Application Programmer Response:   Probable user error. Correct the error and resubmit the job.

Source:   DFSMSdfp

IEB360I  RECORD IDENTIFYING DBCS DATA NOT BRACKETED.

Explanation:   A DBCS data string was found during the search for the last record of a group that matches the string entered in an IDENTG parameter, but the string in the input record is not bracketed by SO and SI bytes. This record does not qualify as the last record of the group.

System action:   The program continues until all input records have been processed. The return code is 8.

Application Programmer Response:   Probable user error. Correct the error and resubmit the job.

Source:   DFSMSdfp

IEB361I  DBCS ERRORS IN RECORD

Explanation:   If the input data has DBCS errors, this message identifies the record number (starting with 1) of the record in error. Messages identifying the types of errors will follow this message.

In the message text:

nnnnnnnnnn.

The record number indicated.

System action:   The program continues until all input records have been processed.

Application Programmer Response:   Probable user error. Correct the error and resubmit the job.

Source:   DFSMSdfp

IEB362I  text

Explanation:   This message displays questionable data in the input file. It may appear along with other messages as additional information.

In the message text:

text

The text of the message.

System action:   The program continues until all input records have been processed.

Application Programmer Response:   Probable user error. Correct the error and resubmit the job.
IEB363I  DBCS LENGTH VARIABLE NOT AN EVEN VALUE.

Explanation: The length variable contains a value that is not an even number.

System action: The program continues until all input records have been processed. The return code is 12.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

Source: DFSMSdfp

IEB364I  UNBRACKETED IDENTG LITERAL.

Explanation: The literal in an IDENTG parameter is not bracketed with SO and SI bytes.

System action: The program ends. The return code is 12.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

Source: DFSMSdfp

IEB365I  WARNING SYSUT2 USING RECFM=U. UNBLOCKED.

Explanation: The SYSUT2 DD statement did not specify a record format but did specify a block size (BLKSIZE). The SYSUT1 DD statement specified RECFM=F. Because SYSUT2 did not specify RECFM, the system supplies RECFM=U; thus, each block will contain only one record.

System action: The system allows the job to run to completion.

Application Programmer Response: On the SYSUT2 DD statement, either specify all three parameters (RECFM, LRECL, and BLKSIZE) or specify none of the parameters. If you specify none, IEBGENER copies RECFM, LRECL, and BLKSIZE from the SYSUT1 statement.

Source: DFSMSdfp

IEB366I  WARNING EMPTY DATA SET NOT COPIED TO TAPE.

Explanation: An attempt was made to copy an EMPTY data set to tape. The SYSUT2 data set will be OPENED and CLOSED and an EOF will be written on the tape but no data will be transferred.

System action: The job runs to completion. The return code is 4.

Application Programmer Response: None.

Source: DFSMSdfp

IEB367I  SYSUT2 MEMBER NAME NOT SPECIFIED FOR PDS

Explanation: An attempt was made to copy to a PDS without specifying a member name on the SYSUT2 DD statement.

System action: The program is terminated. The return code is 12.

Application Programmer Response: Specify at least one member name for the PDS data set supplied in SYSUT2 DD statement. The member name can be given either via the SYSUT2 DD statement (this option may be used only if one output member needs to be supplied) or via the MEMBER control statement (one MEMBER statement per output member needed). Correct the error and resubmit the job.

IEB368I  SYSTEM DETERMINED BLKSIZE USED FOR OUTPUT

Explanation: The SYSUT2 DD statement did not specify a BLKSIZE. The output BLKSIZE need not be specified if LRECL and RECFM are specified or available from the input data set. If LRECL and RECFM, but not BLKSIZE are specified for the SYSUT2 data set, the system will determine an optimal BLKSIZE, SDB (system-determined BLKSIZE).

System action: The system allows the job to run through completion.

Application Programmer Response: None.

Source: DFSMSdfp

IEB369I  EDITING CANNOT BE DONE FOR RECFM=U IF BLKSIZE > 32760.

Explanation: An attempt was made to do editing, involving a data set with RECFM=U and blocksize exceeding 32760. Editing is not supported when LBI is involved for RECFM=U data sets.

System action: The program is terminated. The return code is 12.

Application Programmer Response: Do not specify editing, if input or output or both data sets need(s) to have RECFM=U and blocksize > 32760. Alternatively, if the data set(s) can have small blocksize, specify blocksize accordingly. Resubmit the job.

System programmer response: If the error recurs and the user program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the relevant job log.

Source: DFSMSdfp
IEB401I  PRINT/PUNCH STATEMENT NOT FIRST.

Explanation:  A PRINT or PUNCH statement is not the first utility control statement.

System action:  The program is ended. The return code is 12.

Application Programmer Response:  Probable user error. Correct the error and resubmit the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source:  DFSMSdfp

IEB402I  INVALID OPERATION

Explanation:  In the utility statement preceding this message, the operation is incorrect.

System action:  The program is ended. The return code is 12.

Application Programmer Response:  Probable user error. Correct the error and resubmit the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source:  DFSMSdfp

IEB403I  MORE THAN TWO TITLE STATEMENTS.

Explanation:  More than two TITLE statements are included. Two TITLE statements are the maximum number allowed.

System action:  The program is ended. The return code is 12.

Application Programmer Response:  Probable user error. Correct the error and resubmit the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source:  DFSMSdfp

IEB404I  KEYWORD INVALID OR OMITTED

Explanation:  In the statement preceding this message, a required keyword is either incorrect or missing.

System action:  The program is ended. The return code is 12.

Application Programmer Response:  Probable user error. Correct the error and resubmit the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source:  DFSMSdfp

IEB405I  PARAMETER INVALID OR OMITTED

Explanation:  In the statement preceding this message, a required parameter is either incorrect, inconsistent, or missing.

System action:  The program is ended. The return code is 12.

Application Programmer Response:  Probable user error. Correct or include the required parameter on the preceding statement. If multiple RECORD statements are included, make sure that an IDENT parameter is contained in each statement except the last. The last statement does not require the IDENT parameter.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source:  DFSMSdfp

IEB406I  JOB TERMINATED AFTER USER EXIT

Explanation:  The job was ended after control was returned from an exit routine.

System action:  The program is ended. The return code is 12 or 16, as determined by the exit routine.

Source:  DFSMSdfp

IEB407I  JOB TERMINATED DUE TO I/O ERROR

Explanation:  A permanent input/output error was encountered.

System action:  The program is ended. The return code is 12.

Source:  DFSMSdfp
**Application Programmer Response:** Probable user error. Check the DCB parameters of the SYSUT1 or the SYSIN data sets. Make sure that the maximum LRECL size is specified for variable-length records. Make sure that TYPORG=PO was not specified for a physical sequential data set. If SYSUT1 record format is V or VS, make sure there are no records less than the minimum 5 bytes long. Make sure that SYSIN BLKSIZE is a multiple of 80.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB408I MEMBER memname CANNOT BE FOUND**

**Explanation:** The member specified is not contained in the SYSUT1 data set.

In the message text:

`memname`  
The specified member name.

**System action:** The member is not printed or punched. If there is another MEMBER statement, the next member is read; otherwise, the program is ended. The return code is 8.

**Application Programmer Response:** Make sure that the member to be printed or punched is contained in the SYSUT1 data set.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB410I INCORRECT RECORD STATEMENT**

**Explanation:** The RECORD statement preceding this message is incorrect.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. If an IDENT keyword is in the preceding RECORD statement, make sure that the sum of the input-location parameter minus one and the length parameter does not exceed the SYSUT1 logical record length. If one or more FIELD keywords are in the preceding RECORD statement, make sure that the sum of the input-location parameter and the length parameter does not exceed the SYSUT1 logical record length. Also, make sure that the sum of all length parameters, for fields defined in the preceding RECORD statement, does not exceed the specified output length minus one per printed line or per punched card.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB411I DDNAME ddname CANNOT BE OPENED**

**Explanation:** The indicated DDNAME on the DD statement does not exist. Perhaps a DDNAME is misspelled in an existing DD statement or ddlist.

In the message text:

`ddname`  
The DDNAME.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp
IEB412I INVALID INP/OUTP DCB PARAMETER

Explanation: One or more parameters in the BLKSIZE or LRECL keywords were omitted from the SYSUT1/SYSUT2 DD statement. The omitted parameters were replaced by the value 1.

System action: The program is ended. The return code is 12.

Application Programmer Response: Make sure that the DCB contains all necessary parameters.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB414I parm PARAMETER IS TOO SMALL

Explanation: The number of FIELD keywords, IDENT keywords, literals, or name keywords in MEMBER or RECORD statements is greater than the number specified in parameter parm-MAXFLDs, MAXGPS, MAXLITS, MAXLINE, or MAXNAME.

In the message text:

parm The indicated parameter.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Specify a greater value for the parameter.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB415I VS/VBS DATA PROCESSED IN BLOCKS

Explanation: The LRECL specified for the VS or VBS input data area exceeds 32,756 bytes.

System action: Processing continues on a physical basis; that is, blocks, rather than logical records, are printed or punched.

Source: DFSMSdfp

IEB416I PREFORM, VS LRECL LARGER THAN 32K

Explanation: The LRECL specified for the VS or VBS input data set exceeds 32,756 bytes, and PREFORM was specified in the PRINT or PUNCH utility control statement.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Reformat the data set or delete the PREFORM parameter from the PRINT or PUNCH control statement.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB417I DATA SET EMPTY, RETURN CODE IS 4.

Explanation: The data set to be printed or punched contains no data.

System action: The print or punch operation is ended. The return code is 4.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB418I VS/VBS NOT ALLOWED IN PDS

Explanation: The data set organization conflicts with the record format; that is, if RECFM=VS or VBS, then TYPORG must be PS.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. If SYSUT1 record format is VS or VBS, make sure that TYPORG=PO was not specified.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp
IEB419I  USER RETURN CODE  return-code
           INVALID

Explanation:  The return code was returned by the user. However, the return code is incorrect if it is other than 0, 4, or 16.

In the message text:

return-code  The return code.

System action:  The return code is ignored. Processing continues according to prior conditions.

Application Programmer Response:  Change the return code to 0, 4, or 16.

Source:  DFSMSdtp

IEB420I  SYSIN IS EMPTY

Explanation:  The SYSIN data set does not contain any IEBPTPCH control statements.

System action:  The program is ended. The return code is 12.

Application Programmer Response:  Probable user error. Correct the error and resubmit the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source:  DFSMSdtp

Routing Code:  11
Descriptor Code:  7

IEB431I  INVALID KEYWORD IN COLUMN  dd

Explanation:  In the statement preceding this message, a keyword beginning in the column indicated is either incorrect or not applicable to the command for which it is specified.

In the message text:

dd  The column indicated.

System action:  The program is ended at the end of the control statement scan. The return code is 12.

Application Programmer Response:  Probable user error. Correct the incorrect keyword in the preceding statement. If this is a LABELS command, make sure that the keyword specified for the DATA= operand is either ALL, ONLY, YES, or NO. If this is a PRINT command, make sure that the parameter specified for the CNTRL keyword is not greater than that specified for the MAXLINE keyword. If this is a PUNCH command, make sure that neither the INITPG nor MAXLINE keyword has been specified.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source:  DFSMSdtp

IEB432I  INVALID PARAMETER IN COLUMN  dd

Explanation:  In the statement preceding this message, a parameter beginning in the column indicated is either incorrect or not applicable to the command for which it is specified.

Chapter 2. IEB Messages  2-67
In the message text:

**MISSING KEYWORD BEFORE COLUMN**

**dd** The column indicated.

**System action:** The program is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the incorrect parameter on the preceding statement. If the NAME, INREC, or OUTREC keywords are specified, make sure that the parameter does not exceed 8 characters.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

**MISSING PARAMETER BEFORE COLUMN**

**dd** The column indicated.

**System action:** The program is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct or include the required parameter on the preceding statement. If a TITLE statement precedes this message, make sure that the literal in the ITEM parameter does not exceed 40 characters.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

**INVALID COMMAND**

**IWB436I**

**Explanation:** In the statement preceding this message, a command is incorrect or incorrect because of conditions set by commands, keywords, or parameters on previous statements.

**System action:** The program is ended at the end of the control statement scan. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the command on the preceding statement. Make sure that previous keywords and parameters, such as MAXGPS or MAXNAME, do not conflict with this command or that no RECORD command precedes the first MEMBER command.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp
IEB437I  INVALID ITEM PARAMETER

Explanation: The “title” or “output-location” parameter of the ITEM operand in a TITLE statement is incorrect.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Make sure that the “title” field of the ITEM operand does not exceed 40 bytes, is not zero, or does not contain one apostrophe instead of two. Also, make sure that the sum of the “title” length and the “output-location” length does not exceed the output logical record length.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB438I  INVALID NAME

Explanation: In the statement preceding this message, the statement name is either too long or contains an incorrect character.

System action: Processing continues normally. However, the control statement is ignored.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB439I  CONTINUATION NOT STARTED IN 4-16

Explanation: In the continuation statement preceding this message, data does not begin in columns 4 through 16.

System action: The program is ended at the end of the control statement scan. The return code is 12.

Application Programmer Response: Probable user error. Make sure that the continuation statement begins in columns 4 through 16. If the statement is not a continuation, however, correct the previous statement that indicates a continuation.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB440I  MISSING PARENTHESIS

Explanation: In the statement preceding this message, either a parenthesis is omitted, or there is an error within the parentheses.

System action: The program is ended at the end of the control statement scan. The return code is 12.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB441I  MEMBER INVALID: TYPORG NOT PO

Explanation: The MEMBER statement preceding this message is incorrect since physical sequential (PS) organization was specified. That is, TYPORG=PO must be specified on the PRINT or PUNCH utility control statement.

System action: The program is ended at the end of the control statement scan. The return code is 12.

Application Programmer Response: Probable user error. If SYSUT1 specifies a physical sequential data set, remove the MEMBER statement. If SYSUT1 specifies a partitioned data set, specify TYPORG=PO on the PRINT or PUNCH statement.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB442I  USER LABEL I/O ERROR CAUSED TERM.

Explanation: An uncorrectable I/O error occurred.

- A standard user label exit was present and the error occurred during label processing.
A user totaling exit was present and the error occurred while the utility was placing data on the output data set.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** If further handling of the error is desired, the user exit should be expanded to examine the standard status information and issue an appropriate message.

**Source:** DFSMSdfp

**IEB443I INTEGRITY CHARACTER IN pppp nnnnn**

**Explanation:** An incorrect DBCS character code was encountered.

In the message text:

ppppp The position in the record.

nnnnn The record.

**System action:** The incorrect character code is changed to a DBCS period. The system continues processing. The return code is 8.

**Application Programmer Response:** Correct the input data and resubmit the job.

**Source:** DFSMSdfp

**IEB444I UNPAIRED SO IN pppp nnnnn**

**Explanation:** An SO character is not paired with an SI.

In the message text:

ppppp The position in the record.

nnnnn The record.

**System action:** The incorrect SO will be changed to an SBCS period. The system continues processing. The return code is 8.

**Application Programmer Response:** Correct the input data and resubmit the job.

**Source:** DFSMSdfp

**IEB445I UNPAIRED SI IN pppp nnnnn**

**Explanation:** An SI character is not paired with an SO character.

In the message text:

ppppp The position in the record.

nnnnn The record.

**System action:** The incorrect SI is changed to an SBCS period. The system continues processing. The return code is 8.

**Application Programmer Response:** Correct the input data and resubmit the job.

**Source:** DFSMSdfp

**IEB446I ILLEGAL DBCS LENGTH pppp nnnnn**

**Explanation:** A DBCS field has an odd length.

In the message text:

ppppp The position in the record.

nnnnn The record.

**System action:** The SO and SI characters are changed to an SBCS period. The system continues processing. The return code is 8.

**Application Programmer Response:** Correct the input data and resubmit the job.

**Source:** DFSMSdfp

**IEB447I CONVERSION VARIABLE CV INVALID**

**Explanation:** The CV conversion variable is present, but the DBCS parameter is NO.

**System action:** The system ends processing. The return code is 12.

**Application Programmer Response:** Correct the input parameters and resubmit the job.

**Source:** DFSMSdfp

**IEB448I CONVERSION VARIABLE VC INVALID**

**Explanation:** The VC conversion variable is present, but the DBCS parameter is NO.

**System action:** The system ends processing. The return code is 12.

**Application Programmer Response:** Correct the input parameters and resubmit the job.

**Source:** DFSMSdfp

**IEB449I LENGTH ERROR IN RECORD STATEMENT**

**Explanation:** A DBCS conversion variable is present on a record statement, but the length is odd.

**System action:** The system ends processing. The return code is 12.

**Application Programmer Response:** Correct the input parameters and resubmit the job.

**Source:** DFSMSdfp
IEB451I  FIELD OUTPUT LOCATIONS OVERLAP

Explanation: The output location variables in a set of field parameters overlap one another. The resulting output will be questionable.

System action: The system ends the program.

Application Programmer Response: Correct the overlap error. Submit the job again.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB500I  END OF DISKETTE MAINTENANCE UTILITY

Explanation: Normal end-of-job indication.

System action: Normal system processing continues.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB501I  INCOMPLETE TRACK 0 INFORMATION

Explanation: Track 0 of the output diskette could not be formed because not enough information was specified by the input track 0 and/or control statements. Message IEB512I will follow identifying the sectors in error.

System action: The job is ended.

Application Programmer Response: Provide the necessary control statements and resubmit the job.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB502I  MOUNT OUTPUT DISKETTE ON ddd

Explanation: The read operation of the Diskette Maintenance Utility has been completed. The diskette to be used for output should now be mounted on the device so processing may continue.

In the message text:

ddd  The indicated device.

System action: The system waits for the operator to respond, then continues processing.

Operator response: Mount the output diskette on device ddd, ready the device, and reply 'U' to continue processing. If the output diskette is unavailable, then processing may be ended by replying 'C'.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB503D  ddd UNEXPIRED FILES ON OUTPUT DISKETTE

Explanation: During a COPY operation from one diskette to another diskette, the diskette to be used for output contains unexpired data sets.

In the message text:

ddd  The indicated unit.

System action: The system waits for the operator's reply, then continues processing.

Operator response: If the data sets on the unit are to be overridden, reply with 'U'. If the data sets are not to be overridden, but another diskette is available for use as the output diskette, mount the diskette on the unit, ready the unit and reply 'R'. Otherwise the job may be canceled by replying with a 'C'.

Source: DFSMSdfp
Routing Code: 1,7,9
Descriptor Code: 7

IEB504I  ERROR SECTORS ON OUTPUT DISKETTE

Explanation: An I/O error was encountered while attempting to write the output diskette.

System action: The job is ended.

Application Programmer Response: Resubmit the job using an error-free diskette for output.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB505I  INCORRECT FORMAT – DS STATEMENT

Explanation: The DS statement preceding this message does not conform to the standard format of:

bDSxx nnnnnnn,11111,sssss, eeee,hhhhh, [.,[[b],[a],[w],[r] ,[v]],[dd],[ffffff],[gggggg]].

System action: The job is ended.

Application Programmer Response: Correct the DS statement and resubmit the job.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -
IEB506I  DS nn INVALID SPECIFICATION

Explanation: The information specified by the DS statement was incorrect for one of the following reasons:

- The data set identifier was specified incorrectly. The data set identifier must conform to the IBM standard for simple data set name.
- The creation and/or expiration date was specified and was not of numeric yymmdd format, where 01=yy=99, 01=mm=12, and 01=dd=31.
- The data set identifier specified was a duplicate of an existing data set.
- The beginning of extent, end of extent, or end of data do not maintain the proper relationship of TRK1 Sector 1 ≤ BOE ≤ EOE ≤ TRK73 sector 26, BOE ≤ EOD, and EOD ≤ EOE plus 1.

Note: Sector number must be ≥ 1 and ≤ 26.
- The record length does not contain a value greater than 0 and ≤ 128.
- The bypass indicator was specified and was not a B.
- The write protect indicator was specified and was not a P.
- The verify indicator was specified and was not a V or C.
- The multivolume indicator was specified and was not a C or L.
- The volume sequence number was specified and was not a two digit positive numeric value.

In the message text:

nn The DS statement.

System action: The job is ended.

Application Programmer Response: Correct the extent information and resubmit the job.

Routing Code: -
Descriptor Code: -

IEB508I  SYSUT1 VOL1 SECTOR IN ERROR

Explanation: The VOL1 sector of the input diskette could not be read and no VOL control statement was supplied, or the VOL1 sector of the input diskette was incorrect for one or more of these reasons:

- The label identifier (bytes 01-03) does not contain VOL.
- The volume label number (byte 04) is not 1.
- The volume identifier (bytes 05-10) does not contain all alphabetic or numeric characters or is not left-justified.
- The label standard version (byte 80) does not indicate the standard version by containing a 'W'.

System action: The job is ended.

Application Programmer Response: If the VOL1 sector is incorrect, correct it and resubmit the job. If the VOL1 sector cannot be read, supply a VOL control statement and resubmit the job.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB509I  INCORRECT CONTROL IDENTIFIER

Explanation: The control statement is not properly identified.

System action: The job is ended.

Application Programmer Response: Correct the errors in the identifier parameter of the utility control statements (VOL and DS) and resubmit the job.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB510I  UNIT INVALID

Explanation: For SYSUT1, the device specified is not 3540. For SYSUT2, the device specified is not 3540 or a direct-access device. If both SYSUT1 and SYSUT2 specify 3540, the unit specified must not be the same unit.

System action: The job is ended.
Application Programmer Response: Correct the JCL and resubmit the job.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB511I DDNAME ddbname CANNOT BE OPENED

Explanation: Required DD statement does not exist or the OPEN macro instruction failed for the file specified by the DDNAME.

In the message text:

ddname The DDNAME.

System action: The job is ended.

Application Programmer Response: Either correct the DDNAME, if it is misspelled in the DD statement, or insert a new DD statement with the correct name and JCL parameters and resubmit the job.

Source: DFSMSdfp
Routing Code: 11
Descriptor Code: 7

IEB512I FILE NUMBER xx – ERROR SECTOR

Explanation: The header 1 sector for the file number could not be read from the input diskette and no DS control statement was provided.

In the message text:

xx The file number.

System action: The job is ended.

Application Programmer Response: Supply a DS control statement for the file number and resubmit the job.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB513I READ ERROR – TRACK tt, SECTOR ss

Explanation: The track and the sector of the input diskette could not be read. Any data transferred by the read operation will be written on the output diskette. If no data was transferred, a sector of blank characters will be written to the output diskette. Processing continues with the next sector.

In the message text:

tt The track.
ss The sector.

System action: Processing continues with the next sector of the diskette.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB514I EXCESS DS STATEMENTS

Explanation: More DS statements were provided than there were error sectors in the input diskette track 0. A DS statement should only be supplied for track 0 sectors that cannot be read.

System action: The job is ended.

Application Programmer Response: Remove the excessive DS statements from the control data set and resubmit the job.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB515I CONTROL STATEMENT OUT OF SEQUENCE

Explanation: The statement preceding this message may be out of sequence for one of the following reasons:

- A VOL statement was encountered and it was not the first control statement in the control data set.
- A DS statement has a sequence number greater than 19 or less than 01.
- A DS statement has a sequence number which is not greater than the sequence number on the preceding DS statement.
- A DS statement has a sequence number that is not numeric.

System action: The job is ended.

Application Programmer Response: Correct sequence error and resubmit the job.

Source: DFSMSdfp
Routing Code: -
Descriptor Code: -

IEB516I SYSUT1 INCORRECT VOLUME

Explanation: The volume identifier specified on the VOL control statement was not the same as the input diskette.

System action: The job is ended.

Application Programmer Response: Insure that the volume identifier specified on the VOL control statement is the same as the volume identifier on the input diskette and resubmit the job.
IEB517D  PROTECTED FILES ON OUTPUT DISKETTE

Explanation: The diskette mounted for output contains write protected data sets.

In the message text:

ddd  The device indicated.

System action: The system waits for the operator's reply, then continues processing.

Operator response: If another diskette is available for use as the output diskette, mount the diskette on the device, ready the device, and reply 'R'. Otherwise the job may be canceled by replying with a 'C'.

Application Programmer Response: Supply an output diskette which contains no write protected files.

Source: DFSMSdfp
Routing Code: 1,7,9
Descriptor Code: 7

IEB521I  OUTPUT DISKETTE VOLUME ACCESSIBILITY = s

Explanation: When forming track 0 for the output diskette, a secure data set with a data set security indicator was detected. The VOL1 label as read from the input diskette or provided via the VOL control statement did not have a volume accessibility indicator specified. Since a secure data set must reside on a secure volume, the volume accessibility indicator for the output diskette was set to the indicated setting.

In the message text:

s  The data set security indicator.

System action: Processing continues and the VOL1 label of the output diskette will be written with a volume accessibility indicator of s.

Application Programmer Response: The volume accessibility indicator will be required to access the data on the diskette.

Source: DFSMSdfp
Routing Code: 1,7,9
Descriptor Code: -
IEB530I  INVALID VOL1 LABEL on  ddd, ser

Explanation:  An attempt was made to process a diskette with an incorrect VOL1 label. The VOL1 label was incorrect for one or more of the following reasons:

- The label identifier (bytes 01-03) does not contain VOL.
- The volume label number (byte 04) is not 1.
- The volume identifier (bytes 05-10) does not contain all alphabetic or numeric characters or is not left justified.
- The volume accessibility qualifier on a continuation volume is different from that of the preceding volume of a multivolume diskette data set.
- The label standard version (byte 80) does not indicate the standard version by containing a 'W'.

In the message text:

ddd  The device address.
ser  The contents of the volume identifier field.

dd  The contents from the data set identifier field of the HDR1 label.

System action:  If the error was data set related (for example, volume accessibility qualifier on a continuation volume), processing of the data set is ended and processing continues with other data sets on the same diskette. If the error was volume related, processing on this diskette is ended and processing continues with the next diskette.

Operator response:  Notify the owner of the diskette of the error condition.

Application Programmer Response:  Correct the error(s) in the volume label and rerun the job, if necessary.

Source:  DFSMSdfp
Routing Code:  2,7
Descriptor Code:  7

IEB531I  INVALID HDR1 FOR  dsid ON  ser, ddd

Explanation:  The HDR1 label for the dsid on the volume device was incorrect for one of the following reasons:

- The label identifier (bytes 01-03) does not contain HDR.
- The label number (byte 04) does not contain '1'.
- There are duplicate data set identifiers on this diskette.
- The interchange level indicator does not indicate the basic interchange architecture.
- The beginning of extent (BOE) (bytes 29-33), end of extent (EOE) (bytes 35-39), or end of data (EOD) (bytes 75-79) does not maintain the proper relationship of TRK1 Sector1 ≤ BOE ≤ EOE ≤ TRK73 Sector 26, BOE<EOE, BOE<EOD, and EOD<EOE address plus 1.

Note:  Sector number must be ≥ 1 and ≤ 26.

- The extents of BOE and EOE overlap the extents of another data set on the diskette.
- The block length (bytes 23-27) contains a value of 0 or is greater than 128.
- The volume sequence number is incorrect.
- The data set security qualifier was non-blank and the volume accessibility indicator was blank.
- The block length on a continuation volume is different from that of the preceding volume of a multivolume diskette data set.
- The Bypass Indicator does not contain a 'blank' or B, (input only).
- The Write Protect Indicator does not contain a 'blank' or 'P', (output only).
- A verified data set was requested, but the data set was not verified.
- The Expiration Date is incorrect, (output only).
- The Data Set Security Qualifier on a continuation volume is different from that of the preceding volume of a multivolume diskette data set.

In the message text:

ddd  The device address.
ser  The volume identifier from the VOL1 label.
dsid  The contents from the data set identifier field of the HDR1 label.

System action:  If the device is processing input data sets, the request for the data set is ended. The system will continue processing with the next data set.

If the device is processing output data sets, the diskette is flushed and the system will continue processing with the next diskette.

Operator response:  If the device is being used for output, inform the owner of the diskette of the error. If the device is being used for input, there is no response necessary.

Application Programmer Response:  Correct the error(s) in the HDR1 label and rerun the job if necessary.

Source:  DFSMSdfp
Routing Code:  2,7

IEB532A  MOUNT  vvvvv ON  ddd

Explanation:  During processing of a diskette data set, the operator inadvertently unloaded a diskette with the VOLSER indicated and loaded another diskette on the device.

In the message text:

vvvvv  The volume serial number.
**IEB540D • IEB542D**

**ddd**  The device indicated.

**System action:**  Wait until diskette with VOLSER is mounted and continue processing.

**Operator response:**  Mount diskette with VOLSER indicated.

**Source:**  DFSMSdfp

**Routing Code:**  1,7

**Descriptor Code:**  7

---

**IEB540D  DISKETTE SEQUENCE ERROR, ddd, dsid**

**Explanation:**  An error was detected while attempting to open the input data set or while processing continuation diskettes of the multivolume input data set on the device. A continuation diskette is any diskette in a multivolume file except the first one. The sequence error is a result of one of the following conditions:

- The continuation volume in the drive unit does not contain a HDR1 label describing the data set being processed. This condition may arise because diskettes with incorrect VOL1 or HDR1 labels have been flushed.
- The volume sequence number in the HDR1 label describing the first extent of the data set was one. The volume sequence number in the HDR1 label describing the extent now in the drive unit is a value other than one greater than the previous volume sequence number.
- The volume sequence number in the HDR1 label describing the first extent of the data set was non-blank and was not 1.
- While opening a data set, a volume sequence number of other than blank or one was found in the HDR1 label.
- While opening a data set, a multivolume indicator of L was found in a HDR1 label with a blank volume sequence number.

In the message text:

**ddd**  The device indicated.

**dsid**  The multivolume input data set.

**System action:**  Wait for operator response and continue processing.

**Operator response:**  Provide the correct diskettes in the correct order, without any intervening diskettes, and enter REPLY xx, ‘R’ to retry and continue reading the multivolume file. If unable to provide the correct diskettes in the correct order, enter REPLY xx, ‘C’ to cancel processing of the data set.

**Application Programmer Response:**  Ensure that the diskettes for the multivolume file are contiguous and in the correct order before submitting the job.

**Source:**  DFSMSdfp

**Routing Code:**  1,7

**Descriptor Code:**  7

---

**IEB541D  M ddd,vvvvv**

**Explanation:**  The volume was specified as the diskette volume containing the JCL data set, but the volume was not the first diskette mounted on the 3540 device.

In the message text:

**ddd**  The device indicated.

**vvvvv**  The volume serial number.

**System action:**  Wait for operator response and continue processing.

**Operator response:**  Mount the diskette volume on the device, ready the device, and reply ‘R’ to retry. If unable to supply the diskette volume, reply ‘C’ to cancel processing of the volume.

**Application Programmer Response:**  When submitting a diskette volume containing a JCL data set, be sure that the operator is informed of the correct volume serial number.

**Source:**  DFSMSdfp

**Routing Code:**  1,7

**Descriptor Code:**  7

---

**IEB542D  SECURE {VOLUME | DATA SET} ON ddd,ser[jobname] [dsid]**

**Explanation:**

- For a secure volume, the volume specified on the device is a secure volume and additional qualification is required to access it. The additional qualification on input is required to allow further processing of the data sets on the volume. On output the additional qualification is required to allow data sets to be created on the volume.
- For a secure data set, the data set specified with a volume identifier on the device is a secure data set and additional qualification is required to access it.

In the message text:

**ddd**  The device indicated.

**ser**  The volume serial number.

**jobname**  The jobname.

**dsid**  The data set identifier.

**System action:**  Wait for operator response, and continue processing.

**Operator response:**  Specify the qualifier for volume **ser** or specify the qualifier for data set **dsid** on volume identified by **ser** with a reply of:
REPLY xx, 'q'

where q is the one character qualifier that must match the volume accessibility indicator or data set security indicator to gain access to the volume or data set. If no qualifier is available, reply with
REPLY xx, 'b'.

If 'b' is replied or the correct qualifier is not supplied in three attempts, the data set will not be accessed.

**Application Programmer Response:** Notify the operator of the necessary volume and data set security qualifiers prior to submitting the job stream.

**Source:** DFSMSdfp

**Routing Code:** 1,7,9

**Descriptor Code:** 7

---

**IEB543I ddname DD MISSING OR INVALID FOR DISKETTE READER**

**Explanation:** The DD statement specified was missing from the JCL supplied for running the diskette reader or was incorrect for one of the following reasons:

- The UNIT specified on the SYSDATA DD statement was not a 3350 device.
- The SYSUT2 DD statement did not describe a subsystem data set.
- The SYSUT3 DD statement did not describe a DASD (or VIO) device to contain the intermediate partitioned data set.

In the message text:

```
ddname
```

Specified the DD statement.

**System action:** The diskette reader is ended.

**Operator response:** If JCL parameters were overridden using the START command, be sure that the overridden values are valid.

**Application Programmer Response:** The system programmer should be sure that any reader procedures for use by IEBDRKRDR contain required DD statements that define valid devices.

**Source:** DFSMSdfp

**Routing Code:** 2,7

**Descriptor Code:** 7

---

**IEB545I FOLLOWING DATA SET(S) NOT FOUND ON ddd**

**Explanation:** A delimiter (/DSKT) diskette was encountered on the device. The associated data sets described in message IEB546I, which follows, are required by the job stream but were not found on diskettes on the device.

In the message text:

```
ddd
```

The device indicated.

**System action:** Messages IEB546I and IEB547A are written listing the data sets and requesting operator response.

**Source:** DFSMSdfp

**Routing Code:** 2,7

**Descriptor Code:** 7

---

**IEB544I ASSOCIATED DATA SET LIMIT EXCEEDED READING JOB jji FROM ddd**

**Explanation:** While reading the job from the device indicated, the diskette reader encountered a DD * or DD DATA statement with the DSID keyword, and the limit of associated data sets per job stream has already been reached, or more than 1,000 associated data set requests have been detected in the current job.

In the message text:

```
jji
```

The job name.

```
ddd
```

The device indicated.

**System action:** The diskette reader stops processing the JCL input stream and begins reading the required associated data sets. When associated data set processing is complete the diskette reader ends processing. The job stream beginning with the job is flushed from the system and must be resubmitted.

**Operator response:** In order to have the diskette reader process the remaining jobs in the input stream after associated data set processing is complete, do one of the following:

- If the device is card reader, place the rest of the job stream, beginning with the job, back into input device. Initiate another diskette reader task to process the remaining jobs.
- If the device is not a card reader, initiate another diskette reader to the same input data set, specifying the job as the starting point for the reader.

**Application Programmer Response:** The maximum number of associated data sets per job stream can be increased, if necessary, by changing the PARM specified on the EXEC statement for the diskette reader.

**Source:** DFSMSdfp

**Routing Code:** 2,7

**Descriptor Code:** 7

---
**IEB546I • IEB546I**

**IEB546I  DSNAME=dsname JOBNAME=jjj  [.VOLSER=volser]**

**Explanation:** The data set on the VOLSER indicated is not available for the job on the device named in message IEB545I. This message appears for each data set that is not available. VOLSER appears only if it was coded on the DD statement describing the data set as an associated data set.

In the message text:

- **dsname** The data set name.
- **jjj** The job name.
- **volser** The volume serial number.

**System action:** Message IEB547A is written requesting operator response.

**Source:** DFSMSdfp  
**Routing Code:** 2,7  
**Descriptor Code:** 7

---

**IEB547D • REPLY ‘RETRY’ OR ‘GO’**

**Explanation:** This message follows messages IEB545I and IEB546I which describe associated data sets that appear to be missing from the diskettes containing associated data sets. An associated data set is considered a missing data set in the following cases:

- The requested data set is on a diskette that was fed into the 3540 stacker while reading part of a multivolume data set on the same diskette.
- The job stream contains more than one associated data set request for a data set that is the only data set on the diskette. After the data set has been read to satisfy the first request, the diskette is placed in the stacker and is therefore unavailable for other requests for the same data set.
- The data set identifier in the diskette label does not match the data set identifier in the JCL associated data set request due to key entry errors.
- The requested data set was not on the diskettes submitted with the job.
- The operator did not supply the correct volume accessibility qualifiers for the diskette containing the data set during the allowed three attempts.
- The volume containing the requested associated data set did not have a valid VOL1 label and therefore was placed in the stacker without searching for data sets.
- The index track on the volume containing the requested associated data set could not be read and the diskette was therefore placed in the stacker without searching for data sets.

In the first two cases, the missing data sets may be retrieved by replacing the diskettes in the 3540 hopper and indicating that the reader should again search the diskettes.

**System action:** The system action is determined by the operator’s response.

**Operator response:**

- If the data set(s) listed in message IEB546I are available, the operator should load the diskettes containing those data sets into the hopper of the device named in the message IEB545I, ready the device, and reply RETRY. The reader will then continue processing with these associated data sets.
- If the data set(s) are not available, the operator should reply GO. The diskette reader will then resume processing without the required associated data sets.

**Application Programmer Response:** All associated data sets required for a given job stream should be available when the job stream is processed by the diskette reader.

**Source:** DFSMSdfp  
**Routing Code:** 1,7  
**Descriptor Code:** 7

---

**IEB548E • ddd INPUT ERROR [.READING JOB jjj]**

**Explanation:** An uncorrectable input error occurred while a diskette reader was reading the job in the JCL input stream, or while a diskette reader was reading associated data sets. The optional jobname is not specified if the error occurred while reading associated data sets. If a blank jobname is specified, the error occurred on the JCL input stream before any job was encountered or after an erroneous job statement with no jobname was encountered. When reading a multivolume JCL data set from the 3540, the message will result from conditions that prevent successful end-of-volume processing.

In the message text:

- **ddd** The device indicated.
- **jjj** The job name.

**System action:** If the error occurred while reading the JCL input stream, the diskette reader continues normal processing assuming that the jobs preceding the job indicated are the only jobs in the job stream. Jobs through the end of the job stream are ignored. If the error occurred while reading associated data sets, the diskette reader will be ended.

**Operator response:** After the error-producing device has been corrected, start another diskette reader. If a jobname was written in this message, do one of the following:
• If the device is card reader, place the rest of the job stream, beginning with the job indicated back into input device. Initiate another diskette reader task to process the remaining jobs.
• If the device is not a card reader, initiate another diskette reader to the same input data set, specifying the job indicated as the starting point for the reader.
• If no jobname was written in this message, the whole job stream must be re-run.

Application Programmer Response: Insure that the IEFRDER and SYSDATA DD statements are valid.
Source: DFSMSdfp
Routing Code: 2,7,10
Descriptor Code: 7

IEB549I ddname, DISKETTE READER OPEN FAILED

Explanation: The diskette reader was unable to OPEN the file because the OPEN macro instruction was unsuccessful for the specified file, or the IEFRDER file is using a 3540 device and one of the following errors was detected:
• The diskette data set specified as containing JCL does not have 80 for a record length.
• No volume serial number was specified in the DD statement.
• No data set name was specified in the DD statement or supplied in the START command.
• The data set specified in the DD statement could not be located on the specified diskette.
• The operator was unable to provide volume accessibility or data set security qualifiers for the requested data set.
• The specified volume has an incorrect VOL1 label.
• The HDR1 label describing the specified data set is incorrect.
• A permanent I/O error occurred while trying to read the label track on the specified diskette.
• A delimiter (/*DSKT) was provided in the 3540 as the diskette containing the JCL data set.
• A reply of 'C' was given to message IEB541A.
• The volume serial number specified is an incorrect diskette volume identifier.

In the message text:

ddname The file specified by the OPEN.

System action: The diskette reader is ended.
Operator response: Ensure that the correct volume serial number and data set name were supplied in the START command and the correct diskette was provided in the 3540. Ensure that the correct volume accessibility and data set security qualifiers were provided if requested by the diskette reader.

Application Programmer Response: If the operator was unable to correct the problem, the programmer should ensure that his run instructions were correct. If the run instructions were correct, the diskette that contains the JCL should be checked for label incorrectly or errors. If the diskette is good, or if no diskette was involved in the error, the system programmer should ensure that procedures used for starting the diskette reader correctly define the required files.

Routing Code: 2,7
Descriptor Code: 7

IEB550E JOB NUMBER LIMIT EXCEEDED READING JOB ji FROM ddd

Explanation: The diskette reader can correctly handle up to 9,999 jobs. A job statement was encountered in the job stream that described a new job after 9,999 jobs had already been encountered.

In the message text:

ji The job name.
ddd The device indicated.

System action: The diskette reader stops processing the JCL input stream and begins reading the required associated data sets. When associated data set processing is complete, the diskette reader ends processing. The job stream beginning with the job indicated is flushed from the system and must be resubmitted.

Operator response: In order to have the diskette reader process the remaining jobs in the input stream after associated data set processing is complete, do one of the following:
• If the device is a card reader, place the rest of the job stream, beginning with the job indicated, back into the input device. Initiate another diskette reader task to process the remaining jobs.
• If the device is not a card reader, initiate another diskette reader to the same input data set, specifying the job indicated as the starting point for the reader.

Application Programmer Response: The maximum number of associated data sets per job stream can be increased, if necessary, by changing the PARM specified on the EXEC statement for the diskette reader.

Descriptor Code:  -

IEB552I  INVALID PARAMETERS SUPPLIED TO DISKETTE READER

Explanation:  The value supplied for the PARM= keyword on the EXEC statement of the JCL or as a PARM= override in the START command was not numeric or exceeded six characters.

System action:  The diskette reader is ended.

Operator response:  If a PARM override was supplied in the START command, check its validity. If in error, issue another START command using valid parameter values.

Application Programmer Response:  If the error is not in operator provided parameter values, correct the errors in the JCL provided to run the diskette reader.

Source:  DFSMSdfp
Routing Code:  2,7
Descriptor Code:  7

IEB553I  DISKETTE READER UNABLE TO GET TABLE SPACE

Explanation:  The program was unable to get space for a data set name table large enough to accommodate the number of associated data sets specified on the PARM= keyword.

System action:  The diskette reader is ended.
Operator response: Start the program again specifying a smaller PARM= value.

Application Programmer Response: Change the JCL used to run the diskette reader so that the PARM= value is small enough to have space acquired.

Source: DFSMSdfp
Routing Code: 2,7
Descriptor Code: 7

IEB554E ddname, DISKETTE READER I/O ERROR [{PROCESSING JOB jjj}]

Explanation: An I/O error occurred on the file specified by either SYSUT2 or SYSUT3. The error prevents further processing by the diskette reader. A blank jobname indicates the error occurred before a job was encountered in the JCL stream or after an erroneous job statement with no jobname was encountered.

In the message text:

ddname The DD name.
jjj The job name.

System action: The diskette reader is ended. If some jobs have been passed to the subsystem, the optional jobname in the message will indicate at which job the job stream processing should be resumed on a later attempt. The job named in the message may have been partly passed to the internal reader before the error occurred.

Operator response: Start the diskette reader again. If no jobname was specified, the entire job stream must be re-run. If a jobname was specified, only the jobs starting with the specified job must be re-run.

Application Programmer Response: Ensure that the specified DD statement is satisfactory for the diskette reader.

Source: DFSMSdfp
Routing Code: 2,7
Descriptor Code: 7

IEB555E DISKETTE READER DIRECTORY ERROR

Explanation: The diskette reader issued a STOW or BLDL macro instruction to access the directory of the SYSUT3 intermediate file. The STOW or BLDL could not be successfully completed for one of the following reasons:

- Not enough directory blocks were allocated for the SYSUT3 file, (applicable to STOW only).
- The directory access failed because of permanent I/O errors.
- Insufficient virtual storage was available to perform the STOW or BLDL function.

System action: The diskette reader is ended.

Operator response: If the number of associated data sets to be processed (PARM= value) or the number of directory entry blocks allocated to the SYSUT3 file were modified via the START command, insure that the values were reasonable. The number of associated data sets should not be so large as to leave no virtual storage for the STOW function. The number of directory entry blocks should be $1 + (\text{number of ADS} ÷ 20)$. If these values were reasonable, the error was caused by an I/O error in the SYSUT3 file. Correct the cause of the error if possible, and start the diskette reader again to run the job stream.

Application Programmer Response: Correct the number of associated data sets and number of directory entry blocks specified in the JCL. Then rerun the diskette reader.

Routing Code: 2,7
Descriptor Code: 7

IEB556E DSID KEYWORD ENCOUNTERED READING JOB jjj

Explanation: A direct mode diskette reader detected the DSID keyword while processing the job.

In the message text:

jjj The job name.

System action: The diskette reader is ended.

Operator response: Remove the remainder of the jobstream from the hopper and feed mechanism if a card reader is used to read JCL. Use a merge mode reader to process the remainder of the jobstream starting with the job indicated.

Source: DFSMSdfp
Routing Code: 2,7
Descriptor Code: 7

IEB570I ddd,ser NON-SCRATCH DISKETTE FOUND

Explanation: The diskette that was just fed into the stacker was not a scratch diskette (that is, it contained a write protected data set or an unexpired data set) and, therefore, was not suitable to receive an output data set.

In the message text:

ddd The device address.
ser The volume identifier from the VOL1 label.
System action: Continue processing with the next diskette.

Operator response: Provide additional scratch diskettes, if needed, to allow the diskette writer to complete processing.

Source: DFSMSdfp
Routing Code: 2,7
Descriptor Code: 7

Explanation: A diskette writer has written the data set identified for the job indicated, on the diskette(s) having the volume serial(s) listed. If the data set spans more than five diskettes, the message appears after the fifth diskette has been completed, and will be issued again to list the next group of diskettes used.

In the message text:

jjj The job name.
dsid The data set identifier.
xxx The listed volume serial numbers.

System action: Continue processing.

Operator response: The operator may use this information to correlate the diskettes with the jobs submitted.

Source: DFSMSdfp
Routing Code: 2,7
Descriptor Code: 7

Explanation: This message occurs when a permanent I/O error is encountered by the diskette writer on the device.

In the message text:

ddd The device indicated.

System action: The diskette writer to device ddd is ended.

Operator response: Change the diskette and start another diskette writer. Save the diskette.

Source: DFSMSdfp
Routing Code: 2,7,10
Descriptor Code: 7

Explanation: There was no IEFRDER DD statement supplied in the JCL or the diskette writer was started to a device that was not a 3540.

System action: The diskette writer is ended.

Operator response: Specify a 3540 when the 3540 External Writer is started.

Application Programmer Response: The system programmer should be sure that diskette writer procedures specify a 3540 as the device for the IEFRDER DD statement.

Source: DFSMSdfp
Routing Code: 2,7
Descriptor Code: 7

Explanation: A diskette writer has been started to write secure data sets on the device. The data set for the job indicated requires the operator to specify the security parameters.

In the message text:

dsn The data set name.
jjj The job name.
IEB576I • IEB578I

IEB576I SYSIO ERROR ON dsid FOR JOB jjj

Explanation: While processing the data set for the job indicated the diskette writer (IEBDKWTR) detected an uncorrectable I/O error reading the data set from spool.

In the message text:

dsid The data set identifier.

jjj The job name.

System action: The diskette writer will stop processing the input data set and will go on to process other input data sets.

Application Programmer Response: Recreate the data set by processing the job step that produced it.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp
Routing Code: 2,7
Descriptor Code: 7

IEB577E ddd DISKETTE WRITER ENDED, (OPEN | SUBSYSTEM | ALLOCATION) ERROR

Explanation: The diskette writer to the device detected an error condition that was uncorrectable based on the return codes received from one of the following:

• The subsystem interface.
• The subsystem
• Dynamic allocation/unallocation.
• Subsystem data sets.

System action: The diskette writer to device ddd is ended.

Operator response: Report this message to the system programmer and make sure the problem determination information is available.

Application Programmer Response: For allocation and subsystem errors, the system programmer should examine the error message IEB581E, in the message data set.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job and all printed output and output data sets related to the problem.

Descriptor Code: 7

IEB581I ddd DUPLICATE DATA SET IDENTIFIER dsid FOR jjj

Explanation: While processing diskette output data sets for the job indicated in multiple data sets per diskette mode, the diskette writer to the device encountered two data sets with the same data set identifier.

In the message text:

ddd The device indicated.

jjj The job name.

dsidd The data set identifier.

System action: The diskette writer will write the data
set on the next scratch diskette and continue processing.

**Operator response:** Inform the programmer that submitted the job of this condition.

**Application Programmer Response:** When submitting jobs that create diskette output data sets with the same data set identifiers, care should be taken to insure that they are processed in one data set per diskette mode.

**IEB609I**

**INPUT SEQUENCE ERROR COMPLETION CODE=08**

**Explanation:** Either a record was lost, or a noise record was encountered when loading an indexed sequential data set. Possibly, the RKP, KEYLEN, or OPTCD parameter has been changed.

**System action:** The program is ended. The return code is 8.

**Application Programmer Response:** If possible, use a backup copy of the unloaded data set. UNLOAD the original indexed sequential data set, and respecify the LOAD operation. Also, specify the original DCB parameters in the SYSUT1 DD statement.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB700I**

**DATA GENERATION HAS BEEN [SUCCESSFULLY] COMPLETED. COMPLETION CODE IS ccc**

**Explanation:** If the code is ZERO, data generation was successfully completed.

If the code is FOUR, the job step was ended at the request of the user.

If code is EIGHT, an error occurred while processing a utility control statement.

If the code is TWELVE, an error occurred while processing an input or output data set.

If the code is SIXTEEN, incorrect parameters were encountered in a data control block while opening a data set.

In the message text:

ccc The completion code.

**System action:** The program is ended.

**Application Programmer Response:** If the code is ZERO or FOUR, no action is necessary.

If the code is EIGHT, correct the appropriate control statements, and resubmit the job step.

If the code is TWELVE, correct the error condition described in message IEB729I, and resubmit the job step.

If the code is SIXTEEN, correct the appropriate DD statement, and resubmit the job step.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp
**IEB702I**  
**OPERATION WAS NOT DSD, FD, CREATE, REPEAT, OR END. CORRECT AND RERUN.**

**Explanation:** The preceding utility control statement specified an incorrect operation; that is, the operation was not DSD, FD, CREATE, REPEAT, or END.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdip

**IEB704I**  
**INPUT DDNAME ON CREATE OR FD CARD IS NOT SPECIFIED ON DSD CARD.**

**Explanation:** The ddname specified on a CREATE or FD statement was not referred to on the DSD statement beginning this set of utility control statements. The IEBDG program was unable to open the data set.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdip

**IEB705I**  
**INVALID KEYWORD, POSSIBLE IMBEDDED COMMA.**

**Explanation:** The keyword pinpointed by message IEB727I is incorrect. Possibly:

- A double quotation mark specified within a picture caused an incorrect length.
- A character other than 0-9 or A-F was used when a hexadecimal digit was to be specified.
- A non-numeric character was used when a decimal number was to be specified.
- A keyword was misspelled.
- An FD statement contained a previously used name.
- Mutually exclusive subparameters are encountered such as FORMAT=CO and ACTION=RO. In this case, message IEB727I will not precede this message.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
IEB706I • IEB710I

Source: DFSMSdfp

IEB706I  NUMBER SPECIFIED IS LARGER THAN 32,767 OR EXCEEDS MACHINE CAPACITY.

Explanation: A length parameter on an FD statement was specified larger than 32,767 or machine capacity during an INDEX operation. No conversion is performed.

System action: Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

Application Programmer Response: Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

IEB710I • IEB710I

Source: DFSMSdfp

IEB708I  PICTURE LENGTH TOO LARGE FOR CONVERSION

Explanation: A decimal picture was to be converted to packed decimal or to a binary equivalent; however, the number of digits specified in the picture exceeds 16. No conversion is performed.

System action: Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

Application Programmer Response: Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB709I  USER EXIT ROUTINE RETURNED AN INVALID RETURN CODE

Explanation: The return code returned from the user exit routine was other than 0, 4, 12, or 16.

System action: Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

Application Programmer Response: Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the user exit routine so that a valid return code is returned and resubmit the job.

System programmer response: Contact the IBM Support Center. Have program listing of the associated user exit routine available.

Source: DFSMSdfp

IEB710I  UNABLE TO GET ENOUGH SPACE TO PROCESS REMAINING CONTROL CARDS

Explanation: A GETMAIN operation was unable to get sufficient space to process the remaining control statements.

System action: Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues
normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. If a REGION parameter was specified, ensure that the specified value is sufficient to complete the necessary processing and resubmit the job.

**Source:** DFSMSdfp

---

**IEB711I**  
**KEYWORD VALUE NOT FOLLOWED BY A BLANK OR COMMA**

**Explanation:** The keyword value pinpointed by message IEB727I is not followed by a blank or a comma.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB712I**  
**CONTROL CARD NAME OR KEYWORD VALUE EXCEEDS 8 CHARACTERS**

**Explanation:** The length of a keyword value or control statement name is greater than 8 characters.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB713I**  
**FLAGGED KEYWORD IS NOT COMPATIBLE WITH A PRECEDING KEYWORD**

**Explanation:** The keyword pinpointed by message IEB727I is not compatible with another keyword already specified on the same statement. (For example, the keywords PICTURE and FORMAT cannot be used together.)

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB714I**  
**REPEAT CARD ERROR OR REQUIRED NUMBER OF CREATE CARDS NOT PRESENT**

**Explanation:** One of the following error conditions occurred:

- Two or more REPEAT statements refer either to the same CREATE statement or to the same group of CREATE statements.
- A CREATE keyword in a REPEAT statement specifies a number greater than the number of following CREATE statements.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.
**IEB715I** NAME AND/OR LENGTH OR QUANTITY SPECIFICATION(S) OMITTED FROM FD AND/OR REPEAT CARD

**Explanation:** One or more of the field name, length, and quantity specifications is missing from an FD and/or REPEAT statement.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB717I** INPUT RECORD SIZE EXCEEDS SPECIFIED OUTPUT RECORD SIZE

**Explanation:** The record length specified in a DD statement for an output data set is not sufficient to contain corresponding input records.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB718I** DSD CONTROL CARD MUST BE FIRST CARD OF SET

**Explanation:** The DSD control statement is either out of order or missing.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Insert the missing DSD statement, or correct the sequence of control statements.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB720I** BLANK DOES NOT FOLLOW OPERATION OR CONTROL CARD NAME

**Explanation:** The control statement name or operation is not followed by a blank.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues
normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB721I**  
**Explanation:** A required keyword, keyword value, or delimiter is missing or is specified in column 72.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB725I**  
**Explanation:** The picture length subparameter or the picture value field is not followed by a blank or comma.

**System action:** Syntax checking of the remainder of the utility control statements in this set continues, but no additional data is generated. Processing continues normally with the next DSD statement encountered. The return code is 8.

**Application Programmer Response:** Probable user error. Since the output data set may have been only partially completed, run IEHPROGM to scratch the data set, if necessary. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp
IEB726I EXEC STATEMENT PARM PARAMETER IS CODED INCORRECTLY

Explanation: The PARM parameter of the EXEC statement contains an incorrect character, or does not contain a 4-digit decimal number.

System action: The line count of the message data set is set to a default value of 58. The return code is 0.

Application Programmer Response: Probable user error. If the default value assumed is unacceptable, correct the LINECNT subparameter on the EXEC statement.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB729I PERMANENT I/O ERROR, jii, sss, ddd, devtyp, ddname, op, err, xxxx, acc

Explanation: A permanent input/output error occurred while processing on the device.

In the message text, the error analysis information provided by the SYNADAF data management macro instruction issued by the SYNAD routine was:

jii  Job name.
sss  Step name.
ddd  Device number of the device.
devtyp  Device type.
ddname  Data definition name.
op  Operation attempted.
err  Error description.
xxxx  Last seek address or block count.
acc  Access method.

System action: The program is ended. The return code is 12.

Application Programmer Response: Correct the error condition as indicated in the message text.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB801I {OM|NM} LRECL AND BLOCKSIZE ASSUMED 80/80

Explanation: Necessary DCB parameters were omitted from the SYSUT1 (indicated by OM or old master) or SYSUT2 (indicated by NM or new master) DD statement. The program assumes that the SYSUT1 or SYSUT2 data set, as applicable, contains 80-byte unblocked records.

System action: Processing continues. However, if the data set does not contain 80-byte unblocked records,
additional messages will be generated during processing, and the job step will be ended. The return code is 0.

**Application Programmer Response:** If the record format specifications assumed are correct, there is no response required. Otherwise, correct the applicable parameters.

**System programmer response:** Use IEHLIST to list the VTOCs of the volumes on which the old master and new master data sets reside. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB802I**  
I/O ERROR $jjj$, $sss$, $ddd$, $devtyp$, $ddname$, $op$, $err$, $xxxx$, $acc$

**Explanation:** A permanent input/output error occurred while processing on the device.

In the message text, the error analysis information provided by the SYNADAF data management macro instruction issued in the SYNAD routine was:

- $jjj$: Job name.
- $sss$: Step name.
- $ddd$: Device number of the device.
- $devtyp$: Device type.
- $ddname$: Data definition name.
- $op$: Operation attempted.
- $err$: Error description.
- $xxxx$: Track address or relative block number.
- $acc$: Access method.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Correct the error condition indicated in the message text.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB804I**  
PERMANENT INPUT ERROR - BDL MACRO

**Explanation:** A permanent input/output error was detected by the BDL macro when attempting to search a partitioned data set directory.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Check the DD statement describing the SYSUT1 data set for missing or incorrect parameters.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

---

**IEB805I**  
CONTROL STATEMENT ERROR

**Explanation:** In the utility control statement preceding this message, a name, keyword, or parameter is incorrect.

**System action:** If the data set is partitioned, the program continues processing with the next function statement. If the data set is not partitioned, the program is ended. The return code is 4.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**Source:** DFSMSdfp
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB806I STATEMENT SEQUENCE ERROR

Explanation: Either the utility control statements are out of sequence, or an unnecessary statement has been encountered.

System action: If the data set is partitioned, the program continues processing with the next function statement. If the data set is not partitioned, the program is ended. The return code is 4.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB807I INVALID OPERATION

Explanation: The statement preceding this message is inconsistent with previously specified parameters. Possibly:

- A DELETE statement is encountered during an UPDATE=INPLACE operation.
- A CHANGE statement is encountered, but PARM=NEW was specified on the EXEC statement.
- Data statements are out of sequence. Old master records are out of sequence and renumbering was not requested.
- A NUMBER statement with a SEQ1 parameter is encountered following an ADD statement.
- More than 16 alias statements have been found for the member scheduled to be updated.

System action: If the data set is partitioned, the program continues processing with the next function statement. If the data set is not partitioned, the program is ended. The return code is 4.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB810I DELETE RANGE INVALID

Explanation: In the DELETE statement preceding this message, the SEQ1 or SEQ2 value specified does not match a sequence number in an existing logical record.

System action: Processing continues with the next function statement. The return code is 4.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEB811I NUMBER RANGE INVALID

Explanation: In the NUMBER statement preceding this message, the SEQ1 value does not match a sequence number in an existing logical record.

System action: Processing continues with the next function to be performed. The return code is 4.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

Source: DFSMSdfp
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the JCL
and all printed output and output data sets related to
the problem.

Source: DFSMSdfp

IEB812I  DIRECTORY WRITE ERROR
Explanation: A permanent input/output error occurred
while writing the directory of the SYSUT2 data set.
System action: The program is ended. The return
code is 12.
Application Programmer Response: Ensure that
sufficient space is allocated for the directory on the
SYSUT2 DD statement.
System programmer response: If the error recurs
and the program is not in error, look at the messages in
the job log for more information. Search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the JCL
and the program listing for the job.
Source: DFSMSdfp

IEB813I  OUTPUT DIRECTORY FULL
Explanation: Insufficient space was allocated for
directory entries in the SYSUT2 data set. Therefore, the
member was not placed in the data set.
System action: The program is ended. The return
code is 12.
Application Programmer Response: Re-create the
SYSUT2 data set, allocating sufficient space for the
additional directory entries. Then resubmit IEBUPDTE to
include the members that were omitted.
System programmer response: If the error recurs
and the program is not in error, look at the messages in
the job log for more information. Search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the JCL
and the program listing for the job.
Source: DFSMSdfp

IEB814I  DDNAME ddbname CANNOT BE OPENED
Explanation: The data set specified on the DD
statement cannot be opened. Possibly, the LRECL or
BLKSIZE for the SYSIN volume is not equal to, or a
multiple of, 80.
In the message text:

ddname  Identifies the DD statement.
System action: The program is ended. The return
code is 12.

Application Programmer Response: Probable user
error. Correct the error and resubmit the job.

System programmer response: If the error recurs
and the program is not in error, look at the messages in
the job log for more information. Search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the JCL
and the program listing for the job.
Source: DFSMSdfp

IEB815I  CANNOT PROCESS MORE THAN ONE
PS DATA SET PER PASS
Explanation: A control statement specified the
processing of two input sequential data sets in the same
job step.
System action: The program is ended. The return
code is 12.
Application Programmer Response: Probable user
error. Ensure that there is no disagreement between the
JCL and the user control statements. Resubmit the job.
System programmer response: If the error recurs
and the program is not in error, look at the messages in
the job log for more information. Search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the JCL
and the program listing for the job.
Source: DFSMSdfp

IEB816I  {MEMBER NAME mem
FOUND|MEMBER NAME mem FOUND
IN NM DIRECTORY. TTR IS NOW
ALtered}
Explanation: For the first format of the message, the
member name specified on an ADD statement already
exists.

For the second format of the message, the member
name exists in the new master (NM) directory.
In the message text:

mem  The member name.

System action: For the first format of the message, the
program is ended. The return code is 12.
For the second format of the message, an entry (TTR)
is altered and processing continues. The return code is
0.
Application Programmer Response: For the first
format of the message, change the member name to be
added. For the second format of the message, no action
is necessary.
System programmer response: If the error recurs
and the program is not in error, look at the messages in
the job log for more information. Search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

---

**IEB817I** MEMBER NAME mem NOT FOUND IN NM DIRECTORY. STOWED WITH TTR

**Explanation:** The member name does not exist in the directory of the new master (NM) data set.

In the message text:

*mem* The member name.

**System action:** An entry (TTR) is made for the member in the directory. Processing continues. The return code is 0.

Source: DFSMSdfp

---

**IEB818I** HIGHEST CONDITION CODE WAS ccc

**Explanation:** The condition code indicated was the highest code generated in the job step.

In the message text:

*ccc* The condition code.

**System action:** The program is ended normally.

Source: DFSMSdfp

---

**IEB819I** END OF JOB IEBUPDTE

**Explanation:** IEBUPDTE has completed processing.

**System action:** The program is ended normally.

Source: DFSMSdfp

---

**IEB820I** CANNOT PROCESS MORE THAN ONE FUNCTION STATEMENT WHEN UPDATE=INPLACE IS SPECIFIED

**Explanation:** If a function statement specifies UPDATE=INPLACE, it must be the only function statement in the job step.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job. Have the exit routine listings and linkage editor output available.

Source: DFSMSdfp

---

**IEB821I** INVALID EXIT NAME. JOB ENDED

**Explanation:** The name of a user exit routine specified on a function statement is incorrect.

**System action:** The program is ended. The return code is 12.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job. Have the exit routine listings and linkage editor output available.

Source: DFSMSdfp

---

**IEB822I** EXIT RETURN CODE ENDED JOB

**Explanation:** The return code returned by the user was 16.

**System action:** The program is ended. The return code is 16.

**Application Programmer Response:** If a return code of 16 was not expected, check your exit routine, and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job. Have the exit routine listings available.

Source: DFSMSdfp

---

**IEB823I** {SYSUT1|SYSIN} HAS NO RECORDS

**Explanation:** The SYSUT1 or SYSIN data set, as indicated in the message text, contains no records.

**System action:** For the SYSUT1 data set, processing continues with the next member, if any. The return code is 4.

For the SYSIN data set, the program is ended. The return code is 12.

The system issues messages about the job to the job log.

**Application Programmer Response:** Insert data statements for the SYSIN data set, or ensure that the proper SYSUT1 data set is specified.

If the problem recurs and if the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL for the job and the program listing for the job.

Source: DFSMSdfp
IEB825I  ALIAS IGNORED - SEQUENTIAL DATA SET

Explanation: An ALIAS statement specified an alias name for an output sequential data set.

System action: The statement is ignored. The return code is 4.

Application Programmer Response: Probable user error. Delete the ALIAS statement.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB826I  MEMBER NAME FOUND IN OM DIRECTORY AS AN ALIAS - CHANGED TO TRUE NAME IN NM DIRECTORY

Explanation: The member name is an alias name in the old master (OM) directory, and is entered as a member name in the new master (NM) directory.

System action: Processing continues. The return code is 0.

Source: DFSMSdfp

IEB827I  INVALID INPUT PARAMETER

Explanation: Either the EXEC statement contains an incorrect PARM parameter, or an incorrect parameter was passed to IEBUPDTE.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB828I  PAGE NUMBER PARAMETER INVALID

Explanation: An incorrect starting page number for the message data set was passed to IEBUPDTE.

System action: A page number of 1 is assigned to the first page of the printout. The return code is 4.

Application Programmer Response: Probable user error. If the default of 1 is not acceptable, correct the starting page number.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB829I  DDNAME PARAMETER IS INVALID

Explanation: An incorrect DDNAME parameter was passed to IEBUPDTE.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB830I  OLD AND NEW MASTER LRECL UNEQUAL

Explanation: The logical record lengths of the old and new master data sets are unequal.

System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. Correct the LRECL subparameter of the DCB parameter on the SYSUT2 DD statement.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB831I  OLD AND NEW MASTER DSORGS INCOMPATIBLE

Explanation: The data set organizations implied or specified on the SYSUT1 and/or SYSUT2 DD statements are either:

- Inconsistent with one another.
- Inconsistent with the data set organizations implied or specified on the utility control statements.

Chapter 2. IEB Messages 2-97
System action: The program is ended. The return code is 12.

Application Programmer Response: Probable user error. In the first case, ensure that the space allocation specified on the SYSUT1 and/or SYSUT2 DD statements is consistent with the data set organization. Also, ensure that the DSORG subparameter, if included, is correct.

In the second case, ensure that the keywords specified on the utility control statements are consistent with the data set organizations specified or implied on the SYSUT1 and/or SYSUT2 DD statements.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB832I  routine IS PROCESSING USER \{INPUT|HEADER|OUTPUT|TRAILER\} LABELS

Explanation: The user routine is currently processing input or output, header or trailer labels, as indicated in the message text.

In the message text:

routine  The routine specified.

System action: Processing continues. The return code is 0.

Source: DFSMSdfp

IEB833I  xx ENTRANCES TO routine

Explanation: The number of entrances to user routine is indicated.

In the message text:

xx  The number of entrances to the user routine.

routine  The user routine.

System action: Processing continues. The return code is 0.

Source: DFSMSdfp

IEB834I  LAST RETURN CODE FROM routine WAS return-code

Explanation: The return code indicated was the last return code issued by the user routine.

In the message text:

return-code  The return code.

routine  The user routine.

System action: Processing continues. The return code is 0.

Source: DFSMSdfp

IEB835I  \{TOTALING\|USER LABELS\} SUPPORTED ONLY ON PS DATA SETS

Explanation: The user requested totaling exits or user label processing, as indicated in the message text, for a data set whose organization is not physical sequential. These functions are supported only for physical sequential data sets.

System action: The program is ended. The return code is 8.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB836I  TRAILER LABEL PROCESSING NOT SUPPORTED FOR UPDATE=INPLACE

Explanation: The user specified user trailer label exits with an UPDATE=INPLACE operation. User trailer label exits are not supported for UPDATE=INPLACE operations.

System action: The program is ended. The return code is 8.

Application Programmer Response: Probable user error. Correct the error and resubmit the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: DFSMSdfp

IEB837I  I/O ERROR WHILE PROCESSING USER LABEL

Explanation: An uncorrectable input/output error occurred during user label processing. The results of the label processing are unpredictable.

System action: The program is ended. The return code is 12.

Application Programmer Response: Ensure that no DCB parameters for the data set are incorrect or missing.
System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source:  DFSMSdfp

IEB839I  routine IS TAKING TOTALING EXITS

Explanation:  The user routine is taking totaling exits prior to writing each record.

In the message text:

routine  The user routine.

System action:  Processing continues. The return code is 0.

Source:  DFSMSdfp

IEB840I  routine REQUESTED TERMINATION OF TOTALING EXITS

Explanation:  A return code other than 4 was passed to IEBUPDTE by the user totaling routine.

In the message text:

routine  The user totaling routine.

System action:  If the return code passed to IEBUPDTE was 0, totaling exits are discontinued, but processing continues. The return code is 0.

If the return code was 8, the program is ended. The return code is 12.

If the return code was 16, the program is ended. The return code is 16.

Application Programmer Response:  If ending the totaling exit routine was not expected, check the exit routine, and resubmit the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job. Have the exit routine listings available.

Source:  DFSMSdfp

IEB842I  TOTALING EXITS NOT SUPPORTED FOR UPDATE=INPLACE

Explanation:  The user specified totaling exits with an UPDATE=INPLACE operation. Totaling exits are not supported for UPDATE=INPLACE operations.

System action:  The program is ended. The return code is 12.

Application Programmer Response:  Probable user error. Correct the error and resubmit the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source:  DFSMSdfp

IEB843I  INVALID CORE SIZE

Explanation:  The virtual storage specified in the TOTAL keyword either is a non-numeric character, is less than 2 bytes, or is greater than 32K bytes.

System action:  The program is ended. The return code is 12.

Application Programmer Response:  Probable user error. Correct the error and resubmit the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source:  DFSMSdfp

IEB841I  INVALID RETURN CODE FROM routine, TOTALING EXITS DISCONTINUED

Explanation:  The return code passed to IEBUPDTE by the user totaling routine during a totaling exit was not valid. That is, the return code was not 0, 4, 8, or 16.

In the message text:

routine  The user totaling routine.
**IEB844I** NO USER [HEADER|TRAILER] LABELS EXISTS ON INPUT DATA SET

**Explanation:** The user specified SUL on the DD statement for the input data set, but there are no header or trailer labels, as indicated in the message text, on the data set.

**System action:** Processing continues. The return code is 0.

**Source:** DFSMSdfp

**IEB845I** NO USER [HEADER|TRAILER] LABELS CREATED ON OUTPUT DATA SET

**Explanation:** The user specified SUL on the SYSUT2 DD statement, but no header or trailer labels, as indicated in the message text, were copied from the SYSUT1 data set, and no labels were generated by a LABEL statement.

**System action:** Processing continues. The return code is 0.

**Application Programmer Response:** If user labels are desired on the output data set, make sure that the SYSUT1 data set contains user labels, or supply user labels with the LABEL statement. Resubmit the job.

**System programmer response:** If the error recurs and the user program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center and provide the JCL and the relevant job log.

**Source:** DFSMSdfp

**IEB846I** ALIAS IGNORED FOR UPDATE=INPLACE

**Explanation:** ALIAS statements for partitioned data set members cannot be processed using the UPDATE=INPLACE operation.

**System action:** All ALIAS statements are ignored. Processing continues. The return code is 0.

**Application Programmer Response:** Probable user error. Correct the error and resubmit the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

**IEB847I** SYSPRINT CANNOT BE OPENED

**Explanation:** Either LRECL for SYSPRINT is not between 121 and 151 or BLKSIZE is not compatible with LRECL and RECFM.

**System action:** The program is terminated. The return code is 12.

**Application Programmer Response:** Check the LRECL, BLKSIZE and RECFM for SYSPRINT and make sure that the following requirements are met:
- LRECL is between 121 and 151,
- the RECFM is either FBA or VBA, and
- the BLKSIZE is compatible with LRECL and RECFM.

Resubmit the job.

**System programmer response:** If the error recurs and the user program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center and provide the JCL and the relevant job log.

**Source:** DFSMSdfp

**IEB1010I** function FUNCTION REQUESTED FOR A PDSE.

**Explanation:** An ALTERMOD or COMPRESS operation is requested for a PDSE, or a COPYMOD operation is requested for a PDSE.

**Message inserts and meanings:**
- function
  - is one of:
    - COPYMOD
    - ALTERMOD
    - COMPRESS

**Action** is one of:
- IT IS IGNORED.
- REQUEST TREATED AS COPY.

The severity is 0.

**System action:** An ALTERMOD or COMPRESS operation is ignored. A COPYMOD operation is treated as a COPY request.

**User response:** Remove the compress or ALTERMOD operation to eliminate this message, or change COPYMOD to COPY since the PDSE can not contain a load module.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -
IEB1010S  function FUNCTION REQUESTED FOR A PDSE. NO PDSE SUPPORT IN THIS RELEASE.

Explanation: A PDSE has been encountered on a system before DFP V3 R2. This is probably because the DASD containing the PDSE is shared with a system running a DFP or DFSMS release that does support PDSEs.

Message inserts and meanings:
function is one of:
COPY
COPYMOD
ALTERMOD
COMPRESS
LOAD
UNLOAD

The severity is 12.

System action: Any operation involving a PDSE on a system without PDSE support is ended.

User response: Re-run the job on the system with PDSE support available.

Source: DFSMSdfp

IEB1011E  AVAILABLE STORAGE (avail) IS TOO SMALL. ADD nnnnn MORE BYTES TO WORK SIZE.

Explanation: A list of members to be copied to or from a PDSE was being built when all available virtual storage in the work area was exhausted.

Message inserts and meanings:
avail amount of storage available in the work area when the PDSE operation started.
nnnnn number of additional bytes required.

The severity is 8.

System action: The requested COPY operation is not performed.

User response: Increase the work area size, or reduce the number of members involved in the operation.

The user response for message IEB1057I discusses increasing the WORK area size.

Source: DFSMSdfp

Routing Code: Note 11
Descriptor Code: -

IEB1012E  COPY OPERATION NEEDS nnnnn BYTES MORE STORAGE. OUTPUT AREA IS size BYTES.

Explanation: The amount of storage available to communicate with the PDSE routines is too small. This area is used to return member lists, and messages.

Message inserts and meanings:
nnnnn amount of the virtual storage shortage.
size amount of storage available in the work area when the PDSE operation started.

The severity is 8.

System action: Processing is incomplete.

User response: 1. Refer to preceding IGW messages to learn what processing was completed. 2. Increase the size of the work area, or decrease the number of members involved in the operation, or specify LIST=NO to reduce the message traffic.

The user response for message IEB1057I discusses increasing the WORK area size.

Descriptor Code: -

IEB1013I  COPYING FROM dtype INDD=ddname VOL=volume DSN=dsname

Explanation: This message documents the copy source data set.

Message inserts and meanings:
dtype type of data set:
PDSE a library (DSNTYP=LIBRARY)
PDS a partitioned (DSORG=PO)
PDSU a sequential data set containing a PDS or PDSE in unloaded format.

ddname input DD name from the COPY statement.

volume volume containing the data set.

dsname data set name.

The severity is 0.

System action: Processing continues.

Source: DFSMSdfp

Routing Code: Note 11
Descriptor Code: -
IEB1014I • IEB1018I

**IEB1014I** TO dtype OUTDD=ddname VOL=volume DSN=dsname

**Explanation:** This message documents the destination data set.

Message inserts and meanings:

- **dtype** type of data set:
  - PDSE a library (DSNTYP=LIBRARY)
  - PDS a partitioned (DSORG=PO)
  - PDSU a sequential data set containing a PDS or PDSE in unloaded format.

- **ddname** output ddname from the COPY statement.

- **volume** volume containing the data set.

- **dsname** data set name.

The severity is 0.

**System action:** Processing continues.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -

**IEB1016I** RETURN CODE IS return-code

**Explanation:** This message records information about the results of a copy operation involving a PDSE.

The value of return-code is not a IEBCOPY step completion code; it is a return code from an internal routine. The IEBCOPY completion code is affected by this return-code as documented in message IEB1017.

The severity is 0.

**System action:** Message IEB1017 follows.

**User response:** This may represent either a normal condition or a problem. Refer to accompanying messages for additional guidance.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -

**IEB1018I** COMPRESSING PDS OUTDD=ddname VOL=volume DSN=dsname

**Explanation:** This message documents the data set being compressed.

Message inserts and meanings:

**IEB1017E** -- DIAGNOSTIC CODE IS X'diagcode'

**Explanation:** This message accompanies messages IEB1016I or IEB1137I. Report this diagnostic code to the IBM support center when requesting service.

**Note:** The historical step completion codes from IEBCOPY cause normal attention conditions to be reported as completion code 0. Generally speaking, completion code 4 means that a copy operation has failed, and completion code 8 means that execution can not continue under any circumstances.

In order to reconcile the existing completion codes in IEBCOPY with the modern standards, the return codes from new function related to PDSEs are reduced by 4 to create the IEBCOPY completion code.

Message inserts and meanings:

- **diagcode** an internal DFP diagnostic code.

The severity is based on the return code in message IEB1016I:

- return-code < 8 is severity 0, message IEB1017I.
- return-code = 8 is severity 4, message IEB1017W.
- return-code > 8 is severity 8, message IEB1017E.

**System action:** The next operation is sought.

**User response:** This probably represents an unusual condition or problem. Refer to accompanying messages, particularly those with IGW and IEB prefixes, for specific information and additional guidance.

**System programmer response:** Research accompanying messages in SYSPRINT and in the job log for more specific information.

Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Please furnish the information in this message when requesting service along with the JCL, job log, system messages, and all SYSPRINT output.

Please preserve the input and output data sets related to the problem in case it should be necessary to reproduce the problem.

**Source:** DFSMSdfp

**IEB1018I** -- DIAGNOSTIC CODE IS X'diagcode'

**Explanation:** This message documents the data set being compressed.

Message inserts and meanings:
ddname
  output DD name from the COPY statement.

volume
  volume containing the data set.

dsnname
  data set name.

The severity is 0.

System action:  Processing Continues.

Source:  DFSMSdfp

Descriptor Code:  -

IEB1021I  I/O ERROR ON dtype DDN=ddname
  VOL=volume DSN=dsnname

Explanation:  This messages follows IEB1021E to document the data set involved in the I/O error.

Message inserts and meanings:
  dtype  type of data set:
    PDSE  a library (DSNTYP=LIBRARY)
    PDS  a partitioned (DSORG=PO)
    PDSU  a sequential data set containing a PDS or PDSE in unloaded format.
  ddname  DD name identifying the data set.
  volume  volume containing the data set or blank for VIO.
  dsnname  name of the data set.

The severity is 0.

System action:  An indicative dump may be printed next on SYSPRINT. Message IEB1023I will follow the dump (if any).

Source:  DFSMSdfp

Routing Code:  11

Descriptor Code:  7
IEB1023I  

transaction MEMBER=member  TTR= X'ttr'  
MBBCCHHR=mbbcchhr  TAPE  
BLOCK=bbbbb  

Explanation:  This message follows IEB1022E to  
document the current activity at the time of the I/O error.  
This message identifies the location of the I/O error first  
reported in message IEB1021E. These fields may be  
incomplete or missing depending on the details of  
processing at the time of the error. When a field  
contains zero, it is not valid. If both the TTR and  
MBBCCHHR are not zero then both should identify the  
same record in the data set.  
TTR= and MBBCCHHR= are valid only if the data set  
resides on direct access storage. TAPE BLOCK= is  
valid only if the data set resides on tape.  
Message inserts and meanings:  
activity  is one of:  
COPYMOD READ  
COPYMOD WRITE  
READING UNLOADED PDSE  
WRITING UNLOADED PDSE  
GET FROM CONTROL STMT FILE  
PUT TO MESSAGE FILE  
DURING READ  
DURING WRITE  
DURING ERASE  
DURING READBACK CHECK  
DURING LOAD  
DURING UNLOAD  
UNEXPECTED END OF FILE  
READING OUTPUT DIRECTORY  
PROCESSING HEADER RECORDS

Descriptor Code:  -  

IEB1024E  
SYNTAX ERROR IN PARM FIELD OPTIONS  

Explanation:  There is an error in one of the following:  
• The parameter passed via the PARM= field on the  
EXEC JCL statement  
• The program parameter field in the TSO CALL  
command  
• The first parameter in the parameter list passed by a  
program dynamically invoking IEBCOPY.  

The severity is 8.  
System action:  Processing continues, ignoring options  
which could not be understood because of the syntax  
error.  
User response:  Correct the options.  
Source:  DFSMSdfp  
Routing Code:  Note 11  
Descriptor Code:  -  

IEB1025I  
DD NAME LIST PARAMETER IS IN  
ERROR AND MIGHT BE IGNORED.  

Explanation:  A program invoked IEBCOPY, supplying  
a list of DD names to be substituted for those normally  
used by IEBCOPY. However, some or all of the supplied  
names could not be recognized.  
The severity is 8.  
System action:  Processing continues. The names that  
can be correctly identified as substitutes are used; the  
others are ignored.  
User response:  Correct the program invoking  
IEBCOPY to properly construct and pass the second  
parameter. Refer to the  
"z/OS DFSMSdfp Utilities"  
Appendix A for information about dynamic invocation of  
IEBCOPY and parameters.  
Source:  DFSMSdfp  

IEB1026I  
PAGE NUMBER PARAMETER IS IN  
ERROR AND MIGHT BE IGNORED  

Explanation:  A program invoked IEBCOPY, supplying  
a beginning page number for the IEBCOPY messages  
and control cards listing. The page number is either  
missing, too long, or contains characters which are not  
EBCDIC numbers.  
The severity is 8.  
System action:  Processing continues. If the page  
number is missing in the supplied parameter, the  
beginning page number will be 1. If the page number in  
the supplied parameter is too long, the beginning page  
number will be some left portion of that number. If the  
supplied parameter is not an EBCDIC number, the  
beginning page number will be an unpredictable  
numerical value.

z/OS V1R11.0 MVS System Messages, Vol 7 (IEB-IEE)
**User response:** Correct the program invoking IEBCOPY to properly construct and pass the third parameter. Refer to the z/OS DFSMSdfp Utilities Appendix A for information about dynamic invocation of IEBCOPY and parameters.

**Source:** DFSMSdfp

**IEB1027E**  
**IO LIST PARAMETER IS NOT SUPPORTED AND IS IGNORED.**

**Explanation:** A program invoked IEBCOPY, supplying a fourth parameter which is not used by IEBCOPY. Some IBM Utility programs support user IO routines which are passed in a list as the fourth parameter. Since IEBCOPY does not support user IO routines, it does not expect more than three passed parameters.

The severity is 8.

**System action:** Processing continues.

**User response:** To prevent this message from appearing, change the program invoking IEBCOPY so that it will not pass more than three parameters. Refer to the z/OS DFSMSdfp Utilities Appendix A for information about dynamic invocation of IEBCOPY and parameters.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -

**IEB1028I**  
**OPERATING IN KEY 0 SUPERVISOR STATE**

**Explanation:** IEBCOPY has detected that it was called in supervisor state and protection key zero. The interface to some services changes when the invoker is in supervisor state/key 0 and IEBCOPY is not coded to use these different interfaces.

IEBCOPY must be invoked in problem state and non-zero protect key.

The severity is 0.

**System action:** IEBCOPY ends.

**Application Programmer Response:** Invoke IEBCOPY as an application program.

**System programmer response:** Check the program properties table for programs such as SMP/E that invoke IEBCOPY under the covers.

**Source:** DFSMSdfp

**IEB1030I**  
**DD NAME ddname REFERS TO dtype DATA SET ON VOLUME volume NAMED dsname**

**Explanation:** This message accompanies message IEB120I which occurs when a data set can not be opened. This message may appear multiple times for each DD name involved in the operation.

This message is to document data set names and volumes when the copy operation fails before messages IEB1013I etc. are issued.

Message inserts and meanings:

| ddname | DD name identifying the data set. |
| dtype  | type of data set: |
| PDSE   | a library (DSNTYP=LIBRARY) |
| PDS    | a partitioned (DSORG=PO) |
| PDSU   | a sequential data set containing a PDS or PDSE in unloaded format. |
| volume | volume containing the data set or blank for VIO. |
| dsname | name of the data set. |

The severity is 0.

**System action:** Processing continues.

**User response:** Correct the error indicated by previous message IEB120I.

**Source:** DFSMSdfp

**IEB1029I**  
**INVOKED AS A TSO COMMAND PROCESSOR**

**Explanation:** IEBCOPY has been entered from TSO as a command processor. This message is issued because IEBCOPY was not written to be a TSO command processor but may function when so invoked while not providing all the services of a command processor (for example, prompting for missing/incorrect parameters, providing HELP information).

The severity is 0.

**System action:** Processing continues.

**User response:** Use the TSO CALL command to invoke IEBCOPY. Do not enter IEBCOPY as a TSO command or CLIST statement.

**Source:** DFSMSdfp

**IEB1028T**  
**OPERATING IN KEY 0 SUPERVISOR STATE**

**Explanation:** IEBCOPY has detected that it was called in supervisor state and protection key zero.

The severity is 0.

**System action:** IEBCOPY ends.

**User response:** Correct the error indicated by previous message IEB120I.

**Source:** DFSMSdfp
IEB1031E  VOLUME  volume  DD NAME  ddname 
DOES NOT CONTAIN DATA SET  
\textit{dsname}

**Explanation:** The data set is not present on the indicated volume. Note that the volume information may come from a catalog or from JCL, and that for SMS data sets, volume information in the JCL may be ignored.

Message inserts and meanings:

- **volume**  
  volume serial number.

- **ddname**  
  DD name.

- **dsname**  
  data set name.

The severity is 4.

**System action:** For an output data set, the COPY group is ended. For an input data set, processing continues with the next data set in the INDD group.

**User response:** Correct the catalog, add VOL=SER= to the DD statement, or create the data set on the volume.

**System programmer response:** The IDCAMS utility may be used to display the volume on which a cataloged data set is supposed to reside. The IEHLIST utility may be used to display the names of data sets which reside on a specific volume.

Refer to IGD and IEF prefix messages in the JCL message data set to verify which volume contains a SMS managed data set.

IEB1033E  BLOCK SIZE (\textit{blksize}) INCONSISTENT 
WITH RECORD LENGTH (\textit{reclen}) FOR 
RECFM=\textit{rectm}

**Explanation:** An incorrect combination of block size and logical records length has been detected.

Message inserts and meanings:

- **blksize**  
  physical record size (JCL DD statement BLKSIZE parameter).

- **reclen**  
  logical record size (JCL DD statement LRECL parameter).

- **rectm**  
  record format, as used with the JCL DD statement RECFM parameter.

A summary of the rules follows, based on RECFM:

- **F**  
  LRECL must equal BLKSIZE.

- **FB**  
  LRECL multiplied by an integer must equal BLKSIZE.

- **FBS**  
  LRECL multiplied by an integer must equal BLKSIZE.

- **V**  
  BLKSIZE must exceed LRECL by a minimum of 4.

- **VB**  
  BLKSIZE must exceed LRECL by a minimum of 4.

- **VS**  
  LRECL may exceed BLKSIZE.

- **VBS**  
  LRECL may exceed BLKSIZE.

When track overflow is not used (RECFM does not contain a “T”) then the BLKSIZE must not exceed the track size of a DASD device.

The severity is 4.

**System action:** The operation is ended and the next control statement is sought.

**User response:** Correct or supply DCB parameters.

**System programmer response:** Use the IEHLIST utility to print the data set label and compare the DCB parameter fields with the JCL. If the data set is an output data set, also examine the DCB parameters from the current input data set.

See \texttt{z/OS DFSMS Using Data Sets} for a discussion of how all the sources are merged to determine the effective DCB parameters.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -

---

IEB1032E  RECORD FORMAT OMITTED FOR DD NAME  
\textit{ddname}

**Explanation:** No information about the RECFM for the data set identified by the \textit{ddname} DD statement can be found.

Message inserts and meanings:

- **ddname**  
  name of the DD statement.

The severity is 4.

**System action:** The operation is ended and the next control statement is sought.

**User response:** Verify that the input data set contains data (that is, has been opened for output previously and successfully closed). The IEHLIST utility may be used to display the data set characteristics from the data set label.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -
IEB1034E  RECORD LENGTHS UNEQUAL BETWEEN INDD in_ddname (in_length) AND OUTDD out_ddname (out_length)

Explanation:  IEBCOPY can not pad or truncate logical records when reblocking. When fixed length logical records are copied they must be the same size. (Variable length records can be copied from an input data set with equal or shorter length records than the output data set.)

Message inserts and meanings:

in_ddname  input data set DD statement name.
in_length  logical record size of the input data set.
out_ddname output data set DD statement name.
out_length  logical record size of the output data set.

The severity is 4.

System action:  For an output data set, the COPY group is ended. For an input data set, processing continues with the next data set in the INDD group.

User response:  Correct or supply DCB parameters.

System programmer response:  Use the IEHLIST utility to print the data set label and compare the DCB parameter fields with the JCL. If the data set is an output data set, also examine the DCB parameters from the current input data set.

Refer to [z/OS DFSMS Using Data Sets](https://www.ibm.com/support/knowledgecenter/SSLTBW_AIX_8.6.0/com.ibm.sla.dsm.doc/dfsmsdarpds.html) for a discussion of how all the sources are merged to determine the DCB parameters used.

Descriptor Code:  -

IEB1036E  TRACK OVERFLOW NOT SUPPORTED FOR DD NAME ddname

Explanation:  The DASD device associated with DD name ddname does not support the Track Overflow feature, or the data set associated with DD name ddname is not a PDS.

Message inserts and meanings:

ddname  DD name identifying the data set.

The severity is 4.

System action:  The operation is not preformed and the next control statement is sought.

User response:  Remove the RECFM=T from your JCL to stop requesting the track overflow feature.

Source:  DFSMSdfp

IEB1037I  BLOCK SIZE IN THE DATA SET LABEL OF ddname INCREASED TO newsize FROM oldsize

Explanation:  A COPYMOD operation has been requested to reblock a load module. The MAXBLK parameter supplied on the COPYMOD statement (or the default when MAXBLK is not supplied) limits the largest physical record size that COPYMOD will write. This number is greater than the current block size in the output data set label.

Message inserts and meanings:

ddname  output data set DD statement name.
newsize  new block size placed in the data set label.
oldsize  old block size before the COPYMOD operation.

Chapter 2. IEB Messages  2-107
### IEB1038I

The severity is 0.

**System action:** IEBCOPY updates the data set label to contain a correct block size.

**User response:** If the new block size is not acceptable, then provide a MAXBLK parameter on the COPYMOD statement.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -

#### IEB1038I

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORIGINAL dtpe (BEFORE UNLOAD) WAS RECFM= urecfm BLKSIZE=ublksize LRECL= ulrecl KEYLEN=ukeylen OPTCD= uoptcd UCBTYPE=udevtype INDC= indc</td>
<td></td>
</tr>
</tbody>
</table>

**Explanation:** The unload data set contains header records that record the characteristics of the source PDS or PDSE which was unloaded to create the data set being processed as input. This message informs you what they are.

**Message inserts and meanings:**
- **dtpe** type of data set:
  - PDSE a library (DSNTYP=LIBRARY)
  - PDS a partitioned (DSORG=PO)
  - PDSU a sequential data set containing a PDS or PDSE in unloaded format.
- **urecfm** record format.
- **ublksize** block size.
- **ulrecl** logical record length.
- **ukeylen** key length.
- **uoptcd** option codes.
- **udevtype** device type from UCB.
- **indc** indicator byte.

The severity is 0.

**System action:** Processing continues.

**User response:** Refer to this information if you need to resolve DCB parameter conflicts with the output data set. Appendix B of the z/OS DFSMSdfp Utilities book has details about the header records content.

**Source:** DFSMSdfp

### IEB1039W

PDSU HAS DIFFERENT BLOCK SIZE NOW (current) THAN WHEN IT WAS CREATED (original). AN I/O MAY OCCUR WHILE READING IT.

**Explanation:** One of the following occurred while IEBCOPY was reading an unload data set:
- The data set produced from an unload operation has been reblocked. There is a documented restriction that the data set produced from an unload operation must not be changed. IEBCOPY may encounter an I/O error reading it. IEBCOPY records the block size inside the unload data set so it can be compared with the block size in the unload data set label.
- If the unload data set resides on tape and is processed with LABEL=(,NL) or LABEL=(,BLP) and the DCB parameters are omitted from the JCL then IEBCOPY will see the BLKSIZE as zero and report it as such in this message: IEBCOPY may still encounter an I/O error while processing the tape in this case.

Note that the block sizes refer to the unload data set itself and not to the PDS or PDSE from which it was created.

**Message inserts and meanings:**
- **current** current block size of the unload data set.
- **original** block size IEBCOPY used to create the unload data set.

The severity is 0.

**System action:** Processing continues.

**User response:**
- Do not change a data set produced from an unload operation.
- Always provide correct DCB parameters for an unload data set using JCL or the TSO ALLOCATE or TSO ATTRIB command operands when the data set label is omitted, ignored, or incorrect.

**Source:** DFSMSdfp

### IEB1040D - IEB1049D

#### Explanation:

The following messages contain diagnostic information for you to supply to IBM when requesting service:
- IEB1040D
- IEB1041D
- IEB1042D
- IEB1043D
- IEB1044D
- IEB1045D
- IEB1046D
- IEB1047D
IEB1051

**ut3_blocks in_ddname DIRECTORY ENTRIES SPILLED TO spill_ddname -- nnnnn BYTES MORE WORK MAY IMPROVE PERFORMANCE**

**Explanation:** Not enough virtual storage was available for IEBCOPY to retain in storage the directory entries for all members being copied. IEBCOPY wrote them to SYSUT3 and read them back one by one as individual processing required the individual entries.

Performance may improve if you can give IEBCOPY enough virtual storage to hold all directory entries. Then you will not need to supply a spill data set.

**Message inserts and meanings:**
- **ut3_blocks** number of records written to the spill data set.
- **in_ddname** input data set DD name.
- **spill_ddname** spill data set DD name. (normally SYSUT3).
- **nnnnn** number of additional bytes needed to hold all directory entries in storage.

The severity is 0.

**System action:** Processing continues.

**User response:** Make more virtual storage available to IEBCOPY.

The user response for message IEB1051I discusses increasing the WORK area size.

The [z/OS DFSMSdfp Utilities](https://www.ibm.com/support/knowledgecenter/SSGSGT_5.4.0/dfsmsdfp/zosdfsmdiff_approval/dfsmsdfpbookpage.html) book contains information about calculating the amounts of virtual storage required to hold directories, and choosing between a large region or spill files.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -

---

**IEB1053I**

**in_ddname DIRECTORY ENTRIES SPILLING TO spill_ddname**

**Explanation:** The amount of unused virtual storage in the work area has just been exhausted. IEBCOPY will try to use a spill data set to hold what cannot be retained in the work area.

Should the spill data set not be present or be too small or another problem arise then this message may be the only message to inform you about what IEBCOPY was doing at the time of failure.

**Message inserts and meanings:**
- **in_ddname** input data set DD name.
- **spill_ddname** spill data set DD name. (normally SYSUT3).

The severity is 0.

**System action:** IEBCOPY proceeds to open the spill data set.

**User response:** Look for message IEB1051I which follows later after successful completion of the current operation.

If message IEB120I or other data set related messages follow this message then look for problems related to the spill data set.

**Source:** DFSMSdfp
IEB1054I  out_ddname DIRECTORY BLOCKS SPILLING TO spill_ddname

Explanation: The amount of unused virtual storage in the work area has just been exhausted. IEBCOPY will try to use a spill data set to hold what cannot be retained in the work area.

Should the spill data set not be present or be too small or another problem arise then this message may be the only message to inform you about what IEBCOPY was doing at the time of failure.

Message inserts and meanings:
out_ddname output data set DD name.
spill_ddname spill data set DD name. (normally SYSUT4).

The severity is 0.

System action: IEBCOPY proceeds to open the spill data set.

User response: Look for message IEB1052I which follows later after successful completion of the current operation.

If message IEB120I or other data set related messages follow this message then look for problems related to the spill data set.

Source: DFSMSdfp

IEB1055I THE REMAINING AMOUNT OF WORK AREA, avail BYTES, IS (TOO SMALL TO ALLOCATE ANOTHER BUFFER. SURPLUS SPACE WHICH IS NOT NEEDED.)

Explanation: After reading and saving the directory entries for the members to be copied there is still a small amount of work area available. The extra area will go unused.

This is not an error condition. This message is to help you better manage resources by telling you about idle storage.

Normally the remaining work area is used for additional buffer space. However, the small amount is not enough for a whole buffer, so the buffer space is not expanded.

Message inserts and meanings:
avail amount of virtual storage unused in the work area.

The severity is 0.

System action: Processing continues.

User response: If the amount of storage used by IEBCOPY must be reduced then the size of the work area could be increased enough to hold another buffer. The amount of additional storage required would be the difference between the buffer size in message IEB1058I and avail.

Source: DFSMSdfp

IEB1056I RELEASED nnnnn ADDITIONAL BYTES.

Explanation: IEBCOPY released the indicated virtual storage.

Small quantities of virtual storage are released at various processing stages so the access methods and other operating system services will not fail from lack of virtual storage. At IEBCOPY end, all remaining virtual storage (from the block initially acquired by IEBCOPY) will be released.

Message inserts and meanings:
nnnnn number of bytes released.

The severity is 0.

System action: Processing continues.

User response: Use this message with message IEB1055I to calculate IEBCOPY virtual storage requirements and actual usage, so that you make the best use of the computing resources.

Source: DFSMSdfp

Routing Code: Note 11
Descriptor Code: -

IEB1057I VL GETMAIN REQUESTED minimum TO maximum BYTES. OBTAINED obtained. RELEASED freeamt.

Explanation: IEBCOPY requests virtual storage to be subdivided into work areas and buffers. The amount requested and received is controlled by the WORK= parameter and the JCL REGION= parameter.

This message documents how much was requested and obtained. All numbers are in bytes.

Message inserts and meanings:
minimum minimum amount of virtual storage required by IEBCOPY. Additional virtual storage is required for larger data sets.
maximum value of the IEBCOPY WORK= parameter, default 1M.
obtained amount of virtual storage GETMAIN awarded IEBCOPY.
freeamt amount of virtual storage freed immediately so that the region will still contain unallocated virtual storage for use by system routines, etc.
The severity is 0.

**System action:** Processing continues.

**User response:** Use this message with message IEB1056I to calculate IEBCOPY virtual storage requirements and actual usage, so that you make the best use of the computing resources.

To increase the size of the work area:

1. If the REGION= size is large enough so that IEBCOPY is being given the full amount that it requests for its work area, then increase the REGION= parameter and the WORK= parameter by the same amount. This condition is true when maximum equals obtained.
2. If IEBCOPY is not being given the full amount that it requests for its work area, then increase the REGION= parameter by maximum-obtained.

When the size of the work area cannot be increased,

1. Reduce the amount specified for buffers (with the SIZE= invocation parameter) to the minimum amount (or default it). This will use the minimum amount of work area virtual storage as buffers and increase the amount of virtual storage available for member names and directory entries. Doing this most often results in decreased performance, even if it increases the size of the WORK= area so that the spill file is no longer used.
2. If the current operation is a selective copy, then divide the operation into more operations each with a smaller number of members. This leaves more room in the WORK= area for buffers and directory blocks.

**System programmer response:** Message IEF374I printed in the JCL message data set will tell the actual region size used by a job step.

**Source:** DFSMSdfp

**Routing Code:** Note 11

**Descriptor Code:** -

---

**IEB1058I** ALLOCATED 2 CONTIGUOUS BUFFERS EACH bbbbb BYTES. WORK AREA HAS avail BYTES AVAILABLE.

**Explanation:** At the start of each operation IEBCOPY allocates part of the work area for buffers. The buffers reported by this message are the minimum size required to perform the operation, and are sufficient to complete the operation.

Message inserts and meanings:

- bbbbb: size of 1 buffer.
- avail: amount of virtual storage in the work area still available for tables and saving directory entries, etc.

The severity is 0.

**System action:** Processing continues.

**User response:** This message documents how much of the work area is allocated to buffer to assist you in managing the virtual storage resource.

**Source:** DFSMSdfp

---

**IEB1059I** ALLOCATED SECOND BUFFER OF bbbbb BYTES. FIRST BUFFER IS NOW fffff BYTES. WORK AREA HAS avail BYTES AVAILABLE.

**Explanation:** The copy operation is ready to copy the first member. Enough virtual storage remained in the work area after building tables and saving directory entries for additional buffers to be allocated.

IEBCOPY uses two buffers, so the existing two buffers have been merged into a single "first" buffer. Then a new "second" buffer is created from the free work area.

A small amount of storage may remain unused in the work area after this second buffer allocation. This is normal.

Message inserts and meanings:

- bbbbb: amount of storage added to the buffer pool.
- fffff: original size of the buffer pool.
- avail: residual amount of storage in the work area.

The severity is 0.

**System action:** Processing continues.

**User response:** If it is necessary to reduce the amount of storage IEBCOPY uses then the work area size may be reduced by the size of the second buffer given in this message.

The user response for message IEB1057I discusses increasing the WORK area size.

**Source:** DFSMSdfp

---

**IEB1063W** MEMBER member1 READ FROM DDNAME ddname IS NOT AN ALIAS BUT HAS SAME TTR AS MEMBER member2

**Explanation:** The directory of the dataset contains two entries with the same TTR and neither is an alias.

In the message text:

- member1: name of member to be copied
- member2: name of member already copied
- ddname: ddname of dataset

The severity is 0.

**System action:** Processing continues.

**User response:** The user response for message IEB1057I discusses increasing the WORK area size.

**Source:** DFSMSdfp
The severity is 4.

**System action:** If the current operation is a compress, the identified members are written as one entry (both members will have the same TTR). If the current operation is an unload, IEB1063E is issued. For all other operations, the identified members will be written as two separate members (each member will have a different TTR).

**User response:** Determine proper relationship of the identified members and correct the directory.

**Explanation:** The directory of the dataset contains two entries with the same TTR and neither is an alias.

In the message text:
- `member1`: name of member to be copied
- `member2`: name of member already copied
- `ddname`: ddname of dataset

The severity is 8.

**System action:** If the current operation is an unload, the output data set is incomplete and cannot be successfully reloaded. For all other operations, IEB1063W is issued.

**User response:** Determine proper relationship of the identified members and correct the directory.

**Explanation:** The member named was not copied to the output data set because the output data set already contains a member of the same name.

**Message inserts and meanings:**
- `member`: name of the PDS or PDSE member.
- `disposition`: one of:
  - `COPIED`
  - `LOADED`
  - `UNLOADED`
  - `MOVED`
  - `ALTERED`

**System action:** Processing continues.

**Source:** DFSMSdfp

**IEB1065I** OVERRING DD NAMES- `sysin` `sysprint` `sysut1` `sysut2` `sysut3` `sysut4`

**Explanation:** IEBCOPY has been called by a program which has given IEBCOPY a list of DD names to be used for various files. Message IEB1064I lists the default DD names. Message IEB1065I lists the DD names IEBCOPY will use.

Differences between the two lists indicate that the calling program provided names to override the default names.

**Message inserts and meanings:**
- `sysin`: DD name for the control statement data set.
- `sysprint`: DD name for the listing data set.
- `sysut1`: DD name for the input data set.
- `sysut2`: DD name for the output data set.
- `sysut3`: DD name for the first spill data set.
- `sysut4`: DD name for the second spill data set.

The severity is 0.

**System action:** Processing continues.

**Application Programmer Response:** Refer to [z/OS DFSMSdfp Utilities book Appendix A](https://www.ibm.com/support/docview/092577968) for details about dynamically invoking IEBCOPY.

**Source:** DFSMSdfp

**IEB1066D** diagnostic_text

**Explanation:** This message contains diagnostic information for you to supply to IBM when requesting service.

**IEB1067I** `member` NOT `disposition` FROM INPUT DATA SET BECAUSE REPLACE WAS NOT SPECIFIED

**Explanation:** The member named was not copied to the output data set because the output data set already contains a member of the same name.

**Message inserts and meanings:**
- `member`: name of the PDS or PDSE member.
- `disposition`: one of:
  - `COPIED`
  - `LOADED`
  - `UNLOADED`
  - `MOVED`
  - `ALTERED`
The severity is 0.

**System action:** Processing continues.

**User response:** Code the Replace option on the INDD or SELECT statement to force the member to be copied.

**Source:** DFSMSdfp

---

**IEB1068W**  
JCL FOR DD *ddname* WILL PROCESS THE DATA SET AS SEQUENTIAL BUT THE LABEL SAYS IT IS PARTITIONED.  
(DS1DSORG= X'label_org' JFCDSORG= X'jcl_org')

**Explanation:** There is a conflict between the JCL and the data set label. The JCL supplied DSORG=PS overrides the DSORG=PO in the label.

Parameters like DSORG=PS can be added to your JCL even though you did not code them. SMS ACS routines, Data Classes, the JCL LIKE and DCB parameters can all implicitly add to JCL.

Message inserts and meanings:

- **ddname**  
  DD name identifying the data set.

- **label_org**  
  Value of the DSORG field in the data set label.

- **jcl_org**  
  Value of the DSORG field in the JCL.

The severity is 4.

**System action:** The existing data set will be converted from partitioned to sequential and all members in the partitioned data set will be lost. An unload data set will be created in its place.

**User response:** Determine where the DSORG=PO is coming from. Look for directory blocks in the data set, and use ISMF to look at the definition of any Data Class assigned to the data set.

A conflict like this can either be removed at its source or you may override the conflict by coding DSORG=PS on the DD statement or in the TSO ALLOCATE or ATTRIB command.

**Source:** DFSMSdfp

---

**IEB1070W**  
JCL FOR DD *ddname* REQUESTS DIRECTORY BLOCKS WITH A SEQUENTIAL DATA SET. (JFCDSORG= X'label_org' JFCBDQTY=dir_blocks)

**Explanation:** There is a conflict between parameters in the JCL. The SPACE parameter specifies directory blocks, which implies that the data set is partitioned. DSORG=PS also appears in the JCL and indicates that the data set is sequential.

Parameters like DSORG=PS can be added to your JCL even though you did not code them. SMS ACS routines, Data Classes, the JCL SPACE, LIKE and DCB parameters can all implicitly add to JCL.

Message inserts and meanings:

- **ddname**  
  DD name identifying the data set.

- **jcl_org**  
  Value of the DSORG field in the JCL.

- **dir_blocks**  
  Number of directory blocks specified in the JCL.
The severity is 0.

**System action:** The data set is processed as an unload (sequential) data set.

**User response:** Remove the conflicting DSORG=PS parameter or the directory quantity from the SPACE parameter. If DSORG=PS does not appear in the JCL or on the TSO ALLOCATE or ATTRIB command, and the data set is partitioned then add DSORG=PO to the JCL or DSORG(PO) to the TSO command.

**Source:** DFSMSdfp

---

**IB1071E**

**DD NAME ddname IS SUPPOSED TO BE A PARTITIONED DATA SET BUT IT HAS NO DIRECTORY. EXPECT A TERMINAL I/O ERROR. (DS1LSTAR= X'ttr' DS1DSORG=X'label_org' JFCDSORG=X'jcl_org')**

**Explanation:** There is a conflict between the JCL and the data set label. The data set is assumed to be partitioned because the JCL contains DSORG=PO or because the JCL is silent and the data set label contains DSORG=PO. A valid partitioned data set must contain a directory, which means that the address of the last record in the data set can not be zero. However, DS1LSTAR is zero which implies that a directory was never written in the data set. Thus the data set is really sequential and the JCL incorrectly specifies DSORG=PS, or the data set is corrupt.

Parameters like DSORG=PS can be added to your JCL even though you did not code them. SMS ACS routines, Data Classes, the JCL SPACE, LIKE and DCB parameters can all implicitly add to JCL.

**Message inserts and meanings:**

- **ddname**  
  DD name identifying the data set.

- **ttr**  
  address of the last record in the data set. It is a 3-byte hexadecimal relative disk address.

- **label_org**  
  value of the DSORG field in the data set label.

- **jcl_org**  
  value of the DSORG field in the JCL.

The severity is 8.

**System action:** Processing continues and the data set is assumed to be partitioned.

When IECOPY attempts to read the directory at the start of the data set, one of three things may occur:

1. A Wrong Length Record I/O error may occur because the first record is not 256 byte data with an 8 byte key.  
2. IECOPY may find 0 directory records which is interpreted as a corrupt partitioned data set, or  
3. IECOPY may find the directory of a deleted partitioned data set which used to occupy the disk space, which will cause extra members (possibly corrupt) to appear in the data set.

**User response:** Determine where the DSORG=PO is coming from. Look for directory blocks in the space parameter, look at the label of data sets referenced by the LIKE or DCB parameter, and use ISMF to look at the definition of any Data Class assigned to the data set.

Add DSORG=PO to the DD statement or the TSO ALLOCATE or ATTRIB command to explicitly override the DSORG.

**Source:** DFSMSdfp

---

**IB1072W**

**JCL FOR DD ddname IMPLIES THAT THE DATA SET IS PARTITIONED BUT IT IS ON MAGNETIC TAPE. PROCESSING IT AS SEQUENTIAL. (DEVTYPE=X'dev_type' JFCDSORG=X'label_org' JFCBDQTY=dir_blocks)**

**Explanation:** There is a conflict in the JCL or between the JCL and the catalog entry for the data set. The unit allocated to the data set is a tape drive. Therefore the data set must be an unload (sequential) data set. However, the JCL contains DSORG=PO and/or a SPACE parameter which specifies directory blocks which indicates that the data set is partitioned.

Parameters like DSORG=PO can be added to your JCL even though you did not code them. SMS ACS routines, Data Classes, the JCL SPACE, LIKE and DCB parameters can all implicitly add to JCL.

**Message inserts and meanings:**

- **ddname**  
  DD name identifying the data set.

- **dev_type**  
  device type from the UCBDEVT field.

- **label_org**  
  value of the DSORG field in the JCL.

- **dir_blocks**  
  number of directory blocks specified in the JCL.

The severity is 0.

**System action:** The data set is treated as an unload data set.

**User response:** Determine where the DSORG=PO is coming from. Look for directory blocks in the space parameter, look at the label of data sets referenced by the LIKE or DCB parameter, and use ISMF to look at the definition of any Data Class assigned to the data set.

Add DSORG=PO to the DD statement or the TSO
ALLOCATE or ATTRIB command to explicitly override the DSORG.

Source: DFSMSdfp

IEB1073W  JCL FOR DD ddname REQUESTS A NEW SEQUENTIAL DATA SET WITH DIRECTORY BLOCKS. THE DATA SET WAS CREATED AS PARTITIONED AND WILL BE PROCESSED AS PARTITIONED. (DS1DSORG= X'label_org' JFCDSORG= X'jcl_org' JFCBDQTY=dir_blocks)

Explanation: There is a conflict in the JCL. DSORG=PS has been coded or implicitly added to the JCL, and/or directory blocks appear in the SPACE parameter coded in the JCL or implicitly added to the JCL.

The data set is being created in this job step and DADSM has written a directory and set DSORG=PS in the data set label.

Parameters like DSORG=PS can be added to your JCL even though you did not code them. SMS ACS routines, Data Classes, the JCL SPACE, LIKE and DCB parameters can all implicitly add to JCL.

Message inserts and meanings:

ddname  DD name identifying the data set.

label_org DSORG from the data set label.

jcl_org DSORG from the JCL.

dir_blocks quantity of directory blocks specified in the JCL SPACE parameter.

The severity is 0.

System action: The data set is processed as partitioned.

User response: Examine the JCL, the Data Class assigned, and the label of any data set referred to by the LIKE or DCB parameter in the JCL. Remove the source of the conflict, or code DSORG=PO in the JCL or on the TSO ALLOCATE or ATTRIB command.

Source: DFSMSdfp

IEB1078I  THE BUFFER SPACE LIMIT PARAMETER "SIZE=size" IS LESS THAN THE MINIMUM BUFFER SIZE OF length.

Explanation: A SIZE= parameter was coded in the OS PARM field. The value of this parameter is too small.

Message inserts and meanings:

size "SIZE" parameter value from the OS PARM field.

length minimum value required for the parameter.

The severity is 0.

System action: The SIZE parameter is ignored.

User response: Remove the SIZE parameter.

If you must specify a SIZE parameter, check the Z/OS DFSMSdfp Utilities book for information about calculating the minimum value.

Source: DFSMSdfp

IEB1079I  CAN NOT ALLOCATE ANOTHER BUFFER WITHOUT EXCEEDING THE "SIZE=size" PARAMETER. WORK AREA HAS avail BYTES AVAILABLE.

Explanation: The SIZE parameter was supplied, and the supplied value is the total amount of virtual storage which has been put to use as buffers.

Additional virtual storage is available in the work area after tables are built and directory entries saved. All of this extra space would normally be assigned to additional buffers.

However, this extra space will be unused because the buffers are already as large as the SIZE parameter value will permit.

Source: DFSMSdfp
This is not an error condition. This message is to help you better manage resources by telling you about idle virtual storage.

Message inserts and meanings:

- **size** "SIZE" parameter value from the OS PARM field.
- **avail** amount of storage remaining unused in the WORK area.

The severity is 0.

**System action:** The extra storage remains unused.

**User response:** If the amount of virtual storage used by IEBCOPY must be reduced then the size of the work area could be reduced by about **avail**.

The user response for message IEB1057I discusses increasing the WORK area size.

**Source:** DFSMSdfp

**IEB1080D - IEB1095D** diagnostic_text

**Explanation:** The following messages contain diagnostic information for you to supply to IBM when requesting service:

- IEB1080D
- IEB1081D
- IEB1082D
- IEB1083D
- IEB1084D
- IEB1085D
- IEB1086D
- IEB1087D
- IEB1088D
- IEB1089D
- IEB1090D
- IEB1091D
- IEB1092D
- IEB1093D
- IEB1094D
- IEB1095D

**IEB1097I** FOLLOWING MEMBER(S) disposition IN DATA SET REFERENCED BY **ddname**

**Explanation:** Following messages identify the members altered or compressed.

This message assists in tracing the data sets which were used, and which members they contributed.

Message inserts and meanings:

- **disposition** is one of:
  - MOVED
  - ALTERED

**ddname** DD name for the output data set.

The severity is 0.

**System action:** Messages IEB154I and IEB155I follow.

**Source:** DFSMSdfp

**IEB1098I** mmmmm OF ttttt MEMBERS disposition

**Explanation:** This is a summary of the number of members located in the current input data set and how many were actually copied, etc.

Failure to copy all members may not be an error. Not every members found may be eligible because "replace" was not specified or because a member of the same name was previously copied.

Message inserts and meanings:

- **mmmmm** number of members processed.
- **ttttt** number of members found in the current input data set.

- **disposition** is one of:
  - COPIED
  - LOADED
  - UNLOADED
  - MOVED
  - ALTERED

The severity is 0.

**System action:** Processing continues.

**Source:** DFSMSdfp
**IEB1099I  *** IECOPY IS NOT APF AUTHORIZED  *****

**Explanation:** IECOPY has found that it is not authorized, and may not be able to perform the operation.

The severity is 0.

**System action:** IECOPY will continue to determine if it can proceed without authorization and will issue IEB1099E when it can not avoid using a service requiring authorization.

**User response:** Verify that any STEPLIB or JOBLIB does not have any unauthorized libraries in the concatenation.

**System programmer response:** Verify that IECOPY is linked AC(1) into an APF authorized library and it was not called by an unauthorized program. APF authorization is described in [z/OS MVS Initialization and Tuning Reference](https://www.ibm.com/servers/resourcelink/systems/z/series/zos/bkserv/izs/sam/pdfs/izssh.pdf).

**Source:** DFSMSdfp

---

**IEB1100S statement MAY NOT BE USED TO PERFORM A function OPERATION.**

**Explanation:** Certain operations such as COPYMOD are restricted from performing specific operations such as a compress or unload.

Message inserts and meanings:

- **statement** is one of:
  - COPYMOD
  - ALTERMOD

- **function** is one of:
  - COMPRESS
  - UNLOAD

The severity is 4.

---

**IEB1101D - IEB1102D diagnostic_text**

**Explanation:** Messages IEB1101D and IEB1102D contain diagnostic information for you to supply to IBM when requesting service.

**IEB1103I FIRST GAS BUBBLE IS position MEMBER member AT TTR=tttr.**

**Explanation:** A compress operation is scanning a partitioned data set and has located the first space which is unused. The TTR of this first gas bubble and the name of the member closest to the bubble is given in the message.

A gas bubble inside a member represents space at the end of a track that is large enough to hold the first record from the next track.

A gas bubble outside a member represents member data that was deleted or updated.

**position** is one of:
- BEFORE
- INSIDE
- AFTER

**member** name of PDS or PDSE member.

**tttr** 3-byte hexadecimal relative disk address.

The severity is 0.

**System action:** Scanning stops and repacking members begins.

**Source:** DFSMSdfp

---

**IEB1104E VARIABLE SPANNED RECORD FORMAT DATA SETS CAN NOT BE REBLOCKED. EXECUTION TERMINATES.**

**Explanation:** IECOPY does not support partitioned data sets with RECFM=VS or RECFM=VBS. (Do not confuse this with a unload (sequential) data set which always has a spanned RECFM.)

The input and output DCB parameters demand that logical records be reblocked or deblocked.

The severity is 4.

**System action:** The operation is ended.

**User response:** Use an application program that has
been coded to handle spanned records to process the data set.

Source: DFSMSdfp

IEB1104W VARIABLE SPANNED RECORD FORMAT DATA SETS CAN NOT BE REBLOCKED. EXECUTION CONTINUES.

Explanation: IEBCOPY does not support partitioned data sets with RECFM=VS or RECFM=VBS. (Do not confuse this with a unload (sequential) data set which always has a spanned RECFM.)

The input and output DCB parameters do not demand that logical records be reblocked or deblocked.

The severity is 0.

System action: Execution continues as if the data sets were RECFM=U. An I/O error may occur.

User response: Use an application program that has been coded to handle spanned records to process the data set.

Source: DFSMSdfp

IEB1105I THE TARGET DATA SET IS CURRENTLY EMPTY

Explanation: The scan of the output data set directory discloses that there are no members in the data set.

The severity is 0.

System action: Processing continues.

Source: DFSMSdfp

IEB1106I CONTROL TABLE IS tttt BYTES LONG. WORK AREA HAS avail BYTES AVAILABLE.

Explanation: The table of members to be processed has been built from the SELECT statements or from the input data set directory (for a full copy). There are avail bytes left to hold input data set directory entries and output data set directory blocks.

Message inserts and meanings:

	tttt size of the control table.

	avail amount of remaining free area.

The severity is 0.

System action: Processing continues.

User response: Use this message to estimate how many additional members can be copied with out increasing the work area size. Each additional member will increase the control table size by 10 bytes.

Source: DFSMSdfp

IEB1108I COPYMOD TABLE AREA IS nnnnn BYTES LONG. WORK AREA HAS avail BYTES AVAILABLE.

Explanation: Room for COPYMOD tables and buffers has been reserved.

Message inserts and meanings:

	 nnnnn amount of space reserved for COPYMOD.

	 avail amount of the work area remaining for buffers, tables, and directory entries.

The severity is 0.

System action: Processing continues.

Source: DFSMSdfp

IEB1109D - IEB1129D diagnostic_text

Explanation: The following messages contain diagnostic information for you to supply to IBM when requesting service:

- IEB1109D
- IEB1110D
- IEB1111D
- IEB1112D
- IEB1113D
- IEB1114D
- IEB1115D
- IEB1116D
- IEB1117D
- IEB1118D
- IEB1119D
- IEB1120D
- IEB1121D
- IEB1122D
- IEB1123D
- IEB1124D
- IEB1125D
- IEB1126D
- IEB1127D
- IEB1128D
- IEB1129D

IEB1130I A severity MESSAGE FROM PDSE PROCESSING APPEARS ABOVE -- DIAGNOSTIC INFORMATION IS X'diagcode'

Explanation: Something from the current operation with a PDSE deserves further attention. The diagnostic information may help the IBM support center should you request software service.

Message inserts and meanings:
severity is one of:

- WARNING - an error severity appears as IEB1130W.
- SEVERE ERROR - a severe error severity appears as IEB1130E.
- TERMINATING - a terminating severity appears as IEB1130E.

diagcode diagnostic information that should be supplied when requesting service.

The severity is 0.

System action: Processing Continues.

User response: Look at the IGW prefix messages preceding this message for a message of significance.

Application Programmer Response: This probably represents an unusual condition or problem. Refer to accompanying messages, particularly those with IGW and IEB prefixes, for specific information and additional guidance.

System programmer response: Furnish the information in this message when requesting service. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem.

To determine the cause of the error using the diagnostic information included in the message, see z/OS DFSMSdfp Diagnosis. In particular, if the diagnostic information is X'28xxnnnn', you can refer to the FAMS Reason Codes section of z/OS DFSMSdfp Diagnosis to determine the problem.

Source: DFSMSdfp

IEB1131W PHYSICAL RECORD IN MEMBER member REFERENCED BY ddname EXCEEDS INPUT DATA SET BLOCK SIZE. RECORD LENGTH IS length, INPUT BLKSIZE IS iblksize, TTR=TTR CCHHRKDD=CCHHRKDD.

Explanation: A fat block was found in member member. Most programs cannot read fat blocks; they receive I/O errors when they try.

IEBCOPY is reblocking the input records and will copy all of the logical records in this fat block to 1 or more output blocks as needed.

This message will appear only once per member even when the member contains more than 1 fat block.

Message inserts and meanings:

- member name of PDS or PDSE member.
- ddname DD name of the input data set.
- length length of physical record.
- iblksize input data set block size.
- ttr 3-byte hexadecimal relative disk address.
- mbbcchhr DASD address of record.

The severity is 0.

System action: The operation is ended.

User response: Increase the block size of the output data set.

Source: DFSMSdfp

IEB1133E COPYMOD WORK AREA OVERFLOW PROCESSING MEMBER member

Explanation: The internal tables used by COPYMOD are too small. This may be because the load module being processed is defective.

Message inserts and meanings:

- member name of the PDS or PDSE member.

The severity is 8.

System action: The member is copied as if the operation were COPY instead of COPYMOD.

User response: Try Link Editing the member and/or executing it to verify that it is a valid load module.
System programmer response: If the member is a valid load module then request service as the table size may be too small.

Source: DFSMSdfp

IEB1134D - IEB1137D diagnostic_text

Explanation: The following messages contain diagnostic information for you to supply to IBM when requesting service:

- IEB1134D
- IEB1135D
- IEB1136D
- IEB1137D
- IEB1137E
- IEB1137W

IEB1137E UTTR WORK AREA OVERFLOW PROCESSING MEMBER MMMMMMMM, MISSES=NNNNN

Explanation: UTTR table has overflowed while processing module MMMMMMMM.

System action: Processing ceases.

User response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center and provide the value NNNNN for correction.

IEB1137W UTTR WORK AREA OVERFLOW PROCESSING MEMBER mmmmmmmm, MISSES=nnnnnnnn

Explanation: The table of user TTRs was of insufficient size to copy member mmmmmmmm.

Message inserts and meanings:

- mmmmmmmm: name of member.
- nnnnnnn: amount of storage necessary for successful copy.

The severity is 4.

Operator response: Rerun IEBCOPY specifying PARM='UTTRTAB=nnnnnnnn' where nnnnnnn is the value given in 'misses='.

System programmer response: Processing continues.

Source: DFSMSdfp

IEB1138W THE OUTPUT DATA SET BLOCK SIZE OF <out_size> BYTES IS SMALLER THAN THE INPUT BLKSIZE OF <in_size> BYTES.

Explanation: Increase output BLKSIZE. Records may exist in the input data set that are longer than the maximum length records permitted in the output data set. Such records are called fat blocks. IEBCOPY may create fat blocks if it copies these records. While the link editor and program fetch and IEBCOPY can tolerate fat blocks, other programs may encounter I/O errors when processing the fat blocks.

The severity is 0

System action: Processing continues, possibly creating fat blocks.

User response: Increase the BLKSIZE and/or LRECL of the output data set to be at least as large as the longest record.

IEB1139W THE OUTPUT DATA SET BLOCK SIZE IS BEING REDUCED FROM <old> TO <new> BYTES. ANY EXISTING PHYSICAL RECORDS LONGER THAN <new> BYTES ARE FAT BLOCKS AND MAY CAUSE I/O ERRORS.

Explanation: IEBCOPY may create fat blocks if the data set already contains records longer than the new block size. While the link editor and program fetch and IEBCOPY can tolerate fat blocks, other programs may encounter I/O errors processing them.

System action: Processing continues, possibly creating fat block.

User response: Increase the BLKSIZE and/or LRECL of the output data set to be at least as large as the longest record.

IEB1140W <member> IS NOT A LOAD MODULE. <reason>. EXPECTED=<expected> ACTUAL=<actual>

Explanation: While examining the directory entry for the load module, COPYMOD determined that the member is not a load module for the given <reason>. It will be copied without reblocking as if COPY not COPYMOD was requested. <expected> and <actual> are length in bytes of the directory entry.

Possible <reason>s are:

- DIRECTORY ENTRY TOO SHORT (LESS THAN 33 BYTES)
- 0 OR 3 USER TTRS
- USER TTR 1 IS A NOTELIST
- RESERVED USER TTR 2 NOT ZERO
- SCATTER LOAD/OVERLAY WITH ONLY 1 TTR
- USER TTR 2 IS ZERO
- 2 TTRS BUT NOT SCATTER LOAD/OVERLAY
- OVERLAY MODULE WITHOUT NOTELIST
- SCATTER LOAD MODULE HAS NOTELIST
- DIRECTORY ENTRY SIZE WRONG

System action: Processing continues.
User response: Validate the directory entry and the input data set. Relink or recreate the load module.

System programmer response: Verify that all maintenance has been applied to programs such as the link editor and binder to correct any compatibility problems.

IEB1141W <member> IS NOT A LOAD MODULE.
<reason>

Explanation: COPYMOD determined that the member currently being processed is not a load module for <reason>. It will be copied without reblocking as if COPY not COPYMOD was requested.

Possible <reason>s are:
- OVERLAPPING TEXT BLOCKS
- TEXT RECORD SIZE WRONG
- OVERLAY MODULE NOTE LIST SIZE
- CESD RECORD SIZE WRONG
- CONTROL RECORD SIZE WRONG
- ECORD IS NOT A CONTROL RECORD
- NO-TEXT MODULE CESDN RECORD SIZE
- IDR RECORD SIZE WRONG
- SYM (TEXTRAN) RECORD SIZE WRONG
- UNIDENTIFIABLE RECORD TYPE
- READRLD DIAGNOSED RLD PROBLEM
- RAN OFF END OF ESD TABLE
- GETINPUT DIAGNOSED DS SPACE PROBLEM
- OVERLAY MODULE SEGMENT OVER/UNDER RUN
- OVERLAY MODULE SEGMENT NOT IN NOTE LIST

System action: A COPY operation is performed for the member.

User response: Validate the directory entry and the input data set. Relink or recreate the load module.

SYSTEM PROGRAMMER RESPONSE: Verify that all maintenance has been applied to programs such as the link editor and binder to correct any compatibility problems.

IEB1142W module IS AN INCOMPATIBLE OR DAMAGED LOAD MODULE AND SHOULD BE RE-LINKED -- COMMON SECTION OUT OF PLACE

Explanation: The COPYMOD function of the IEBCOPY utility cannot unblock a module because the common sections for the module are not at the end of the module where the link editor usually places them. COPYMOD cannot process the module displayed in the message text.

In the message text:
- module
  The load module being processed by COPYMOD.

System action: IEBCOPY uses the COPY function instead of the COPYMOD function to process the displayed load module.

System programmer response: Relink or rebind the load module and then retry the COPYMOD function of the IEBCOPY utility.

Source: DFSMSdfp

Detecting Module: IECBPMOD

IEB1143I AT LOAD MODULE RECORD <record_count>

Explanation: The relative record number of the last load module record COPYMOD examined before detecting the error or problem reported in message IEB1141W or IEB1142W is <record_count>.

System action: Processing continues.

IEB1144I MEMBER TT-R AF TT-R.N TT-R.N TT-R.N ATTR ...

Explanation: See message IEB1144I.

System action: Processing continues.

System programmer response: Refer to the link editor or BLDL macro documentation to interpret the hex data.

IEB1145I <de_member> <hex_data>

Explanation: IEB1144I titles the printout of the load module directory entry in hexadecimal by message IEB1145I. These two messages follow IEB1140I.

System action: Processing continues.

System programmer response: Refer to the link editor or BLDL macro documentation to interpret the hex data.

IEB1153I An INVALID RECORD WAS READ FROM PDSU DDN=ddname RECORD=nn DSN=dsname

Explanation: An invalid record was detected in off loaded data set.

In the message text:
- ddname
  The DDNAME of the data set.
- nn
  The invalid record number.
- dsname
  The data set name.

System action: The copy operation is ended.

Source: DFSMSdfp

Detecting Module: IECBPMOD
IEB1157W  DIRECTORY ENTRY FOR MMMMMMMM
CONTAINS AN INVALID UTTR 'tttrr'
<text>

Explanation:  An invalid user TTR was detected while processing module MMMMMMMM.
In the message text,
text
One of the following:

REPLACED BY VALID DATA FROM NNNNNNNN
The invalid data was replaced by the corresponding user TTR from module NNNNNNNN.

- UTTRDATAUNCHANGED
The invalid user TTR data could not be corrected.

System action:  Processing continues.
User response:
text
One of the following:

REPLACED BY VALID DATA FROM NNNNNNNN
Verify that the copied module functions correctly.

- UTTRDATAUNCHANGED
Obtain a valid copy of the module in error.

IEB1161W  DIRECTORY ENTRY FOR MMMMMMMM
CONTAINS AN INVALID TTR

Explanation:  An invalid user TTR was detected while processing module MMMMMMMM.
System action:  Processing continues.
User response:  Verify that the copied module functions correctly.
Source:  DFSMSdfp
Detecting Module:  IEBWSU

IEB1157E  DIRECTORY ENTRY FOR MMMMMMMM
CONTAINS AN INVALID UTTR 'tttrr' - UTTRDATAUNCHANGED

Explanation:  An invalid user TTR was detected while processing module MMMMMMMM.
System action:  Processing ceases.
User response:  Obtain a valid copy of the module in error.

IEB1160I  OUTPUT DATASET RECFM/LRECL/BLKSIZE COPIED FROM INPUT DATASET

Explanation:  The JCL for the output dataset did not specify one or more of the dataset attributes listed. The values have been set from the corresponding attribute of the input dataset.
System action:  The copy operation continues.
User response:  None.
Source:  DFSMSdfp
Detecting Module:  IEBDSCPY
Chapter 3. IEC Messages

IEC messages associated with output tape abends may specify: "number" LOST BLOCKS. This refers to the number of blocks buffered in the hardware but not successfully written to the tape medium when the Buffered Tape Marks function is active.

An application activates the Buffered Tape Mark function by setting DCBE bit DCBESYNC_NONE in byte DCBEFLG3. With BTM active and when stacking multiple tape data sets by leaving the tape positioned at the end of each file created, multiple tape data sets might be buffered in the hardware prior to being written or synchronized to the tape medium. Therefore, the Lost Block number might include multiple tape data sets.

To determine which data sets were not successfully written to the tape medium, add the number of blocks externalized in IEC205I...TOTALBLOCKS associated with each immediately preceding data set, until the sum equals or exceeds the Lost Block number in the IEC message associated with the tape abend. The file sequence numbers in these associated IEC205I messages were either not completely written or never written to the tape medium.

IEC001A M dev,ser,[jjj,sss][,dsname]

Explanation: M indicates that a stack of documents, identified by the volume serial number, is to be readied on a 1419/1275 unit.

In the message text:

dev The device number of the specified device.
ser The volume serial number.
jjj The specified job name.
sss The specified step.
dsname If a MONITOR DSNMA command is active, the data set requesting the volume.

System action: The job step waits for the operator to ready the documents or until the task reaches time-out.

Operator response: Ready the indicated documents on the device.

Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:

DCB=DIAGN=TRACE

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

Detecting Module: IGG0197B, IDA0192V

Routing Code: 4,11
Descriptor Code: 2

IEC003E R dev,ser,jjj,sss[, SPACE=prm][,dsname]

Explanation: R indicates that the volume on device dev is to be demounted and retained near the computer for use in the near future:

• If the volume serial number is a 6-digit number, it is the serial number of the volume, which contains labels.
  
• If the volume serial begins with a slash or L, the volume to be demounted is unlabeled; the number after the slash or L is an internal serial number assigned by the system to an unlabeled volume. If the volume serial begins with L, the number after the L is of the form xxxyy, where xxx is the data set number and yy is the volume sequence number of the data set.

In the message text, labtype and den appear only for tape volumes. The volume has the type of label specified by labtype: SL for standard label, AL for ISO/ANSI label, NSL for nonstandard label, or NL for no label; the density is as specified by den.

For direct access volumes, if a MONITOR SPACE command is active, the field.

SPACE=cccctttt,aaaaa/yyy,zzzz is specified:

ccc Total number of free cylinders on the volume.
ttt Total number of tracks in addition to the free cylinders.
aaaa Areas or extents dividing the cylinders and tracks.
Maximum number of contiguous free cylinders of the largest extent within the total remaining space.

Number of tracks in addition to the free cylinders of the largest extent within the total remaining space.

If an error occurred during the listing of the parameters in the SPACE field, one of the following messages is specified:

- LSPACE-PERMANENT I/O ERROR
- LSPACE-NON-STANDARD OS VOLUME
- LSPACE-NOT A DIRECT ACCESS VOL
- LSPACE-INVALID PARAMETER

If a MONITOR DSNAMES command is active, data set dsname contained on the volume is also specified in the message text.

In the message text:

- dev The device number of the specified device.
- ser The volume serial number.
- jji The specified job name.
- sss The specified step.
- prm The specified parameter.

dsname If a MONITOR DSNAMES command is active, the data set requesting the volume.

System action: For tape, the system rewinds and unloads the tape volume.

Operator response: Demount the volume. Mark the serial number, label type, and density on the volume, if they are not so marked. (The internally assigned number should appear externally on the volume in case a subsequent step needs the volume; for the subsequent mounting, the system will specify the volume by the internally assigned number.) Then retain the volume near the computer. If LSPACE-PERMANENT I/O ERROR was in the message, a permanent I/O error was encountered while trying to read the VTOC. Execute the IIEHLIST utility program to list the VTOC of this volume. If errors occur, take appropriate action as indicated in the message. If LSPACE-NOT A DIRECT ACCESS VOL or LSPACE-INVALID PARAMETER was in the message, perform the problem determination action.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: IDAVBPJ2

Routing Code: 11

Descriptor Code: 3

Explanation: The Auxiliary Storage Manager (ASM) was unable to reset its control blocks for a VIO data set to its status at the time it was journaled. This message should be followed by message IEF086I.

System action: Restart processing is ended.

Application Programmer Response: See message IEF086I and rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the SYSOUT output for the job.

Source: DFSMSdfp

Detecting Module: IDAVBPJ2

Routing Code: 11

Descriptor Code: -

Explanation: D indicates that the volume on the device is to be demounted. The control program has determined that this volume, mounted in response to an earlier mount message, either:
- Contains labels that cannot be read due to a permanent input/output error.
- Contains no label or nonstandard labels when standard labels were specified.
- Contains standard labels when no labels or nonstandard labels were specified.
- Contains labels that are written in a density other than the density specified.

In the message text:

dev The device number of the specified device.

System action: The system rewinds and unloads the tape volume.

Operator response: Demount the volume. The system will then request that a new volume be mounted. Mount a volume with the correct density and label type.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: DFSMSdfp

Detecting Module: MISSING INFO.

Routing Code: 3/4
and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output for the job, and the associated volume.

<table>
<thead>
<tr>
<th>IEC015I</th>
<th>A37-rc,mod, jjj, sss,ddname[-#],dev,ser,dsname (member)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Explanation:</strong> The error occurred during end-of-volume processing.</td>
<td></td>
</tr>
</tbody>
</table>
| *In the message text:*  
  - **rc** Associates this message with system completion code A37 and with a return code.  
  - **jjj** Job name.  
  - **sss** Step name.  
  - **ddname[-#]** DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).  
  - **dev** Device number.  
  - **ser** Volume serial number.  
  - **mod** The name of the module in which the error occurred.  
  - **dsname(member)** The data set name. Member name if specified. |

The explanation of the hex return code is as follows:

<table>
<thead>
<tr>
<th><strong>Return Code</strong></th>
<th><strong>Explanation</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>An SVC 55 (EOV) was issued, usually by a CHECK, GET, or PUT routine, against a DCB which was not open.</td>
</tr>
<tr>
<td>08</td>
<td>DEB does not point to DCB.</td>
</tr>
</tbody>
</table>

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

**Application Programmer Response:** Probable user error. An open DCB may have been partially overlaid, closed by the user in a SYNAD routine, or automatically closed by a previous end-of-volume error where ignore was specified in the DCB ABEND exit routine. Correct the errors causing abnormal end as indicated by the return code in the message text. Rerun the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output and the program listing for the job.

**Routing Code:** 11  
**Descriptor Code:** 6

<table>
<thead>
<tr>
<th>IEC020I</th>
<th>001-rc,mod, jjj, sss,ddname[-#],dev,ser,dsname(member)</th>
</tr>
</thead>
</table>
| **Explanation:** The preceding line is followed by one of the lines:  
  - NO ERROR HANDLING, (SYNAD), EXIT SPECIFIED  
  - ERROR OCCURRED WHILE CLOSING DATA SET  
  - NON-ACCEPTABLE ERROR  
  - DCB EROPT=ABE OR AN INVALID CODE, AND/OR NO SYNAD EXIT SPECIFIED  
  - GET ISSUED AFTER END-OF-FILE |

A 001 system completion code was issued for the step of the job for one of the following reasons:

- If the return code is 0, the logical record length and blocksize specified in the data control block (DCB) or DD statement differ from the logical record length and blocksize indicated in the data set.
- If the return code is 1, an I/O error occurred during BDAM, BSAM, BISAM, QSAM, QISAM, or BPAM and no SYNAD exit was specified by the user. For BSAM, one of the following conditions might be true:
  - RECFM=U was specified on the DCB macro instruction, but no logical record length was specified.
  - A write was attempted to a data set that was opened for input.
  - A read was attempted to a data set that was opened for output.
  - For concatenated data sets, some data set in the concatenation has attributes that are different than the attributes of the first data set in the concatenation. For example, some data set may have a different blocksize than the first data set.
- If the return code is 2, an error was encountered while attempting to close the data set.
- If the return code is 3, for QSAM, an unacceptable error occurred because of one of the following:
  - The caller returned from the SYNAD.
  - The caller did not provide a SYNAD.

Look at the input/output block (IOB) to determine why the error was unacceptable to QSAM.
If the return code is 4, for QSAM, ABE or an incorrect value for EROPT parameter in the DCB and/or no error handling (SYNAD) exit was specified.

If the return code is 5, for QSAM, a GET was issued after end-of-file.

Other conditions that cause this message are:

- CLOSE processing called end-of-volume (EOV), and EOV processing detected an out-of-space condition.
- The POINT macro instruction was issued with an incorrect value for the relative track address (TTRz).
- A hardware error has occurred. Message IEA000I is also issued.

In the message text:

- `ddname[-#]`: DName (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- `dev`: The device number.
- `ser`: The serial number of the volume.
- `dsname`: The data set name.
- `rc`: The return code.
- `mod`: The name of the module.
- `jjj`: The job name.
- `sss`: The step name.
- `dsname(member)`: The data set name. Member name if specified.

For concatenated data sets, `dsname` is the name of the first data set in the concatenation and is not necessarily the data set causing the error.

The unit address, volume serial number, and data set name fields do not appear in the message text when it applies to a subsystem data set, such as SYSIN or SYSOUT.

**System action:** A WTP message is issued to give the ABEND and return codes, pertinent control blocks are recorded on the GTF data set, and the job abnormally ends.

**Application Programmer Response:** Correct any errors that caused the abnormal end. Then run the job step again. Corrective procedures for the problems mentioned above are as follows:

- If no error analysis routine was available, specify the address of a SYNAD routine in the SYNAD operand of the DCB macro instruction.
- If the EROPT parameter in the DCB is incorrect, correct the value of the EROPT operand in the DCB macro instruction or in the DCB subparameter of the appropriate DD statement. If desired, specify the ACC or SKP option for the EROPT operand. Be sure the problem program does not issue a GET macro instruction after an end-of-data condition.
- If an out-of-space condition was detected, change the JCL SPACE parameter in the DD statement for the data set to specify a larger primary quantity or add a secondary quantity.
- If the logical record length and/or blocksize is incorrect, correct the value of LRECL and/or BLKSIZE in the DCB macro instruction or in the DCB subparameter of the DD statement.
- If the POINT macro instruction is incorrect, correct the relative track address operand.
- If a hardware error has occurred, see the explanation of the accompanying IEA000I error message.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL.

**Source:** DFSMSdfp

**IEC021I NO SPACE IN PASSWORD DATA SET**

**Explanation:** The password data set on the system residence device is full. No additional entries may be added until entries are deleted or a new password data set is created.

**System action:** The job step is ended.

**Operator response:** Inform the programmer responsible for the installation that you have received this message.

**Application Programmer Response:** Delete outdated entries in the present password data set or create a new password data set.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Detecting Module:** IGG019DN, IFC051D, IFC0554T, IFC0005E, IGG019JC, IGG019LI, IGG019AH

**Routing Code:** 11

**Descriptor Code:** 3
IEC022I 137-rc,mod,ssi,sssdname
[+#],dev,volser,dsname(member) [,nnn
LOST BLOCKS]

Explanation: The error occurred during end-of-volume processing on a magnetic tape.

In the message text:

137-rc Associates this message with system completion code 137 and the return code. For explanations of the hex return codes, see Return Code Explanations in the following text.

mod The name of the module in which the error occurred.

js The job name.

sss The step name.

ddname[-#] The data definition name, followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation.

dev The device number.

volser The volume serial number.

dsname(member) The data set name. Member name if specified.

nnn The number of blocks written to the hardware buffer but not written to the tape medium.

The explanation of the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>An I/O error occurred while an end-of-volume label or a tape mark was being written.</td>
</tr>
<tr>
<td>08</td>
<td>An I/O error occurred while the tape was being positioned in preparation for label processing.</td>
</tr>
<tr>
<td>0C</td>
<td>An I/O error occurred while the system was reading a trailer label for a data set opened with the input or output option. If an embedded short block was encountered when using FBS to read a data set, the I/O error occurred during an attempt to read the EOF1 label to verify EOD. If the data set was opened with the option RDBACK, the I/O error occurred while the header label was being read.</td>
</tr>
<tr>
<td>10</td>
<td>An I/O error occurred while a magnetic tape was being positioned at the end of the data set.</td>
</tr>
<tr>
<td>14</td>
<td>An I/O error occurred while header labels for a data set opened for INPUT or INOUT was being read. If the data set was opened for RDBACK, the error occurred while the trailer label was being read.</td>
</tr>
<tr>
<td>18</td>
<td>An I/O error occurred while a magnetic tape was being positioned at the first data record of a data set or during a Read Block ID command used to establish the tape position.</td>
</tr>
<tr>
<td>1C</td>
<td>An incorrect trailer label was read during end-of-volume processing. Execute the IEBPTTP utility program to determine the contents of the volume. Take any corrective action necessary to recreate the volume so that the information can be accessed.</td>
</tr>
<tr>
<td>20</td>
<td>An incorrect header label was read during end-of-volume processing. Execute the IEBPTTP utility program to determine the contents of the volume. Take any corrective action necessary to recreate the volume so that the information can be accessed.</td>
</tr>
<tr>
<td>24</td>
<td>A specific volume serial number was specified for the second or subsequent volume of an output data set on magnetic tape. During end-of-volume processing, it was discovered that the expiration date (from the HDR1 label of the first data set currently on the specified volume) had not passed. When requested to specify whether the volume could be used in spite of the expiration date, the operator did not reply 'U'. Ask the operator to reply 'U' or specify another volume serial number.</td>
</tr>
<tr>
<td>28</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>• The operator responded with an 'M' reply (reject VOL1 label rewrite) to message IEC704A.</td>
</tr>
<tr>
<td></td>
<td>• During end-of-volume (EOV), IEC704A was issued 10 times because of an invalid reply or repeated I/O errors during the VOL1 rewrite.</td>
</tr>
<tr>
<td></td>
<td>The input volume contains an ASCII volume label with a standard ISO/ANSI tape label that is not Version 1 or Version 3 or Version 4.</td>
</tr>
<tr>
<td></td>
<td>A label violated the published standard for that label, and the label...</td>
</tr>
</tbody>
</table>
validation exit issued a return code requesting OPEN/EOV to reject the volume.

37 During end-of-volume processing, the operator replied 'U' to message IEC510D. The magnetic tape volume is mounted on a Cartridge Stack Loader, the File Protect Ring is not enabled, and a specific volume serial was specified. Specify a different volume in the DD statement.

38 During the processing of a Read Block ID command to establish the tape position, an I/O error occurred.

3C For a specific private tape in the Automated Tape Library (ALT), either of the following events occurred:
- Message IEC534D was issued and the reply was 'M' to mount another volume.
- An existing data set with an unexpired date was detected, and either message IEC507D was issued with reply 'M' or the File Validation Tape Installation Exit received control and returned RC08 to reject the volume.

In an ATL, all volume serial numbers must be unique. There cannot be any volume substitution for specifically requested volumes.

System action: The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine. If the error is to be ignored, the system will attempt to close the DCB before returning to the user.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with TRACE=SYS,USR,SLIP

In the DD statement for the data set in error, specify DCB=DIAGNS=TRACE

Application Programmer Response: This is a probable user error unless an I/O error has occurred. Correct the errors that caused the abnormal end as indicated by the return code in the message text. Then resubmit the job.

If the return code is 2C, correct the volume label to be compatible with ISO/ANSI Version 3 processing (use the IEHINITT utility program).

If the return code is 30, the label field that is in error is identified in message IEC512I. Respond to IEC512I before reusing the volume.

If an I/O error has occurred, a defective volume or device may be the cause. Rerun the job, specifying a different volume or device. If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement. If a specific volume is needed, try requesting a different device in the UNIT parameter of the DD statement. Rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Descriptor Code: 6

IEC023I 237-rc,mod, jji,sss,ddname[-#],
dev,ser,dsname(member)

Explanation: The error occurred during end-of-volume.

In the message text:

rc Associates this message with system completion code 237 and with the return code.

jji Job name.

sss Step name.

ddname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev Device number.

ser Volume serial number.

mod The name of the module in which the error occurred.

dsname(member) Data set name. Member name if specified.

The values of the hex return codes and their meanings are as follows:

Return Code Explanation

04 The block count in the DCB does not match that in the trailer label. A block of data has been missed or skipped (probably due to a hardware error).

08 The DSNAME in a header label does not match that in the JFCB on the second or subsequent volume of a
magnetic tape data set. Verify that the correct volume and DSNAME were specified.

0C This error was caused by one of the following:

- The number of blocks processed, which is determined by the position of the tape, does not match the number of blocks specified in the DCB.
- A multi-volume tape read with (DCB=EROPT=SKIP) coded in the JCL encountered an I/O error. The software block count is 4 greater than the hardware block count. Correct the I/O error.

10 The number of blocks processed, as indicated in the DCB for an ASCII standard label data set, exceeds 999,999, which is the maximum block number which can be recorded in an ASCII label.

14 An EOV or FEOV macro instruction was attempted against an HFS data set that is part of a sequential concatenation. EOV and FEOV do not support HFS data sets.

18 An EOV or FEOV macro instruction was attempted against an HFS data set that is part of a sequential concatenation. EOV and FEOV do not support HFS data sets.

1C One or more of the stripes of an extended sequential data set did not satisfy the hardware requirements of an extended sequential data set.

20 A magnetic tape data set with a block size greater than 32760 is the next data set to be processed in a sequential concatenation, but the large block interface is not being used.

System action: The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine. If the error is to be ignored, the system will attempt to close the DCB before returning to the user.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

`TRACE=SYS,USR,SLIP`

On the DD statement for the data set in error, specify:

`DCB=DIAGNS=TRACE`

Application Programmer Response: Probable user error unless hardware error has occurred. Correct the errors causing the abnormal end as indicated by the return code in the message text. Then rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

IEC024I 337-
rc,mod, jji,sssl,ddname[-#],
deveserdsname(member)

Explanation: The error occurred when the end of a data set was reached.

In the message text:

rc Associates this message with system completion code 337 and with the return code.

jji Job name.

sss Step name.

ddname[-#] DDname (followed by a concatenation number if it is part of a physical sequential concatenated data set and not the first DD statement in the concatenation).

dev Device number.

ser Volume serial number.

mod The name of the module in which the error occurred.

dsname(member) Data set name. Member name if specified.

The explanation of the hex return code is as follows:

Return Code Explanation

04 The end of a data set was reached, but no end-of-data-set routine (EODAD) was specified in the DCB or DCBE. The EODAD routine pointer in the DCBE is ignored when the DCBE is not in the same storage key in which the OPEN was issued.

08 No EODAD specified in the DCB for DD DUMMY data set.

System action: The task is ended.

Operator response: Start a generalized trace facility
(GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:** Probable user error. Correct the errors causing the abnormal end as indicated by the return code in the message text. Then rerun the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

<td>The system encountered an error while attempting to update a volume record in the tape configuration database.</td>
</tr>
</tbody>
</table>
An ATLDS tape library volume was opened for output processing and it is file protected.

An ATLDS or MTLDS tape library volume record to be updated was not found in the tape configuration database.

A CBRXVOL parameter list error was detected when the system was attempting to update an ATLDS or MTLDS tape library volume record.

A CBRXVOL internal processing error occurred while the system was attempting to update an ATLDS or MTLDS tape library volume record.

An SAF/RACF authorization failure occurred while the system was accessing the ATLDS or MTLDS tape configuration database.

The system encountered a catalog access error while processing an ATLDS or MTLDS tape library volume record.

A label type other then SL, SUL, AL, or AUL was specified for a tape volume in an ATLDS or MTLDS.

The error system default value has been exceeded for a tape volume in an automatic tape library dataserver (ATLDS) or MTLDS.

The operator replied M to WTO IE507D for a private volume in an automatic tape library dataserver.

An unexpected return code was returned by CBRXVOL while attempting to update or read an ATLDS or MTLDS tape volume record.

An extended length ATLDS cartridge was mounted on a non-extended length cartridge capable device.

An ATLDS cartridge was mounted that exceeds the IBM supported maximum length and an I/O encryption error occurred during processing of an EOV macro instruction.

An ATLDS private cartridge’s internal volume serial number was unreadable, had no label (NL), or the volume was uninitialized.

Invalid return code from an OCE Tape Installation Exit. See IEC998I for name of specific exit and value of invalid return code.

A private labeled (SL or AL) D/3494 or D/T3494 (ATL) volume is mounted for input processing and the request was for a NL volume while the ATL is in automatic mode.

The 3590 cartridge mounted for a specific mount request in an automated tape library dataserver is unformatted. 3590 cartridges must be formatted before they can be processed.

The 3590 cartridge mounted for a specific mount request in an automated tape library dataserver is either an unsupported media type or medium length.

Media6, Media7 or Media8 mounted on D/T3592 and no software support exists.

The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine. If the error is to be ignored, the system will attempt to close the DCB before returning to the user. If the error occurred in an IBM 3495 Tape Library Dataserver then a software error record is also written to the logrec data set.

Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

Probable user error unless an I/O error has occurred. Correct the errors causing abnormal end as indicated by the return code in the message text. Then rerun the job.

If an I/O error has occurred, a defective volume or device may be the cause. Save the output from the failing job to aid in the analysis of the problem.

Rerun the job specifying a different volume or device. If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement. If a specific volume is needed, try requesting a different device in the UNIT parameter of the DD statement. Rerun the job.

If the error occurred in an IBM 3495 Tape Library Dataserver and it was not because the volume is file-protected, then resubmit the job. If the job fails after resubmission, then Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

This error may be caused by a hardware problem; if applicable, contact
hardware support. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job and the logrec data set error record if the error occurred in an IBM 3495 Tape Library Dataserver.

<td>An I/O error occurred reading the format-1 DSCB, or the format-1 DSCB could not be found on the first volume specified on the DD statement or in the catalog for the next data set in the concatenation.</td>
</tr>
<tr>
<td>44</td>
<td>EOV failed when switching to a volume after the first volume of a data set or any volume in a concatenation because the data set type is large format sequential but the application program could not access the whole data set on the volume. All of the following are true:</td>
</tr>
</tbody>
</table>

- The access method is either EXCP or BSAM with the NOTE or POINT function requested.
**IEC028I**

- **BLOCKTOKENSIZE=LARGE** is not specified on the DCBE macro.
- The data set has more than 65535 tracks allocated on the volume.

EOV failed when switching to a volume after the first volume of a data set or any volume in a concatenation because the data set type is large format sequential but the application program could not access the whole data set on the volume. All of the following are true:

- The access method is EXCP, BSAM or EXCP.
- **BLOCKTOKENSIZE=LARGE** is not specified on the DCBE macro.
- The data set has more than 65535 tracks allocated on the volume.
- **BLOCKTOKENIZE(REQUIRE)** is specified in PARMLIB member IGDSMSxx.

**System action:** The task ends unless the error can be ignored as specified in the DCB ABEND exit routine. If the error can be ignored, the system attempts to close the DCB before returning to the user.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:** If an I/O error has occurred, a defective volume or device may be the cause. Save the output from the failing job to aid in the analysis of the problem.

Rerun the job specifying a different volume or device. If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement. If a specific volume is needed, try requesting a different device in the UNIT parameter of the DD statement. Rerun the job.

If the format-1 DSCB could not be found or read (as with return codes 04/40), be sure that the DSNAME and VOLUME parameters on the DD statement are correct. A recovery attempt request can be specified in the DCB ABEND exit routine.

The 28 return code error indicates a subsystem interface problem and your system programmer should be contacted for advice.

If return code is 2C, probable user error. Make sure that the DCBFDAD field is not being corrected before the FEOV macro instruction is issued.

For return code 3C, contact your system support personnel.

For return code 44 or 45, (a) update the DCB to point to a DCBE macro with **BLOCKTOKENSIZE=LARGE** and if necessary modify the program to handle large format data sets as described in z/OS Using Data Sets, or (b) if the data set contains 65535 or fewer tracks, ensure the OPEN option is INPUT (with BSAM or EXCP) or UPDAT (with BSAM).

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Source:** DFSMSdfp

**Detecting Module:** IFG0554C, IFG0552X

**Routing Code:** 11

**Descriptor Code:** 6

---

**IEC028I**

837-rc,mod, jji, sss, ddname[-#],
dev,ser,dsname(member)

**Explanation:** The error occurred during end-of-volume for a sequential data set.

In the message text:

- **rc** Associates this message with system completion code 837 and with the return code.
- **jjj** The job name.
- **sss** The step name.
- **ddname[-#]** DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- **dev** The device number.
- **ser** The volume serial number.
- **mod** The name of the module in which the error occurred.
- **dsname(member)** The data set name. Member name if specified.

The values of hex return codes and their meanings are as follows:

**Return Code** | **Explanation**
--- | ---
04 | The tape volume whose serial number is **ser** was first requested and then mounted on device **dev**. However, a density conflict exists between the user's specified density and the unit's density capability.
The volume whose serial number is ser was not found in the JFCB and no address was found for the JFCB extension in the SWA. Specify more volume serial numbers, or a larger volume count in the VOL parameter of the DD statement. See [z/OS MVS JCL User's Guide](https://www.ibm.com/support/docview.wss?uid=swg21286084) for a description of the rules for coding volume count.

This situation can also occur if an OPEN TYPE=J macro is used to open the data set after the volume serial number is changed and the JFCB is not updated in the SWA because bit 4 of the JFCBTSDM field of the JFCB is set to one.

0C

The indicated tape volume whose serial number is ser was requested and mounted on device dev but another data set was processing the volume.

10

The device does not support the recording mode requested by the user or determined by the system.

14

The tape volume whose serial number is ser does not conform to the single recording mode rules. For input data sets, the violation has occurred during a previous process in which the rules could not be enforced. For output data sets, no violation has yet occurred, since the abend prevents this from happening.

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine. If the error is to be ignored, the system will attempt to close the DCB before returning to the user.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:

DCB=DIAGNS=TRACE

**Application Programmer Response:** Run the job step again.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Source:** DFSMSdfp

**Detecting Module:** IFG0554A

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** The error occurred at an end-of-volume. In most cases, this abnormal end condition results from an unsatisfactory response by the operator to message IEC254D, IEC255D, or IEC256A. These messages are issued when a checkpoint data set is created, modified, or deleted in installations that wish to ensure the security of their checkpoint data sets.

In the message text:

rc Associates this message with system completion code 937 and with the return code.

jjj The job name.

sss The step name.

dcname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev The device number.

ser The volume serial number.

mod The name of the module in which the error occurred.

dname(member) The data set name. Member name if specified.

The values of the hex return codes and their meanings are as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>1) If the data set is opened for input, the second or succeeding volume of a secure checkpoint data set has been found to be insecure. 2) If the data set is opened for output, the second or succeeding volume of a secure checkpoint data set could not be made secure.</td>
</tr>
<tr>
<td>14</td>
<td>During EOV processing, the second or subsequent volume of a noncheckpoint data set was found to be a secure checkpoint data set.</td>
</tr>
<tr>
<td>18</td>
<td>An unauthorized user has issued a FEOV or an EOV SVC against a checkpoint data set open with a security interface.</td>
</tr>
<tr>
<td>1C</td>
<td>An error was detected after mounting a new volume for a data set that</td>
</tr>
</tbody>
</table>
spans volumes. The extents listed in
the data extent block (DEB) and in the
data set control block (DSCB) do not
match.

**20**

**For ISO/ANSI Version 1:**
The indicated tape volume whose
serial number is ser contained ASCII
labels. The volume accessibility byte
(offset X'0A' in the volume label) is not
blank. This indicates that the label
was not created on an IBM system or
that it was created by the user. If the
volume accessibility field is not blank,
the tape cannot be used on an IBM
system.

**For ISO/ANSI Version 3 or Version 4:**
This message occurs after message
IEC029E with the ddn-c field in the
message text. If c is 2, access to the
data set has been denied.

**24**
A specific volume serial number was
specified for the second or
subsequent volume of an output data
set on magnetic tape. During EOV
processing for this volume, it was
determined that the first data set
currently on the specified volume was
password protected, and the
protection mode indicator in the HDR1
label did not match that in the JFCB.
Supply the password to the operator
or select another volume.

**28**
At end of volume, the caller is not
authorized to use the data set on the
new DASD or tape volume.

**29**
At end-of-volume, the caller is not
authorized for input.

**2C**
RACF definitions are inconsistent. A
previously allocated multi-volume
direct access data set or a tape
volume is being processed for output.
The first volume is not RACF defined
and the current volume is
RACF-defined, or the first volume was
RACF defined and no longer is.

**30**
An end of volume occurred and the
data set on the new volume is
RACF-indicated in the Format-1
DSCB; however, the data set on the
new volume is not RACF-defined.

**34**
A VSAM data space requested at end
of volume is RACF-defined.

**38**
RACF failed to add a volume to an
existing RACF-defined, direct access
data set while the data set was being
extended to a new volume.

**3C**
RACF definitions are inconsistent. A
previously allocated multi-volume
direct access data set or a tape
volume is being processed for output.
The first volume is not RACF defined
and the current volume is
RACF-defined, or the first volume was
RACF defined and no longer is.

**40**
RACF definitions are inconsistent. A
previously allocated multi-volume
DASD data set or a tape volume is
being processed for output. The
current volume being processed at
end of volume is defined to RACF, but
not as part of the same volume set as
the previous volume. DFSMS allows
you to have a maximum of 255 tape
volumes, while if you have TAPEVOL
turned on, RACF will limit you to 42. If
you have TAPEVOL turned on, RACF
will limit you to 42 volumes whether
you have one data set spanning the
volume or multiple data sets spanning
the volume.

**System action:** The task is ended unless the error is
to be ignored as specified in the DCB ABEND exit
routine. If the error is to be ignored, the system will
attempt to close the DCB before returning to the user.

**Application Programmer Response:** If the return
code is 10 and the data set is open for input, one of the
checkpoint data set volumes has lost its secure status.
Contact the installation personnel to verify the secure
status of the checkpoint volumes. If all volumes are
found to be secure, rerun the job and make sure the
operator responds correctly when the system requests
the status of each volume. Otherwise, rerun the job
which creates the checkpoint data set.

If the return code is 10 and the data set is open for
output, one of the volumes specified on the checkpoint
data set DD statement could not be made secure.
Contact the installation personnel and verify the
eligibility of all volumes, then rerun the job.

If the return code is 14, probable user error. Contact the
installation personnel to ensure that the status of each
data set volume is as expected.

If the return code is 18, probable user error. Only
APF-authorized programs can access a secure
checkpoint data set. Remove the referenced FEOV SVC
call, recompile the program, and rerun the job.

If the return code is 1C, probable user error. Check to
see if the program incorrectly modifies the job file
control block (JFCB) of the subject data set after OPEN
and before CLOSE. Of particular interest are the JFCB
data set name field and volume serial number field.

If the return code is 20, make sure that the correct
volume was mounted. If the correct volume was
mounted, the tape volume must be recreated for use on an IBM system.

If the return code is 28, the owner of the data set must update the RACF data set profile to permit access.

If the return code is 2C or 3C, make RACF definitions consistent among all volumes of a multi-volume data set.

If the return code is 30, define the data set to RACF without setting the RACF-indicated bit in the Format-1 DSCB.

If the return code is 34, delete the RACF-definition of the VSAM data space.

If the return code is 38, the data set may have been previously defined to RACF on the new volume. Check with the data set owner, or inspect the data set RACF profile.

If the return code is 40, ensure that the current volume is defined to RACF in the same profile as the previous volume.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the SYSOUT output for the job.

Source: DFSMSdfp

Detecting Module: IFG0193D

Routing Code: 11

Descriptor Code: 6

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>During end-of-volume processing, one of the following occurred: 1. For an output data set, all space was used on the current volume and no more volumes were specified. 2. The system had to demount a volume in order to mount the next volume of the data set. It was unable to demount the volume for one of the following reasons: a. The volume was permanently resident. b. The volume was reserved. c. Another job had data sets allocated on the volume. d. There were open data sets on the volume for the failing task.</td>
</tr>
</tbody>
</table>

For an output data set on a direct access device, the system might have needed to demount the volume for one of the following reasons:

- No more space was available on the volume.
- The data set already had 16 extents, but required more space.
- The data set has reached the 65535 tracks per volume limit.
- More space was required, but the volume table of contents (VTOC) was full. If additional space were allocated, another data set control block (DSCB) might have been needed, but could not have been written.

For an output data set on magnetic tape, a volume needed to be demounted because the reflective spot was encountered and more records were to be written.

For an input data set on more than one volume, one of the volumes needed to be demounted so that the next one could be mounted, but the system was unable to demount the volume.

**Explanation:** The error occurred during end-of-volume.

In the message text:

- **rc** Associates this message with system completion code B37 and with the return code.
- **jjj** Jobname
- **sss** The step name.
- **ddname[#]** DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- **dev** The device number.
- **ser** The volume serial number.
- **diagcode** The DADSM Extend diagnostic code, if available.
During end-of-volume processing, the system attempted to extend data set \texttt{dsname} to a volume on which the VSE bit or the DIRF bit (bits 0 and 5 respectively in the DS4VTOCI byte of the format-4 DSCB) was set. The VTOC for the volume could not be converted to standard format for one of the following reasons:

- Two data sets were allocated to the same space on the volume.
- A split cylinder data set was located on cylinder zero, the same cylinder as the VTOC, or the same cylinder as a non-split cylinder data set.
- The DADSM VTOC conversion routine had been modified to reject any space allocation requests on a volume on which the DIRF bit is set to one. See \texttt{z/OS DFSMsdsp Diagnosis} for more information.
- Under VSE, the alternate tracks were assigned to cylinder zero.

The indicated direct access volume \texttt{ser} on device \texttt{dev} was requested to continue processing the data set, but the unit already contained 127 users, the maximum number.

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine. If the error is to be ignored, the system will attempt to close the DCB before returning to the user.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:** Probable user error. For all cases, allocate as many units as volumes required.

For return code 04, case 1, specify at least one more volume in the SER, VOL COUNT, or REF subparameter of the VOLUME parameter of the DD statement.

For return code 04, case 2a and 2b, if the volume to be demounted is permanently resident or reserved, set up the JCL to allocate devices that are removable.

For return code 04, case 2c, change the JCL to request deferred mounting, or specify more volumes than units to prevent sharing of required units.

For return code 04, case 2d, rewrite the program or change the JCL insuring that there are no open data sets on volumes that must be demounted.

For the next case (first of 08 return code), scratch one of the data sets that has the overlapping extent.

For the next case (second of 08 return code), either scratch or move the split cylinder data set that is causing the error.

For the next case (third of 08 return code), the VTOC can be converted by either removing the modification to IGG0325Z or by resetting the DIRF bit to zero and setting the VSE bit to one and allocating a data set to the volume.

For the next case (last of 08 return code), the volume can only be used under z/VSE.

In all cases, correct the errors and run the job step again.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

### Return Code Explanation

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>A data set opened for output used all the primary space, and no secondary space was requested. Change the JCL specifying a larger primary quantity or add a secondary quantity to the space parameter on the DD statement.</td>
</tr>
</tbody>
</table>

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine. If the error is to be ignored, the system will attempt to close the DCB before returning to the user.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIGNS=TRACE
```

**Application Programmer Response:** Probable user error. Correct the errors that caused the abnormal end as indicated by the return code in the message text. Rerun the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

---

### IEC032I

**Explanation:** The error occurred when an output operation was requested. The data set was on a direct access or magnetic tape device.

In the message text:

- `rc` Associates this message with system completion code E37 and with the return code.
- `jjj` The job name.
- `sss` The step name.
- `ddname[-#]` DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- `dev` The device number.
- `ser` The volume serial number.
- `mod` The name of the module in which the error occurred.
- `diagcode` The DADSM Extend diagnostic code, if available.
- `dsname(member)` The data set name. Member name if specified.

The values of hex return codes and their meanings are as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>A data set opened for output used all space available to or on the current volume, and no more volumes were available. Change the JCL to specify more volumes.</td>
</tr>
</tbody>
</table>

1. Not enough volumes were specified for the data set, through the SER, volume count, or REF subparameter of the VOLUME parameter of the DD statement. When all the volumes were filled, the program attempted to write another record.

2. For a partitioned data set on a direct access volume or for a VIO data set, all space was filled when the program attempted to write another record. (A partitioned data set or a VIO data set can reside on only one volume with a maximum of 65535 tracks.)

3. For a partitioned data set on a direct access volume, 16 extents had been used when the program attempted to write another record.

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>A multi-volume physical sequential data set was being written on a direct access device. All space was filled on the volume, and an attempt was made to obtain space on the next specified volume. Either the space was not available on that volume, the data set already existed on that volume, or there is no space available in the VTOC or the VTOC index. The message contains the volume serial number of the last volume used.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0C</td>
<td>An installation DADSM exit, IGGPRE00, rejected the extend request.</td>
</tr>
</tbody>
</table>

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine. If the error is to be ignored, the system will attempt to close the DCB before returning to the user.

**Operator response:** Start a generalized trace facility
(GTF) trace, and re-create the problem. Reply to message AHL100A with:
TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:
DCB=DIAGNS=TRACE

**Application Programmer Response:** Probable user error. Correct the errors causing the abnormal end as indicated by the return code in the message text as follows:

For return code 04, case 1, specify at least one more volume than the number of volumes previously used for the data set. For case 2, specify a different volume for the partitioned data set or specify more space for the VIO data set.

For case 3, either specify a volume for the data set, use a utility program to reorganize the volume so that data sets will not be fragmented (that is, no more than 16 extents used for this data set), or change the program so that a device will be free when a volume must be mounted.

For return code 08, either specify a new volume to continue the data set or make sure that enough space is available on the volumes already specified. Ensure that the data set does not already exist on the volumes to be used. In all cases, rerun the job.

For return code 0C, consult your installation procedures.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Source:** DFSMSdfp

**Detecting Module:** IFG0554P

**Routing Code:** 11

**Descriptor Code:** 6

---

**IEC033I**

C37-rc,mod, jjj, sss, ddname[-#], dev,ser,dsname

**Explanation:** The error occurred when an input operation was requested. The data set was on a direct access device.

In the message text:

- `rc`: Associates this message with system completion code C37 and with the return code.
- `jjj`: The job name.
- `sss`: The step name.
- `ddname[-#]`: DDname (followed by a concatenation number if it is part of the concatenation and not the first DD statement in the concatenation).
- `dev`: The device number.
- `ser`: The volume serial number.
- `mod`: The name of the module in which the error occurred.
- `dsname`: The data set name.

The explanation for the hex return code is as follows:

**Return Code** | **Explanation**
--- | ---
04 | An end-of-volume condition occurred on a data set opened for input, but the next volume of the data set contained more than 16 extents.
08 | An end-of-volume condition occurred on a data set opened for input, but the next volume of the data set contained a type of split cylinder allocation that cannot be processed under MVS.

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine. If the error is to be ignored, the system will attempt to close the DCB before returning to the user.

**Application Programmer Response:** Probable user error. The volume was created on z/VSE or an earlier version of it and is not compatible with z/OS. Either recreate the data set under z/OS or correct the problem by creating it under z/VSE so it is compatible.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide all printed output and output data sets related to the problem.

---

**IEC034I**

INCONSISTENT RECORD FORMATS rc1 AND rc2, ddn-#, dsname

**Explanation:** This is an informational message issued during processing of an OPEN macro instruction for processing sequentially concatenated data sets using BSAM. The RECFM of one of the concatenated data sets is inconsistent with the RECFM of the first data set in the concatenation.

In the message text:
rc1 RECFM of the first data set in the concatenation.

rc2 RECFM of the data set that is inconsistent with the first data set.

ddn-# DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dsname Data set name of the data set which has an inconsistent RECFM.

System action: Processing continues.

Application Programmer Response: Probable user error. If this is an error, then either process the data sets with unlike concatenation or ensure all concatenated data sets have compatible RECFMs. See z/OS DFSMS Using Data Sets for information about sequential concatenation processing.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output related to the problem.

Source: DFSMSdfp

Detecting Module: IFG0196J

Routing Code: 11

Descriptor Code: 6

IEC036I 002-rc,mod, jjj, sss, ddname[-#], [dev,ser,dsname(member)]

Explanation: The error occurred while the control program was processing a sequential data set with BSAM or QSAM, or creating a direct data set.

In the message text:

rc Associates this message with system completion code 002 and with the return code.

jjj The job name.

sss The step name.

ddname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev The device number.

ser The volume serial number.

mod The name of the module in which the error occurred.

dsname(member) The data set name. Member name if specified.

The unit address, volume serial number, and data set name do not appear in the message text when it applies to a subsystem data set, such as SYSIN or SYSOUT.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>One of the following occurred:</td>
</tr>
<tr>
<td></td>
<td>• An incorrect record was encountered during a QSAM GET operation. The data set consists of variable format records. The length field in the record descriptor word (RDW) is incorrect for one of the following reasons:</td>
</tr>
<tr>
<td></td>
<td>‒ The RDW specifies a length less than 4.</td>
</tr>
<tr>
<td></td>
<td>‒ The RDW specifies a length greater than the DCBLRECL value that was specified when the data set was opened. DCBLRECL is the logical record length (LRECL) in the data control block (DCB).</td>
</tr>
<tr>
<td></td>
<td>• QSAM tried to read segments of variable spanned records that are not in proper sequence.</td>
</tr>
<tr>
<td></td>
<td>• LRECL is not large enough.</td>
</tr>
<tr>
<td></td>
<td>• The record area in QSAM locate mode is too small to contain a logical record from a spanned-format data set.</td>
</tr>
<tr>
<td></td>
<td>• The BDW contained a length greater than the blocksize specified in the data control block (DCB).</td>
</tr>
</tbody>
</table>

One of the following is true:

• An incorrect record was encountered on a QSAM or BSAM PUT or WRITE operation. If the large block interface is not being used, or output is not to a magnetic tape device, then the record or block length plus the key length and required overhead add up to more than 32,767 bytes. If the large block interface is being used and output is to a magnetic tape device, then the block length is greater than 65,535 bytes and greater than the blocksize specified when the DCB was opened.

• The data consists of spanned format records, and the RDW, SDW, or BDW length field, being translated to an ISO/ANSI format, exceeds the length field capacity (9999) of the ISO/ANSI format RCW, SCW, or block prefix.
IEC036I

0C An incorrect record was encountered on a QSAM or BSAM PUT or WRITE operation. The record or block length plus the key length and required overhead is greater than the DASD track capacity.

10 An incorrect record was encountered on a QSAM PUT operation; the data set uses the track overflow feature. The record descriptor word (RDW) for a variable length record specifies a length greater than 32,752.

14 An incorrect record was encountered on a QSAM PUT or WRITE operation. The record length is greater than the blocksize specified in the DCB.

18 An incorrect record was encountered on a QSAM PUT operation; the data set uses the variable record format. The value in the length of the record descriptor word (RDW) is incorrect for one of the following reasons:

• It is greater than 32,767, or greater than the blocksize specified in the DCB.

• It is less than 4, or less than 5 if ASA or machine control characters are used.

• It specifies a value greater than the DCBLRECL value (maximum record size) that was specified when the data set was opened.

1C The error occurred during the creation of a direct data set. A WRITE macro instruction was issued for a record larger than the track capacity, and the record format does not use the track overflow feature. Return code 1C also occurs when a DCB, LRECL, BLKSIZE, RECFM, or KEYLEN parameter is missing.

20 The error occurred during the creation of a direct data set. A WRITE macro instruction was issued causing a secondary extent to be obtained. The block will not fit on the amount of space allocated for the secondary extent.

24 The error occurred during the creation of a direct data set. A WRITE macro instruction was issued to write out a block larger than the primary extent on the preallocated data set. This could also occur if allocation of the primary extent was split and any of the secondary extents were smaller than the block.

28 The error occurred during the creation of a direct data set. During the processing of OPEN it was detected that the blocksize was larger than the primary extent.

30 One of the following is true:

• A READ macro was issued, but the length calculated to be read was zero.

• A PUT macro using move mode was issued for a format ‘F’, ‘FB’, or ‘U’ QSAM data set, but the DCBLRECL field contained zero or a negative value.

38 A READ macro was issued for a data set on a DASD device that was open for output only. Or a WRITE macro was issued for a data set on a DASD that was open for input only.

40 While processing a data conversion request for an ISO/ANSI Version 4 tape, an internal SAM data conversion control block (SDC) was found to be not valid.

41 While processing a data conversion request for an ISO/ANSI Version 4 tape, it was detected that the key of the request was different than the key of the task. This is not supported.

42 While processing a data conversion request for an ISO/ANSI Version 4 tape, an invalid user record length was detected.

43 While processing a data conversion request for an ISO/ANSI Version 4 tape, an error was returned from the system services used to perform the data conversion.

44 While processing a data conversion request for an ISO/ANSI Version 4 tape, an internal SAM data conversion control block (SDC) was found to contain a zero conversion token.

50 Serialization of an internal SAM control block has been violated. (For PDSE processing, it is the SACB. For extended sequential data set processing, it is the SSCB.)

54 DEBCHK failed. The DEBCHK was issued while attempting to process a request for a PDSE or extended sequential data set.

58 An internal SAM control block contains incorrect information. (For PDSE processing, it is the SACB. For
extended sequential data set processing, it is the SSCB.)

5C  An internal SAM control block used for queueing requests contains incorrect information. (For PDSE processing, it is the FRQ. For extended sequential data set processing, it is the SAQ or SRQ).

60  A non-zero keylength specified in the DCB on output for a PDSE member or an extended sequential data set.

64  For BSAM, the READ or WRITE request could not be accepted because the value specified in the DCB for NCP had been exceeded.

68  Incorrect blocksize specified in the DCB for a PDSE or an extended sequential data set.

6C  Unable to create a PDSE member.

70  Unable to update an internal SAM control block (PACB) used for PDSE processing with information concerning a member being accessed.

74  An internal SAM control block (PACB) used for storing PDSE directory and member information is incorrect.

78  Error return from IGWFMPSCR when attempting to give control to a routine to process a request for a PDSE or extended sequential data set.

7C  POINT detected that information concerning the member being accessed is not found in the PACB.

80  POINT detected an error while attempting to synchronize data on output.

84  POINT detected an error while attempting to reconnect to a PDSE member for hold.

88  POINT detected an error while attempting to reconnect to a PDSE member for I/O.

8C  POINT detected an error while attempting to disconnect from a PDSE member.

90  POINT detected an error while attempting to connect to a PDSE member.

94  A write would have had to create another member in a PDSE which already contained the maximum allowable number of members. The limit is 522,239 members.

98  Unable to complete a WRITE request issued within a PDSE member.

9C  Incorrect update WRITE detected. All outstanding READS had not been CHECKed prior to the WRITE.

A0  Incorrect attempt to access the directory of a PDSE. Either:
   • WRITE attempted to the directory of a PDSE.
   • READ attempted to the directory of a PDSE and either RECFM was not F with a blocksize greater or equal to 256, or RECFM was not U with a blocksize greater or equal to 256.

A4  Unable to complete the READ against the PDSE directory due to an error return code from an SMS service used to obtain directory information.

A8  Maximum number of records in PDSE member has been exceeded. Or maximum number of blocks allowed in an extended sequential data set has been exceeded.

AC  Bad buffer format detected for variable length records. Either:
   • The program attempted to WRITE an extended format BDW, but the output device is not a magnetic tape, or the large block interface is not being used.
   • RDW length is less than 4.
   • Length of a spanned record is greater than 32760.
   • The sum of the lengths in the RDWs plus 4 does not equal the length specified in the BDW.
   • RECFM does not specify blocked but more than 1 RDW was found in the buffer.

B0  Either RECFM = F and DCBBLKSI does not equal DCBLRECL, or RECFM = FB and DCBBLKSI is not a multiple of DCBLRECL. Note that since concatenated data sets can have different block sizes, and in most cases the BLKSIZE the system will use for the entire concatenation is the largest one in the concatenation, this block size can cause invalid attribute combinations when combined with the attributes (e.g., RECFM or LRECL) obtained from the first data set in the concatenation.

Chapter 3. IEC Messages 3-21
Unable to create a system buffer required for PDSE processing.

Unable to obtain or release a lock required for processing a PDSE directory.

A sequential compressed format data set was opened for BSAM POINT processing. However, control information within the data set required by POINT was found to be invalid. The data set should be copied (via REPRO, GENER or etc.). After being copied, the resulting data set should no longer have a problem with POINT processing. ISPF COPY 3.3 cannot be used to copy the data set as it invokes POINT processing.

Invalid attempt to read program object member of PDSE due to one of the following reasons:
- not OPEN for input
- not RECFM = U or F(B)
- DCBBLKSI not a 4K multiple

Error return from a system service while reading a directory of a PDSE containing program objects.

Invalid attempt to create a data member in a PDSE already containing program object members. One PDSE cannot contain both program object members and data members.

Access to PDSE program object is denied.

One of the following invalid combinations was specified in the DCB for a PDSE:
- DCBBLKSI=0 or LRECL=0 and RECFM = FB or RECFM = U
- DCBBLKSI=0 and RECFM = VB

An error was returned from a system service used to initialize system control blocks required for processing an extended sequential data set.

An error was returned from a system service used to process I/O requests for an extended sequential data set.

SF64 or SF64P was coded on the READ or WRITE macro but fixing or unfixing a 64-bit data area failed.

During the execution of a READ or WRITE macro instruction for an extended sequential data set, it was detected that a POINT had been issued before ensuring that all outstanding I/O had completed.

One of the following situations occurred while processing a tailored compressed data set on output:
- An error was encountered while writing a tailored dictionary to a compressed format data set.
- An invalid situation was detected in tailored dictionary processing. This could be the result of a previous cancel or time-out situation which occurred while processing the sampling buffers. Or, this could be the result when the tailored compressed data set was opened with the INOUT option and an output operation was attempted without a preceding input operation.

An error was encountered while reading a tailored dictionary from a compressed format data set.

An invalid dictionary token for a tailored compressed format data set was encountered.

Error attempting to access catalog while processing a data set in the compressed format.

An invalid tailored dictionary was found within a compressed format data set.

An error was encountered from Compression Services while validating a tailored dictionary for a compressed format data set.

A serialization problem was detected within an internal SAM control block (SAQ) which prevented further compression of user blocks for a compressed format data set being created with tailored compression.

Error return code from Compression Services COMPRESS/DECOMPRESS.

An error was encountered in a routine (IGG019VX) while attempting to compress a user block for a compressed format data set using tailored compression. The user IOB was marked in error.

An error return code was returned from a routine (IGG019VX) while attempting to compress a user block for a compressed format data set using tailored compression.

While attempting to store a dictionary token in the catalog for a compressed data set.
format data set being created with tailored compression, it was discovered that a dictionary token had been stored in the catalog since the time this DCB was opened. This implies that more than one DCB was writing to this data set concurrently.

**EC**
An invalid compressed format physical block (CI) encountered on output with BSAM/QSAM.

**ED**
An error was encountered while writing a tailored dictionary to a compressed format data set. The dictionary is allowed only on the first volume.

**EE**
READ or WRITE macro coded with SF64 but data set is compressed format or is not extended format.

**EF**
An I/O error occurred while writing shadow buffers.

**F0**
Compressed record found in data set but the dictionary token in the catalog is not valid.

**F1**
Large block interface is being used, RECFM = U, but READ or WRITE macro does not specify ‘S’.

**F4**
EOV detected a bad return code from a system service used to calculate the high allocated RBN when externing to a new volume of an extended format data set.

**F8**
Autodata area passed to IGG019VX from IGG019V7 is already in use.

**FC**
Autodata area passed to IGG019VX from IGG019V9 is already in use.

**System action:** Pertinent control blocks are written to the GTF trace data set as follows:

<table>
<thead>
<tr>
<th>Code</th>
<th>Trace Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>DCB, IOB, or ICB seek field, current logical record (maximum, 88 bytes).</td>
</tr>
<tr>
<td>08,10,14</td>
<td>DCB, DECB (if BSAM), current block (maximum, 88 bytes).</td>
</tr>
<tr>
<td>0C,1C</td>
<td>DCB, DECB (if BSAM), current block (maximum, 88 bytes), track capacity.</td>
</tr>
<tr>
<td>18</td>
<td>DCB and the current logical record (maximum, 88 bytes).</td>
</tr>
<tr>
<td>20,24</td>
<td>DCB, DECB, current block (maximum, 88 bytes), track capacity, current DEB extent.</td>
</tr>
<tr>
<td>28</td>
<td>DCB, DSCB.</td>
</tr>
</tbody>
</table>

**30, DE, EE**
DCB.

**38**
DCB and the JFCBDSNM field of the JFCB.

The user’s DCB ABEND exit routine is taken if one is provided.

**Application Programmer Response:** Probable user error.

If rc is 04 or 18, ensure that the DCBRECL value specified includes the maximum data length plus 4 bytes for the RDW.

If rc is 08, 10, or 14, verify that the record size passed to the access method is correct.

If rc is 14, if necessary, increase the blocksize to accommodate the largest logical record.

If rc is 0C or 1C, use a smaller blocksize, or a device with a greater track capacity, or specify track overflow.

If rc is 20, 24, or 28, allocate a larger primary or secondary extent, specify a smaller blocksize, or use a device with greater track capacity. If the error occurred because the primary allocation was fragmented into a number of extents, specify the CONTIG subparameter on the SPACE parameter.

If rc is 2C, do not issue the POINT macro for a binary EOF with RECFM=V(B(S)) or RECFM=U specified in the DCB.

If rc is 30 and BSAM or BPAM is processing the data set, verify that the DCBRECL value is greater than zero or, for undefined record format data sets without the ‘S’ parameter specified, that the value of the DECLNGTH field in the DECB is greater than zero.

If rc is 30 and QSAM is processing the data set, the LRECL value must be greater than zero and less than or equal to 32760 for format ‘F’, ‘FB’, or ‘U’ data sets.

If rc is 38, open the data set for INPUT, OUTIN, INOUT, or UPDATE.

Note that return codes 40, 43, and 44 are to be added to the existing list of return codes which indicate to contact the System Programmer. Other new return codes are covered under the general “probably user error” comment and do not need to be individually mentioned.

If rc is 3C or 94, delete a member to allow the creation of another member (even one with an existing name). The member name to be deleted must be a primary member name, not an alias.

If rc is 60, set DCBKEYLE to zero.

If rc is 64, verify that the number of outstanding READs and WRITEs issued prior to a CHECK does not exceed the value specified in DBCNCP.

If rc is 68 and a WRITE (BSAM) or an OPEN with DISP=MOD (QSAM) is issued, verify that the value for
DCBBLKSI (or in DECLNGTH if RECFM=U and BSAM) does not exceed the blocksize of the data set. For extended sequential data sets, once the blocksize of the data set is determined, no larger blocks can be added to the data set.

If rc is 9C, verify that a CHECK has been issued for all outstanding READs prior to issuing a WRITE.

If rc is AC and a WRITE (BSAM) is issued, verify that the data in the block is correct.

If rc is DE, the 64-bit storage must be obtained with the CONTROLP=AUTH option of the IARV64 macro or with the TYPE=FIXED option of the IARCP64 macro or with the IARST64 macro.

If rc is E0 and BSAM, verify that a CHECK is issued for all outstanding READ and WRITE requests prior to issuing a POINT.

If rc is EE, choose an extended format data set that is not compressed format.

Contact the system programmer for the following return codes: D8, DC, E4, E8, EC, F0, F4, F8 and FC.

Correct the error and rerun the job step.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Source:** DFSMSdfp

**IEC037I**

008-rc,mod,jjj,ddname, dev,ser,dsname

**Explanation:** The error occurred following processing of a CHECK macro instruction during the processing of the creation of a direct data set.

In the message text:

rc Associates this message with system completion code 008 and with the return code.

jjj The job name.

sss The step name.

ddname DDname

dev The device number.

ser The volume serial number.

mod The name of the module in which the error occurred.

dsname The data set name.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>During the creation of a direct data set, EOV was unable to allocate more space because the current volume was taken. The user returned to the CHECK module from his SYNAD routine.</td>
</tr>
<tr>
<td>08</td>
<td>During the creation of a direct data set, an I/O error occurred and the SYNAD exit was taken. The user returned from his SYNAD routine to the check module.</td>
</tr>
</tbody>
</table>

**System action:** The user’s DCB ABEND exit routine will receive control if one was specified. On return, the following control blocks are traced to a GTF data set for return code 04:

1) all DEB extents and 2) the first 88 bytes (or less if blocksize is less) of the user’s output record. No control blocks are traced for return code 08. In both cases, the task is ended.

**Application Programmer Response:** For return code 04, allocate more space or more volumes. For return code 08, check the IOB in error. If the IOBCSW field does not indicate a user error, (user’s data area less than blocksize or not in user key, which could result in a channel program check), rerun the job.

For return code 04, if the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the SYSOUT output for the job.

For a return code of 08, if the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

**IEC040I**

ddname=rc UNABLE TO LOAD \{3890 CONTROL UNIT\} FORMAT RECORD xxx

**Explanation:** If 3890™ CONTROL UNIT appears in the message text, the 3890 document processor support was unable to load the 3890 control unit for the data set for the return code. If the FORMAT RECORD appears in the message text, the 3886 optical reader support was unable to load a format record whose identifier is specified for the data set for the return code.

In the message text:
ddname
   The data set identifier.
rc
   The return code.
xxx
   Identifies the format record.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>For the 3890, the SCI program or subroutine was not added to SYS1.IMAGELIB. For the 3886, the format record specified for the data set was not added to SYS1.IMAGELIB.</td>
</tr>
<tr>
<td>08</td>
<td>For the 3890, an SCI program or subroutine from SYS1.IMAGELIB could not be loaded. Make sure SYS1.IMAGELIB is mounted. For the 3886, a format record from SYS1.IMAGELIB could not be loaded. Make sure SYS1.IMAGELIB is mounted.</td>
</tr>
<tr>
<td>0C</td>
<td>A hardware error occurred.</td>
</tr>
</tbody>
</table>
| 10          | For the 3890, one of the following occurred:  
   - DCB address operand in the SETDEV macro instruction was missing.  
   - IREC operand in the SETDEV macro instruction was missing.  
   - Sum of the lengths for the fields (bytes) specified in the IREC macro instruction does not equal LRECL-12. (LRECL is specified in the DCB macro instruction.)  
   - I/O error posted in the data control block.  
   - The data control block specified in the SETDEV macro instruction was not opened.  

For the 3886, the format record identifier was missing from the SETDEV parameter list when the run form of the macro was issued. |
| 14          | For the 3890, the error can be found by investigating the sense bytes and header record. |
| 18          | For the 3890, the SCI program does not begin with the ENTR stacker control instruction. |

**System action:** The error occurred during a SETDEV operation where the 3890 control unit or format record was to be dynamically loaded. The write-to-programmer message is printed and control is returned to the user with a return code in register 15.

**Application Programmer Response:** For the 3890, return codes 04, 08, 10, and 18 are probable user errors. Correct the error and resubmit the job. Return code 0C is a probable hardware error and return code 14 is an exceptional condition that should be handled according to condition.

For the 3886, return code 04 and 10 are probable user errors. Make sure that the SETDEV parameter list has a format record identifier when the run form of the macro is issued (return code X'10'). If the return code is X'04', make sure that the format record specified for the data set has been added to SYS1.IMAGELIB. If the return code is X'08', make sure the volume containing SYS1.IMAGELIB is mounted. If the return code is X'0C', it is a probable hardware error.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** DFSMSdfp

**Routing Code:** 11

**Descriptor Code:** 6

---

IEC041I 005-rc,mod, jji, sss, ddname[-#], dev

**Explanation:** The DECB specified is incorrect.

In the message text:

rc  
   Associates this message with system completion code 005 and with the return code.

ji
   The job name.

sss
   The step name.

ddname[-#]
   DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev
   The device number.

mod
   The name of the module in which the error occurred.

The values of hex return codes and their meanings are as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>A required address was not specified. This can be either the header address and/or the area address.</td>
</tr>
<tr>
<td>08</td>
<td>The RBL type of read was not used for the 3886.</td>
</tr>
</tbody>
</table>

**System action:** The task is ended with a 005-rc system completion code.
**Application Programmer Response:** Make sure the RBL type of read is used and the area address and header address parameters are specified so that the DECB is valid.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the program listing for the job.

**Source:** DFSMSdfp

**Detecting Module:** IGG0196R

**Routing Code:** 11

**Descriptor Code:** 6

---

**IEC042I**

**Explanation:** The parameter passed to the data management routine for 3886 support was incorrect. The operation can be one of the following:

- **RD LINENO**
  
  An attempt to read backwards was made (for example, a line number less than the last line read was specified) or the support detected two EOP conditions on successive reads with no eject between them.

- **LINEFMAT**
  
  The line format number specified was greater than 63.

- **NUM TIME MKS**
  
  The number of timing marks specified on an eject was greater than 33.

- **NO LINE FMAT**
  
  No line format number specified for read.

- **LINE MK CODE**
  
  The code specified for a line mark was greater than 15.

- **LINE NK NO**
  
  The line number to be marked was greater than 33.

- **DOC CODE**
  
  The code specified for a document mark was greater than 15.

In the message text:

- **prm**
  
  The parameter specified.

- **opr**
  
  The operation specified.

**System action:** Processing continues. An I/O error will be caused by the incorrect data passed to the device.

**Application Programmer Response:** Correct the incorrect data specification and rerun the job.

**IEC051I**

**Explanation:** A TRUNC macro instruction was issued for a PDSE member processed by QSAM. Block boundaries are not maintained for PDSE members; therefore, the short block created will not be reflected on input. This attention message is issued only on the first occurrence.

In the message text:

- **mod**
  
  The name of the module which detected the error.

- **ddname[#]**
  
  DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

**System action:** The current buffer is released, but block boundaries will not be maintained. On the first occurrence of the TRUNC macro, an indicator is set in record type 15 in the SMF data set. Processing continues.

**Application Programmer Response:** Analyze the program to see if the TRUNC macro is necessary to operation.

**Source:** DFSMSdfp

---

**IEC051I**

**Explanation:** A null record segment was created for a PDSE member containing VBS records processed by QSAM or BSAM; however, the null segment will not be saved. This attention message is issued only on the first occurrence.

In the message text:

- **mod**
  
  The name of the module which detected the error.

- **ddname[#]**
  
  DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

**System action:** The null record is ignored. On the first occurrence, an indicator is set in record type 15 in the SMF data set. Processing continues.

**Application Programmer Response:** Analyze the
program to see if the null record segments are necessary to operation.

Routing Code: 2,11

Descriptor Code: 4

IEC067I CHKPT=EOV FACILITY EXECUTED UNSUCCESSFULLY

Explanation: The checkpoint at EOV facility, module IFG0558X received a return code, other than 0 or 4, which indicates an unsuccessful or unusual processing of the CHKPT macro. A preceding Checkpoint/Restart message (prefixed IHJ) should identify more exactly the nature of the problem. Checkpoint/Restart, if required, would probably not be possible using the Checkpoint at EOV checkpoint data set (SYSCKEOV) entry which just failed.

System action: Processing continues. Checkpoint at EOV will be attempted again at the next end-of-volume occurrence.

Operator response: Refer to associated IHJ message for recommended action and notify programmer of error situation.

Source: DFSMSdfp

Detecting Module: IFG0558X

Routing Code: 2,11

Descriptor Code: 6

IEC068A U dev,ser

Explanation: U indicates that the tape volume indicated on the device is not file protected. That is, a program without RACF output authorization attempted to use the volume for INPUT only and the tape’s file-protection ring is inserted. Therefore, the volume is not completely write protected.

In the message text:
- ser The volume serial number.
- dev The device number of the specified device.

System action: The volume is rewound, the device is unloaded and task waits for the operator to remount the volume or until the task reaches time-out. If a volume is mounted with its file protect ring still inserted, the volume will be unloaded again and the message reissued.

Operator response: Remove the file-protection ring, remount the volume, and ready the device.

Detecting Module: IGC0K05B

Routing Code: 3

Descriptor Code: 2

IEC070I rc[(sfi)- ccc,jjj,sss,ddname, dev,volser,xxx,dsname,cat

Explanation: An error occurred during EOV (end-of-volume) processing for a VSAM data set.

In the message text:
- rc The return code. This field indicates the specific cause of the error. For an explanation of this return code, see message IEC161I.
- sfi Subfunction information (error information returned by another subsystem or component). This field appears only for certain return codes, and its format is shown with those codes to which it applies. When a catalog LOCATE request fails, this field appears for return code 032 or 034.
- ccc A problem-determination function (PDF) code. The PDF code is for use by the IBM Support Center if further problem determination is required. If the PDF code has meaning for the user, it is documented with the corresponding reason code (rc).
- jjj The job name.
- sss The step name. If the step is part of a procedure, this field contains an eight-character procedure step name, with trailing blanks, followed by the name of...
the job step that called the procedure, without trailing blanks. The two names are not separated by a comma.

**ddname**
The data definition (DD) name.

**dev**
The device number, if the error is related to a specific device.

**volser**
The volume serial number, if the error is related to a specific volume.

**xxx**
The name of the cluster that contained the data set being processed when the error was detected, or when not available, the data set name specified in the DD statement indicated in the access method control block (ACB).

**dsname**
The name of the data set being processed when the error was detected.

**cat**
The catalog name.

Any missing field is indicated by a comma.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide all printed output and output data sets related to the problem.

**IEC089I**

```
rsnc RACF VOL SET CONFLICT dev, ser, jji, sss
```

**Explanation:** The system issues this message under either one of the following conditions:

- The OPEN tape mount verification function, detected a RACF volume conflict with the volume being opened; the system cannot use the volume.
- The end of volume (EOV) tape mount verification function, detected a RACF volume set conflict (1) between the current volume and the previous volume or (2) on the current volume. In either case, the system cannot use the current volume.

A RACHECK macro is issued for tape volumes that are write enabled, and not file protected. An error occurred while the system was processing the scratch tape volume for input or output in either OPEN or EOV.

**Reason Code**  **Explanation**

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>rsnc</td>
<td>The reason code.</td>
</tr>
</tbody>
</table>

OPEN processing found either one of the following conditions to be true:

- PROTECT is specified for a tape volume that is already RACF protected.
- An open was issued for a RACF protected tape volume, but the caller was not authorized.

The EOV processing of a concatenated tape volume encountered either one of the following conditions:

- PROTECT is specified for a tape volume that is already RACF protected.
- At EOV, the user is not authorized to use the data set on the new volume.

During EOV processing of a tape volume (1) for output that was not concatenated, and (2) the previous volume was not RACF defined, the system encountered either one of the following conditions:

- The RACF definitions are inconsistent. The system is processing a previously allocated tape volume for output. One of two conditions may exist. The first volume is not RACF defined while the current volume is defined as such or the first volume was previously RACF defined, but currently is not defined as such.
- At EOV, the caller is not authorized to use the new tape volume.

During EOV processing of a tape volume (1) for output that was not concatenated, and (2) the previous volume was RACF defined, the system encountered one of the following conditions:

- PROTECT is specified for a tape volume that is already RACF protected.
- The RACF definitions are inconsistent. The system is processing a previously allocated tape volume for output. The current volume being processed at EOV is defined to RACF, but this current volume is not a part of the same RACF volume set as the previous volume.

In the message text:

```
rsnc
```

The reason code.
ser The volume serial number.
dev The device number.
jjj The jobname.
sss The stepname.

**System action:** The system issues messages IEC502E and IEC501A. These messages request that the operator mount a new scratch volume.

**Operator response:** If PROTECT was specified, either mount a scratch volume that is not RACF protected or remove the PROTECT specification. If the user is not RACF authorized to use the volume, mount a scratch tape volume that is not defined to RACF.

If message IEC089I contains a reason code of either 3 or 4 you can take following additional steps:

- If the reason code is 3 and the current volume is defined to a RACF volume set, but the previous volume was not defined to a RACF volume set mount a scratch tape volume that is not defined to RACF. If you want RACF protection for the dataset being created, the volumes must be manually defined to the same RACF volume set at a later time.
- If the reason code is 4 and the current volume and the previous volume are defined to different RACF volume sets then you have two choices. You can make sure that either (1) the scratch tape volumes are defined to the same RACF volume set or (2) none of the volumes are defined.

**Detecting Module:** IFG0194F

---

**IEC090I** 50D-18, DCB RESIDES ABOVE 16MB.

**Explanation:** An EOV macro was issued with the MODE=31 parameter, and register 15 contains the address of one of the following:

- a DCB that resides above 16 megabytes, or
- an ACB, for an access method other than VSAM and VTAM®; that resides above 16 megabytes.

**System action:** The system ends the task.

**Application Programmer Response:** Before issuing the EOV call, change the residency of the DCB or ACB to below 16 megabytes.

**Source:** DFSMSdfp

**Detecting Module:** IGC0005E

**Routing Code:** 11

**Descriptor Code:** 2

---

**IEC102I** INCORRECT AUTHORIZATION TO RUN 1419.

**Explanation:** The processing and stacker select routines were not in the correct libraries to run a 1419. This message is associated with system completion code 006.

**System action:** The job is abnormally ended with a 006 ABEND code.

**Application Programmer Response:** The pocket
select routine must be link-edited into SYS1.SVCLIB. The processing program should be link-edited into an authorized library as an authorized program.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Source:** DFSMSdfp

**Routing Code:** 11

**Descriptor Code:** 4

---

**IEC103I**

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>A permanent I/O error occurred during the attempt to block or unblock data checks on the printer.</td>
</tr>
<tr>
<td>08</td>
<td>The user totaling option was specified in the DCB and could not be supported for one of the following reasons:</td>
</tr>
<tr>
<td></td>
<td>- No DCB exit list was provided.</td>
</tr>
<tr>
<td></td>
<td>- No user totaling entry was found in the DCB exit list.</td>
</tr>
<tr>
<td></td>
<td>- The user totaling area address in the user totaling entry was zero.</td>
</tr>
</tbody>
</table>

**System action:** The DCB is not opened. If the OPEN macro instruction specified more than one DCB, the system continues normal OPEN processing on the other DCBs. Then control is given to the next sequential instruction after the OPEN macro instruction.

**Application Programmer Response:** For return code 08, if the jobstep should be rerun and this data set processed, either provide a user totaling area in the DCB exit list, or do not specify the user totaling option.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**IEC104I**

<table>
<thead>
<tr>
<th>fc, jjj, sss, ddname[#], sn, rc, rsn</th>
</tr>
</thead>
</table>

**Explanation:** A failure occurred during the open of a data control block (DCB) for a z/OS UNIX file. DFSMSdfp might have issued an IEC141I or IEC143I message that further describes the failure. For BPAM, this message can occur for a BLDL or FIND macro.

In the message text:

| fc | A function code that describes the error. |
| jjj | The job name. |
| sss | The step name. |
| ddname [#] | The data definition (DD) name, followed by a concatenation number (#) if the DD statement is part of a concatenation and not the first DD statement in the concatenation. |
| dev | The device number. |
| ser | The volume serial number. |
| mod | The name of the module in which the error occurred. |
| dsname(member) | The data set name. Member name if specified. |
| sn | The name of the service that encountered a problem. |
| rc | A return code from the service that encountered a problem. |
| rsn | A reason code from the service that encountered a problem. |

Explanations of the function code (fc) values follow:

**X'01'**

An invalid system control block was encountered. This is a probable system error.

**X'02'**

An invalid system control block was encountered. This is a probable system error.

**X'04'**

The CSVQUERY service returned an error. This is a probable system error.

**X'05'**

The MVS scheduler JCL facility (SJF) returned an error. This is a probable system error.
An unexpected error was encountered.

The path name resolves to a z/OS UNIX type that is not supported. This is a probable user error.

The path name resolves to a UNIX file that no longer exists. This is a probable user error.

A z/OS UNIX service returned an unexpected error.

An OMVS error occurred.

An invalid ACB option was encountered.

An unsupported ACB operand was encountered.

An missing ACB operand was detected.

Directory was not found.

A USS Check Address error was detected.

An IGGSO0PL error was encountered during a BLDL or FIND.

Permission denied was encountered.

No access available.

An unsupported filetype was encountered.

A BPX1STA error occurred.

System action: The system ends the task.

Operator response: None

Application Programmer Response: Correct any probable user error that caused the abnormal end of the task, as indicated by the function code in the message text. Then rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center and provide the job control language (JCL) and the program listing for the job.

Detecting Module: IGG0194J

IEC111E D dev,ser

Explanation: D indicates that the volume on a device is to be demounted. The control program has determined that this volume, mounted in response to an earlier mount message, is not the requested volume.

In the message text:

dev The device number of the specified device.

ser The volume serial number.

Operator response: Demount the volume. The system will then request that the correct volume be mounted.

Source: DFSMSdfp

Detecting Module: IGG0CLBL

Routing Code: 11

Descriptor Code: 6
IEC113A  ENTER PASSWORD FOR DATA SET  
dsname

Explanation:  The requested data set is password protected. The correct password must be provided within two tries before access is allowed to the data set. Any Time Sharing Option/Extensions (TSO/E) logon password or the last previous password for the corresponding DD statement has already been tried and found to be incorrect.

In the message text:

dsname    The data set name.

System action:  The system waits for the TSO/E user to reply.

Application Programmer Response:  Enter the correct 1 to 8 character password. On terminals that support the suppress print feature, the printing or displaying of the password will be suppressed.

Source:  DFSMSdfp

Detecting Module:  READPSWD

Routing Code:  9

Descriptor Code:  2

IEC114E  D  dev[.ddname-n]

Explanation:  D indicates that the volume on a device is to be demounted. The control program has determined that this volume, mounted in response to an earlier mount message, either:

- Contains labels that cannot be read due to a permanent input/output error.
- Contains no labels or nonstandard labels when standard labels were specified.
- Contains standard labels when no labels or nonstandard labels were specified.
- Contains labels that are written in a density other than the density specified.

If the DDNAME is supplied in the message text, the tape volume to be demounted was recorded in ASCII.

In the message text:

dev    The device number of the specified device.

ddname    The DD name.

n    The reason for the demount.

The reasons for the demounting follow:

if n equals

1    The accessibility field of the volume label contains a nonblank character which means that the volume is data set password protected and may not be processed by the operating system.

2    The accessibility field of the file header label contains a nonblank character other than one, which means that the file may not be processed by the operating system.

3    The system cannot process the volume which is recorded in ASCII, because the ASCII option was not specified at system generation.

4    The control program has determined that conflicting data control block attributes have been used to define the data set on the volume. Some of the conflicting attributes may be the following:

• BUFOFF greater than 99.
• BUFOFF not equal to L on OUTPUT, OUTIN, OUTINX, or EXTEND.
• BUFOFF equal to L where RECFM is not equal to D.
• OPTCD not equal to Q where LABEL equals AL or AUL.
• OPTCD equal to Q where DSORG is not equal to PS.
• OPTCD not equal to Q where RECFM equals D.
• OPTCD equal to Q where RECFM equals V.
• LABEL equal to AL or AUL for a seven track tape device.

System action:  The data set is not opened and processing continues.

Operator response:  Demount the volume. The system will then request that a new volume be mounted. Mount a volume with the correct density and label type.

Application Programmer Response:  Probable user error. Respond as indicated for the following values of n:

1    Make sure that the correct volume was specified in the job control statements.

2    Make sure that the correct file and volume are being used.

3    The ASCII option was not specified at system generation, so bit 6 in the CVTOPTA field of the communications vector table is 0.

4    Make sure that the data control block attributes do not conflict.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the
IEC115I  INVALID PASSWORD

Explanation:  The first password supplied was incorrect. Either the password did not exist for the requested data set, its read/write mode was incorrect, or it was longer than 8 characters.

System action:  The system issues message IEC116A.

Application Programmer Response:  Determine what the correct password is and respond to message IEC116A.

Source: DFSMSdfp

Detecting Module:  READPSWD
Routing Code:  9
Descriptor Code:  2

IEC119I  ERROR-IMAGELIB, CODE=rc

Explanation:  An attempt to open SYS1.IMAGELIB was unsuccessful for one of the following reasons:

• CODE=1. SYS1.IMAGELIB was not a cataloged data set.
• CODE=2. The volume on which SYS1.IMAGELIB resides is not permanently resident or, if SYS1.IMAGELIB was an alias for a data set, the user does not have RACF read authority for that data set.
• CODE=3. An error occurred in reading the catalog or VTOC.
• CODE=4. No space was available in subpool 230 for constructing the DCB, DEB and workspace, or SAF work area.

In the message text:

rc The reason code.

System action:  The related program was ended if the error occurred when the output data set was being opened. If the error occurred during processing of the SETPRT macro, the problem is passed a return code and determines further processing based on the nature of the error.

Operator response:

• If CODE=2, mount the proper volume and rerun the job.
• If CODE=1 or 3, report the message to the system programmer.

Application Programmer Response:

• If CODE=1, catalog SYS1.IMAGELIB.
If CODE=3, check the format DSCB for errors. Contact your programming support personnel if the problem persists.

If CODE=4, ensure that sufficient storage is available when the storage request ran.

**IEC120A**

M dev, charcde[,FOLD] [,VERIFY]

Explanation: M indicates a mounting request. The programmer has requested that the chain, train or band specified by the character set code, be used on the UCS printer.

In the message text:

**dev** The device number of the specified UCS printer.

**charcde** The character set code.

Operator response: Mount the train, chain or band that was requested and enter REPLY xx,'text' where text is the character set code.

To ignore the request and use the character set image currently loaded, enter REPLY xx,'U'.

Otherwise, mount a suitable alternate chain, train or band and enter REPLY xx,'text' where text is the alternate character set code followed, if applicable, by FOLD or F and/or VERIFY or V. (If FOLD or F is omitted but VERIFY or V is specified, indicate the omission of FOLD or F by specifying two consecutive commas -- for example, REPLY xx,'AN,,V'.)

If the mounting request cannot be satisfied with any available chain, train or band enter REPLY xx,'CANCEL' or REPLY xx,'C' to cancel the UCS request. The system will end the job if the request occurred during processing of an OPEN macro instruction. If the request was due to processing of a SETPRT macro, a return code of X'04' will be placed in register 15, and control returned to the program issuing the SETPRT macro.

Source: DFSMSdfp
Detecting Module: IGG0197U
Routing Code: 7
Descriptor Code: 2

**IEC122D**

dev, charcde UCS IMAGE NOT FOUND

Explanation: The character set image, specified by the character set code, to be used on the printer could not be found in the image library or image table.

In the message text:

**dev** The device number of the specified UCS printer.

**charcde** The character set code.

Operator response: To correct an erroneous specification, mount the requested chain, train or band and enter REPLY xx,'text' where text is the correct character set code.

If an alternate character set can be used, select the alternate chain, train or band and enter REPLY xx,'text' where text is the alternate character set code followed, if applicable, by FOLD or F and/or VERIFY or V. (If FOLD or F is omitted but VERIFY or V is specified, indicate the omission of FOLD or F by specifying two consecutive commas -- for example, REPLY xx,'AN,,V'.)

To ignore the request and use the character set image currently in use, enter REPLY xx,'U'. A reply of 'U' for printers other than 4245 is incorrect at the first occurrence.

If no alternate character set can be used, enter REPLY xx,'CANCEL' or REPLY xx,'C' to cancel the UCS load. The system will end the job if the request occurred during processing of an OPEN macro instruction. If the request was due to processing of a SETPRT macro, a
return code of X'04' will be placed in register 15, and control returned to the program issuing the SETPRT macro.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Descriptor Code:** 2

---

**IEC123D**  
**dev, SPECIFY UCS PARAMETER**

**Explanation:** The current job step did not specify UCS parameters and the character set currently in use on UCS printer *dev* cannot be assumed as a default option for one of the following reasons:
- The character set is unknown to the system.
- The character set is incorrect because of a previous error condition.
- The character set is not a default character set.

In the message text:

`dev` The device number of the specified UCS printer.

**Operator response:** For the first occurrence of this message, mount the chain, train or band of a suitable default character set and enter `REPLY xx,'text'` where `text` is the character set code followed, if applicable, by FOLD or F and/or VERIFY or V. (If FOLD or F is omitted but VERIFY or V is specified, indicate the omission of FOLD or F by specifying two consecutive commas -- for example, `REPLY xx,'AN,,V,'`.) Note that this response should be used only the first time this message is produced.

1. For all printers other than the IBM 4245, enter `REPLY xx 'U'` to ignore the request and use the character set image currently in use when one of the following conditions exist:
   - If this is not the first occurrence of message IEC123D since the printer was varied online.
   - If this is not the first occurrence of message IEC123D since the system was IPLed.
2. For the IBM 4245 printer this reply is valid at all times.

If no character set is available for the job step, enter `REPLY xx,'CANCEL'` or `REPLY xx,'C'`. The system will end the job if the request occurred during processing of an OPEN macro instruction. If the request was due to processing of a SETPRT macro, a return code of X'04' will be placed in register 15, and control returned to the program issuing the SETPRT macro.

**IEC124I**  
**dev, ERROR OCCURRED WHILE LOADING FCB**

**Explanation:** A permanent I/O error persisted after two attempts were made to load the FCB. The error occurred while opening the data control block for the printer or during the processing of a SETPRT macro. This error can be caused by:
- A form control buffer parity error.
- An attempt to load an incorrect FCB image.
- A hardware error occurred during the printer interrogation and forms positioning part of the load FCB routine.

In the message text:

`dev` The device number of the specified UCS printer.

**System action:** The related program was ended.

**Operator response:** If the associated I/O error message (IEA000I) contains a X'02' in the first sense byte, an attempt was made to load an incorrect FCB image.

Specify a substitute image or correct the one in error. An image is incorrect if:
- Its specified length exceeds the maximum allowed for the device.
- Its specified and actual lengths are not equal.
- There is an incorrect channel specified.
- The last byte of the image is incorrect.

If IEA000I contains a X'04' in the first sense byte a buffer parity error occurred.

**Routing Code:** 7

**Descriptor Code:** 2

---

**IEC127D**  
*dev*, *imgeid* FCB IMAGE NOT FOUND

**Explanation:** The FCB buffer of a printer was not loaded because the FCB image specified by the image identification was not in the image library.

In the message text:

*dev*  
The device number of the specified printer

*imgeid*  
The image id.

**Operator response:** To correct an erroneous specification, enter REPLY *xx*,’text’ where text is the correct or alternate FCB image-id to be used. The image-id can then be followed by VERIFY or V, or ALIGN or A.

Specifying VERIFY or ALIGN allows the operator to align forms to the new image.

The VERIFY option also provides a printout of the image loaded.

To ignore the request and use the FCB image currently loaded, enter REPLY *xx*,’U’.

If no alternate image can be used, enter REPLY *xx*,’CANCEL’ or REPLY *xx*,’C’ to cancel the FCB load. The system will end the job if the request occurred during processing of an OPEN macro. If the request occurred during processing of a SETPRT macro a return code (X'04') will be placed in register 15 and control returned to the program issuing the SETPRT macro.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

**Descriptor Code:** 4

---

**IEC129D**  
*dev*, SPECIFY FCB PARAMETER

**Explanation:** The current job step did not specify FCB parameters and the image currently loaded on the printer *ddd* cannot be assumed as a default for one of the following reasons:

- The image is incorrect because of a previous error condition.
- The image is not a default image.

In the message text:
dev  The device number of the specified UCS printer.

Operator response:  For the first occurrence of this message, load the FCB buffer by entering \texttt{REPLY xx,'text,'} where text is the image-id to be used. STD1 or STD2 may be specified to load the IBM forms-control buffer images. In addition to the image-id, VERIFY or ALIGN can be specified after a comma.

Specifying VERIFY or ALIGN allows the operator to align forms to the new image.

The VERIFY option also provides a printout of the image loaded.

To ignore the request and use the image currently loaded, enter \texttt{REPLY xx,'U'}.

If no image is available for the job step, enter \texttt{REPLY xx,'CANCEL'} or \texttt{REPLY xx,'C'}. The system will end the job if the request occurred during processing of an OPEN macro instruction. If the request was due to processing of a SETPRT macro, a return code of \texttt{X'04'} will be placed in register 15, and control returned to the program issuing the SETPRT macro.

Routing Code: 7
Descriptor Code: 2

IEC129I 002-rc,mod,jjj,sss,[-#],dev,ser,dsname
Explanation:  The error occurred during BDAM CREATE.

In the message text are:

rc  The return code.
jjj  The job name.
sss  The step name.

\texttt{ddname[-#]}  DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev  The device number.
ser  The volume serial number.
mod  The name of the module in which the error occurred.

dsname  The data set name.

The values of hex return codes and their meanings are as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>BDAM OPEN was attempted on a data set containing zero extents as specified in the DSCB.</td>
</tr>
<tr>
<td>1C</td>
<td>A record was found to be larger than 1 track.</td>
</tr>
<tr>
<td>20</td>
<td>The block will not fit in the amount of space allocated for a secondary extent.</td>
</tr>
<tr>
<td>24</td>
<td>The block will not fit in the amount of space allocated for the primary extent.</td>
</tr>
<tr>
<td>28</td>
<td>Upon opening a data set for BDAM CREATE, BLKSIZE was found to be larger than the primary extent.</td>
</tr>
</tbody>
</table>

System action:  A WTP message is issued to give the ABEND and return code. Pertinent control blocks on the GTF data set are recorded and the job is abnormally ended.

Application Programmer Response:  If \texttt{rc} is 28, allocate more space, specify a smaller blocksize or use a larger device. If \texttt{rc} is 1C, specify a shorter blocksize, a larger device, or use track overflow.

If \texttt{rc} is 04, specify \texttt{A}, \texttt{K}, or \texttt{I} in the DCB.

If \texttt{rc} is 08, specify a positive nonzero value for primary allocation in the space parameter of the DD statement when creating the data set.

If \texttt{rc} is 20, specify a larger secondary allocation, shorter blocks, or use a larger device.

If \texttt{rc} is 24, specify a larger primary allocation, shorter blocks, or use a larger device.

IEC130I  \texttt{ddname} - DD STATEMENT MISSING
Explanation:  An OPEN macro instruction was issued for a data control block that specified the DDNAME. However, \texttt{ddname} does not appear in the name field of any DD statement for the job.

In the message text:

\texttt{ddname}  The DD name.

System action:  Processing continues. However, abnormal end is likely if an attempt is made to read or write the data set.

Application Programmer Response:  Probable user error. Supply the missing DD statement, and run the job step again.

Source: DFSMSdfp
**IEC131I**  xx, jj, sss, RDJFCB ISSUED FOR DCB WITH BLANK DDNAME

**Explanation:** A RDJFCB macro instruction was issued. A DCB in the parameter list had a blank DDNAME field.

In the message text:
- **xx** The position of the DCB in the parameter list.
- **jj** Job name.
- **sss** Step name.

**System action:** The request for this DCB is ignored and a return code of 4 is passed in register 15.

**Application Programmer Response:** Correct the errors causing the DDNAME field to be blank and run the job step again. The error is usually caused by not specifying DDNAME= when coding the DCB.

**Source:** DFSMSdfp

---

**IEC132I**  ddbname, MACRF=E WAS SPECIFIED FOR A SYSin OR SYsOUT DATA SET

**Explanation:** An OPEN macro was issued for a subsystem data set, such as SYSin or SYsOUT, whose DCB specified a macro format of EXCP (MACRF=E). The EXCP macro instruction cannot be used for subsystem data sets. In the message text, ddn is the name of the DD statement for the subsystem data set. If the data set is a concatenated subsystem data set, the ddbname field in the message text is blank.

In the message text:
- **ddname** The DD name.
- **jj** Indicates the job name.
- **sss** Indicates the step name.
- **dsn** Indicates the data set name
- **ddn** The ddbname

**System action:** The data set is not opened but control is returned to the problem program. Attempts to read or write the data set can result in abnormal end.

**Application Programmer Response:** Probable user error. Correct the MACRF operand of the DCB to specify a BSAM or QSAM macro instruction.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and all printed output and output data sets related to the problem.

**System action:** Processing continues.

**Source:** DFSMSdfp.
for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the source program listing, and the SYSOUT output for the job.

**Source:** DFSMSdfp

**Detecting Module:** IFG0194F

---

**IEC135A**  
**U** dev,ser,\( j jj, s ss, (d d name)\)

**Explanation:** U indicates that the tape volume indicated by ser on a device is not file-protected. That is, a program without RACF output authorization or a program accessing a password protected data set attempted to use the volume for INPUT only and the tape’s file-protection ring is inserted. Therefore, the volume is not completely write protected.

In the message text:

- \( j jj\) Indicates the job requesting the volume.
- \( s ss\) Indicates the job step requesting the volume.
- \( d d name\) If a MONITOR DNAME command is active, indicates the data set requesting the volume.
- \( d ev\) The device number of the specified device.
- \( s er\) The volume serial number.

**System action:** The volume is rewound, the device is unloaded and the task waits for the operator to remount the volume or until the task reaches time-out. If a volume is mounted with its file protect ring still inserted, the volume will be unloaded again and the message reissued.

**Operator response:** Remove the file-protection ring, remount the volume, and ready the device.

Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the program listing, the SYSOUT output for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

**Detecting Module:** IFG0194F

---

**IEC138I**  
**020-rc,mod,\( j jj, s ss, \(dd name, d ev, s er, d d name\)\)**

**Explanation:** The error occurred following processing of an OPEN macro for a BDAM data set.

In the message text:

- \( r c\) Associates this message with system completion code 020 and with the return code.
- \( j jj\) The job name.
- \( s ss\) The step name.
- \( d d name\) DDname
- \( d ev\) The device number.
- \( s er\) volume serial
- \( m od\) The name of the module in which the error occurred.
- \( d d name\) The data set name.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>The BDAM OPEN routine found that neither A, K, nor I was specified in the MACRF field of the DCB. Therefore, the functions requested by the user remain unclear.</td>
</tr>
<tr>
<td>08</td>
<td>An attempt was made to open a BDAM data set that contained no primary extents, as specified in the DSCB.</td>
</tr>
<tr>
<td>0C</td>
<td>An attempt was made to open a BDAM data set that had more than the maximum number of extents (255).</td>
</tr>
</tbody>
</table>

**System action:** If the user specified a DCB ABEND exit routine, it will receive control. On return, the
following control blocks are traced to a GTF data set: DCB for return code 04, and DCB and DSCB for return code 08 and 0C. In both cases the task is ended.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIGNS=TRACE
```

**Application Programmer Response:** For return code 04, specify A, K, or I in the MACRF field of the DCB. For return code 08, create a BDAM data set before accessing it with the BDAM access method. In building it, a positive nonzero value must be specified for primary allocation in the SPACE parameter. For return code 0C, ensure the BDAM data set is not created with more than the maximum of 255 extents.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output and the source program listing for the job.

**Source:** DFSMSdfp
**Detecting Module:** IGG0193A, IGG0193A
**Routing Code:** 11
**Descriptor Code:** 6

IEC139I INCOMPATIBLE VOLUME ON

```
ddd,ddn,cc NONFORMATTED VOLUME
ON dev,ddname UNSUPPORTED
MEDIUM ON dev,ddname MEDIUM
LENGTH ERROR ON dev,ddname
```

**Explanation:** A problem has been detected with the tape volume on `dev`.

If INCOMPATIBLE VOLUME appears in the message text, the error recovery code (ERA) `cc` provides the following information:

- **5A**: An extended length cartridge is mounted on a drive not capable of reading extended length tape cartridges.
- **5C**: A 36 track recorded tape cartridge is mounted on a drive not capable of reading 36 tracks.
- **5D**: The cartridge length exceeds any valid length for the device type.

If NONFORMATTED VOLUME appears in message text, a 3590 tape cartridge with no servo tracks has been mounted on a 3590 device. Cartridges should come from the factory with servo tracks. However, the servo tracks can be damaged or destroyed if the volume is degausssed. The cartridge is unusable without servo tracks.

If UNSUPPORTED MEDIUM appears in message text, the mounted cartridge is not a supported media type for a 3590 tape device.

If MEDIUM LENGTH ERROR appears in message text, the mounted cartridge length is not a supported length for a 3590 tape device.

**System action:** Processing continues. Depending on the type of error, device type, volume request type and if applicable, the operating mode of the automated tape library, the volume will either be rejected and for SMS tape put into an error category, or relabeled via the label editor routines, or the job may be abended.

**Operator response:** Respond as indicated in subsequent messages.

IEC140I `ddname,ser, {START|END} OF DATA SET NOT ON VOLUME`

**Explanation:** If START appears in the message text, one of the following occurred:

- The data set was opened to the start of an SL or AL magnetic tape file. The file sequence number specified (default=1) in the LABEL parameter of the DD statement is greater than the last file on the tape volume indicated, which ends with an EOV label. More volume serial numbers follow.
- The data set was opened for MOD processing to a magnetic tape file. The volume sequence number specified is less than the last volume number that the existing data set resides on. More volume serial numbers follow.

If END appears in the message text, the data set was opened to the end of an SL or AL magnetic tape file 1. One of the following error conditions exists:

- The `dsname` in the HDR1, EOV1, or EOF1 label was not correct.
- The file sequence number specified (default=1, must be 1 for this message) in the LABEL parameter of DD statement `ddn` is less than the first file on the tape volume indicated by `ser`.
- A tape mark was read instead of a HDR1 label.

There are more previous volume serial numbers. This usually occurs when several specific volume serial numbers are specified in advance for a DISP=MOD data set to use instead of scratch tapes.

In the message text:

```
ddname
```

The DD name.

```
ser
```

The volume serial number.
**System action:** For START, the open routine permanently increases the volume sequence number by one and continues processing on the next volume specified.

For END, the open routine decreases the working volume sequence number by one and continues processing on the next volume specified.

**Application Programmer Response:** To save the time required to do this multivolume positioning recovery, change the JCL.

For **START:**
- Specify a volume sequence number in the VOL parameter of the DD statement, or
- Omit the skipped volume serial numbers, or
- Specify VOL=REF=*.ddname to get only the last volume serial number of the previous file. This then is the first volume serial number of this file.

For **END:**
- Specify a volume sequence number in the VOL parameter of the DD statement, or
- Omit the excess volume serial numbers, or
- Omit all the volume serial numbers. This lets the system assign scratch volumes as needed instead of you making specific requests.

If you want to rerun the job, analyze and/or modify the JCL and program to ensure that the job does not accept the wrong tape because one of the three original error conditions for END may no longer exist.

**Source:** DFSMSdfp  
**Detecting Module:** IFG0195H  
**Routing Code:** 11  
**Descriptor Code:** 6

### Explanation

An error occurred during the processing of an OPEN macro. System completion code 013, with the return code, accompanies this message.

In the message text:

- **rc** The return code.  
- **mod** The name of the module in which the error was detected.  
- **jjj** The job name.  
- **sss** The step name.  
- **ddname[-#]** A data definition (DD) name, followed by a concatenation number (#) if the DD statement is part of a concatenation and not the first DD statement in the concatenation.

**Return Code** | **Explanation**  
--- | ---  
04 | One of the following problems occurred:  
- ISO/ANSI tape labels were specified in the LABEL parameter of the DD statement (as AL), but the system does not support them.  
- OPTCD=Q processing was specified, but the system does not support it.  
08 | ISO/ANSI tape labels were specified in the LABEL parameter of the DD statement (as AL), but the UNIT parameter specified a 7-track tape drive. ISO/ANSI tape labels are not valid for 7-track drives. Correct the LABEL or UNIT parameter, or both, in the DD statement.  
0C | A buffer length of 0 was specified for a BDAM data set for which dynamic buffering was requested. Correct the data control block (DCB) by specifying a valid buffer length.  
10 | An OPEN macro instruction was issued for a dummy data set; the BLKSIZE and BUFL values are both 0. Correct the DCB by specifying a BLKSIZE or BUFL value other than 0.  
14 | One of the following problems occurred:  
- An OPEN macro instruction was issued with OUTPUT or OUTIN specified. The DCB specifies DSORG=PO or POU, but the data set control block (DSCB) indicates that the data set is not partitioned. Take one of these actions to correct the problem:  
  - Change the DCB macro instruction DSORG subparameter to PS.  
  - Delete and recreate the data set and imply partitioned organization by allocating space
for the directory in the SPACE parameter of the DD statement.

- Verify that the values of the DSNAME and VOLUME parameters in the DD statement are correct.

- An OPEN macro instruction was issued with INPUT specified. The DSCB indicates that the DSORG value is PO, but the DCB specifies neither DSORG=PO nor DSORG=PS.

18

An OPEN macro instruction was issued for a partitioned data set. The DSNAME parameter specified a member that could not be found.

1C

An OPEN macro instruction was issued for a partitioned data set, but an I/O error occurred during a search of the directory.

20

An OPEN macro instruction was issued for a sequential data set using queued access. BLKSIZE is not a multiple of LRECL, or LRECL is 0 with RECFM=FB or RECFM=FS, or BLKSIZE is not at least four bytes greater than LRECL with RECFM=V.

24

An OPEN macro instruction was issued with INPUT, INOUT, RDBACK, or UPDATE specified, but the DCB did not specify a MACRF value of EXCP, GET, or READ.

28

An OPEN macro instruction was issued with OUTPUT, OUTIN, OUTINX, or EXTEND specified, but the DCB did not specify a MACRF value of EXCP, PUT, or WRITE.

30

A sequential data set using queued access with exchange buffering was opened for input, and the buffer control-block address was 0. Verify that DCBBUFNCB was not incorrectly modified. This type of error often occurs if two or more tasks share a DCB or if the DCB is opened and closed several times within one job step.

3C

A sequential data set was opened for INPUT, OUTPUT, or EXTEND, but the next available buffer address in the buffer control block was zero. Verify that DCBBUFNCB was not incorrectly modified. This type of error often occurs if a DCB is reused or is opened and closed several times within one job step.

34

The system detected one of these conditions:

- The following combination was specified: QSAM, MACRF=GD or PD, and a RECFM value that is not VS, VBS, DS, or DBS.

- An OPEN macro instruction was issued for a data set with BLKSIZE and BUFL equal to 0. The system determined that it had to obtain buffers but was unable to do so.

- RECFM was specified with both the A and M attributes.

- The following combination was specified: QSAM, LRECL=0, and a RECFM value that is not V or VB.

- The following combination was specified: RECFM=V or VB and LRECL greater than the quantity BLKSIZE minus 4.

- The following combination was specified: QSAM and BLKSIZE=0. No nonzero BLKSIZE value was available from any source and the system could not determine one. Coding BLKSIZE=0 in the JCL never has an effect except when overriding a cataloged procedure variable.

- The following combination was specified: RECFM not variable or undefined and LRECL greater than BLKSIZE.

- The following combination was specified: BFTEK=A, RECFM=VBS, and LRECL=0.

- An OPEN macro instruction was issued for a sequential data set on a direct access device with track overflow, but the buffer control block address was zero. Verify that DCBBUFNCB was not incorrectly modified. This type of error often occurs if a DCB is reused or is opened and closed several times within one job step.

38

A sequential data set was opened for INPUT, OUTPUT, or EXTEND, but the next available buffer address in the buffer control block was zero. Verify that DCBBUFNCB was not incorrectly modified. This type of error often occurs if a DCB is reused or is opened and closed several times within one job step.

40

A sequential or direct data set was opened for INPUT, but the next
An OPEN macro instruction was issued for a data set on a direct access device for which chained scheduling was specified, but the next available buffer address in the buffer control block was 0. Verify that DCBBUFCB was not incorrectly modified. This type of error often occurs if a DCB is reused or is opened and closed several times within one job step.

An OPEN macro instruction was issued for a sequential data set using queued access techniques, but the next available buffer address in the buffer control block was 0. This means the DCB has an existing buffer pool that does not have enough available buffers.

An OPEN macro instruction was issued for a data set using queued access. The system determined that a buffer pool existed for this data set and checked the buffer length value as follows, detecting an error:

- If the data was to be sent directly to a unit record device (no spooling), the buffer length value in the buffer control block had to be equal to or greater than the value specified in the DCB for LRECL. This type of error often occurs if a DCB is shared by two or more tasks or is opened or closed several times within one job step.
- Otherwise, the buffer length value in the buffer control block or in DCBBUFL had to be equal to or greater than the value specified in the data control block extension (DCBE) or DCB for BLKSIZE.

An OPEN macro instruction was issued for a data set allocated to a printer did not have OUTPUT specified as an OPEN option.

An OPEN macro instruction was issued for a paper-tape data set, but concatenation with unlike attributes was specified; that is, the DCBOFLOGS bit 4 was 1. Set the DCBOFLOGS bit 4 to 0 and do not attempt to concatenate a data set on paper tape with data sets of unlike attributes.

One of the following events occurred:
- An OPEN macro instruction was issued for a sequential data set using queued access. The data set contained spanned variable-length records larger than 32766, but GET locate mode was not specified, or the logical record interface (LRI) and LRECL=x were both specified.
- An OPEN macro instruction was issued for a sequential data set with the DCB specifying BFTEK=A logical record interface and MACRF=GM or MACRF=PM.
- An OPEN macro instruction was issued for a data set with the DCB specifying RECFM=F, but the BLKSIZE value was not equal to LRECL. Correct the DCB parameters to specify RECFM=FB, or make LRECL and BLKSIZE equal.
- An OPEN macro instruction was issued for a dummy data set using an access method other than QSAM or BSAM. Correct the DD statement to specify a real data set, or access the data set using BSAM or QSAM.
- An OPEN macro instruction was issued for a data set for which the DCB or DCBE specified a block size and key length whose sum is greater than the maximum allowed for the allocated device. For information about the maximum block size and key length, see z/OS DFSMS Using Data Sets.
- An OPEN macro instruction was issued for a data set with RECFM=T in the DCB, requesting track overflow, but the direct access device allocated does not support track overflow. Correct the DCB or specifically request a device that supports track overflow, through the unit parameter or through a generic name that applies only to the needed devices.

One of the following events occurred:
- An OPEN macro instruction was issued for a data set on magnetic tape. A conflict exists between LABEL parameters in the DD statement and the DCBRECFM, DCBOPTCD, DCBBUFOF, and DCBUSASI fields, which give the
appearance of mixed ASCII and EBCDIC attributes for the data set; or TRTCH was specified for a 9-track tape.

Some examples of conflicts are that you cannot use RECFM=V, VB, or U with AL tapes, and the BLKSIZE value must be no more than 2048 with AL Version 1 tapes. For details about AL tape restrictions, see z/OS DFSMS Using Magnetic Tapes. Most utilities (except IEHINITT) do not support ASCII.

- An OPEN macro instruction was issued for a data set not on magnetic tape. Either OPTCD=Q was specified, or OPEN was issued for an ISAM data set using QSAM.

- An OPEN macro instruction was issued for an optical character reader data set, but option 1 in the OPEN macro instruction did not specify input.

- An OPEN macro instruction was issued for an optical character reader data set. The BUFL parameter in the DCB was either specified as zero or incorrectly modified during processing.

- An OPEN macro instruction was issued for an optical character reader data set, but the LRECL parameter value in the DCB was zero. Specify an LRECL value other than zero, and rerun the job.

- An OPEN macro was issued for an optical character reader data set, but the specified BUFL value was less than LRECL. Specify BUFL equal to, or greater than, LRECL, and rerun the job.

- An OPEN macro instruction was issued for a BSAM, BPAM or QSAM DCB for a telecommunications device, but the DD statement or dynamic allocation did not specify TERM=TS, which would signify a TSO terminal.

- RECFM was not specified for a direct organization (BDAM) data set. Specify the correct RECFM value in the DCB.

- An OPEN macro instruction was issued for a 3890 document processor. It did not specify INPUT.

- An OPEN macro instruction was issued for a 3890 document processor. The BUFL or BLKSIZE parameter in the DCB was less than 16 times the LRECL parameter in the DCB.

- An OPEN macro instruction was issued for a 3890 document processor. The MACRF parameter in the DCB was not GM, or the DSORG parameter in the DCB was not PS.

- An OPEN macro instruction was issued for a subsystem data set, such as SYSIN or SYSOUT, but DSORG was not specified as PS.

- An incorrect record format was requested for a SYSIN, SYSOUT, or subsystem data set with BSAM or QSAM or for a z/OS UNIX directory with BPAM. One of the following conditions was detected:
  - RECFM=D was specified.
  - Variable spanned records (VS or VBS) were requested for input.
  - Both ANSI and machine control characters were specified.

- An OPEN macro instruction was issued for a sequential data set using the queued access technique. However, a key length that is not supported for using the queued access technique was specified in the DCB.

- An OPEN macro instruction specified the RDBACK option, and the DCB specified a record format of variable spanned records. These are conflicting parameters.

- An OPEN macro instruction specified the INOUT, OUTIN, or OUTINX option, and the DCB specified QSAM MACRF values. These are conflicting parameters.

- An OPEN macro instruction was issued for a 3890 document processor.
BC
A subsystem DCB, such as SYSIN, SYSOUT, or a z/OS UNIX FIFO file, was opened with incorrect options. One of these was true:

- The OPEN option 1 specified UPDAT or RDBACK.
- For BSAM, the NOTE and POINT macro function was selected (MACRF=RP or WP) for a FIFO file. Repositioning or updating a FIFO file is not permitted. It is also not permitted to open the file for writing with the PATHOPTS=OAPPEND option.
- For a subsystem data set, the OPEN option 1 was OUTINX.
- Both the CNTRL and POINT macros were requested as if MACRF=RCP or WCP were coded. The CNTRL and POINT options are mutually exclusive.

C0
An open failure occurred for a subsystem data set. Possible failures follow:

- A SYSIN or SYSOUT data set opened by JES.
- A SYSIN or SYSOUT data set opened under the master subsystem.
- A subsystem data set (such as an HFS data set) that uses the same interface as JES.
  For JES2, a SYSOUT data set incurred a subsystem JCL failure (SJF), and JES2 might issue a $HASP708 message to further describe the error. For JES3, a reserved DD name, such as JOURNAL, might have been specified in a DD statement. In either case, the failing DCB was not opened; processing for other DCBs opened in parallel continues normally.

C4
During the creation of a direct data set, the open routine found that the DCB specified READ (R) or GET (G) in the MACRF field. Only WRITE LOAD (WL) is allowed.

C8
One of the following events occurred:

- The open subsystem module was passed an error return code in register 15 after issuing the IEFSSREQ macro to connect the access method control block (ACB) to the subsystem. This indicates that the subsystem was not operating, unless the recovery routine recovered from a prior program check.
- IEFSSREQ failed. SMS is not available.

CC
An OPEN macro instruction was issued for the IBM 3800 Printing Subsystem, but the SETPRT processing to set up the device failed. For the reason for the failure, see the accompanying IEC162I message.

D0
An incorrect record format of FBS or FS was specified for a partitioned data set. RECFM=FS or FBS is not supported with BPAM.

D4
A DS/DBS record format has been specified for QSAM locate mode, but the logical record interface is not present in the associated buffer control block; that is, segment mode is implied.

D8
A conflict has occurred for the extended logical record interface (XLRI) of the spanned record format.

E0
The DEVTYPE macro issued during open processing had an error (register 15 was nonzero). This is probably a system error.

E1
A magnetic tape data set with a block size greater than 32 760 is being opened for input or output extend processing, but the large block interface is not being used.

E4
In a partitioned concatenation, the sum of the following numbers exceeded 255: the number of partitioned data sets extended (PDSEs), the number of UNIX directories, and the number of partitioned data set (PDS) extents. Before z/OS 1.5, the limit was approximately 120.

E8
The open verification function of the IEFSSREQ macro passed an error return code in register 15. This indicates an error in connecting to the subsystem or a failure in the subsystem verification processing for the data set.

EC
An OPEN macro instruction was issued with a DCB that specified an LRECL value different from that specified by the format-1 DSCB. The
data set was a PDSE. For data sets in the compressed format, this return code is issued only if the data set is open for output and RECFM=FB.

**F0**
A catalog error occurred during an attempt to update the catalog record for a data set on a direct access device.

**F4**
An error occurred in reading the catalog record during an attempt to open an extended-format data set. Reading this record is required to determine the stripe count.

**F8**
OPEN was issued for a DCB that specifies QSAM, RECFM=F or FB, a block size greater than 32 767, and no LRECL value. Correct the DCB parameters by specifying an LRECL value.

**FC**
OPEN was issued for a DCB that specifies that the system is to obtain and build the buffer pool. However, the calculated size of the buffer pool is greater than the maximum size that can be requested. The calculated size of the buffer pool is the size of the buffer control block plus the product of BUFNO (or NCP) and the buffer length. Unless the DCB specified QSAM and RMODE31=BUFF is coded in the DCBE, the maximum buffer storage request is 16 777 208 bytes.

**FD**
OPEN was issued for a DCB that specifies both the large block interface and OPTCD=H.

**FE**
OPEN was issued with the UPDAT option for a DCB that specifies the large block interface.

**FF**
OPEN was issued for a DCB that specifies both the large block interface and exchange buffering.

**System action:** The system issues a WTP message to give the ABEND and return codes, records pertinent control blocks on the GTF data set, and abnormally ends the job.

**Application Programmer Response:** Correct the error that caused the abnormal end, as indicated by the return code in the message text. Then rerun the job.

If ddname is part of a concatenation, the error is probably because of a violation of the sequential concatenation requirements. For more information, see [z/OS DFSMS Using Data Sets](https://www.ibm.com/support/knowledgecenter/SSEPGG_1v15.1.0/com.ibm.zos.v1r15.edi.doc/edifam000000.htm). A C8 return code indicates that the subsystem was not operating when OPEN was issued. Notify your system programmer.

If the return code is D4, specify the logical record interface by using the BUILDRCD macro before OPEN processing or by specifying A for the DCB BFTEK operand. If records are greater than 32 KB, specify the extended logical record interface (XLRI) by using 0K for the DCB LRECL operand.

If the return code is D8, follow these rules:

- LRECL=nnnK for JCL, or dynamic allocation requires the DCB to indicate the K format. You can indicate the DCB K format by specifying LRECL=0K in the DCB macro instruction or by a DCB exit during open setting DCBBFTEK=DCBBFTK and DCBLRECL=0. Do not specify LRECL=0K in a JCL DD statement. The use of XLRI is not required for an LRECL value less than 32 760.

- A spanned-record-format data set with a logical record length greater than 32 760 requires the use of XLRI. The record length can come from the label for input data sets with the spanned format, up to 99 999 bytes.

- LRECL=X is not valid for spanned record format.

- The value for XLRI LRECL cannot exceed 16383K (in which K indicates 1024-byte multiples).

- XLRI is valid only for an ISO/ANSI-label (AL) tape. The DCB must indicate spanned record format (DS or DBS); and the access method must be QSAM locate mode.

If the return code is F0, notify your system programmer to correct the catalog error, and then rerun the job.

If the return code is F4, notify your system programmer to correct the catalog error, and then rerun the job.

**System programmer response:** If the error recurs and the program is not in error, see the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center and provide the SYSOUT output for the job.

IEC142I 113-rc,mod,iii,sss,ddname[-#],dev,ser,dsname(member)

**Explanation:** The error occurred during processing of an OPEN macro instruction or an OPEN macro instruction with a TYPE=J operand.

In the message text:
rc  Associates this message with system completion code 113 and with the return code.

jjj  The job name.

sss  The step name.

ddname[-#]  DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev  The device number.

ser  The volume serial number.

mod  The name of the module in which the error occurred.

dsname(member)  The data set name. Member name if specified.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>A JFCB extension block was needed for processing a physical sequential data set but none was available.</td>
</tr>
<tr>
<td>0C</td>
<td>An OPEN TYPE=J was issued, but no JFCB exit was found in the DCB exit list. Specify a JFCB exit, supply the JFCB.</td>
</tr>
<tr>
<td>18</td>
<td>A JFCB extension block was needed for processing a direct or index sequential data set.</td>
</tr>
<tr>
<td>20</td>
<td>An end-of-volume condition was encountered while processing a VSAM data set. Multi-volume data sets are not supported when a VSAM data set is opened with a DCB.</td>
</tr>
<tr>
<td>24</td>
<td>An OPEN was issued to a multi-volume VSAM data set. Only single-volume VSAM data sets can be opened with a DCB.</td>
</tr>
<tr>

</tbody>
</table>

System action:  The task is ended.

Operator response:  Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

Application Programmer Response:  Correct the error causing the abnormal end as indicated by the return code in the message text. Rerun the job.

System programmer response:  If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSPUT output for the job.

Source:  DFSMSdfp

Detecting Module:  IFG0194A, IFG0194D, IFG0194E, IFG0195V, IGC0001I
IEC143I

Routing Code: 11
Descriptor Code: 6

IEC143I 213-rc,mod,iii,sss, ddname[-#],dev,volser,dsname(member)

Explanation: An error occurred during the processing of an OPEN macro instruction for a data set on a direct access device. This is probably a user error.

In the message text:

rc Associates this message with system completion code 213 and with the return code.

mod The name of the module in which the error was detected.

iii The job name.

sss The step name.

ddbname[-#] The data definition (DD) name, followed by a concatenation number (#) if the DD statement is part of a concatenation and not the first DD statement in the concatenation.

dev The device number.

volser The volume serial number.

dsname(member) The data set name. Member name if specified. If the value of dsname in the message is ...PATH=.SPECIFIED..., the problem was with a z/OS UNIX file.

Explanations of the hexadecimal return codes follow.

Return Code Explanation
04 One of the following:
  • An I/O error occurred in reading the format-1 data set control block (DSCB).
  • The format-1 DSCB for the data set could not be found on the first volume (the volume indexed by the volume sequence number) specified by the DD statement or the catalog. For this case, make sure that the DSNAME and VOLUME parameters in the DD statement or in the catalog are correct.
  • The data set name in the JFCB passed to OPEN has been incorrectly modified.
  • The volume serial number of the data set name supplied in the JFCB passed to OPEN was not available to the job because it was being used by some other job. (It's possible that the volume serial number in the JFCB of either this job or the other job which is already using the volume, has been incorrectly modified.) Either the data set was being opened for INPUT and some other job had exclusive control of the data set (either referenced the data set in a DD control statement with DISP of OLD or MOD, or issued an OPEN TYPE=J macro instruction with processing option INOUT, OUTIN, OUTPUT, OUTINX, EXTEND, or UPDATE), or the data set was being opened for an option other than INPUT (INOUT, OUTIN, OUTPUT, or UPDATE: requiring exclusive control of the data set) and some other job was using the data set (either referenced the data set in a DD control statement, or issued an OPEN TYPE=J macro instruction).

An OPEN macro instruction was issued for a password-protected data set, but the system was unable to locate the PASSWORD data set. Make sure that the PASSWORD data set exists on the system residence volume. If this data set does not exist, build it and run the job step again.

An I/O error occurred in reading a format-1 DSCB for a direct-sequential or indexed-sequential data set, or the format-1 DSCB could not be found on the volume specified by the DD statement for a direct-sequential or indexed-sequential data set. Ensure that the DSNAME and VOLUME parameters in the DD statement are correct.

OPEN failed because the data set type was large format sequential, but the access method was not QSAM, BSAM or EXCP or the DCB did not specify DSORG=PS.

OPEN failed because the data set type was large format sequential, but the application program could not access the whole data set on the volume. Both of the following are true:
  • The access method is either EXCP being opened for UPDAT or output processing or the access method is BSAM with the NOTE or POINT
OPEN failed because the data set type was large format sequential, but the application program could not access the whole data set on the volume. All of the following are true:

- The access method is EXCP, BSAM or QSAM being opened for UPDAT or output processing.
- BLOCKTOKENSIZE=LARGE is not specified on the DCBE.
- BLOCKTOKENSIZE(REQUIRE) is specified in PARMLIB member IGDSMSxx.

OPEN failed because the data set type was large format sequential, but the application program could not access the whole data set on the volume. All of the following are true:

- The access method is either EXCP or it is BSAM with the NOTE or POINT function requested
- The DCB is being opened for input processing.
- BLOCKTOKENSIZE=LARGE is not specified on the DCBE.
- The data set has more than 65535 tracks allocated on the volume.

OPEN failed because the data set type was large format sequential, but the application program could not access the whole data set on the volume. All of the following are true:

- The access method is EXCP, BSAM or QSAM being opened for input processing.
- BLOCKTOKENSIZE=LARGE is not specified on the DCBE.
- The data set has more than 65535 tracks allocated on the volume.
- BLOCKTOKENSIZE(REQUIRE) is specified in PARMLIB member IGDSMSxx.

An I/O error occurred in writing back a format-1 DSCB.

An OPEN macro instruction was issued for an ISAM data set, and failed because ISAM is no longer supported. For OPEN to succeed, the data set must be converted to VSAM.

During an open, a volume contained more than 16 extents of the indicated data set.

During an open, a volume of the indicated data set had a type of split cylinder allocation that is not supported under the operating system.

An OPEN macro instruction was issued for a demountable direct-access data set, UNIT=SYSDA, but the unit already contained 127 users, the maximum number. This should never occur for any currently supported direct-access devices.

The DFSMShsm format-1 DSCB-not-found module encountered an error.

An attempt was made to open a partitioned data set (PDS) for OUTPUT,DISP=SHR. The PDS is already open in this condition, and a DCB is already open for output to the data set. The data set might be on the same system or on another system that is sharing the volume. Access was not serialized before the attempt to open the data set.

An OPEN macro instruction was issued for a compressed-format data set created with tailored compression on a system that does not support accessing such a data set.

An OPEN macro instruction was for a partitioned data set extended (PDSE) and one of the following conditions was not satisfied:

- A DCB key length of zero is required if output operations are to be performed on a PDSE or extended-format data set.
- A key length of zero or eight is required if input operations are to be performed on the directory of a PDSE.

An OPEN macro instruction was issued with a RECFM value that specified a format different from that specified by the format-1 DSCB, and the data set was a PDSE or compressed data set.

An OPEN macro instruction was issued for a PDSE with a DCB specification indicating MACRF=(E). MACRF=(E), EXCP, is not supported for PDSEs.
The program issued an OPEN macro to extend a UNIX file, but the DCB record format is FB and the file length is not a multiple of the record length (LRECL). Either the OPEN option was EXTEND or OUTINX, or DISP=MOD was coded with an OPEN option of OUTPUT or OUTIN.

OPEN detected a bad return from the extended cache attribute facility.

OPEN was issued for output against a PDSE and the DCB indicated a DSORG of PS, but no member was specified.

OPEN detected an error return code from an SMS service while processing a PDSE.

An attempt was made to change the DSORG value in the Format1 DSCB for an SMS-managed data set either from PS to PSU or from PO to POU. Unmovable data sets are not supported on SMS-managed volumes.

OPEN detected an error return code from the resident convert routine while processing a PDSE.

An incorrect OPEN option was specified for a PDSE.

An OPEN macro instruction was issued for a PDSE with RECFM = FB(S) and LRECL = 0.

An OPEN macro instruction issued for a PDSE requested a QSAM update, but locate mode was not specified in MACRF.

OPEN detected a cross-system share conflict for the PDSE.

OPEN detected a member share option conflict for the PDSE.

An OPEN macro instruction was issued against a PDSE; however, the primary space amount was zero.

An OPEN macro instruction for output was issued against a PDSE, but a DFSMSdss™ dump (or equivalent function) was in progress.

OPEN detected a bad return code from the SETLOCK macro instruction while attempting to get or release the local lock around a branch entry GETMAIN. The data set is a PDSE or extended-format data set.

An OPEN macro instruction was attempted for a path, using a DCB, but the system does not support the combination of access method and OPEN macro option. With BSAM and QSAM, OPEN supports any options except RDBACK and UPDAT. With BPAM, the system supports only the INPUT option of OPEN.

An OPEN macro instruction was attempted for an HFS data set, using a DCB. You cannot use BSAM or QSAM OPEN to open a data set with DSNTYPE=HFS.

An OPEN was attempted for a PDSE data set while a restore operation was in progress.

An OPEN macro instruction was attempted against an extended-format data set, but the DSORG value is not PS.

An OPEN was issued for an extended-format data set that consists of more than one stripe, but the volumes specified were not in the correct ascending sequence.

An OPEN macro instruction was issued with a DCB that pointed to a data control block extension (DCBE) that had a nonzero DCB pointer. The DCB address in the DCBE must be zero before OPEN is issued.

OPEN detected a bad return code from TRKCALC while processing an extended-format data set.

OPEN detected a bad return code from a system service used in calculating the high-allocated relative byte number (RBN) of an extended-format data set.

OPEN detected that the stripes of an extended-format data set were not consistent.

OPEN detected that the last volume indicator in the volume label of one of the stripes of an extended-format data set was set incorrectly.

OPEN detected that the volume sequence number in the volume label of one of the stripes of an extended-format data set was incorrect.

An OPEN was attempted against an...
extended-format data set with a DCB that specified EXCP. EXCP is not supported for extended-format data sets.

BC  An OPEN macro instruction was issued; however, the DCB specified BDAM and OPTCD=A, which is invalid.

C0  An OPEN macro instruction was attempted against an extended-format data set; however, one or more of the stripes did not satisfy the hardware requirements of an extended-format data set.

C4  An OPEN was issued for an extended-format data set, which is not supported on this level of the system.

C8  An attempt was made to open a compressed data set for update. The update option is not supported for compressed data sets.

CC  The compressed indicator is on in the DSCB, but the extended format-indicator is off.

D0  OPEN encountered an error attempting to access the catalog while processing a data set in the compressed format.

D4  OPEN was unable to calculate a physical block size for a data set in the compressed format.

D8  OPEN detected that no physical block size was found in the catalog for a compressed-format data set.

DC  Error return code from compression services OPEN.

E0  A null dictionary token was found in a catalog for a compressed-format data set open for input, and the data set is not empty.

E2  During open processing, an error was encountered in reading a tailored dictionary from a compressed-format data set.

E3  During open processing, an invalid dictionary token for a tailored compressed-format data set was encountered.

E4  OPEN encountered an I/O error while attempting to read in the last block of a compressed-format data set.

E5  During open processing, an invalid tailored dictionary was found within a compressed-format data set.

E6  During open processing, an error was encountered from compression services in validating a tailored dictionary for a compressed-format data set.

E7  During open processing, an error was returned from the routine responsible for processing the tailored dictionary of a compressed-format data set (the IGG019VT routine).

E9  During open processing, a physical sequential data set was found within a partitioned concatenation.

F0  An error occurred in reading the format-1 DSCB on one of the volumes of an extended-format data set during the calculation of the size of the data set because GETSIZE=YES was coded in the DCBE macro.

F4  An error occurred in reading a DSCB on one of the volumes of a compressed-format data set during the calculation of the size of the data set because GETSIZE=YES was coded in the DCBE macro.

F8  The OPEN function for BSAM or QSAM access to a UNIX file found that the file type is not supported. For example, BSAM and QSAM do not support an external link.

FC  The OPEN function for BSAM or QSAM access to a UNIX file found that the file does not exist.

FD  An attempt was made to open a physical sequential data set for output with DISP=SHR when the data set was already opened for output processing and enhanced data integrity MODE(ENFORCE) was active.

System action: The system ends the task, unless the DCB ABEND exit routine specifies that the error is to be ignored. For return code 30, DFSMSdfp also issues message IEC813I.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Enter the following reply to message AHL100A:

```
TRACE=SYS,USR,SLIP
```

In the DD statement for the data set in error, specify these values:

```
DCB=DIAGNS=TRACE
```

Application Programmer Response: Correct any user error that caused the abnormal end of the task, as indicated by the return code in the message text. Rerun the job.

Return code 04 indicates a probable user error. If an OPEN TYPE=J macro instruction is issued to a data set not referenced in a DD JCL statement, the normal procedures for data set protection are not performed with the JOB is initiated, but must be performed at open time when no recovery is possible. The issuer of such an OPEN TYPE=J must ensure that no other JOB is processing the data set in a manner which is in conflict with the processing requested by the OPEN macro instruction. This can best be accomplished by not using the OPEN TYPE=J macro instruction to open to a data set which is not already referenced in a DD control statement, and not opening with a processing option of INOUT, OUTPUT, OUTINX, EXTEND or UPDAT unless the DD control statement indicates DISP=OLD OR DISP=MOD. Ensure that the JFCB has not been incorrectly modified.

For return code 10, (a) update the DSORG to be PS or (b) update the access method to be either EXCP, BSAM or QSAM.

For return code 14, (a) update the DCB to point to a DCBE macro with BLOCKTOKENSIZE=LARGE and if necessary modify the program to handle large format data sets as described in z/OS Using Data Sets, or (b) if the data set contains 65535 or fewer tracks, ensure the OPEN option is INPUT (with BSAM or EXCP) or UPDAT (with BSAM).

For return code 15, (a) update the DCB to point to a DCBE macro with BLOCKTOKENSIZE=LARGE or (b) if the data set contains 65535 or more tracks, ensure the OPEN option is OUTPUT, OUTIN, OUTINX, EXTEND or UPDAT (with any access method) and UPDAT (with BSAM or QSAM).

For return code 16, (a) update the DCB to point to a DCBE macro with BLOCKTOKENSIZE=LARGE or (b) if the data set contains 65535 or more tracks, ensure the OPEN option is INPUT (with BSAM or EXCP) or UPDAT (with BSAM).

For return code 17, (a) update the DCB to point to a DCBE macro with BLOCKTOKENSIZE=LARGE or (b) if the data set contains 65535 or more tracks, ensure the OPEN option is INPUT (with any access method) or UPDAT (with BSAM).

For return code 20, contact the IBM Support Center.

For return code 30, see message IEC813I to determine who owns the PDS resource that is preventing this open from being successful.

For return code 38, set the key length to zero if output operations are to be performed, or set the key length to zero or eight if input of the directory is to be attempted. Rerun the job. Optionally, you can rerun the job with no changes if allocation of the PDSE is changed to the allocation of a PDS.

For return code 3C, you can change the record format so that the blocked attribute can be removed or added. A fixed data set, however, cannot be accessed as variable, and a variable data set cannot be accessed as fixed. Rerun the job after changing the DCB to utilize the record format consistent with the DSCB.

For return code 44, change the file name, the file length, or the record format.

For return codes 48, 50, and 60, contact the system programmer.

For return code 4C, output to a PDSE directory is not allowed. If you attempt to write to the PDSE, either specify a member name or specify DSORG = P0. If you attempt to access the directory, open it for input.

For return code 64, verify that the DCB does not specify an option that is not allowed for a new library, such as RDBACK.

For return code 68, verify that the DCB specifies a correct LRECL if RECFM = FB is specified.

For return code 6C, QSAM update can be used only with locate mode. Modify the DCB to specify locate mode in MACRF.

For return code 70, ensure that share restrictions are not violated for a PDSE accessed by multiple computer processor complexes (CPCs).

Contact the system programmer for the following return codes: D0, D4, D8, DC, E0, and E4.

For return code E9, DSORG=PO is specified in the DCB, but one or more of the concatenated data sets are not PDSs or PDSEs. BPAM concatenation requires that all the concatenated data sets be PDSs or PDSEs. Correct the error and rerun the job. In this case, the message displays the concatenation number and the data set name for the first data set in the concatenation, and, therefore, does not identify the data set in error.

For return code F8, choose a different file.

For return code FC, change the file name or create the file.

For return code FD, change the file name or create the file.

For return code 3, opening a PS data set for output while it is already open for output is not allowed by the enhanced data integrity function. Correct the application, have the system programmer add this data set name to the exclude list in the PARMLIB member IFGPSEDI, or bypass enhanced data integrity processing by setting the DCBEEXP0S bit on in the DCBE or by specifying the "bypass data set integrity" option in the program properties table or the dynamic allocations options. For information about specifying the "bypass data set integrity" option, see z/OS MVS Initialization and Tuning Reference.

System programmer response: If the error recurs
and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Problem determination:** Not applicable

**Source:** DFSMSdfp

**Detecting Module:** IFG0194A

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** The error occurred during processing of an OPEN macro instruction for a data set on a direct access device.

In the message text:

- **rc** Associates this message with system completion code 313 and with the return code.
- **jjj** The job name.
- **sss** The step name.
- **ddname[-#]** DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- **dev** The device number.
- **ser** The volume serial number.
- **mod** The name of the module in which the error occurred.
- **dsname(member)** The data set name. Member name if specified.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>An I/O error occurred reading a format 2 or format 3 DSCB.</td>
</tr>
<tr>
<td>08</td>
<td>Unexpected return code from DASD calculation services (DCS). OPEN received a non-zero return code from DCS while trying to get a system-determined blocksize for the DASD data set being opened. The call was made to DCS because the user didn’t specify a blocksize.</td>
</tr>
<tr>
<td>0C</td>
<td>During an attempt to open a data set, open encountered an extended attribute DSCB (format-8) for a data set that is not eligible to have extents above 65,520 cylinders. This is invalid for this type of data set.</td>
</tr>
</tbody>
</table>

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:** Corrective action depends on the return code displayed in this message:

For return code 04: A defective volume or device may be the cause. Save the output from the failing job to help analyze the problem. Try rerunning the job, with a different volume or device:

- If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement.
- If the job needs a specific volume, try requesting a different device in the UNIT parameter of the DD statement.

For return code 08: For information on diagnosing DASD calculation service errors, refer to [z/OS DFSMSdfp Diagnosis](https://www.ibm.com/systems/ibm/dfsmsdfp/diagnosis/)

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Source:** DFSMSdfp

**Detecting Module:** IFG0194C, IFG0194E

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** The error occurred during processing of an OPEN macro instruction for a data set on magnetic tape or on a direct access device.

In the message text:

- **rc** Associates this message with system completion code 413 and with the return code.
- **jjj** The job name.
- **sss** The step name.
IEC145I

**ddname[-#]**  DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

**dev**  The device number.

**ser**  The volume serial number.

**Note:** This is the mounted volume. The volume serial number is omitted if there is no volume mounted on the drive.

**mod**  The name of the module in which the error occurred, if it is available.

**dsname(member)**  The data set name. Member name if specified.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>No device is available for mounting the volume containing the data set to be opened (dsn), or the allocated device is not available for one of these reasons:</td>
</tr>
<tr>
<td></td>
<td>• The volume already on the allocated device, identified in the ser field of the message text, is permanently resident, reserved, or enqueued.</td>
</tr>
<tr>
<td></td>
<td>• The requested volume is in use elsewhere.</td>
</tr>
<tr>
<td></td>
<td>• Another DCB is open on the device and the device is a magnetic tape.</td>
</tr>
<tr>
<td></td>
<td>• The device type is incompatible with the DSORG in the DCB.</td>
</tr>
</tbody>
</table>

Specify another device in the UNIT parameter of the DD statement.

**Notes**

• This error can occur if you modify the volume serial number in the JFCB after the device is allocated but before the data set is opened. In this case, specifying the DEFER subparameter on the UNIT parameter of the DD statement might solve the problem.

• This error can be caused by a previous abnormal termination associated with the same device in the same step. In this case, correct the error that caused the previous abnormal termination.

08  If this message is not preceded by an IEC710I, IEC711I or IEC712I message, an I/O error occurred when positioning a magnetic tape volume. If this message is preceded by an IEC710I, IEC711I or IEC712I message, the label anomaly exit routine of your installation caused this ABEND. In the latter case, the system called this exit because of the condition described in that message.

10  An I/O error occurred reading the volume label on a magnetic tape volume or the operator replied 'A' to message IEC514D after a label error.

18  The specified data set was opened for input, but no volume serial number was specified on the DD statement. A recovery attempt request may be specified in the DCB ABEND exit routine.

20  An OPEN macro instruction was issued for a data set, but volume sequence number on the associated DD statement was greater than the number of volumes containing the data set.

One of the following is true:

• An I/O error occurred while reading the volume label on a direct access volume.

• The label is incorrect.

• An I/O error occurred while reading the format-4 DSCB.

• The format-4 DSCB in the VTOC is incorrect.

24  An OPEN macro instruction was issued for a data set on magnetic tape. A density was specified in the DCB DEN parameter which was incompatible with the recording density of the drive allocated to the data set. Change the DD statement to specify a tape drive with the recording density specified in the DCB macro instruction.

The OPEN DA volume verification module was passed an error return code in register 15 after issuing the IEFSSREQ macro instruction. This code indicates the subsystem discovered a functional or logical error that it could not process.

28  An error occurred during MOUNT, DEMOUNT, ACQUIRE, or
RELINQUISH operation on an Mass Storage System (MSS) virtual volume.

The MSS hardware mounted a virtual volume other than the one requested.

LABEL=(n) was specified, where n is greater than 1, and vol=ser was not specified for a tape data set.

During a Read Block ID command to establish the tape position, an error occurred.

Open detected a bad return code from the Extended Cache Attribute Selection Facility (CASF).

The device does not support the recording mode requested by the user or determined by the system.

The tape volume does not conform to the single recording mode rules. For input data sets, the violation has occurred during a previous process in which the rules could not be enforced. For output data sets, no violation has yet occurred, since the abend prevents this from happening.

A JFCB contained a data set name of blanks. The address of this JFCB was found during both OPEN TYPE=J processing in the DCB exit list for a RDJFCB and OPEN TYPE=J,SVC processing.

The job file control block (JFCB) contained an expiration date of X'FFFFFF', which indicates that expiration date checking should be bypassed by open processing. However, the application is not APF authorized, and expiration date checking can only be bypassed by APF authorized applications. The JFCB address was found during OPEN TYPE=J processing in the device control block (DCB).

Invalid return code from an OCE Tape Installation Exit. See IEC998I for name of specific exit and value of not valid return code.

An OPENJ macro instruction was issued for a data set, but the volume sequence number in the JFCB provided by the application was greater than the maximum allowed of 255.

The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:
TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:
DCB=DIAGNS=TRACE

Application Programmer Response: Probable user error unless an I/O error has occurred. Correct the errors causing abnormal termination as indicated by the return code in the message text. Rerun the job. The 28 return code error indicates a subsystem interface problem and your system programmer should be contacted for advice.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Source: DFSMSdfp

Detecting Module: IFG0194A

Routing Code: 11

Descriptor Code: 6

IEC146I 513-rc,mod,iii,sss, ddname[-#],dev,ser,dsname

Explanation: The error occurred during processing of an OPEN macro instruction for a data set on magnetic tape.

In the message text:
rc Associates this message with system completion code 513 and with the return code.
iii The job name.
sss The step name.

ddname[-#] DName (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev The device number.
ser The volume serial number.
mod The name of the module in which the error occurred.
dsname The data set name.

The explanation for the hex return code is as follows:

Return Code Explanation
04 An OPEN macro instruction was issued for a magnetic tape data set
allocated to a device that already has an open data set on it. Make sure that the first data set is closed before the second is opened, or allocate the second data set to a different device. This error may be due to a previous abnormal end associated with the same unit in the same step. If so, correct the error causing the previous abnormal end.

08 A label violated the published standard for that label, and the label validation exit issued a return code requesting OPEN/EOV to reject the volume.

10 An OPEN macro instruction was issued for output (DISP=MOD) processing for an ISO/ANSI Version 4 tape data set, but the tape was not created using the IBM Version 4 label standards. z/OS DFSMS Using Magnetic Tapes describes these standards.

User Response: Correct the problem and rerun the job.

14 An OPEN macro instruction was issued for either input or output (DISP=MOD) processing for an ISO/ANSI Version 4 tape data set but the coded character set ID (CCSID) specified is not compatible with the CCSID of the data currently on the tape.

User Response: Correct the specified CCSID and rerun the job.

18 Data conversion requested for an ISO/ANSI Version 4 tape. However, OPEN was issued in a key different from the key of the task. This is not supported.

0C The volume contains a volume label that is not a standard version label supported for any of the following kinds of DCB processing:

- An input volume with an ISO/ANSI standard VOL1 label that is not 1, 3 or 4.
- An output volume with an ISO/ANSI VOL1 1 label that is not Version 3 or 4 and is to be written at other than the first data set, or that is to extend the first data set (for example, DISP=MOD). The system does not support extending a volume that has Version 1 or unsupported labels.

1C Data conversion requested for an ISO/ANSI Version 4 tape. However, OPEN was issued by an authorized user. This is not supported.

20 Data conversion requested for an ISO/ANSI Version 4 tape. However, the system encountered a problem attempting to create the conversion tables required for input processing.

24 Data conversion requested for an ISO/ANSI Version 4 tape. However, the system encountered a problem attempting to create the conversion tables required for output processing.

28 Data conversion requested for an ISO/ANSI Version 4 tape. However, data conversion is not supported on the level of the system. The minimum system level requirements are OS/390 Release 5 and DFSMS/MVS 1.5.0.

2C An OPEN macro instruction was issued for a magnetic tape data set whose label indicates it has a BLKSIZE greater than 32760 bytes. This is not supported on this level of the system.

System action: The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

Application Programmer Response: Probable user error. Correct the errors causing abnormal end as indicated by the return code in the message text. Rerun the job.

If the return code is 08, the label field in error is identified in message IEC512I. Respond to IEC512I before reusing the volume.

If the return code is 0C, correct the volume label to be compatible with ISO/ANSI Version 3 or Version 4 processing (use the IEHINITT utility program).

For return codes 20 and 24, verify the specified CCSIDs are supported. For a list of supported CCSIDs, see z/OS DFSMS Using Data Sets. If a CCSID is not valid, correct the CCSID and rerun the job. Otherwise, the System Programmer.

If the return code is 2C, then either correct the tape BLKSIZE, or override the BLKSIZE in the tape label by specifying the BLKSIZE parm on the DD statement. However, that should only be done if you know that the records on the tape are actually not greater than 32760 bytes. If you do override the BLKSIZE in the label, and there are records greater than 32760 bytes, then unpredictable results can occur.

Note that other new return codes are covered under the general “probable user error” comment and do not need to be individually mentioned.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Source: DFSMSdfp
Detecting Module: IFG0194A
Routing Code: 11
Descriptor Code: 6

IEC147I 613-rc,mod, jji, sss, ddname[-#, dev, ser, dsname]

Explanation: The error occurred during processing of an OPEN macro instruction for a data set on magnetic tape.

In the message text:
rc Associates this message with system completion code 613 and with the return code.
jjj The job name.
sss The step name.
ddname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
dev The device number.
ser The volume serial number.
mod The name of the module in which the error occurred.
dsname The data set name.

The explanation for the hex return code is as follows:

Return Code Explanation
04 An I/O error occurred positioning a magnetic tape, or the installation exit, via return code 08, rejected the tape volume.
08 An I/O error occurred reading a label on a magnetic tape volume.
0C An incorrect label was read from a magnetic tape volume. Make sure that the correct volume was mounted, and that it contains standard labels. If it is the desired volume, recreate it, and rerun the job. This error may be due to a previous abnormal end associated with the same tape since it was last mounted, possibly in a previous job or step, leaving the tape positioned improperly. If so, either correct the error causing the previous abnormal end or reestablish the tape position by causing it to be unloaded and mounted again by the system.
10 An I/O error occurred writing a tape label.
14 An I/O error occurred writing a tape mark after the header labels.
18 A perform subsystem function error was detected during a logical write protection operation in an AT LDS.
1C An error was detected while processing a tape cartridge in an AT LDS or MTLDS. See the accompanying message(s) for detailed information about the error.
20 While attempting to update a volume record in the tape configuration database an error was encountered during SSI processing.
24 An AT LDS tape volume was opened for output processing and it is file protected.
28 An AT LDS or MTLDS tape volume record to be updated was not located in the tape configuration database.
2C A CBRXVOL parameter list error was detected while the system was attempting to update an AT LDS or MTLDS tape volume record.
30 A CBRXVOL internal processing error occurred while the system was attempting to update an AT LDS or MTLDS tape volume record.
34 An SAF/RACF authorization failure occurred while the system was accessing the AT LDS or MTLDS tape configuration database.
38 The system encountered a catalog access error while processing an AT LDS or MTLDS tape volume record.
40 A label type other than SL, SUL, AL, or AUL was specified for a tape volume in an automatic tape library dataserver (AT LDS) or manual tape library dataserver (MT LDS).
44 The error system default number for system mount messages for a tape volume in an AT LDS or MTLDS has been exceeded.

The operator replied M to WTOR
IEC507D for a private volume in an automatic tape library dataserver.

An unexpected return code was returned by CBRXVOL while attempting to update or read an ATLDS or MTLDS tape volume record.

An extended length ATLDS cartridge was mounted on a non-extended length cartridge capable device.

An ATLDS cartridge was mounted that exceeds that IBM maximum length.

An ATL private cartridge’s internal volume serial number was unreadable, had no label, or the volume was uninitialized.

A private labeled (SL or AL) D/3494 or D/T3494 (ATL) volume is mounted for input processing and the request was for a NL volume while the ATL is in automatic mode.

The 3590 cartridge mounted for a specific mount request in an automated tape library dataserver is unformatted. 3590 cartridges must be formatted before they can be processed.

The 3590 cartridge mounted for a specific mount request in an automated tape library dataserver is either an unsupported media type or medium length.

An attempt was made to open a tape data set with a data set sequence number greater than 9999 which is not supported at this level of the system.

An attempt was made to overwrite existing data or labels on a WORM type tape cartridge. Neither data nor labels can be overwritten on this cartridge type.

Media6, Media7 or Media8 mounted on D/T3592 and no software support exists. Neither is there software support for the media type or the recording technology.

An I/O encryption error occurred during processing of an OPEN macro instruction.

**System action:** The system ends the task unless either one of the following conditions is true:

- The error is to be ignored or recovered as specified in the DCB ABEND exit routine.
- Retry processing for return code 08 or 0C is successful.

If the error occurred in an IBM 3495 Tape Library Dataserver then a software error record is also written to the logrec data set.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

`TRACE=SYS,USR,SLIP`

On the DD statement for the data set in error, specify:

`DCB=DIAGNS=TRACE`

**Application Programmer Response:** Probable user error unless an I/O error has occurred. Correct the errors causing abnormal end as indicated by the return code in the message text. Rerun the job.

**System programmer response:** This error may be caused by a hardware problem; if applicable, contact hardware support. If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

If the error occurred in an IBM 3495 Tape Library Dataserver and it was not because the volume is file protected resubmit the job. If the job fails after resubmission, then search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job and the logrec data set error record.

**Source:** DFSMSdfp

**Detecting Module:** IFG0195B

**Routing Code:** 11

**Descriptor Code:** 6

IEC148I 713-rc,mod,iii,sss, ddname[-
#],dev,ser,dsname(member)

**Explanation:** The error occurred during processing of an OPEN macro instruction for a data set on magnetic tape or on a direct access device.

In the message text:

- `rc` Associates this message with system completion code 713 and with the return code.
- `iii` The job name.
- `sss` The step name.
- `ddname[-#]` DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in concatenation).
- `dev` The device number.
ser  The volume serial number.
mod  The name of the module in which the error occurred.

dsname(member)  The data set name.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>A data set on magnetic tape was opened for INOUT, OUTIN, OUTPUT, OUTINX, or EXTEND, but the volume contained a data set whose expiration date had not been reached. The operator replied 'M' to message IEC507D and a specific volume serial had been specified. Specify a different volume on the DD statement, or, in the case of INOUT only, open for input only by changing the OPEN macro instruction or by specifying input in the LABEL parameter of the DD statement.</td>
</tr>
<tr>
<td>08</td>
<td>An OPEN macro instruction was issued with INOUT for a data set on a direct access device with DISP=OLD specified on the DD statement. The expiration date on the data set had not been reached. The operator replied 'M' to message IEC507D. Specify a different volume on the DD statement, or open for input only by changing the OPEN macro instruction or by specifying input in the LABEL parameter of the DD statement. There is another possible meaning for return code 08: the volume serial number in the UCB is 000000. In this case, the system does not issue message IEC507D.</td>
</tr>
</tbody>
</table>
| 0C          | One of the following:
• During OPEN processing, the system issued messages IEC704A with either L, L UVL, C, C UVL in the text and the operator replied M to the message, meaning reject VOL1 label rewrite. The system had to end the job step.
• During OPEN processing, IEC704A was issued 10 times because of a not valid reply or repeated IO errors during the VOL1 rewrite. |
| 10          | A data set on magnetic tape was opened for OUTPUT or OUTIN. The volume is mounted on a cartridge stack loader and is file-protected. The operator replied U to message IEC510D and specified a volume serial number. Specify a different volume on the DD statement. |

For a specific private tape in the Automated Tape Library (ALT), either:
• message IEC534D was issued and the reply was 'M' to mount another volume, or
• an existing data set with an unexpired date was detected, and either message IEC507D was issued with reply 'M' or the File Validation Tape Installation Exit received control and returned a RC08 to reject the volume.

In an ATL, all volume serial numbers must be unique. There can not be any volume substitution for specifically requested volumes.

System action: The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

Application Programmer Response: Probable user error unless the volser in the UCB is 000000. If the volser is 000000, it is probably a system error and the system programmer should be contacted. Otherwise, correct the errors causing abnormal end as indicated by the return code in the message text. Rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Descriptor Code: 6
IEC150I

rc Associates this message with system completion code 813 and with the return code.

jjj The job name.

sss The step name.

ddbname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev The device number.

ser The volume serial number.

mod The name of the module calling the routine that issued the message.

dsnam The data set name.
tapelbeldsn The data set name in the tape label.

The explanation for the hex return code is as follows:

Return Code Explanation
04 An OPEN macro instruction was issued for a data set on magnetic tape, but the data set name on the header label did not match that in the JFCB. Verify that the DD statement specifies the correct DSNAME and volume serial number. If they are correct, ensure that the JFCB was not incorrectly modified prior to issuing the OPEN macro. This error may also appear if the first file on the magnetic tape does not exist; that is, the tape contains only a volume label and a dummy header.

System action: The task is ended unless the error is to be ignored or recovered as specified in the DCB ABEND exit routine.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:
TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:
DCB=DIAGNS=TRACE

Application Programmer Response: Probable user error. Correct the errors causing abnormal end as indicated by the return code in the message text. Rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Detecting Module: IFG0195H
Routing Code: 11
Descriptor Code: 6

IEC150I 913-rc,mod,jjj,sss, ddbname[-#],dev,ser,dsname(member)

Explanation: The error occurred during 1) the processing of an OPEN macro instruction or during end-of-volume for a password-protected data set after the operator attempted to enter a password in response to message IEC301A or 2) the processing of an OPEN macro instruction involving a checkpoint data set. A VSAM data set is being opened with a DCB instead of an ACB.

In the message text:
rc Associates this message with system completion code 913 and with the return code.

jjj The job name.

sss The step name.

ddbname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev The device number.

ser The volume serial number.

mod The name of the module in which the error occurred.

dsnam The data set name. Member name if specified.
tapelbeldsn The data set name in the tape label.

The explanation for the hex return code is as follows:

Return Code Explanation
04 For ISO/ANSI Version 1:

An OPEN macro instruction was issued for a magnetic tape data set with ISO/ANSI labels. The volume accessibility byte (the eleventh byte) is not blank. This indicates that the label was not written on an IBM system or that it was written by the user. If the volume accessibility byte is not blank, the tape cannot be used on an IBM system. Make sure that the correct volume is mounted. If it is the correct volume, it must be recreated for use on an IBM system.
For ISO/ANSI Version 3 or Version 4:

This message occurs after message IEC502E with the $ddn$-$c$ field in the message text and with $c=1$, meaning that the mounted volume is the requested volume, but access to it has been denied.

For ISO/ANSI Version 1:

An OPEN macro instruction was issued for a magnetic tape data set with ISO/ANSI labels. The security byte in the header label was not blank and not equal to ASCII 1. This means that the label was not created on an IBM system or was created by the user. Make sure that the correct volume is mounted. If it is the correct volume, it must be recreated on an IBM system.

For ISO/ANSI Version 3 or Version 4:

This message occurs after message IEC502E with the $ddn$-$c$ field in the message text and with $c=2$, meaning that access to the requested data set has been denied.

An OPEN macro instruction was issued, but either an I/O error occurred during password verification, or one of the following conditions occurred:

1. For a password-protected data set, the operator failed to supply the correct password in response to message IEC301A or Time Sharing Option/Extensions (TSO/E) message IEC113A.
2. For a protected VSAM data space that has password-protected or RACF-protected data or index components, the operator failed to supply the correct passwords or the user did not have proper RACF authorization.
3. For a VSAM data set being opened using a DCB, the DSCB contained incorrect information.

An OPEN macro was issued to the VTOC for output processing by an unauthorized job step or job-step task. The ability to open the VTOC for output is restricted to authorized job steps or job step tasks.

An OPEN macro instruction was issued to concatenate checkpoint and noncheckpoint data sets.

An OPEN TYPE=J macro instruction was issued for a magnetic tape volume. The JFCB was modified to indicate LABEL=BLP (bypass label processing) and the task was not authorized. BLP can be specified in the JCL (if the installation allows it via its reader procedure), but the JFCB cannot be modified to indicate BLP unless the task is authorized.

The error occurred during processing of an OPEN TYPE=J macro instruction to a data set residing on a direct access device. The JFCB has been incorrectly modified or the data set name supplied in the JFCB passed to OPEN was not available to the job because it was being used by some other job. Either (1) the data set was being opened for INPUT and some other job had exclusive control of the data set (either referenced the data set in a DD control statement with DISP of OLD or MOD, or issued an OPEN TYPE=J macro instruction with processing option INOUT, OUTIN, OUTPUT, OUTINX, EXTEND, or UPDATE), or (2) the data set was being opened for an option other than INPUT (INOUT, OUTIN, OUTPUT, or UPDATE: requiring exclusive control of the data set) and some other JOB was using the data set (either referenced the data set in a DD control statement, or issued an OPEN TYPE=J macro instruction).

An OPEN macro instruction was issued using the EXCP access method in which user-written appendages were required. The appendage names were not included in the SYS1.PARMLIB member IEAAPPO0, and the program issuing the OPEN was not authorized either under APF, or by being in a system protect key (0-7).

An OPEN macro instruction was issued for a checkpoint data set. The data set organization was not BPAM or BSAM and the task was not authorized via the authorized program facility (APF).

An OPEN or OPEN TYPE=J macro instruction was issued to an ISAM data set defined by two or three DD statements. Either 1) the data set
names coded in the DD statements were not all the same, or 2) the JFCB passed to OPEN TYPE=J has a data set name different from that coded in the DD statements. All the DD statements for an ISAM data set must contain the same data set name. If an OPEN TYPE=J macro instruction is issued to a DName referencing an ISAM data set which is defined by two or three DD statements, the data set name cannot be altered from that coded in the DD statement, because the JFCBs for the other DD statements cannot be similarly altered.

30 An OPEN macro instruction was issued to write a data set on a magnetic tape containing one or more previous data sets. The protection mode of the data set to be written was different than the protection mode of the previous data set.

34 The OPEN/E0V volume security exit requested that the volume be rejected.

38 An OPEN was issued for a RACF-protected data set on a DASD volume or a RACF-protected tape volume to which the caller was not authorized.

3C An OPEN was issued for a non VSAM data set with a format-1 DSCB indicating a discrete RACF-protection, bit DS1ND40 set. RACROUTE REQUEST=AUTH was issued resulting in SAF, Security Authorization Facility, return code 4. This indicates the SAF router could neither accept nor fail the request. Verify the RACF security function is running on the system and that a discrete profile for the data set exists in the RACF database. See z/OS Security Server RACROUTE Macro Reference for complete explanation for SAF return code 4.

40 A VSAM data space being OPENed is RACF-defined.

44 An OPEN macro was issued to a password-protected data set. However the system’s PASSWORD data set was not valid because it is in large or extended format.

48 Incorrect specification of PROTECT. PROTECT is specified but the system tape option is not in effect.

4C Incorrect specification of PROTECT.

50 PROTECT is specified but the user is not defined to RACF.

54 Incorrect specification of PROTECT. PROTECT is specified but the request is for a NL, BLP or LTM tape.

58 Incorrect specification of PROTECT. PROTECT is specified but the volume sequence number or the file sequence number is not equal to one on a tape with LABEL=SL, SUL, AL or AUL or the tape is being opened with DISP=MOD (including OPEN options OUTINX and EXTEND).

5C Incorrect specification of PROTECT. PROTECT is specified but the volume being used is a public volume.

60 One of the following occurred:
• The user is not authorized to define a data set with the specified name. The specified data set name and file sequence indicator do not match the corresponding names in the Tape Volume Table of Contents (TVTOC).
• The user is not authorized to access this data set.

64 The user is not authorized to specify BLP.

68 One of the following errors occurred:
• The maximum number of allowed data sets in a TVTOC has been exceeded.
• An attempt was made to create a tape data set profile for a tape volume specifically defined as not allowing a TVTOC.
• An attempt was made to add a duplicate data set to a TVTOC.
• An attempt was made to add a second data set to a tape that has been defined as only allowing a single data set.
• An attempt was made to add a new data set in the middle of the tape or tape set.

6C The user is not authorized to define a data set that is protected with a general profile.

70 The caller of the open has RACF EXECUTE authority only. One of the following requirements has been violated:
The caller must be in supervisor state or the data set must be a partitioned data set (PDS).

The access method must not be EXCP.

An unexpected return code has been returned from RACF.

A security violation occurred when opening a subsystem data set or z/OS UNIX file with a DCB. The subsystem was unable to determine the user had appropriate access.

For JES3, the problem occurred when a security verification call failed.

For a UNIX file, permission was denied or the user has no access to the file. One possibility is the user has only read authority to that file but is trying to open the file for output.

An OPEN for a password-protected data set failed because the system’s PASSWORD data set was not valid because it was in extended format or large sequential data set format.

System action: The task is always ended if the return code is 0C. For all other return codes, the task is ended unless otherwise specified in the DCB ABEND exit routine.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:

DCB=DIAGNS=TRACE

Application Programmer Response: Probable user error. Correct the errors causing abnormal end as indicated by the return code in the message text. Rerun the job.

If rc is 0C for a protected data set, supply the operator with the correct password or have the correct password added to the PASSWORD data set and run the job step again.

If rc is 0C for a protected VSAM data space, supply the operator with the correct passwords or obtain the proper RACF user authorization for the data and index components within the data space and run the job step again.

If rc is 0C and an I/O error occurred, correct the problem causing the error and run the job step again.

If rc is 14, redefine the concatenated data sets such that only checkpoint or only noncheckpoint data sets are in the concatenation.

If rc is 18, probable user error. Unless your task is authorized, do not modify the JFCB to indicate BLP.

If rc is 1C, probable user error. If an OPEN TYPE=J macro instruction is issued to a data set not referenced in a DD JCL statement, the normal procedures for data set protection are not performed when the JOB is initiated, but must be performed at OPEN time when no recovery is possible. The issuer of such an OPEN TYPE=J must ensure that no other JOB is processing the data set in a manner which is in conflict with the processing requested by the OPEN macro instruction. This can best be accomplished by not using the OPEN TYPE=J macro instruction to open to a data set which is not already referenced in a DD control statement, and not opening with a processing option of INOUT, OUTIN, OUTPUT, OUTINX, EXTEND, or UPDATE unless the DD control statement indicates DISP=OLD or DISP=MOD. Ensure that the JFDB has not been incorrectly modified.

If rc is 28, redefine the data set organization to BPAM or BSAM or authorize the program issuing the OPEN macro instruction under APF.

If rc is 2C, correct the data set name on the DD statement or do not alter the data set name in the JFCB before issuing the OPEN TYPE=J macro instruction.

If rc is 30, all data sets on a tape volume must have the same security level. Change the requested security level to match the previous data sets and rerun the job.

If rc is 74, determine why z/OS UNIX system services or the subsystem gave the security failure. It may be due to opening for output but only input is allowed or due to not having search authority to the UNIX directory.

For return code 78, ensure that the PASSWORD data set has a DSNTYPE other than Extend or Large.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Detecting Module: IFG0195U

Routing Code: 11

Descriptor Code: 6

IEC1511 Explanation: The error occurred during processing of an OPEN macro instruction for a data set on magnetic tape.

In the message text:
 Associates this message with system completion code A13 and with the return code.

 jjj The job name.

 sss The step name.

 ddname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

 dev The device number.

 ser The volume serial number.

 mod The name of the module in which the error occurred.

 dsname The data set name.

 The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>An unexpected load point was encountered while positioning a tape. For NL tape this is probably a user error associated with the use of multivolume multifile NL tape. Check the file sequence number and whether the tape was demounted during the job.</td>
</tr>
<tr>
<td>08</td>
<td>The requested file sequence number is less than that of the first file on the SL or AL tape during an open to the start of the file. Probable user error. Check the file sequence number and volume serial numbers.</td>
</tr>
<tr>
<td>0C</td>
<td>The requested file sequence number is less than that of the first file on the SL or AL tape during an open to the end of a file. Probable user error. Check the file sequence number and volume serial numbers.</td>
</tr>
<tr>
<td>10</td>
<td>A tape mark was read instead of a HDR1 label while forward spacing to the desired file on an SL or AL tape. Thus, the multifile tape ends before the desired file. When positioning to the end of file 1, this means the vol label is followed by a tape mark. Probable user error. Check the file sequence number and volume serial numbers and that the job that wrote the tape wrote all the files.</td>
</tr>
<tr>
<td>14</td>
<td>A tape mark was read instead of HDR1 label while opening for input to the start of the desired file on an SL or AL tape. Thus, the tape ends just before the desired file. Probable user error. Check the file sequence number and volume serial numbers and that the job that wrote the tape wrote all the files.</td>
</tr>
<tr>
<td>18</td>
<td>An EOV1 label was read on the last SL or AL tape volume while forward spacing to the desired file or just before the desired file. There are two possible conditions:</td>
</tr>
<tr>
<td></td>
<td>1. If opening to the end of the file, it could not be treated as the end of the data set because it was for a previous file sequence number. Probable user error.</td>
</tr>
<tr>
<td></td>
<td>2. If the user is trying to extend a data set that had abended during EOV, it is necessary to specify a volume count on the DISP=MOD DD statement. This volume count must exceed the number of known volumes for the data set.</td>
</tr>
</tbody>
</table>

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:

DCB=DIAGNS=TRACE

**Application Programmer Response:** The three most common causes of this problem are:

1. Invalid volume refer backs where the DD statement referred-back-to has extended to a new volume.
2. EOV Abends (ABENDX37) occurred the last time this data set was updated. This would cause the last tape in the data set to be left with EOV labels instead of EOF labels.
3. The wrong VOLSER is specified as the last VOLSER in the data set.

Probable user error. Correct the errors causing abnormal end as indicated by the return code in the message text. Rerun the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Routing Code:** 11

**Descriptor Code:** 6
Explanation: The error occurred during processing of an OPEN macro instruction for a data set on an impact printer.

In the message text:

rc Associates this message with system completion code B13 and with the return code.

jjj The job name.

sss The step name.

ddname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev The device number.

ser The volume serial number.

mod The name of the module calling the routine that issued the message.

dsname The data set name.

The explanation for the hex return code is as follows:

Return Code Explanation

04 An OPEN macro instruction was issued for a data set allocated to a printer. The operator replied ‘CANCEL’ to message IEC120A, IEC122D or IEC123D because the UCS image could not be found in SYS1.IMAGELIB data set. Specify the correct character set type, or have the system programmer update the SYS1.IMAGELIB to include the associated UCS image or image table entry and run the job step again. During 3886 OPEN, the requested format record identifiers could not be found on SYS1.IMAGELIB.

08 An OPEN macro instruction was issued for a data set allocated to a printer. A permanent I/O error was detected when the BLDL macro instruction was issued to locate the requested UCS image in the SYS1.IMAGELIB data set.

0C An OPEN macro instruction was issued for a data set allocated to a printer or to IBM 3886. A permanent I/O error persisted after two attempts were made to load the UCS buffer or a permanent I/O error occurred while loading the format record into the 3886.

10 An OPEN macro instruction was issued for a data set allocated to a printer. A permanent I/O error was detected when (1) an attempt was made to display the character set image on the printer for visual verification with the previous output operation or (2) during an operation which resulted in possible lost data.

14 An OPEN macro instruction was issued for a data set allocated to a printer. The operator replied ‘CANCEL’ to the message IEC121D because the wrong UCS image was displayed for visual verification. Specify the correct character set type, or have the operator mount the proper chain, train or band, and run the job step again.

18 An OPEN macro instruction was issued for a data set allocated to a printer. A permanent I/O error was detected when an attempt was made to display the FCB image on the printer for visual verification.

1C An OPEN macro instruction was issued for a data set allocated to a printer. The operator may have replied ‘CANCEL’ to the message IEC128D because an incorrect FCB image was displayed for visual verification or forms alignment was not possible. If this is the case, specify the correct FCB image-id and run the job step again. Other reasons for this return code include: an error associated with the previous output operation, or a lost data condition.

20 An OPEN macro instruction was issued for a data set allocated to a printer, but not enough storage was available to open SYS1.IMAGELIB. During 3886 OPEN, either the proper volume was not mounted, or a permanent I/O error occurred while reading from SYS1.IMAGELIB.

24 An OPEN macro instruction was issued for a data set allocated to a printer, but the volume containing SYS1.IMAGELIB was either not mounted or not cataloged. During 3886 OPEN, the format record identifier was not specified in the DCB or the DD statement for the data set being opened.

28 An OPEN macro instruction was issued for a data set allocated to a printer, but the system was not able to open the SYS1.IMAGELIB data set. It
might not be cataloged correctly or, if SYS1.IMAGELIB is an alias for a data set, the user does not have RACF authority for that data set.

2C

An OPEN macro instruction was issued for a data set allocated to a printer. A permanent I/O error was detected when the BLDL macro instruction was issued to locate the requested FCB image in the SYS1.IMAGELIB data set.

30

An OPEN macro instruction was issued for a data set allocated to a printer. A permanent I/O error persisted after two attempts were made to load the forms control buffer.

34

An OPEN macro instruction was issued for a data set allocated to a printer. The operator replied ‘CANCEL’ to the message IEC127D because the FCB image could not be found in SYS1.IMAGELIB data set. Specify the correct FCB image-id, or have the system associated FCB image and run the job step again.

38

An OPEN macro instruction was issued for a data set allocated to a printer. No operation was performed for one of the following reasons:

- The data control block was not open.
- The data control block was not valid for a sequential data set.
- The SETPRT parameter list was not valid.
- The output device was not a UCS or 3800 printer.

System action: The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

Application Programmer Response: Probable user error unless an I/O error has occurred. Correct the errors causing abnormal end as indicated by the return code in the message text. Rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

### IEC157I

**Explanation:** The error occurred during the processing of an OPEN macro instruction for a graphic data control block.

In the message text:

- **rc** Associates this message with system completion code C13 and the return code.
- **jjj** The job name.
- **sss** The step name.
- **ddname[−#]** DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- **dev** The device number.
- **mod** The name of the module in which the error occurred.

### IEC158I

**Explanation:** The error occurred during the processing of an OPEN macro instruction for a graphic data control block.

In the message text:

- **rc** Associates this message with system completion code D13 and the return code.
- **jjj** The job name.
- **sss** The step name.
- **ddname[−#]** DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- **dev** The device number.
- **mod** The name of the module in which the error occurred.
The explanation for the hex return code is as follows:

**Return Code** | **Explanation**
---|---
04 | The data control block (DCB) was associated with a device other than a graphic device, or a permanent I/O error occurred during processing of an OPEN macro instruction for a DCB associated with a graphic device. The device was specified by the name subparameter of the UNIT parameter of the DD statement for the graphic data set.

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:** Probable user error. Correct the errors causing the abnormal end as indicated by the return code in the message text. Rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide all printed output and output data sets related to the problem and the source program listing for the job.

IEC161I (return code 001)  

rc{(sfi)‑}ccc, jjj, sss, ddname, dev, volser, xxx, dsname, cat

**Explanation:** General Information for Message IEC161I

An error occurred during the processing of an OPEN macro instruction for a VSAM data set. The return code and system actions documented in the following text also apply to the CLOSE and EOV messages IEC251I (CLOSE), IEC252I (CLOSE TYPE=T), and IEC070I (END OF VOLUME).

In the message text:

- **rc** The return code. This field indicates the reason for the error. For the meaning of a return code and the corresponding system actions and operator and programmer responses, see “Specific Information
for This Return Code” in the IEC1611 message description for the return code.

**sfi** Subfunction information (error information returned by another subsystem or component). This field appears only for certain return codes, and its format is shown with those codes to which it applies.

**ccc**
The problem determination function (PDF) code. The PDF code is used only by the IBM Support Center if further problem determination is required. If the PDF code has meaning for the user, it is documented with the corresponding return code.

**jjj** The job name.

**sss** The step name. This field might contain the name of the procedure step followed by the name of the job step that called the procedure. No comma separates the two names:
- If the step is part of a procedure, the eight-character name of the procedure step, including trailing blanks
- The step name, without trailing blanks

**ddname**
The data definition (DD) name.

**dev**
The device number, if the error is related to a specific device.

**volser**
The volume serial number, if the error is related to a specific volume.

**xxx**
The name of the cluster that contains the data set being processed when the error was detected. When the cluster name is not available, this field contains the DSNAME value specified in the DD statement indicated in the access method control block (ACB).

**dsname**
The name of the data set being processed when the error was detected.

**cat** The catalog name.

Any missing field is indicated by a comma.

If **xxx** specifies AMASTCAT, the error involved the master catalog. If the master catalog failed to open successfully, the cause of the failure must be corrected and the system restarted (re-IPL).

### Specific Information for This Return Code

System-managed buffering (SMB) was requested. If any subfunction information was returned, it indicates that:

1. An error occurred during VSAM system-managed buffering processing with the direct optimized (DO) technique. Either SMB proceeded with a different access bias (direct weighted), or normal VSAM processing took over and SMB was not used.

   The **(sfi)** field in the message is in the form of *(rc,rsn)*. It contains the return code and reason code for the error. The **(sfi)** field might represent a message from either one of the following sources:
   - The BLDVRP function when SMB is building an LSR pool.
   - SMB processing.

   **For BLDVRP information message text:**
   
   - **rc** The BLDVRP return code, a decimal value.
   - **rsn** The BLDVRP reason code, a decimal value.

   **For SMB information message text:**

   - **rc** Is one of the following return codes:
     - 101: The user did not specify enough virtual storage for direct optimized (DO) when using the SMBVSP parameter. Direct weighted (DW) was used instead.
     - 102: During direct optimized (DO) processing, the first try for an optimum amount of storage failed. The optimum amount, however, was already less than the defined minimum, so SMB defaulted to using the direct weighted (DW) technique.

   - **rsn** The reason code is set to 0 when accompanied by SMB return code 101 or 102.

2. If ccc=255, user requests informational message regarding the actual access bias being chosen by SMB by specifying JCL AMP MSG=SMBBIAS. The system issues two IEC1611 (return code 001) messages.

   The first IEC1611 (return code 001) message indicates the access bias used by SMB. The **sfi** field can be:
   - **DO** – Direct Optimized
   - **DW** – Direct Weighted
   - **SO** – Sequential Optimized
   - **SW** – Sequential Weighted
   - **CO** – Create optimized
   - **CR** – Create Recovery

   The second IEC1611 (return code 001) message that follows contains the SFI information in the form of four hexadecimal numbers:

   **IEC1611 001(AAAAAAAA BBBBBBBB CCCCCCCC DDDDDDDD)-255**.
Hexadecimal value of the number of buffers selected for base data component.

Hexadecimal value of the number of buffers selected for base index component.

Either an hexadecimal value of the number of buffers selected for PATH data component or zero if no path.

Either an hexadecimal value of the number of buffers selected for PATH index component or zero if no path.

**Note:** It is suggested that this message is for diagnostic or informational purpose only. VSAM OPEN will issue the message for every component being opened using this DD statement. It might flood the console during normal processing.

For more information on SMB and its access bias, see [z/OS DFSMS Using Data Sets](https://www.ibm.com/support/knowledgecenter/SSEPGU_8.4.2/com.ibm.zos.v2r4.msh.dsms_char/dsms_char_msg_icsvrvr0000.htm).

**System action:** OPEN processing continues for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 0 (X'00').

**Operator response:** None

**Application Programmer Response:** Correct the error and rerun the job.

**Detecting Module:** IDA0192A

---

**IEC161I (return code 003)  \( rc[(sfi)]\)-ccc,ijj,  
\( sss,ddname,dev,ser,xxx, dsname,cat \)

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**

One of the following warnings was issued during the OPEN of a VSAM recoverable data set being opened for output and MACRF=RLS specified on the ACB.

- \( ccc = 773 \) - An attempt to write to the undo log failed.
- \( ccc = 774 \) - An attempt to write to the forward recovery log failed.
- \( ccc = 775 \) - An attempt to write to the log of logs failed.

**System action:** OPEN processing continues for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 103 (X'67').

**Application Programmer Response:** Refer to any associated IGW* messages indicating reasons the SMSVSAM address space could not allocate/write to the specified log data set.

**Detecting Module:** IDAV192A
IEC161I (return code 004)  

rc{[sfl]}-ccc, sss, dname, dev, ser, xxx, dsname, cat

Routing Code:  11
Descriptor Code:  6

Explanation:  General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

One of the following errors occurred during VSAM catalog processing:

1. Not enough storage was available for work areas.
2. An I/O error occurred while reading the catalog cluster record, the format-1 DSCB, the format-4 DSCB, or the JFCB/SWB.
3. The format-1 DSCB or the catalog cluster record is incorrect.
4. The user-supplied catalog name does not match the name on the catalog entry.
5. The user is not authorized to open the catalog as a catalog.
   • ccc = 080 - IFG0193A: READ JFCB request failed.

System action:  OPEN, CLOSE, or EOV processing ends for the data set. CLOSE (TYPE=T operand) processing continues, if possible. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 132 (X’84’).

Application Programmer Response:  If the error occurred during OPEN processing, the required action depends on which of the errors listed in an earlier IEC161I message caused a return code of 04. Look at earlier IEC161I messages for more information. The possible actions are:

1. Rerun the job.
2. Make sure the unit is available to mount/demount the volume.
3. Rerun the job.
4. Make sure the correct catalog name is supplied. Rerun the job. If the problem persists, contact your IBM Support Center.
5. Be sure the program is running in storage protect key 0 through 7, in supervisor state, or that it is an APF-authorized program.

If the error occurred during CLOSE processing, use the access method services VERIFY command to make sure that the end-of-file marker in the data set entry in the catalog is correct. Then proceed as for OPEN processing above.

If the error occurred during EOV or CLOSE (TYPE=T operand) processing, no response is required; informational message only.

IEC161I (return code 005)  

rc{[sfl]}-ccc, sss, dname, dev, ser, xxx, dsname, cat

Routing Code:  11
Descriptor Code:  6

Explanation:  General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

An OPEN of an ACB failed for one of the following reasons:

• ccc = 002 - Improved Control Interval Processing (ICIP) requested for an Extended Format VSAM data set. Control interval processing is not allowed with an extended format data set.
• ccc = 532 - RLS processing requested for a VSAM Keyrange data set
• ccc = 533 - RLS processing requested for a VSAM Linear data set
• ccc = 550 - RLS processing requested with Global Shared Resources - MACRF=LSR
• ccc = 551 - RLS processing requested with Local Shared Resources - MACRF=GSR
• ccc = 552 - RLS processing requested for a VSAM Temporary data set
• ccc = 553 - RLS processing requested for a Catalog
• ccc = 554 - RLS processing requested for a VVDS
• ccc = 555 - RLS processing requested for a VSAM System data set
• ccc = 556 - RLS processing requested with Control Blocks In Common (CBIC)
• ccc = 557 - RLS processing requested with User Buffering (UBF)
• ccc = 558 - RLS processing requested with Improved Control Interval Processing
• ccc = 685 - RLS processing requested for data set defined with IMBED
• ccc = 709 - RLS processing requested but the backup while open (BWO) flags are TYPEIMS or TYPEOTHER.
• ccc = 713 - RLS processing requested for a striped data set
• ccc = 731 - RLS processing requested for an extended attribute data set.

System action:  OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 160 (X’A0’).

Application Programmer Response:  Do one or more of the following:

1. Change the ACB to only specify options supported for VSAM RLS processing.
2. Change the data set to a type supported for VSAM RLS processing.
3. Remove the RLS processing specification from the ACB/JCL.
4. Remove the ACB MACRF=(I,CI,...) specification from the ACB and rerun the JOB.

**IEC161I (return code 006)**  
\[
\text{rd}\{sfl\}-ccc,ddname,dev,ser,xxx, dsname,cat
\]

**Routing Code:** 11  
**Descriptor Code:** 6  
**Explanation:** General Information for Message IEC161I  
For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**  
An OPEN of an ACB failed for one of the following reasons:

- ccc = 027 - An attempt was made to open a VSAM data set for non-RLS processing with SHAREOPTIONS other than (2,x) and the data set is already open for RLS processing. SHAREOPTIONS (3,x) or (4,x) may not be used when the data set has been opened for RLS processing since either would violate the integrity provided by RLS.
- ccc = 120 - Non-RLS processing requested but record level locks are in lost locks state.
- ccc = 121 - Non-RLS processing requested but record level locks are in a retained lock state.
- ccc = 122 - Non-RLS output processing requested but sphere already opened for RLS processing.
- ccc = 125 - Non-RLS output processing requested by sphere is in lost locks state and user is not permitted.
- ccc = 126 - Non-RLS processing requested but sphere is in retain locks state and user is not permitted.
- ccc = 559 - RLS processing requested with Media Manager Services Connect.
- ccc = 575 - RLS processing requested but RLS Sphere already opened for non-RLS output processing.
- ccc = 689 - RLS processing requested and lost locks exist.
- ccc = 690 - RLS processing requested and retained locks exist.
- ccc = 745 - RLS and non-RLS reader coexist and cross-region share option 2 not specified.

**System action:** OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 203 (X'CE').

**Application Programmer Response:** Ensure that an ACB being opened for RLS processing does not have a JRNAD exit specified in the ACB's EXLST.

For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**  
RLS processing requested but LOG parameter is not defined in the catalog.

**System action:** OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 206 (X'CE').

**Application Programmer Response:** Specify the LOG parameter on the IDCAMS DEFINE or ALTER commands before attempting to open the VSAM data set for RLS processing.

**Detecting Module:** IDAV192C
IEC161I (return code 009)  \text{rc}\{\text{sfi}\}\text{-ccc,ijj},
                        \text{sss,ddname,dev,ser,xxx, dname,cat}

Routing Code:  11
Descriptor Code:  6
Explanation:  General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

System action:  The SMVSAM address space is unavailable. OPEN or EOV processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 182 (X'B6').

Application Programmer Response:  Ensure that the VSAM Address space is active before attempting RLS processing.

IEC161I (return code 011)  \text{rc}\{\text{sfi}\}\text{-ccc,ijj},
                        \text{sss,ddname,dev,ser,xxx, dname,cat}

Routing Code:  11
Descriptor Code:  6
Explanation:  General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

System action:  VSAM or VSAM/RLS processing requested for a NON-SMS Managed VSAM data set. The function requested is not supported.
\begin{itemize}
  \item ccc = 003 - Opening a data set with more than 255 extents.
\end{itemize}

Application Programmer Response:  Assign a Storage Class name to the data set before requesting RLS processing of the VSAM data set.

Detecting Module:  IDA0192C

IEC161I (return code 012)  \text{rc}\{\text{sfi}\}\text{-ccc,ijj},
                        \text{sss,ddname,dev,ser,xxx, dname,cat}

Routing Code:  11
Descriptor Code:  6
Explanation:  General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

System action:  OPEN, CLOSE, or EOV processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 210 (X'D2').

Application Programmer Response:  The return code indicates that an internal logic error has occurred during VSAM RLS open, close, or EOV processing. The SFI field contains a unique return and reason code that might relate this error to an 0F4 SVC dump containing the same return and reason code. Problems with this data set might persist until the SMVSAM address space is recycled. Report this error and any associated dumps to the IBM Support Center.

IEC161I (return code 013)  \text{rc}\{\text{sfi}\}\text{-ccc,ijj},

IEC1611 (return code 020)  

\[rc\{sfi\}]-ccc,\{jjj, sss,ddname,dev,ser,xxx, dsname,cat\]

Routing Code: 11

Descriptor Code: 6

Explanation: General Information for Message IEC1611

For general information about message IEC1611, see the explanation for return code 001.

Specific Information for This Return Code

Not enough virtual storage was available for work areas, buffers, or control blocks.

The SFI field, if present is of the format (xxxxxxxxxx yy) where xxxxxxxx is the hexadecimal length of the GETMAIN request and yy is the hexadecimal subpool for the GETMAIN request.

- ccc = 217 - IDA0557D: GETMAIN failed for RPL.
- ccc = 220 - IDA0557E: GETMAIN failed for IDAOPWRK.
- ccc = 222 - IDA0557E: GETMAIN failed for VDT.
- ccc = 225 - IDA0557E: GETMAIN failed for HEB.
- ccc = 226 - IDA0557E: GETMAIN failed for EDB.

System action: OPEN, CLOSE, or EOV processing ends for the data set. CLOSE (TYPE=T) processing continues, if possible. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 136 (X'88').

Application Programmer Response: If the error occurred during OPEN, CLOSE (TYPE=T), or EOV processing, specify a larger REGION parameter or have the system programmer increase the size of the SQA (system queue area). Rerun the job. For information on possible region size limits, see "IEFUSI – Step Initiation Exit" in z/OS MVS Installation Exits.

If the error occurred during CLOSE processing, and the data set was open for output, use the access method services VERIFY command to make sure that the end-of-file marker in the data set entry in the catalog is correct, and specify a larger region size or increase the size of the SQA. Do this before trying any further processing on the data set. If the data set was open for input, the VERIFY command need not be used.

IEC1611 (return code 021)  

\[rc\{sfi\}]-ccc,\{jjj, sss,ddname,dev,ser,xxx, dsname,cat\]

Routing Code: 11

Descriptor Code: 6

Explanation: General Information for Message IEC1611

For general information about message IEC1611, see the explanation for return code 001.

Specific Information for This Return Code

An error occurred on an IEFDDSRV call to obtain UCB addresses. The SFI field of the message, if present, contains the hexadecimal return and reason codes returned by IEFDDSRV.

System action: Open processing is ended for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 140 (X'90').

Application Programmer Response: Probable system error. Look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide all printed output related to the problem.

Detecting Module: IDA0192A, IDA0557B, IDA0557E

IEC1611 (return code 022)  

\[rc\{sfi\}]-ccc,\{jjj, sss,ddname,dev,ser,xxx, dsname,cat\]

Routing Code: 11

Descriptor Code: 6

Explanation: General Information for Message IEC1611

For general information about message IEC1611, see the explanation for return code 001.

Specific Information for This Return Code

An I/O error occurred while I/O requests were being completed. For EOV processing, the (sfi) field, if present, contains the RPL feedback word from the last I/O request.

- ccc = 217 - EOV preformat failed for striped component. SFI area contains RPL Feedback word.
- ccc = 063 - OPEN preformat failed. SFI contains reason code for 022 failure and RPL feedback word.
- ccc = 358 - RLS processing requested and possible I/O error occurred while flushing buffers during CLOSE.
- ccc = 408 - RLS processing requested and possible I/O error occurred while flushing buffers during CLOSE TYPE=T.
- \( ccc = 631 \) - RLS processing requested and preformat of new extent failed.

**System action:** OPEN, CLOSE, or EOV processing ends for the data set. CLOSE (TYPE=T operand) processing continues, if possible. For Open or Close, the error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 184 (X'B8').

**Application Programmer Response:** If the error occurred during OPEN, CLOSE (TYPE=T), or EOV processing, rerun the job.

**Table 3-1. SFI Reason Codes for Code 022**

<table>
<thead>
<tr>
<th>SFI Dec Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>019</td>
<td>PREFMT - Error return code from call to IDA0192L to preformat a page/swap space.</td>
</tr>
<tr>
<td>020</td>
<td>PREFMT - Error return code from call to Record Management to preformat CA (SPEED=OFF). SFI information is of format: (20,21080018) where the 20 is the decimal reason code followed by the RPL feedback word.</td>
</tr>
<tr>
<td>021</td>
<td>PREFMT - Error return code from call to Record Management to process MRKBF request.</td>
</tr>
</tbody>
</table>

If the error occurred during CLOSE processing, and the data set was open for output, use the access method services VERIFY command to make sure that the end-of-file marker in the data set entry in the catalog is correct. Do this before trying any further processing on the data set. If the data set was open for input, the VERIFY command need not be used.

System action: Open processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 195 (X'C3').

Application Programmer Response: Make sure the user attempting to open the catalog is running in storage protect key zero.

Detecting Module: IDA0192A

IEC161I (return code 032)  \( rcd\{sfi\}\)-ccc,\( sss,\)ddname,\( dev,volser,xxx,\) dsname,\( cat \)

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.
Specific Information for This Return Code

The catalog record for the data set being processed was not found. During end-of-volume (EOV) processing, the error can also occur if an additional volume is required for a data set but the catalog contains no more volume records for the data set.

For message IEC070I, the subfunction information field, if present, might contain a decimal problem-determination code (reason code) for use by the IBM Support Center in case further problem diagnosis is necessary. The following table lists the reason codes for return code 032.

<table>
<thead>
<tr>
<th>SFI Decimal Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>001</td>
<td>End of volume - Catalog locate VOLSER. Unable to retrieve the volume serial number for a specific control interval from the catalog.</td>
</tr>
<tr>
<td>002</td>
<td>End of volume - Catalog locate extents. A VSAM component was extended, but end-of-volume processing was unable to retrieve the extents from the catalog.</td>
</tr>
<tr>
<td>003</td>
<td>End of volume - Catalog locate high-allocated control interval. Unable to retrieve a component's high-allocated control-interval number from the catalog.</td>
</tr>
<tr>
<td>004</td>
<td>End of volume - Catalog locate failed. The requested catalog entry does not exist.</td>
</tr>
<tr>
<td>005</td>
<td>End of volume - Locate for partial release. The catalog request for the number of tracks released by partial release returned no data.</td>
</tr>
</tbody>
</table>

The sfi field has the following format:

(rc, crs, cmi)

rc  The catalog return code.

crs  The catalog reason code.

cmi  The name of the catalog module that detected the error.

See message IDC3009I for a list of these catalog return and reason codes:

- ccc = 002 - Catalog field not returned (IDA0192C)
- ccc = 003 - LOC2 Proc - Locate attributes failed (IDA0192C)
- ccc = 025 - Error on catalog update or retrieval of compression dictionary token (IDA0557C)
- ccc = 055 - UCB not found (IDA0192X)
- ccc = 202 - Catalog field not returned (IDA0557B)
- ccc = 205 - Catalog field not returned (IDA0557B)
- ccc = 513 - Storage Class Name field not returned by catalog (IDA0192C)
- ccc = 514 - AMDSBAT1 name field not returned by catalog (IDA0192C)
- ccc = 515 - AMDATTR3 field not returned by catalog (IDA0192C)
- ccc = 516 - Base Cluster Name field not returned by catalog (IDA0192C)
- ccc = 694 - Compression indicators not returned by catalog (IDA0192C)

System action: OPEN, CLOSE, or EOV processing ends for the data set. CLOSE (TYPE=T) processing continues, if possible. The error flag (ACBERFLG) in the access method block (ACB) for the data set is set to 148 (X'94').

System programmer response: If the error occurred during OPEN, CLOSE (TYPE=T), or EOV processing, make sure that the correct catalog is available (for example, the volume is online) and rerun the job. If the error occurred during CLOSE processing, proceed as for OPEN or EOV processing. Then, if the data set was open for output, use the access method services VERIFY command to make sure that the end-of-file marker in the data set entry in the catalog is correct. Do this before trying any further processing on the data set. If the data set was open for input, the VERIFY command need not be used.

Routing Code: 11

Descriptor Code: 6

IEC161I (return code 033)  rc[(sfi)]-ccc,ijj, sss,ddname,dev,ser,xxx, dsname,cat

Routing Code: 11

Descriptor Code: 6

Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

Cannot extend the catalog. The catalog has reached the maximum number of extends. Either additional space is unavailable or a system error occurred. The (sfi) field in the message is of the form (rc, crs, cmi) where

- rc - catalog return code
- crs - catalog reason code
- cmi - catalog module name that detected the error

Chapter 3. IEC Messages 3-79
See message IDC3009I for a list of these catalog return and reason codes.

**System action:** EOV processing ends for the data set.

**Application Programmer Response:** The access method services DELETE command can be used to delete entries from the catalog. If no entries can be deleted, the access method services EXPORT command can be used to move some of the data sets defined in the full catalog to a portable volume. The IMPORT command can be used to define the exported data sets in a user catalog that has space available.

**Detecting Module:** IDA0557A, IDA0557B, IDAV557A

### IEC161I (return code 034)  
`rc(sfi)-ccc,jjj, sss,ddname,dev,volser,xxx,dsname,cat`

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**

The maximum relative byte address (RBA) limit (4,294,967,295) has been reached.

The subfunction information field, if present, contains a decimal problem-determination code (reason code) for use by the IBM Support Center in case further problem diagnosis is necessary. The following table lists the reason codes for return code 034.

<table>
<thead>
<tr>
<th>SFI Decimal Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>016</td>
<td>End of volume - The PRIMARY allocation amount would cause the maximum RBA to be exceeded.</td>
</tr>
</tbody>
</table>

The `sfi` field has the following format:

`(rc, crs, cmi)`

- **rc** - The catalog return code.
- **crs** - The catalog reason code.
- **cmi** - The name of the catalog module that detected the error.

---

See message IDC3009I for a list of these catalog return and reason codes.

**System action:** EOV processing ends for the data set.

**System programmer response:** Use the access method services REPRO command to make a backup copy of the cluster that contains the data set. Delete the cluster from the catalog with the DFSMS DELETE command. Redefine the cluster with extended format and extended addressability.

**Detecting Module:** IDA0557B, IDAV557A, IDA0557E

**Routing Code:** 11

**Descriptor Code:** 6

---

### IEC161I (return code 035)  
`rc(sfi)-ccc,jjj, sss,ddname,dev,ser,xxx,dsname,cat`

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**

The catalog record for the data set has reached the maximum number of sets of fields allowed. The number of key ranges and volume entries have reached the maximum allowed. The `(sfi)` field in the message is of the form `(rc, crs, cmi)` where

- **rc** - catalog return code
- **crs** - catalog reason code
- **cmi** - catalog module name that detected the error

See message IDC3009I for a list of these catalog return and reason codes.
System action: EOV processing ends for the data set.

Application Programmer Response: Use access method services to: (1) copy the cluster that contains the data set to another volume, (2) delete the cluster, (3) redefine the cluster and either reduce the number of key ranges and volumes or increase the space allocation for each key range to reduce the number of overflow volumes, and (4) reload the copy of the cluster.

Detecting Module: IDA0557A, IDA0557B, IDAV557A

IEC161I (return code 036) \( rc[\text{ddname,dev,ser,xxx,dsname,cat}] \)

Routing Code: 11

Descriptor Code: 6

Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

An I/O error was detected while the system was reading or writing a catalog record. The \((sfi)\) field in the message is of the form \((rc, crs, cmi)\) where

- \(rc\) - catalog return code
- \(crs\) - catalog reason code
- \(cmi\) - catalog module name that detected the error

See message IDC3009I for a list of these catalog return and reason codes.

System action: OPEN, CLOSE, or EOV processing ends for the data set. CLOSE (TYPE=T operand) processing continues, if possible. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 144 (X'90').

Application Programmer Response: If the error occurred during OPEN, CLOSE (TYPE=T), or EOV processing, rerun the job. If the error persists, restore the catalog and all volumes controlled by the catalog from synchronized restore tapes. If the error occurred during CLOSE processing, and the data set was open for output processing, use the access method services VERIFY command to ensure that the end-of-file marker is properly addressed in the data set's entry in the catalog; then rerun the job. If the problem persists, restore the catalog and all volumes controlled by it from synchronized restore tapes.

IEC161I (return code 038) \( rc[\text{ddname,dev,ser,xxx,dsname,cat}] \)

Routing Code: 11

Descriptor Code: 6

Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

OPEN processing encountered an empty path alternate index.
System action: OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 196 (X'CA').

Application Programmer Response: Use the access method services BLDINDEX command to build the alternate index defined under the path that the OPEN was issued against.

Detecting Module: IDA0192B, IDAV192B

IEC1611 (return code 039) \( rc \{sfi\}\)-\( ccc,\)\( jjj, \)\( sss,ddname,dev,ser,xxx, dsname,cat \)

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC1611
For general information about message IEC1611, see the explanation for return code 001.

Specific Information for This Return Code
OPEN processing encountered an empty upgrade alternate index.

System action: OPEN processing continues; however, the empty upgrade alternate index is not updated to reflect changes in the base data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 100 (X'64').

Application Programmer Response: You can ignore the warning and process the base data set, but the empty upgrade alternate index will not be updated to reflect changes in the base data set. Use the access method services BLDINDEX command to build an upgrade alternate index.

Detecting Module: IDA0192B, IDAV192B

IEC1611 (return code 040) \( rc \{sfi\}\)-\( ccc,\)\( jjj, \)\( sss,ddname,dev,ser,xxx, dsname,cat \)

For general information about message IEC1611, see the explanation for return code 001.

Specific Information for This Return Code
The data set being opened is security protected and the unauthorized program is attempting to open a catalog as a data set. The (sfi) field in the message is of the form (rc, crs, cmi) where
- rc - catalog return code
- crs - catalog reason code
- cmi - catalog module name that detected the error

See message IDC3009I for a list of these catalog return and reason codes.

System action: OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 152 (X'98').

Application Programmer Response: If the password could not be validated, make sure that the correct password was supplied in the ACB or by the system or Time Sharing Option/Extensions (TSO/E) terminal operator. Use the access method services LISTCAT command to list the passwords for each data set in a catalog. (The master password for the catalog is needed to do this.) If an unauthorized program attempted to use a catalog as a data set, change the authorization for the program.

Detecting Module: IDA0192C, IDAV192C

IEC1611 (return code 041) \( rc \{sfi\}\)-\( ccc,\)\( jjj, \)\( sss,ddname,dev,ser,xxx, dsname,cat \)

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC1611
For general information about message IEC1611, see the explanation for return code 001.

Specific Information for This Return Code
The buffer space specified is not consistent with the buffer requirements of the data set.

System action: OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 160 (X'A0').

Application Programmer Response: Make sure that the buffer space specified is large enough to contain the data and index buffers required to process the data set for the specified number of concurrent multiple requests.

Detecting Module: IDA0192B

IEC1611 (return code 044) \( rc \{sfi\}\)-\( ccc,\)\( jjj, \)\( sss,ddname,dev,ser,xxx, dsname,cat \)

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC1611
For general information about message IEC1611, see the explanation for return code 001.

Specific Information for This Return Code
User buffering was specified in the MACRF field of the ACB (access method control block), but processing other than control-interval was also specified.

System action: OPEN processing ends for the data
set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 160 (X'0A').

**Application Programmer Response:** Change the ACB so that only control-interval processing is specified if user buffering is specified.

**Detecting Module:** IDA0192A

\end{align*}
\]

**Specific Information for This Return Code**

An unusable data set was opened for output.

**System action:** OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 192 (X'C0').

**Application Programmer Response:** Use the access method services IMPORT command to load a backup copy of the data set, or delete and reload the data set.

**Detecting Module:** IDA0192B, IDAV192B

---

### IEC1611 (return code 047)

\[
\begin{align*}
\text{Routing Code:} & \quad 11 \\
\text{Descriptor Code:} & \quad 6 \\
\text{Explanation:} & \quad \text{General Information for Message IEC1611} \\
\text{For general information about message IEC1611, see the explanation for return code 001.}
\end{align*}
\]

**Specific Information for This Return Code**

The ACB (access method control block) specifies improved control interval processing but the data set attributes are not consistent with this mode of access. One of the following errors was detected:

- Physical block size was not equal to control interval size.
- The data set was not an entry-sequenced data set or the data/index component of a key-sequenced data set.
- The data set was an index with IMBED or REPLICATE specified.

**System action:** OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 160 (X'0A').

**Application Programmer Response:** Correct the indicated error and rerun the job.

**Detecting Module:** IDA0192A, IDA0192B

---

### IEC1611 (return code 048)

\[
\begin{align*}
\text{Routing Code:} & \quad 11 \\
\text{Descriptor Code:} & \quad 6 \\
\text{Explanation:} & \quad \text{General Information for Message IEC1611} \\
\text{For general information about message IEC1611, see the explanation for return code 001.}
\end{align*}
\]

**Specific Information for This Return Code**

The requested master or user catalog does not exist or is not open. The (sfi) field in the message is of the form (rc, crs, cmi) where

- rc - catalog return code
- crs - catalog reason code
- cmi - catalog module name that detected the error

See message IDC3009I for a list of these catalog return and reason codes.

**System action:** OPEN, CLOSE, or EOV processing requested and the data set is an INDEX component.

**System action:** OPEN, CLOSE, or EOV processing ends for the data set. CLOSE (TYPE=T operand)
processing continues, if possible. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 180 (X'B4').

**Application Programmer Response:** If the error occurred during OPEN, CLOSE (TYPE=T), or EOV processing, make sure that the correct catalog is available (for example, the volume is online) and rerun the job. If the error occurred during CLOSE processing, make sure that the correct catalog was not deleted and is open. If the data set was open for output, use the access method services VERIFY command to make sure that the end-of-file marker in the data set entry in the catalog is correct. Do this before trying any further processing on the data set. If the data set was open for input, the VERIFY command need not be used.

**Detecting Module:** IDA0192C, IDAV192C

---

**IEC161I (return code 049)  rc{[sfi]}-ccc,ijj, sss,ddname,dev,ser,xxx, dsname,cat**

**Routing Code:** 11
**Descriptor Code:** 6
**Explanation:** General Information for Message IEC161I
For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**
The ACB MACRF indicates improved control interval processing, and the OPEN is for an empty data set (create mode).

**System action:** OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 224 (X'E0').

**Application Programmer Response:** Correct the indicated error and rerun the job.

**Detecting Module:** IDA0192B

---

**IEC161I (return code 052)  rc{[sfi][jobname]}-ccc,ijj, sss,ddname,dev,volser,xxx, dsname,cat**

**Routing Code:** 11
**Descriptor Code:** 6
**Explanation:** General Information for Message IEC161I
For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**
One of the following events occurred:
- The OPEN routine was unable to get the resource that the system requested for the data set being opened because another task in the system was using the resource.
- The OPEN routine was unable to open the data set for output or update processing because the update inhibit indicator was on in the data set's catalog record.
- The OPEN routine was unable to open the data set for CBUF processing because the data set was already opened for non-CBUF processing.
- The OPEN routine found conflicting CBUF attributes for the data and index components of the ACB for the data set being opened.
- The concurrent enqueue limit has been reached. The ENQ macro issued return code 18, indicating that the limit for the number of concurrent resource requests has been reached.
- The OPEN routine was unable to open the resource that the system requested for the data set that was being opened because another task in the system was loading the data set. With initial load-mode processing, VSAM acquires an exclusive enqueue on SYSVSAM.
- \( ccc = 095 \) - ENQ for the N resource failed - IDA0192A.
- \( ccc = 028 \) - ENQ for the P resource failed - IDA0192A.
- EOV - Error occurred in SVC 109 call to update VSAM shared information (VSI).
- \( ccc = 215, 220 \) - EOV- Error occurred in updating the VSI.

If present, the subfunction information (SFI) field contains a decimal problem-determination code (reason code) for use by the IBM Support Center if further problem diagnosis is necessary. The SFI field has the following format:

(reason)[jobname]

reason
One of the reason codes described in the following table.

jobname
If present, the name of the first job that caused the SHAREOPTION conflict that the SFI reason code describes.

<table>
<thead>
<tr>
<th>SFI Decimal Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>001</td>
<td>LOCVAL - Connecting to an existing control block structure, but the ACB specifies RESET processing. Cannot connect to an existing control block structure with RESET specified.</td>
</tr>
<tr>
<td>002</td>
<td>DVALCHK - WRITE INHIBIT is on in the catalog for this component, and the ACB is being opened for output.</td>
</tr>
</tbody>
</table>
Table 3-4. VSAM OPEN SFI Reason Codes for Return Code 052 (continued)

<table>
<thead>
<tr>
<th>SFI Decimal Value</th>
<th>Description</th>

Chapter 3. IEC Messages 3-85
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

The last request to close this data set was not completed successfully. (OPENIND is on in the catalog). A previous VSAM job might have ended abnormally and left the data set open. This is a normal message for system data set during IPL.

System action: OPEN processing continues. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 116 (X'74').

Application Programmer Response: If the error occurred at a time other than during IPL, use the access method services VERIFY command to make sure the end-of-file marker in the data set entry in the catalog is correct. Note that it is not valid to use VERIFY on a linear data set. If you ignore the warning and try to process the data set, the results are unpredictable. For example, you could cause lost records. If you use the VERIFY command, this message can appear when VERIFY processing opens the data set. If VERIFY processing then successfully closes the data set, it issues condition code 0.

Detecting Module: IDA0192B, IDAV192B

IEC161I (return code 058)  \textcolor{red}{rc\{sfi\}-ccc, jjj, sss, ddname, dev, ser, xxx, dsname, cat}

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

The time stamp for the index does not match the time stamp for the data set. This could occur if the data set was updated without the index being open.

If present, the SFI field is for use by IBM if further problem determination is required.

Table 3-5. SFI Reason Codes for Code 058

<table>
<thead>
<tr>
<th>SFI Dec Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>017</td>
<td>OPEN of a Catalog and the Index component's timestamp (AMDTMSTP) is less than the data component's timestamp.</td>
</tr>
<tr>
<td>018</td>
<td>OPEN of a non-Catalog and the Index component's timestamp (AMDTMSTP) is not equal to the data component's timestamp.</td>
</tr>
</tbody>
</table>

System action: OPEN processing continues. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 104 (X'68').

Application Programmer Response: You can continue to process the data set, but errors can occur if the data set and index do not correspond. Check for possible duplicate VVRS.

Detecting Module: IDA0192F, IDA0192V

IEC161I (return code 059)  \textcolor{red}{rc\{sfi\}-ccc, jjj, sss, ddname, dev, ser, xxx, dsname, cat}

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

The time stamp for the volume does not match the time stamp in the catalog entry for the data set, and the data set is opened for input. This might mean that the cluster existing on the volume is not accurately described in the catalog.

System action: OPEN processing continues. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 104 (X'68').

Application Programmer Response: You can continue to process the data set, but the results are unpredictable. The volume contents do not correspond with the catalog contents for that volume. If the volume contents are more current, then the catalog should be restored. For further information on catalog recovery, see \textcolor{blue}{z/OS DFSMS Managing Catalogs}

Detecting Module: IDA0192F, IDA0192V
IEC161I (return code 060)  \texttt{rc((sfi))}-ccc,ijj,
\texttt{sss,ddname,dev,ser,xxx, dsname,cat}

Routing Code:  11
Descriptor Code:  6
Explanation:  General Information for Message IEC161I
For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code
The time stamp for the volume does not match the time stamp in the catalog entry for the data set, and the data set is opened for output.

System action:  OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 240 (X'F0').

Application Programmer Response:  The volume contents do not correspond with the catalog contents for that volume. If the volume contents are current, then the catalog should be restored. For further information on catalog recovery, see \textit{Managing Catalogs}.

Detecting Module:  IDA0192F

IEC161I (return code 062)  \texttt{rd((sfi))}-ccc,ijj,
\texttt{sss,ddname,dev,ser,xxx, dsname,cat}

Routing Code:  11
Descriptor Code:  6
Explanation:  General Information for Message IEC161I
For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code
VERIFY has been successfully run by OPEN to determine the end of a VSAM data set which was not previously closed successfully.

System action:  OPEN processing continues. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 118 (X'76'). If the data set was opened for output, then the catalog will be updated when the data set is successfully closed. If the data set is opened for input, the catalog will not be updated by close and VERIFY will again be run by OPEN the next time the data set is opened.

Application Programmer Response:  The last request to close this data set was not successful. OPEN has attempted to verify the end of the data set and the VERIFY completed without errors. The catalog will be updated when the data set has successfully been opened for output and then successfully closed. You should verify that all of the expected records are in the data set. For additional information on VERIFY processing, see \textit{z/OS DFSMS Using Data Sets}.

Detecting Module:  IDA0192B, IDAV192B

IEC161I (return code 064)  \texttt{rc((sfi))}-ccc,ijj,
\texttt{sss,ddname,dev,ser,xxx, dsname,cat}

Routing Code:  11
Descriptor Code:  6
Explanation:  General Information for Message IEC161I
For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code
The last request to close this data set was not completed successfully and an attempt by OPEN to run VERIFY has been unsuccessful. A previous VSAM job might have ended abnormally and left the data set open. The cataloged information pertaining to the data set may be in error. The sfi field in the message indicates a record management physical error occurred and is of the form rc, which is the request parameter list reason code. See \textit{MVS/DFP Macro Instructions for Data Sets} for a description of these reason codes.

System action:  Open processing continues. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 116 (X'74').

Application Programmer Response:  You should first correct the problem that is causing the VERIFY to fail, then use the Access Method Services VERIFY command to make sure that the end-of-file marker in the data set entry in the catalog is correct. If VERIFY processing successfully closes the data set, it issues a condition code of 0. If you ignore the warning and try to process the data set the results are unpredictable. For example, you could lose records. You can continue to process the catalog; however, catalog information might be in error and erroneous results could occur. You can run the Access Method Services DIAGNOSE command against the catalog to identify possible problems.

Detecting Module:  IDA0192B, IDAV192B
• ccc = 114 - VSAM CLOSE encounters a freemain storage request of 0 length or 0 address.

System action: CLOSE processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the dataset is set to 117 (X'75').

Application Programmer Response: Correct previous error and resubmit

Detecting Module: IDA0200B, IDA0200T

IEC1611 (return code 066) \( \text{return \( \text{code} \) 066} \)

Specific Information for This Return Code
Journaling was requested, but a JRNAD exit was not specified on the first ACB opened for the data set.

System action: OPEN processing continues, but the request for journaling is denied. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 110 (X'6E').

Application Programmer Response: Ensure that the
first ACB opened for the data set specifies a JRNAD exit.

**Detecting Module:** IDA0192B

**IEC161I (return code 076)**

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**

The ACB (access method control block) that was opened was not associated with a valid data set. (NOT an Index, Data, or a Cluster) OR it was an invalid ACB.

- Attempt to open a PAGE SPACE data set which was not correctly closed.
- Attempt to open a PAGE SPACE in other than CREATE mode.
- Data returned from the catalog was not for a valid VSAM data set type (Index, Data, Cluster, AIX, Path, etc.) or the data set is not a VSAM data set.
- Attempt to close an ACB from RLS access and the ACB is not currently open in the SMSVSAM address space.

**System action:** OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 188 (X'BC').

**Application Programmer Response:** Correct the indicated error and resubmit the job.

**Detecting Module:** IDA0192B, IDA0192C, IDAV201T, IDAV231T, IDAV232T

**Table 3-6. SFI Reason Codes for Code 076**

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

**Specific Information for This Return Code**

The AMBL (access method block list) is incorrect, or the caller of EOV was not in supervisor state, or EOV for an AMB which had a previous EOV error, or

- Invalid AMBL - AMBL address not in the VAT
- Invalid IOMB - IOMB address not PLH not found in AMB IOMB chain.
- Invalid BLDVRP/DLVRP parameter list.
- Attempt to open a Catalog, System data set, or for GSR but not authorized, key 0-7, supervisor state.
- \( \text{ccc} = 215 - \) EOV with AMBLESET=ON
- \( \text{ccc} = 218 - \) Invalid AMB.

**System action:** CLOSE or EOV processing ends for the data set. CLOSE (TYPE=T operand) processing continues, if possible. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 188 (X'BC'). Media Manager services sets ACBERFLG to 130 (X'82').

**Application Programmer Response:** If the error occurred during CLOSE, CLOSE (TYPE=T), or EOV processing, correct the indicated error and resubmit the job.

**Detecting Module:** ICYMMMSRV, IDA0192A, IDA0192F, IDA0192W, IDA0192Y, IDA0200B, IDA0200T, IDA0231B IDA0231T IDA0557A IDA0557D IDAV202T

```

**Routing Code:** 11

**Descriptor Code:** 6

**Explanation:** General Information for Message IEC1611

For general information about message IEC1611, see the explanation for return code 001.

**Specific Information for This Return Code**

No more volumes are available on which to allocate space (no more candidate volumes).

**System action:** End-of-volume (EOV) processing ends for the data set.

**Application Programmer Response:** Use the access method services ALTER command to provide additional volumes for the data set. Close the ACBs for the data set, reallocate the DD statements being used to access the data set, and reopen the ACB for the data set.

Adding volumes with AMS ALTER just puts volumes in the catalog. Before the data set can use the added volumes, you need to close it, reallocate the DD statements to the data set (this picks up the added volumes), and then reopen the data set (this makes the new volumes available for use by VSAM EOV).

**Source:** DFSMSdfp

**Detecting Module:** IDA0557B, IDA0557E, IDA0557X, IDAV557A, IDAV557X
Specific Information for This Return Code
The EOV routine was unable to locate a required volume.

System action: EOV processing ends for the data set.

Application Programmer Response: Ensure that all required volumes are online and remain online while running the job.

The EOV routine was unable to extend the data set due to a critical error in the previous EOV space allocation.
- ccc = 215
  - An extend of a striped data set failed because a previous EOV extend has failed.

- For data sets defined with Share Options 3 or 4, you might see this message if one job is attempting EOV while another job is extending the data set due to improper serialization by the application.

System action: The OPEN OR EOV fails. If OPEN, the error flag (ACBERFLG) in the ACB (access method block) for the data set for OPEN is set to 88 (X’58’). For data sets defined with Share Options 3 or 4, make sure that the application program uses ENQ/DEQ to maintain data integrity while sharing the data set.

IEC161I (return code 178)  
$$rc[(s/f)]-ccc,ijji$$

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC1611
For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code
An error occurred during RESET processing (ACB MACRF=RST) and VSAM open was unable to unallocate a reset volume.

System action: Open processing is ended for the data set. The SFI message field contains the SMS Return code and Reason Code. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 133 (X’85’).

Application Programmer Response: Reallocate the DDNAME to the data set and rerun the JOB.

Detecting Module: IDA0192B, IDAV192A

rc{{sfi]}-ccc,ijj,  
sssdname,dev,ser,xxx, dsname,cat  
Routing Code: 11  
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

The ACB (access method control block) specifies a system data set (ACBDS) for path or upgrade processing. OPEN of a system data set for path or upgrade processing is not supported.

System action: OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 160 (X'A0').

Application Programmer Response: Correct the error and rerun the job.

Detecting Module: IDA0192A

-----------------------------------
IEC161I (return code 195) \texttt{rd}\{\texttt{sfi}\}\{-ccc,\texttt{jjj}, \texttt{ss},\texttt{ddname},\texttt{dev},\texttt{ser},\texttt{xxx}, \texttt{dsname},\texttt{cat}\}

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

An error occurred attempting to extend a VSAM striped component.

- ccc = 220 - IDA0557E: ALLOCSPC. Unexpected extend error.
  The SFI field in the message, if present, is of the format (rc,crs) where rc=return code and crs=reason code from IDA0557F.
- ccc = 220 - IDA0557E: ALLOCSPC. Unexpected extend error.
  The SFI field in the message is of the format (rc,crs) where rc=return code and crs=reason code from IDA0557F.

- When message IEC070I is issued with a return code of 195 and an SFI value of (00000004,00000009), it means the following result:
  An attempt to extend a striped data set failed because the amount of space returned by DADSM was not the same as the amount of space requested.
- When message IEC070I is issued with a return code of 195 and an SFI value of (00000004,0000000A), it means the following result:
  The amount of space returned by DADSM was not a multiple the VSAM data set control area size. This condition normally results from a user or

OEM implementation of the IGGPRE00 exit modifying the space amount requested.

- ccc = 220 - IDA0557E: CATALC. SFI = 32. NO UCB address returned from call to IDA0557F.
- ccc = 221 - IDA0557E: CATALC. SFI = 32. Unexpected extend error from call to IDA0557F.

The SFI field in the message is of the format (rc,crs) where rc=return code and crs=reason code from IDA0557F.

System action: EOV processing ends for the data set.

Application Programmer Response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, including the entire text of any IEC messages.

Detecting Module: IDA0557E

Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

Message IEC161I: Open detected an Interrupt Recognition condition while opening a data set for output.

Message IEC070I: EOV detected that a previous EOV had not completed successfully.

System action: Open/EOV processing is ended for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set if from OPEN is set to 193 (X'C1').

Application Programmer Response: A critical operation was interrupted on this data set and the operation did not complete. Erroneous results could occur. You may wish to diagnose the Catalog and VVDS entries associated with this data set to identify possible problems.

Detecting Module: IDA0192B, IDA0557X, IDAV192B, IDAV557X

IEC161I (return code 203)  
rc([sfl])-ccc,ijj,  
sss,ddname,dev,ser,xxx, dsname,cat

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

An extend was attempted, but no secondary space allocation quantity was specified.

- ccc = 220
  
  A secondary space quantity of zero was specified for a striped data set and the maximum space amount has been allocated. The maximum for striped data sets, specifying a secondary of zero, is equal to the volume count times the primary space. Candidates volumes may still be available but will not be used when the maximum is allocated. See the discussion in Access Method Services for ICF, under the description for secondary space amount, for further details.

For the case of an Extended Format data set using a data class including 'Additional Volume Amount' set to secondary, the data class will have to be altered to set 'Additional Volume Amount' to primary and the data set redefined, or the data set must be redefined with a data class that does not include 'Additional Volume Amount' set to secondary, or the data set redefined to include a secondary space allocation.

System action: Extend processing is ended for this data set.

Application Programmer Response: Scratch unneeded data sets from the volume, or run an access method services ALTER command to add more candidate volumes to the catalog entry for the data set, or specify a secondary space quantity.

Detecting Module: IDA0557E, IDA0557X, IDA0557E

IEC161I (return code 204)  
rc([sfl])-ccc,ijj,  
sss,ddname,dev,ser,xxx, dsname,cat

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

- ccc = 220
  
  An extend was attempted, but the maximum number of extents was reached because the user did not specify VSAM extent constraint removal. In this case, the maximum number of extents for a VSAM data set is between 251 and 255 extents per component or between 251 and 255 extents per stripe for a striped component, depending upon the number of extents (1-5) allocated by DADSM per allocate/extend request.

System action: Extend processing is ended for this data set.

Application Programmer Response: List the catalog in order to determine space fragmentation. Use the REPRO command to reorganize the data set in order to reduce fragmentation.

Detecting Module: IDA0557D, IDA0557X, IDAV557X, IDA0557E

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code
An extend was attempted, but the number of new extents after DADSM extend is inconsistent, zero, or more than 5.

System action:  Extend processing is ended for this data set.

Application Programmer Response:  Run the access method services DIAGNOSE command against the VVDS(s) associated with the data set. Perform any required recovery operations for the VVDS or data set.

Detecting Module:  IDA0557X, IDAV557X

IEC161I (return code 215)  
rc{(sfi)}-ccc,iji,  
sss,dsname,dev,ser,xxx, dsname,cat

Routing Code:  2, 11
Descriptor Code:  6
Explanation:  General Information for Message IEC161I
For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code
Open failed for the data set dsname.
• ccc = 799: Open failed for the data set dsname. The file was already open on a system that supports secondary lock structures.
• ccc = 800: Open failed for the data set dsname. The file is being opened on a system that supports secondary lock structures. The lock structure associated with the data set is being quiesced or has completed quiesce.
• ccc = 801: Open failed for the data set dsname. The file is being opened on a system that supports secondary lock structures. The lock structure associated with the data set could not be connected.

System action:  The system does not complete the open.

Operator response:  None.

Application Programmer Response:
• ccc = 799: Contact the system programmer to verify that the data set is not open in the sysplex.
• ccc = 800: Contact the system programmer to have the lock structure associated with this data set placed in enable status.
• ccc = 801: Contact the system programmer to verify that the data set is not open in the sysplex.

System programmer response:
• ccc = 799: Verify that the data set is not open in the sysplex. If the data set is not open, run the job again. The IDCAMS subcommand SHCDS LISTDS can be used to determine if the data set was opened on a system that supports secondary lock structures. See access method services for ICF catalog for the syntax of the command.
• ccc = 800: Submit the jobs if the lock structure has been enabled.
• ccc = 801: Verify the following:
  – The data set is using the correct storage class.
  – The storage class has a lock set specified.
  – The lock set is specified in the DFSMS base configuration definition.
  – The DFSMS configuration was validated and activated.
  – Verify that the lock structure is defined to the CFRM policy.
  – Search the syslog for messages with the IXL or IXC prefixes that are related to the related lock structure.

Chapter 3. IEC Messages 3-111
IEC161I (return code 250)  

rc{(sfi)}=ccc, sss, ddname, dev, ser, xxx, dsname, cat

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

One of the following errors occurred:

1. VSAM RLS processing was requested from an address space currently identified as being a commit protocol application:
   - ccc = 565 - The required SUBSYSNM parameter was not specified on the ACB.
   - ccc = 566 - The SYNSNMVAL value mapped by the IFGSYSNM macro does not match the value currently identified for the address space.

2. VSAM RLS processing was requested from an address space which has not been identified as being a commit protocol application:
   - ccc = 568 - The ACB specified the SUBSYSNM parameter for a non-commit protocol application.

System action: OPEN processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 202 (X'C1').

Application Programmer Response: Verify that the ACB SUBSYSNM parameter is valid for the identified address space.

2. Remove the ACB SUBSYSNM parameter.

Detecting Module: IDAV192A

IEC161I (return code 253)  

rc{(sfi)}=ccc, sss, ddname, dev, ser, xxx, dsname, cat

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

The compression management services (CMS) open or close function failed. The sfi field in the message contains the following in the form (rc,crs):

- rc - CMS return code
- crs - CMS reason code

System Action: Open or close processing ends for the data set. The error flag (ACBERFLG) in the ACB (access method block) for the data set is set to 246 (X'F6').

Application Programmer Response: Probable subsystem error. Follow the procedures specified by the subsystem message or messages.

Detecting Module: IDA0192Z, IDAV192Z

IEC161I (return code 254)  

rc{(sfi)}=ccc, sss, ddname, dev, ser, xxx, dsname, cat

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

A TOLERATION warning, this reason code is given when an Open for output is issued for a data set whose attributes are obsolete or will be obsolete (ignored by AMS on a define) in a future release. The attributes are supported for currently defined data sets, and the message will not cause Open processing to terminate.

ccc = 026 - IDA0192Z: VSAM Open detected data set has more than 255 extents.
ccc = 780 - IDAV192Z: RLS Open detected data set has more than 255 extents.

If present, the SFI field is for use by IBM if further problem determination is required.

Table 3-9. SFI Reason Codes for Code 254

<table>
<thead>
<tr>
<th>SFI Dec Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Imbed</td>
</tr>
<tr>
<td>02</td>
<td>Keyrange</td>
</tr>
<tr>
<td>03</td>
<td>Replicate</td>
</tr>
<tr>
<td>04</td>
<td>Data set has more than 255 extent, but user did not turn on the VSAM extent constraint removal flag through data class.</td>
</tr>
</tbody>
</table>

System action: Open processing continues.

Application Programmer Response: This is a warning that this data set has either:
- Obsolete attributes, or
- More than 255 extents. For SMS-managed volumes, user can set the extent constraint removal flag in the SMS data class to Y (yes) via the ISMF panels to remove the VSAM limit of 255 extents per component, or 255 extents per stripe for a VSAM striped data set.

Detecting Module: IDA0192Z

IEC161I (return code 255)  

rc((sfi))-ccc,ijji, sss,ddname,dev,ser,xxx, dsname,cat

Routing Code: 11
Descriptor Code: 6
Explanation: General Information for Message IEC161I

For general information about message IEC161I, see the explanation for return code 001.

Specific Information for This Return Code

A TOLERATION error, this reason code is given when an attempt is made to use a function on a release that does not support it. The SFI field describes the error.
- (001) - Attempt to open a VSAM Striped data set on a release that does not support that type of striped data set.
- (002) - Attempt to open a VSAM multi-layered Striped data set on a release that does not support it.
- (003) - Attempt to extend a VSAM Striped data set on a release that does not support extending a striped data set.

System action:

Application Programmer Response: Probable user error.

Detecting Module: Varies with release.

IEC162I  SETPRT FAILURE IN OPEN FOR UNIT dev, 3800 PRINTER.

R15 = hhh R0 = h

Explanation: An error was detected during SETPRT processing for the IBM 3800 printing subsystem.

In the message text:
- dev The device number of the specified device.
- hhh A 3-byte hexadecimal return code contained in register 15 that identifies the failure.
- h A 1-byte hexadecimal reason code contained in register 0 that identifies the failure.

For an explanation of the return and reason codes, see [Z/OS DFSMS Macro Instructions for Data Sets](#).

System action: Processing associated with the OPEN macro instruction is ended, and message IEC141I issued with system completion code 013 and return code CC specified.

Application Programmer Response: Probable user error. Correct the setup requirements for the 3800, and rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL.

Source: DFSMSdfp

Detecting Module: IGG0196Q

IEC163A L dev,cccc,LOAD FORMS OVERLAY FRAME

Explanation: This message indicates that the forms overlay frame must be loaded in the IBM 3800 Printing Subsystem device.

In the message text:
- dev The device number of the specified device.
- cccc The forms overlay frame.

System action: IBM 3800 Printing Subsystem processing does not continue until the operator responds to this message.

Operator response: Load the forms overlay frame into the device. Then enter REPLY xx,'LOAD' or REPLY xx,'L'. If forms overlay frame cccc cannot be loaded, enter REPLY xx,'CANCEL' or 'REPLY xx','C'. In this
case, a return code of X'28' is placed in register 15 to be passed to the requester of the SETPRT function.

**IEC164A**

dev, THREAD (SHEET STACKER | CONTINUOUS FORM STACKER)

**Explanation:** This message is a request to change the paper threading on the IBM 3800 Printing Subsystem device so that the output will go into the burster-trimmer-stack or the continuous form stacker, as indicated in the message text.

In the message text:

dev The device number of the specified device.

**System action:** IBM 3800 Printing Subsystem processing does not continue until the operator responds to this message.

**Operator response:** If you perform the requested action and wish to continue, enter REPLY xx,'PROCEED' or REPLY xx,'P'. If you do not perform the requested action but wish to continue, enter REPLY xx,'CANCEL' or REPLY xx, 'C'. In this case, device dev uses whatever output stacker unit it is threaded to.

If you cannot satisfy the requested action, enter REPLY xx,'CANCEL' or REPLY xx, 'C'. In this case, the system ends its current SETPRT operation for device dev. In addition, a return code X'2C' is placed in register 15 to be passed to the requester of the SETPRT function.

dev text NOT IN LIBRARY

**Explanation:** text is one of the following:

- CHARACTER ARRANGEMENT TABLE mod
- GRAPHIC MODIFICATION
- COPY MODIFICATION
- FCB
- LIBRARY CHARACTER SET

A SETPRT macro instruction was issued for a 3800 printer and a module of the specified type, was not found in the SYS1.IMAGELIB data set or a private image library.

In the message text:

dev The device number of the specified device.

**System action:** SETPRT processing ends and places a return code in register 15.

**Application Programmer Response:** Be sure that you specified the module name correctly in the JCL or on the SETPRT macro instruction. If module mod was specified correctly, add it to the SYS1.IMAGELIB data set or a private image library.

**Source:** DFSMSdfp

**Detecting Module:** IGG08110

dev I/O ERROR SEARCHING FOR text IN LIBRARY

**Explanation:** text is one of the following:

- CHARACTER ARRANGEMENT TABLE mod
- GRAPHIC MODIFICATION
- COPY MODIFICATION
- FCB
- LIBRARY CHARACTER SET

A SETPRT macro instruction was issued for a 3800 printer. A permanent I/O error was detected when the BDL macro instruction was issued to locate module mod, a module of the specified type, in SYS1.IMAGELIB or a private image library. This error can occur when the private library is not authorized.

In the message text:

dev The device number of the specified device.

**System action:** SETPRT processing ends and places a return code in register 15.

**Application Programmer Response:** Be sure that you specified the module name correctly in the JCL or on the SETPRT macro instruction. If module mod was specified correctly, add it to the SYS1.IMAGELIB data set or a private image library.

**Source:** DFSMSdfp

**Detecting Module:** IGG08110
**Operator response:** Probable system error. Report the problem to the system programmer.

**Application Programmer Response:** If the specified module resides in a private library, be sure the library is authorized.

**Source:** DFSMSdfp

**Detecting Module:** IGG08110

**IEC170I**

**dev I/O ERROR WHILE LOADING text**

**Explanation:** Where text is one of the following:
- TRANSLATE TABLE FOR mod
- COPY MODIFICATION mod
- GRAPHIC MODIFICATION mod
- FCB mod
- LIBRARY CHARACTER SET mod
- WCGMS id-id-id-id
- STARTING COPY NUMBER
- COPY AND/OR FORMS OVERLAY COUNT

A SETPRT macro instruction was issued for a 3800 printer, and a permanent I/O error was detected for the specified operation. If one of the first five message texts appears, mod is the name of a module; if WCGMS appears, each id is a two-character hexadecimal identifier for a character set. Message IOS000I, which gives detailed information about the I/O error, precedes this message.

In the message text:

- **dev** The device number.

**System action:** SETPRT processing ends and places a return code in register 15.

**Operator response:** Notify the system programmer.

**Application Programmer Response:** Respond as indicated for message IOS000I.

**Source:** DFSMSdfp

**Detecting Module:** IGG08111

---

**IEC172I**

**dev OPERATOR CANCELED text**

**REQUEST**

**Explanation:** text is one of the following:
- FCB imageid VERIFY
- FORMS OVERLAY
- RETHREAD

During SETPRT processing, the operator received and replied CANCEL to one of these messages for 3800 printer dev:
- Message IEC128D, requesting that the operator verify the alignment of forms to the forms control buffer image; imageid is the one to four-character identifier specified for the image on the FCB operand of the SETPRT macro instruction.
- Message IEC163A, asking that the operator load a forms overlay frame.
- Message IEC164A, asking that the operator change the paper threading.

In the message text:

- **dev** The device number of the specified device.

**System action:** SETPRT processing ends and places a return code in register 15.

**Operator response:** If you decide that you should not have replied CANCEL to message IEC128D, IEC163A, or IEC164A, rerun the job that issued the SETPRT macro instruction. If you tried to perform the action requested by message IEC128D, IEC163A, or IEC164A but you could not, or if you think that the message was issued because of a programming error, notify the programmer whose job issued the SETPRT macro instruction.

**Application Programmer Response:** If the operator tried to perform the action requested by message IEC128D, IEC163A, or IEC164A, but could not, determine why the operator could not perform the action and correct the problem. If it appears that the system should not have issued message IEC128D, IEC163A, or IEC164A, there is probably an error in the values specified for the 3800 printer parameters in the JCL or on the SETPRT macro instruction.

**IEC171I**

**dev I/O ERROR WHILE PRINTING FCB imageid**

**Explanation:** A SETPRT macro instruction with the FCB VERIFY option was issued for a 3800 printer. A permanent I/O error was detected while the 3800 was printing a representative map of the requested FCB image. Message IOS000I, which gives detailed information about the I/O error, precedes this message.

In the message text:

- **imageid** The 1- to 4-character identifier specified for the FCB image on the macro.
- **dev** The device number of the specified device.

**System action:** SETPRT processing ends and places a return code in register 15.
IEC173I  dev I/O ERROR ON text

Explanation: Text is one of the following:
PREVIOUS OUTPUT
BLOCKING OR UNBLOCKING DATA CHECKS

A SETPRT macro instruction was issued for 3800 printer dev. If I/O ERROR ON PREVIOUS OUTPUT appears in the message text, a permanent I/O error occurred during a previous output operation. If I/O ERROR BLOCKING OR UNBLOCKING DATA CHECKS appears in the message text, a permanent I/O error occurred while SETPRT processing was running an internal channel command that blocks or unblocks data checks. Message IOS0001, giving details about the I/O error, precedes this message.

In the message text:
dev The device number of the specified device.

System action: If I/O ERROR ON PREVIOUS OUTPUT appears, the system enters the error analysis (SYNAD) routine when it encounters the next PUT or CHECK macro instruction. In all cases, SETPRT processing ends and places a return code in register 15.

Operator response: Notify the system programmer. Respond as indicated for message IOS0001.

Application Programmer Response: Follow your installation’s procedures for correcting the permanent I/O error.

Source: DFSMSdfp
Detecting Module: IGG08110

IEC175I  dev SYS1.IMAGELIB CANNOT BE OPENED

Explanation: A SETPRT macro instruction was issued for a 3800 printer. One or more of the operands specified on the macro data set, but SYS1.IMAGELIB cannot be opened.

In the message text:

dev The device number of the specified device.

System action: SETPRT processing ends and places a return code in register 15.

Operator response: Use the IEBCOPY utility to copy the SYS1.IMAGELIB onto tape. Notify the system programmer.

Application Programmer Response: If the error recurs and the program is not in error, look at the messages in the JOB log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSSOUT output for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp
Detecting Module: IGG08110

IEC176I  dev CHARACTER ARRANGEMENT TABLE mod CAUSED WCGM OVERFLOW (2|4)

Explanation: A SETPRT macro instruction was issued for a 3800 printer. The character arrangement table module cannot be loaded. The number of unique character sets it specified, when combined with the number of unique character sets specified by other character arrangement tables, would require more writable character generation modules (WCGMs) than are available. The number of WCGMs on the printer is 2 or 4, as indicated in the message text.

When two or more character arrangement tables specify the same character set, only one copy of that character set is loaded into a WCGM. However, if a character arrangement table calls for graphic modification modules for a character set, the modified character set is considered unique.

In the message text:

dev The device number of the specified device.

mod The specified module.

System action: SETPRT processing ends and places a return code in register 15.

Application Programmer Response: Specify fewer character arrangement tables, or modify the character
arrangement tables you do specify so that they require fewer WCGMs.

Source: DFSMSdfp
Detecting Module: IGG08111

IEC177I dev CHARACTER ARRANGEMENT TABLE FOR COPY MODIFICATION mod NOT SPECIFIED

Explanation: A SETPRT macro instruction was issued for a 3800 printer, and the MODIFY parameter specified copy modification table. The table reference character (TRC) subparameter was specified, but it contained an error. Either the value for the TRC was incorrect (4 or greater), or there is no character arrangement table in the position specified by TRC value.

In the message text:
dev The device number of the specified device.
mod The specified module.

System action: SETPRT processing ends and places a return code in register 15.

Application Programmer Response: If the value specified for the TRC subparameter is incorrect (4 or greater), respecify it correctly. If there is no character arrangement table in the position specified on the TRC subparameter, either use the CHARS parameter to load a character arrangement table in that position or specify a different position on the TRC subparameter.

Detecting Module: IGG08112

IEC178I dev I/O ERROR ON INITIALIZE PRINTER COMMAND

Explanation: A SETPRT macro instruction was issued for a 3800 printer, but a permanent I/O error occurred while the printer was being initialized. Message IOS000I, which gives details about the I/O error, precedes this message.

In the message text:
dev The device number of the specified device.

System action: SETPRT processing ends and places a return code in register 15.

Operator response: Notify the system programmer. Respond as indicated in message IOS000I.

Application Programmer Response: Follow your installation’s procedures for correcting the I/O error.

Source: DFSMSdfp
Detecting Module: IGG08114

IEC179I dev BURST REQUESTED BUT BTS NOT INSTALLED

Explanation: A SETPRT macro instruction was issued for a 3800 printer, and either BURST=Y was coded or Y is the default value selected by your job entry subsystem (JES) for the BURST parameter. However, information in the UCB extension indicates that there is no burster-trimmer-stacker (BTS) installed on the printer.

In the message text:
dev The device number of the specified device.

System action: SETPRT processing ends and places a return code in register 15.

Application Programmer Response: Either specify BURST=N on the SETPRT macro instruction or allocate the output to a printer that has a burster-trimmer-stacker installed.

Source: DFSMSdfp
Detecting Module: IGG08114

IEC180I dev I/O ERROR WHILE text

Explanation: text is one of the following:
SENSING PRESENT PAPER THREAD PATH
SELECTING TRANSLATE TABLE 0
DISPLAYING STATUS CODE

A SETPRT macro instruction was issued for a 3800 printer, but a permanent I/O error occurred during the operation indicated in the message text. Message IOS000I, which gives details about the I/O error, precedes this message.

In the message text:
dev The device number of the specified device.

System action: SETPRT processing ends and places a return code in register 15.

Operator response: Notify the system programmer. Respond as indicated for message IOS000I.

Application Programmer Response: Follow your installation’s procedure for correcting the I/O error.

Source: DFSMSdfp
Detecting Module: IGG08114

IEC181I ddname IN-STORAGE ADDRESSES AND FCB/OPEN EXITS INVALID

Explanation: A SETPRT macro instruction was issued for the SYSOUT data set identified in the ddname field of the message text. One of the following errors occurred:
• A copy modification module, a character arrangement table, or a forms control buffer was specified on the SETPRT macro instruction as an in-storage address instead of by name.
• The address of a user library DCB was specified instead of the system library.
• The OPEN exit routine specified a forms control buffer.

In the message text:

\texttt{ddname} \quad \text{The specified DD name.}

\textbf{System action:} SETPRT processing ends and places a return code in register 15.

\textbf{Application Programmer Response:} Reissue the SETPRT macro instruction and data set.

\textbf{Source:} DFSMSdfp

\textbf{Detecting Module:} IGG08117

\underline{IEC182I} \quad \texttt{dev} \text{ CHARACTER ARRANGEMENT TABLE \textit{mod} REFERENCES AN EMPTY WCGM}

\textbf{Explanation:} A SETPRT macro instruction was issued for a 3800 printer. A byte in the translate table part of character arrangement table module references a writable character generation module (WCGM) that does not contain a character set.

In the message text:

\texttt{dev} \quad \text{The device number of the specified device.}

\texttt{mod} \quad \text{The specified module.}

\textbf{System action:} SETPRT processing ends and places a return code in register 15.

\textbf{Application Programmer Response:} If the translate table has an incorrect reference for the WCGM ID, correct the reference. If the translate table reference is correct but the WCGM has no character set assigned to it, assign a character set to the WCGM.

\textbf{Source:} DFSMSdfp

\textbf{Detecting Module:} IGG08117

\underline{IEC183I} \quad \texttt{dev} \text{ LOST \textit{nnnn} PAGES DUE TO text}

\textbf{Explanation:} text is one of the following:

CANCEL KEY
PRINTER SYSTEM RESTART

A SETPRT macro instruction was issued for a 3800 printer. If CANCEL KEY appears in the message text, the operator pressed the cancel key and pages of data (the pages in the 3800 page buffer) were lost. If PRINTER SYSTEM RESTART appears, a paper jam occurred that requires a printer system restart and pages of data (the pages from the user back to the transfer station and in the 3800 page buffer) were lost.

In the message text:

\texttt{dev} \quad \text{The device number of the specified device.}

\texttt{nnnn} \quad \text{The number of pages lost.}

\textbf{System action:} SETPRT processing ends and places a return code in register 15.

\textbf{Operator response:} If you pressed the cancel key, but you need the data that was lost, rerun the job. If you are restarting the printer system, retransmit the lost pages.

\textbf{Source:} DFSMSdfp

\textbf{Detecting Module:} IGG08116

\underline{IEC184I} \quad \texttt{dev} \text{ LOAD CHECK WHILE LOADING text}

\textbf{Explanation:} text is one of the following:

TRANSLATE TABLE FOR \textit{mod}
COPY MODIFICATION \textit{mod}
GRAPHIC MODIFICATION \textit{mod}
FCB \textit{mod}
LIBRARY CHARACTER SET \textit{mod}
WCGMS \textit{id-id-id-id}

A SETPRT macro instruction was issued for a 3800 printer. A load check I/O error occurred while the data specified in the message text was being loaded. If a value for the module appears in the message text, it is the name of a module of the indicated type. If WCGMS appears in the message text, each \textit{id} is a two-character hexadecimal identifier for a character set.

In the message text:

\texttt{dev} \quad \text{The device number of the specified device.}

\texttt{mod} \quad \text{The specified module.}

Each \texttt{id} is an identifier for a character set.

\textbf{System action:} SETPRT processing ends and places a return code in register 15.

\textbf{Application Programmer Response:} Correct any errors in the format of the data to be loaded. Be sure that the printer is set up with the appropriate operating characteristics.

\textbf{Source:} DFSMSdfp

\textbf{Detecting Module:} IGG08117

\underline{IEC185I} \quad \texttt{ddname \text{ ERROR ON SETPRT TO SYSOUT \text{ REASON CODE rsncde}}}

\textbf{Explanation:} text is one of the following:

QMGRIO
CLOSE
A SETPRT macro instruction was issued for the SYSOUT data set identified in the ddname field of the message text. One of the following errors occurred:

- **QMGRIO ERROR, reason code X'00000008':** an error occurred while SETPRT processing was attempting to read a JFCB or JFCBE control block from the system work area (SWA).

- **CLOSE ERROR, reason code X'0000000C':** an error occurred when SETPRT processing invoked the CLOSE subsystem interface for the previous data segment.

- **OPEN ERROR, reason code X'00000010':** an error occurred when SETPRT processing invoked the OPEN subsystem interface for the new data segment being created.

- **SEGMENTING ERROR, reason code X'00000014':** an error occurred while the scheduler spool file allocation routine was segmenting the data set.

- **ENQ ERROR, reason code X'00000018':** SETPRT processing issued an ENQ macro instruction that failed.

- **MULT DCB ERROR, reason code X'0000001C':** More than one DCB was opened for the SYSOUT data set.

In the message text:

**ddname**

The DD name.

**rsncde**

The reason code.

**System action:** SETPRT processing ends and places a return code in register 15 and a reason code in register 0.

**Operator response:** Notify the system programmer.

**Application Programmer Response:** Follow your installation’s procedures for correcting the error. If necessary, contact your programming support personnel.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the SYSOUT output for the job.

**IEC191I**

50D-rc, INVALID PARAMETER LIST SUPPLIED TO OPEN MACRO, DCB ADDRESS = dcb

**Explanation:** The OPEN parameter list contains an incorrect data control block (DCB) address. The hexadecimal reason code explains the error.

**Return Code**

**Explanation**

1C

The execute form of the OPEN macro specifies MODE=31, but the parameter list specifies, or defaults to, MODE=24.

20

The execute form of the OPEN macro specifies MODE=24, but the parameter list specifies MODE=31.

In the message text:

**rc**

The reason code.

**dcb**

The DCB address.

**System action:** The task ends.

**Application Programmer Response:** If you generated the parameter list by using the list form of the OPEN macro, change the mode specification to be consistent on both the MF=L and MF=E forms of the OPEN macro. Otherwise, to have consistent modes, you may either change the form of the parameter list or
change the mode specification on the MF=E form of the OPEN macro.

Source: DFSMSdfp
Detecting Module: IGC0001I
Routing Code: 11
Descriptor Code: 6

IEC192I OPEN MACRO MAY HAVE BEEN USED WITH INCONSISTENT MODE SPECIFICATIONS.

Explanation: The first DCB address in the OPEN parameter list is zero. This address value could be caused by specifying MODE=31 on the list form of the OPEN macro, and MODE=24 on the execute form.

System action: If this is a multiple-DCB invocation of OPEN, the second DCB address should point to storage that belongs to the user. If it does, the job continues; otherwise, the job fails and message IEC191I appears after this message.

Application Programmer Response: If you generated the parameter list by using the list form of the OPEN macro, change the mode specification to be consistent on both the MF=L and MF=E forms of the OPEN macro. Otherwise, to have consistent modes, you may either change the form of the parameter list or change the mode specification on the MF=E form of the OPEN macro.

IEC204I fc,jjj,sss,ddn-#[sn[,rc,rsn]]

Explanation: In the message text:
- fc Function code describing the error.
- jjj Job name.
- sss Step name.
- ddnname -# DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- sn Name of the service which encountered a problem.
- rc Return code from the service which encountered a problem.
- rsn Reason code from the service which encountered a problem.

The explanation for the function code (fc) is as follows:
- X'01' Invalid system control block encountered. Probable system error.
- X'02' Invalid system control block encountered. Probable system error.
- X'03' Invalid system control block encountered. Probable system error.
- X'07' An unexpected error encountered.
- X'0B' An unexpected error returned from a UNIX System Services service.

A failure occurred during CLOSE of a DCB for a UNIX System Services file. An IEC214I message may have been issued that further describes the failure.

System action: The task is ended.

Operator response: None.

Application Programmer Response: Correct probable user errors causing the abnormal end as indicated by the return code in the message text. Then rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

Source: IGGS0CLS
Destination: Operator console
stepname
The step name.
nnn
The decimal file sequence number of the tape data set that was created or extended.
dsn
The data set name.
vols
A list of volume serial numbers. The message lists up to eight volume serial numbers per line. If there are more than eight volume serial numbers in the message, there will be additional lines in the message until all the volume serial numbers have been listed. Each new line of volume serial numbers will begin with VOLS=.
mmm
The decimal multivolume total of data blocks for a data set. TOTALBLOCKS is omitted when a multivolume data set is extended starting on a volume other than the data set's first volume. It will also be omitted if the access method being used by the application isn't maintaining the block count in the DCB such as may be the case for the EXCP access method.

System action: Processing continues.
Operator response: None
Application Programmer Response: When the extended capacity area of the volume or volumes is used, subsequent access of the data set on a 3590 device in 3490-E emulation might require the application to request extended capacity mode through the CAPACITYMODE=XCAP parameter of the DCBE macro.

dname [,nnn LOST BLOCKS]

Explanation: The error occurred during processing of a CLOSE macro instruction for a data set on magnetic tape. The number of blocks processed, which is determined by the position of the tape, does not match the number of blocks specified in the DCB. This error can occur if a cancel command is issued during the time a QSAM tape output job using more than one output buffer is executing. Canceling the job might cause an abend 210 with return code 10.

In the message text:
rc Associates this message with system completion code 214 and with the return code. For explanations of the hex return codes, see Return Code Explanations in the following text.
IEC211I

mod The name of the module in which the error occurred.

jjj The job name.

sss The step name.

ddname[-#] The data definition name, followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation.

dev The device number.

volser The volume serial number.

dsname The data set name.

nnn The number of blocks written to the hardware buffer but not written to the tape medium.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>An I/O error occurred while a user label was being read on magnetic tape.</td>
</tr>
<tr>
<td>08</td>
<td>An I/O error occurred while a magnetic tape volume was being positioned during the processing of a CLOSE macro instruction.</td>
</tr>
<tr>
<td>0C</td>
<td>While a Read Block ID command was being processed to establish the tape position, an I/O error occurred.</td>
</tr>
<tr>
<td>10</td>
<td>The number of blocks processed, which is determined by the position of the tape, does not match the number of blocks specified in the DCB. This error can occur if a cancel command is issued during the time a QSAM tape output job, using more than one output buffer, is executing.</td>
</tr>
<tr>
<td>14</td>
<td>The number of blocks processed, as indicated in the DCB for an ISO/ANSI standard label data set, exceeds 999,999, which is the maximum block number which can be recorded in an ISO/ANSI label.</td>
</tr>
<tr>
<td>18</td>
<td>A return code from an OCE Tape Installation Exit was not valid. For the name of the specific exit and the value of the return code that was not valid, see IEC998I.</td>
</tr>
</tbody>
</table>

System action: The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with

In the DD statement for the data set in error, specify DCB=DIAGNS=TRACE

Application Programmer Response: If an I/O error has occurred, a defective volume or device might be the cause. Save the output from the failing job to aid in the analysis of the problem.

Rerun the job specifying a different volume or device. If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement. If a specific volume is needed, try requesting a different device in the UNIT parameter of the DD statement. Rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

              to be ignored as specified in the DCB ABEND exit
              routine.

Operator response: Start a generalized trace facility
                   (GTF) trace, and re-create the problem. Reply to
                   message AHL100A with:
                   TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:
DCB=DIAGNS=TRACE

Application Programmer Response: If an I/O error
has occurred, a defective volume or device may be the
cause. Save the output from the failing job to aid in the
analysis of the problem.
Rerun the job specifying a different volume or device. If
a scratch volume was being used when the I/O error
occurred, request a different volume. If that does not
solve the problem, request a different device in the
UNIT parameter of the DD statement. Rerun the job.

System programmer response: If the error recurs
and the program is not in error, look at the messages in
the job log for more information. Search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the
SYSOUT output for the job.

IEC212I 414-rc,mod,iji,sss, ddname[-#],dev,ser,dsname

Explanation: The error occurred during processing of
a CLOSE macro instruction for a data set on a direct
access device or tape.
In the message text:
IEC214I

Source: DFSMSdfp
Detecting Module: IFG0201R
Routing Code: 11
Descriptor Code: 6

Explanation: The error occurred during processing of a CLOSE macro instruction for a data set on a direct access device or a subsystem data set.

In the message text:

rc Associates this message with system completion code 614 and with the return code.
jjj The job name.
sss The step name.
ddbname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
dev The device number.
ser The volume serial number.
mod The name of the module in which the error occurred.
dname(member) The data set name. Member name if specified.

The explanation for the hex return code is as follows:

Return Code Explanation
04 Either an I/O error occurred writing a file mark for a data set on a direct access device during processing of a CLOSE macro instruction or I/O prevention has completed.
08 A file mark should have been written on an output data set. The DCBFDAD field in the DCB indicated an extent number in the DEB greater than the number of extents in the data set. Consequently, it could not be determined where the file mark should have been written.
0C The close subsystem executor module was passed an error return code in register 15 after issuing the IEFSSREQ macro to connect to the subsystem. This indicates the subsystem was not operating.
10 A spooled or subsystem data set or a z/OS UNIX file could not be closed by a subsystem. The failing DCB could not be closed. Generally there is another message to explain the failure further.
14 A CLOSE macro instruction detected an error return code from an SMS service while processing a PDSE data set.

During the execution of a CLOSE macro instruction, an error was returned from a system function called to process a PDSE containing program objects.

CLOSE detected a bad return code from a system service used in calculating DS1LSTAR for a stripe of an extended format sequential data set. The DS1LSTAR field is in the data set label (DSCB or data set control block). It identifies the last user block on the volume.

An error occurred when the system attempted to write a software file mark at the end of an extended format sequential data set. This was during execution of a CLOSE macro instruction.

A catalog error occurred attempting to update the catalog record for an attribute extension data set during execution of a CLOSE macro instruction.

Statistics (compressed and uncompressed data sizes) in the catalog are incorrect for a data set in the compressed format. The data set may be damaged.

Error attempting to access a catalog while processing a data set in the compressed format.

During close processing, an error was encountered while processing the dictionary token or the tailored dictionary of a compressed format data set created with tailored compression.

During close processing, an error was encountered while attempting to compress a user block for a compressed format data set using tailored compression.
During close processing, an error was returned from the routine (IGG019VT) responsible for processing the tailored dictionary of a compressed format data set.

During close processing, while attempting to store a dictionary token in the catalog for a compressed format data set being created with tailored compression, it was discovered that a dictionary token had been stored in the catalog since the time this DCB was opened. This implies that instruction with a TYPE=T operand.

Data conversion requested for an ISO/ANSI Version 4 tape. The system encountered a problem attempting to free resources obtained for conversion tables used during input processing.

Data conversion requested for an ISO/ANSI Version 4 tape. The system encountered a problem attempting to free resources obtained for conversion tables used during output processing.

CLOSE detected that processing of a newly derived tailored dictionary and associated data did not complete successfully.

System action: The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:
TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:
DCB=DIAGNS=TRACE

Application Programmer Response: If an I/O error has occurred, a defective volume or device may be the cause. Save the output from the failing job to aid in the analysis of the problem.

Rerun the job specifying a different volume or device. If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement. If a specific volume is needed, try requesting a different device in the UNIT parameter of the DD statement. Rerun the job.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

IEC215I 714-rc,mod, jjj, sss, ddname[-#], dev, ser, dsname

Explanation: The error occurred during processing of a CLOSE macro instruction for a data set on magnetic tape.

In the message text:
rc Associates this message with system completion code X'714' and the return code.
jjj The job name.
sss The step name.
ddname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
dev The device number.
ser The volume serial number.
mod The name of the module in which the error occurred.
dsname The data set name.

The explanation for the hex return code is as follows:

Return Code Explanation
04 An I/O error occurred writing trailer label 1 for a data set on magnetic tape during processing of CLOSE macro instruction.
08 An I/O error occurred writing trailer label 2 for a data set on magnetic tape.
0C If opened for output processing, an I/O error occurred writing a tape mark during processing of a CLOSE macro instruction. If opened for input processing, a previous positioning error has been detected in volume disposition processing during processing of a CLOSE macro instruction. A possible cause is that ERP detected a permanent error and the tape position was unknown.
10 For a QSAM data set, either an I/O error occurred while flushing the buffers during close processing or a close was issued in the caller's SYNAD routine.
**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:** If an I/O error has occurred, a defective volume or device may be the cause. Save the output from the failing job to aid in the analysis of the problem.

Rerun the job specifying a different volume or device. If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement. If a specific volume is needed, try requesting a different device in the UNIT parameter of the DD statement. Rerun the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Source:** DFSMSdfp

### IEC217I

**Explanation:** The error occurred during processing of a CLOSE macro instruction for a partitioned data set opened for output to a member.

In the message text:

- `rc` Associates this message with system completion code B14 and with the return code.
- `jjj` The job name.
The step name.

**ddname[#]** DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

**dev** The device number.

**ser** The volume serial number.

**mod** The name of the module in which the error occurred.

**dsname**(member) The data set name. Member name if specified.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>A duplicate name was found in the directory of a partitioned data set. The CLOSE routine attempted to add a member name to the directory using the STOW macro instruction, but a code of 4 was returned, indicating that the member already exists. Specify a different member name, or remove the old member name using the IEHPROGM utility, or specify DISP=OLD on the DD statement.</td>
</tr>
<tr>
<td>08</td>
<td>The partitioned data set (PDS) directory has become fragmented or full if you replace a member in a PDS repeatedly. In this situation, compress the PDS to rebuild the directory. Or the CLOSE routine attempted to update the PDS directory; however, the TTRN value for that member was not within the extents in the DEB.</td>
</tr>
<tr>
<td>0C</td>
<td>The CLOSE routine attempted to update the directory of a partitioned data set; however, a code of 12 was returned by the STOW macro instruction, indicating that either there is no space left in the directory, or there is no space left in the data set (space in the data set is required for writing an end of file record). If this IEC217I message was preceded by an IEC030I (ABEND B37), IEC031I (ABEND D37), or IEC032I (ABEND E37) message, then the interpretation of this IEC217I message should be out of space in the data set. If IEC217I is issued (with return code 0C) without one of the out of space messages, the interpretation should be out of space in the directory. In either case, to resolve the problem, copy the data set to a scratch volume, reallocate space for the data set specifying either more directory blocks or more space for the data set, and then copy it back using IEBCOPY.</td>
</tr>
<tr>
<td>10</td>
<td>An I/O error occurred trying to update the directory of a partitioned data set.</td>
</tr>
<tr>
<td>14</td>
<td>The CLOSE routine attempted to update the directory of a partitioned data set; however, the DCB of the partitioned data set was not open; or opened incorrectly. Make sure the DCB is open before issuing a CLOSE.</td>
</tr>
<tr>
<td>18</td>
<td>Unsuccessful GETMAIN for STOW work area when CLOSE routine attempted to update a partitioned data set. Specify a larger region and rerun the job.</td>
</tr>
<tr>
<td>1C</td>
<td>The STOW routine failed while creating an empty data member because the PDSE was already defined as a program object.</td>
</tr>
<tr>
<td>24</td>
<td>The CLOSE routine attempted to update the directory of a PDSE; however, STOW returned a return code of 36, indicating that it received an incorrect member token.</td>
</tr>
<tr>
<td>2C</td>
<td>The CLOSE routine attempted to update the directory of a PDSE; however, STOW returned a return code of 44, indicating that it received an error return code from a system service which is used with PDSE processing.</td>
</tr>
<tr>
<td>30</td>
<td>The CLOSE routine attempted to update the directory of a PDSE; however, STOW returned a return code of 48, indicating that it detected an inconsistent input parameter.</td>
</tr>
</tbody>
</table>

**System action:** The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:** Probable user error unless an I/O error has occurred. Correct the errors causing abnormal end as indicated by the return code in the message text. Then rerun the job.

If an I/O error has occurred, a defective volume or
device may be the cause. Save the output from the failing job to aid in the analysis of the problem. Rerun the job specifying a different volume or device. If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement. If a specific volume is needed, try requesting a different device in the UNIT parameter of the DD statement. Rerun the job. For return code 08, the TTRN value can be found in the DCBRELAD field of the DCB. This value can be compared with the extent information contained in the DEB.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Detecting Module: IGG0201B
Routing Code: 11
Descriptor Code: 6

IEC218I 117-rc,mod,ii,sss, ddname[-#],dev,ser,dsname(member)

Explanation: The error occurred during processing of a BSAM CLOSE macro instruction with a TYPE=T operand.

In the message text:

rc Associates this message with system completion code 117 and with the return code.

jjj The job name.

sss The step name.

ddname[-#] DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).

dev The device number.

ser The volume serial number.

mod The name of the module in which the error occurred.

dsname(member) The data set name. Member name if specified.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>A CLOSE macro instruction with a TYPE=T operand was issued for a data set that was opened with the options RDBACK and LEAVE or INOUT and REREAD. An I/O error occurred in tape positioning while performing a forward space file past a tape mark.</td>
</tr>
<tr>
<td>10</td>
<td>An I/O error occurred in tape positioning during processing of a CLOSE macro instruction with a TYPE=T operand. A backspace file past the tape mark following trailer labels was being attempted.</td>
</tr>
<tr>
<td>14</td>
<td>An I/O error occurred in tape positioning attempting a rewind during processing of a CLOSE macro instruction with a TYPE=T operand. The data set was opened with the options RDBACK and LEAVE or INOUT and REREAD.</td>
</tr>
<tr>
<td>18</td>
<td>An I/O error occurred in tape positioning during processing of a CLOSE macro instruction with a TYPE=T operand. An forward space file was being performed past a tape mark preceding data for a data set with standard labels opened for RDBACK.</td>
</tr>
<tr>
<td>1C</td>
<td>An I/O error occurred in tape positioning during processing of a CLOSE macro instruction with a TYPE=T operand. A forward space file was being performed past a tape mark following data for a data set with no labels opened for input, or a data set with standard labels opened for output.</td>
</tr>
<tr>
<td>20</td>
<td>An I/O error occurred in tape positioning during the processing of a CLOSE macro instruction with a TYPE=T operand for a data set with no labels opened for input, or a data set with standard labels opened for output.</td>
</tr>
<tr>
<td>24</td>
<td>An I/O error occurred in tape positioning during the processing of a CLOSE macro instruction with a TYPE=T operand for a data set with no labels opened for input, or a data set with standard labels opened for output.</td>
</tr>
<tr>
<td>28</td>
<td>An I/O error occurred in tape positioning during processing of a CLOSE macro instruction with a TYPE=T operand. A backspace file past the tape mark following data was being attempted.</td>
</tr>
</tbody>
</table>
being attempted for a data set opened with the options INPUT and LEAVE.

An I/O error occurred in tape positioning during the processing of a CLOSE macro instruction with a TYPE=T operand. A tape mark was written following the last data record. During this operation, end-of-volume condition was encountered. The CLOSE routine attempted to backspace file past the tape mark prior to calling EOV, and encountered an I/O error.

An I/O error occurred in tape positioning during processing of a CLOSE macro instruction attempting a backspace following user trailer label processing.

A CLOSE macro instruction with a TYPE=T operand was issued for a data set opened for output processing for which a file mark should have been written. The DCBFAD field in the DCB indicated an extent number in the DEB greater than the number of extents in the data set. Consequently, it could not be determined where the file mark should be written.

While processing a Read Block ID command to establish the tape position, an I/O error occurred.

The number of blocks processed, which is determined by the position of the tape, does not match the number of blocks specified in the DCB.

A CLOSE MACRO instruction with a TYPE = T operand was issued for an output data set with no file mark. The file mark could not be written for the data set because of conflicting information in the PROGRAM DCB. First, the MBBCCHHR field of the DCBFAD contains a value for R that is greater than zero; this value indicates that data is written on the track. Secondly, the DCBTRKBA field indicates that the track is empty.

The number of blocks processed, as indicated in the DCB for an ASCII standard label data set, exceeds 999,999, which is the maximum block number which can be recorded in an ASCII label.

Invalid return code from an OCE Tape Installation Exit. See IEC998I for name of specific exit and value of invalid return code.

System action: The task is ended unless the error is to be ignored as specified in the DCB ABEND exit routine.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:

DCB=DIAGNS=TRACE

Application Programmer Response: If an I/O error has occurred, a defective volume or device may be the cause. Save the output from the failing job to aid in the analysis of the problem.

If return code is 34 or 40, probable user error. Make sure that the DCBFAD field is not being corrected before the CLOSE TYPE=T macro instruction is issued.

Rerun the job specifying a different volume or device. If a scratch volume was being used when the I/O error occurred, request a different volume. If that does not solve the problem, request a different device in the UNIT parameter of the DD statement. If a specific volume is needed, try requesting a different device in the UNIT parameter of the DD statement.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

- `rc` The return code.
- `mod` The name of the module in which the error occurred.
- `jjj` The job name.
- `sss` The step name.
- `ddname[-#]` DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- `dev` The device number.
- `ser` The volume serial number.
- `dsname(member)` The data set name. Member name if specified.

The explanation for the hex return code is as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>The DCB parameter of the DD statement was not DSORG=PO or PS.</td>
</tr>
<tr>
<td>04</td>
<td>The DCB was opened for input to a member of a partitioned data set.</td>
</tr>
<tr>
<td>08</td>
<td>An input data set, with the CLOSE disposition of LEAVE, did not specify DSORG=PO or PS in the DCB.</td>
</tr>
</tbody>
</table>
| 0C          | Output processing was specified for a
The REREAD option was specified for a data set that did not specify DSORG=PO or PS in the DCB.

**System action:** Processing is discontinued for the DCB error. Other DCBs in the CLOSE (TYPE=T) parameter list will be processed normally.

**Application Programmer Response:** Probable user error. Consult [z/OS DFSMS Macro Instructions for Data Sets](https://www.ibm.com) to correct the specification that is in error, then run the job again.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output, the program listing, and the assembly listing for the job.

---

**IEC255D**

```
jjj IS (ddname, utn, ser) A SECURE CHECKPOINT VOLUME REPLY 'YES' OR 'NO'
```

**Explanation:** The job has defined an old checkpoint data set with the DD statement, on the volume, mounted on the device.

In the message text:
- `jjj` The job name.
- `ddname` The DD name on the DD statement.
- `utn` The device number of the specified device.
- `ser` The volume serial number.

**System action:** The system waits for the operator to reply.

**Operator response:** Determine if the desired volume can be made secure after the data set is created. If the request is for a direct access volume, determine if there have been any opportunities for prior offline use of the volume by an unauthorized user. If the request is for a tape, make sure that it is either a new tape, an old secure checkpoint volume, or an old tape which has been bulk erased. Reply 'YES' to allow the use of the volume for checkpoint entries. Reply 'NO' to prevent its use for checkpoint entries. If the reply is 'YES', attach a special label to the volume to indicate that the volume contains a checkpoint data set.

**Source:** DFSMSdfp

**Detecting Module:** IFG0196T

**Routing Code:** 3,4,9

**Descriptor Code:** 5

---

**IEC254D**

```
SHOULD jjj USE (ddname, utn, ser) FOR CREATING A NEW CHECKPOINT DATA SET REPLY 'YES' OR 'NO'
```

**Explanation:** A request has been made by the job to create a new checkpoint data set on the volume, mounted on the device, and described by the DD statement.

In the message text:
- `jjj` The job name.
- `ddname` The DD name on the DD statement.
- `utn` The device number of the specified device.
- `ser` The volume serial number.

**System action:** The system waits for the operator to reply.

**Operator response:** When the reply is 'NO', processing continues with the indicated volume, making it a non-secure volume. When the reply is 'YES' and the original request was for a specific volume, processing continues with the indicated volume. If the original mount request was for a scratch volume, another MOUNT SCRATCH request is issued by the system.

**Source:** DFSMSdfp

**Detecting Module:** IFG0193D, IFG0195B, IFG0195K, IFG0196Q, IFG0196T, IGC0Q05B

**Routing Code:** 1,3,4,5,6,9

**Descriptor Code:** 2
IEC256A  

**jiij (ddname,utn,ser) IS NO LONGER A SECURE CHECKPOINT VOLUME**

**Explanation:** The job is overlaying a secure tape checkpoint data set with a noncheckpoint data set. The volume serial number involved is mounted on the device defined by the DD statement.

In the message text:

- **jjj**  The job name.
- **ddname**  The DD name on the DD statement.
- **utn**  The device number of the specified device.
- **ser**  The volume serial number.

**System action:** Processing continues.

**Operator response:** Reclassify the volume as nonsecure. This will probably involve the removal of a special checkpoint label attached to the physical tape volume.

IEC291I  

**50D-rc, INCORRECT PARAMETER LIST SUPPLIED TO CLOSE MACRO, DCB ADDRESS = dcb**

**Explanation:** The CLOSE parameter list contains an incorrect data control block (DCB) address.

The hexadecimal return code explains the error:

**Return Code**  

**Explanation**  

- **1C**  The execute form of the CLOSE macro specifies MODE=31, but the parameter list specifies, or defaults to, MODE=24.
- **20**  The execute form of the CLOSE macro specifies MODE=24, but the parameter list specifies MODE=31.

In the message text:

- **rc**  The return code.
- **dcb**  The incorrect DCB address.

**System action:** The task ends.

**Application Programmer Response:** If you generated the parameter list by using the list form of the CLOSE macro, change the mode specification to be consistent on both the MF=L and MF=E forms of the CLOSE macro. To have consistent modes, you may change either the list form or the execute form of the CLOSE macro.

**Source:** DFSMSdfp

**Detecting Module:** IGC00020

**Routing Code:** 11

**Descriptor Code:** 6
CLOSE MACRO MAY HAVE BEEN USED WITH INCONSISTENT MODE SPECIFICATIONS

Explanation: The first data control block (DCB) address in the CLOSE parameter list is zero. This address value could be caused by specifying MODE=31 on the list form of the CLOSE macro, and MODE=24 on the execute form.

System action: If this is a multiple-DCB invocation of CLOSE, the second DCB address should point to storage that belongs to the user. If it does, the job continues; otherwise, the job fails and message IEC291I follows this message.

Application Programmer Response: If you generated the parameter list by using the list form of the CLOSE macro, change the mode specification to be consistent on both the MF=L and MF=E forms of the CLOSE macro. To have consistent modes, you may change either the list form or the execute form of the CLOSE macro.

Source: DFSMSdfp
Routing Code: 11
Descriptor Code: 6

FIRST DCB IN CLOSE PARAMETER LIST IS NOT ACCESSIBLE, DCB ADDRESS = aaaaaaaa

Explanation: The address of the first DCB or ACB in the parameter list passed to CLOSE is not accessible. The message text specifies the invalid address.

System action: Processing continues. If the CLOSE SVC 20 was issued by task termination, an ABEND C03 will be detected, otherwise; a program check will probably occur in IGC00020.

User response: None.
Operator response: None.
Application Programmer Response: Probable user error. There are two possible explanations:

- The DCB or ACB storage whose address is specified in the message text was incorrectly freed without first closing the associated data set prior to task termination. Your program must close each DCB or ACB if it frees the area that contains the DCB or ACB.
- The program issued the CLOSE macro incorrectly and did not pass a valid DCB address. An example of this error is CLOSE (11), which means the DCB or ACB is at absolute address 11. It should be coded as CLOSE ((11)), which means that register 11 contains the address of the DCB or ACB. Examine the macro expansion to check whether this is the problem.

Source: DFSMSdfp
Detecting Module: IGC00020

Note: It is suggested that you code the register with a symbolic name as a good programming practice. For example, ((R11)) would be better.
supplied for the concatenation number. If the indicated function is not authorized or if no password was supplied, cancel the job by entering REPLY xx, zzzzzzzz twice, where zzzzzzzz is any zero- to eight-character dummy password. This will result in message IEC150I 913-0C being issued.

If the program is attempting to scratch, catalog, or rename the data set, a WRITE password must be supplied.

Source: DFSMSdfp

Detecting Module: READMEPSWD

Routing Code: 9

Descriptor Code: 2

IEC331I  ro-crs[sierror],jji, sss,proc{func},mmm VOL,ser,NAME,dsname

Explanation: An error condition was detected while processing a catalog management request directed to either a VSAM or an ICF catalog. See message IDC3009I for an explanation of the return and reason codes.

Note: If ro-crs is 004-33 or 04-34, a VSAM catalog was OPENed. IBM support for VSAM catalogs will end January 1, 2000. This message is intended to help identify VSAM catalogs that are still in use. If you need to use a VSAM catalog after December 31, 1999, you must convert it to an ICF catalog. To do this, use facilities such as the IDCAMS CNVTCAT command. For more details on 004-33 and 004-34, see message IDC3009I.

In the message text:
rc The return code.
crs The catalog reason code.
sierror Hexadecimal fullword of information that further describes the error; this information appears only if an invoked subfunction (SFI) detected the error. The meaning depends on the possible combinations of the return code and the reason code.
jji The job name.
sss The step name.
proc The name of the VSAM catalog management procedure that caused the message to be issued. (The name omits the IGGP prefix.)
func Indicates that an error occurred during the VSAM catalog/ACB open process.
mmm The name of the VSAM catalog management control section (CSECT) that detected the error condition.
ser The volume serial number.

System action: The command is ended.

Application Programmer Response: See programmer response for the specific return code and reason code in message IDC3009I.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Source: DFSMSdfp

Routing Code: 2,11

Descriptor Code: 6

IEC332I  proc[proc...]]

Explanation: This message lists the nest of VSAM catalog management procedures that existed when control was passed to the VSAM catalog management routine that caused message IEC331I to be issued.

In the message text:
proc proc... The procedure names. The IGGP prefix is omitted.

System action: The command is ended.

Application Programmer Response: See message IEC331I.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

Source: DFSMSdfp

Routing Code: 2,11

Descriptor Code: 6

IEC333I  terr[vvv],xx, cat,yyy

Explanation: An I/O error condition was detected while processing a catalog management request that was directed to either an ICF or a VSAM catalog (or VSAM catalog recovery area). This message follows messages IEC331I and IEC332I. The fields in the message text have the following meanings:
t L - Logical error (associated with a VSAM record management return code of 8).
  P - Physical error (associated with a VSAM record management return code of 12).
err The VSAM record management logical or
physical error code. See the explanation of message IDC3351I for an explanation of these codes.

If this field is zero, no record management error is associated with this message.

**vvv**

If present, this information further describes the error by providing a unique problem determination function code, in decimal, for VSAM record management. See z/OS DFSMSdfp Diagnosis for an explanation of this function code.

**xx**

A control byte that indicates the type of I/O that resulted in the error. If field **xx** is provided, it can be interpreted as follows:

- 1... .... GET
- 0... .... PUT
- .1... .... ERASE
- .0... .... DO NOT ERASE
- ..1.... USE ARA BUFFER
- ..0.... USE URA BUFFER
- ...1 .... KEYED REQUEST
- ...0 .... ADDRESSED REQUEST
- .... 1... NON-UPDATE REQUEST
- .... 0... UPDATE REQUEST
- .... .1.. NO ERROR CHECK
- .... .0.. CHECK FOR ERRORS
- .... .1.. TRUENAME REQUEST
- .... .0.. LOW KEYRANGE REQUEST
- .... ...1 FOR GET, MEANS KEY GREATER THAN OR EQUAL
- .... ...0 FOR PUT, MEANS SEQUENTIAL REQUEST

**1100 0000**
SEQUENTIAL GET

**1000 0100**
GET AND NOTE STRING POSITION

**cat**

Identifies the name of the catalog in EBCDIC with trailing blanks truncated.

**yyy**

Identifies the catalog or catalog recovery area (VSAM catalog only) logical record that was being processed when the error occurred. The value of **yyy** is either the key of the record, (excluding position 45 if an ICF catalog), in EBCDIC with trailing blanks truncated, or ‘Cl=cccccc’, where cccccc is the relative control-interval number of the record, in hexadecimal (VSAM catalogs only). If the area is associated with a VSAM-recoverable catalog, then ‘CRAVOL=vvv’ will appear in the message following ‘Cl=cccccc’, where vvv is the volume serial number of the volume containing the catalog recovery area.

**zz**

Identifies, for the ICF catalog only, the extension record number (key position 45) associated with the I/O request. **zz** is only included if the extension number is non-zero.

**System action:** The system ends the request. see the system action associated with the value printed for **rc**-**crs** for message IDC3009I.

**Application Programmer Response:** See the programmer response associated with the value printed for **rc**-**crs** for message IDC3009I.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Routing Code:** 2,11

**Descriptor Code:** 6

**IEC334I**

DUPLICATE SUBSYSTEM X’ssid’ CCA X’cca’, DEVICE addr NOT BROUGHT ONLINE.

**Explanation:** During Nucleus Initialization Processing (NIP) or during VARY,ONLINE command processing, storage subsystem validation determined that when the initialization of the addressed device on the system occurred, it already had a device table entry initialized for the identified subsystem. This device cannot be brought online.

In the message text:

- ssid The identifier of the subsystem being processed.
- cca The channel connection address of the device being processed.
- addr The device number of the subsystem device.

**System action:** Processing continues.

**Operator response:** Probable subsystem configuration problem. The identified Subsystem already has a device configured with the same Channel Connection Address (CCA) and Director-to-Device Connection address (DDC). Use the IDCAMS Cache Utility LISTDATA command to obtain a full device status report. The system operator may vary the device online after the problem is repaired. DEVSERV QDASD,SSID=ssid can be used to get the information regarding the duplicate subsystems.

**Source:** DFSMSdfp
IEC335E  CHECK STORAGE SUBSYSTEM X'Ssid' DUAL COPY STATUS FOR pri/sec DEVICE addr DUPLEX PAIR STATUS: stat PRIMARY CCA: X'xx' SECONDARY CCA: X'xxx'

Explanation: During Nucleus Initialization Processing (NIP), storage subsystem validation detected an inconsistency in determination of the primary or secondary device of a duplexed volume. The primary device of a duplex pair cannot be associated with a secondary device or the secondary device cannot be associated with its primary. If it is a primary device, it is marked offline. If a secondary device is encountered without a primary, the primary device address may have been Gen'd offline and this case may not be a problem. If the primary device is varied on before the problem is resolved, then I/O operations that may occur to the duplexed volume may result in subsequent error conditions from the subsystem.

In the message text:

ssid The identifier of the subsystem being processed.

pri/sec Either PRI or SEC depending on whether the addressed device is the primary or the secondary.

addr The device number of the affected device in the duplex pair.

stat Status, can be any of the following:
- AVAILABLE when the duplex pair is available.
- PENDING when the copy to establish a duplex pair had been in progress.
- SUSPENDED when the duplex pair had been put into the suspended state by host command or by the subsystem.

xx The channel connection address (CCA) value of the devices in the duplex pair returned in the Sense Subsystem Status data.

System action: Processing continues.

Operator response: Use the IDCAMS Cache Utility LISTDATA command to obtain a full status report. The system operator should only vary the primary device online after the problem is repaired.

Source: DFSMSdfp

IEC337I  ASYNCHRONOUS OPERATIONS MANAGER TRACE FUNCTION DISABLED, SUFFICIENT STORAGE UNAVAILABLE

Explanation: The Asynchronous Operations Manager Trace function is not able to obtain enough storage (8K) from subpool 241 in ESQA to perform component trace. No trace entries are generated.

System action: Processing continues. If tracing is to be performed, then the ESQA size must be expanded to accommodate the trace table.

Source: DFSMSdfp

IEC338I  xxxxxxxx VALIDITY CHECK FAILED ON CATALOG PARAMETER LIST [STORAGE]

Explanation: The VSAM catalog initialization routine received an error code when an attempted catalog parameter list validity check failed.

In the message text:

xxxxxxx The module name of the routine.

System action: VSAM catalog management returns to the caller with error code 128 in Register 15 immediately after detecting the error.

Application Programmer Response: See description under message IDC3009I for error code 128. If access method services detects the error, message IDC3009I will appear; however, there will be no module name or reason code in the message.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the SYSOUT output for the job.

Source: DFSMSdfp

Routing Code: 11

Descriptor Code: -
IEC339I  xxxxxxx INSUFFICIENT STORAGE FOR VSAM CATALOG [COMMUNICATION] WORK AREA

Explanation: VSAM catalog initialization issued a conditional GETMAIN for CCA storage and it failed due to a lack of storage.

In the message text:

xxxxxxx The module name of the routine.

System action: VSAM catalog management returns to the caller with an error code in Register 15 immediately after detecting the error. If the catalog request is from job scheduler or the catalog controller, the return code value will be 8. Otherwise, the return code value will be 164 and the reason code will be 10.

Application Programmer Response: Increase the region size available to the job step. The storage size requested was approximately 4288 bytes.

Source: DFSMSdfp
Routing Code: 11
Descriptor Code:  -

IEC340I  mmmm, INSUFFICIENT STORAGE FOR THE CATALOG WORK AREA

Explanation: Catalog management issued a conditional GETMAIN for work area storage space. GETMAIN failed due to insufficient storage in your region.

In the message text:

mmmm The name of the catalog management control section (CSECT) that detected the error condition.

System action: Catalog management returns to the caller immediately after detecting the error with an error code in Register 15. If the catalog request points to a catalog parameter list (CTGPL), the return code value is 64 and the reason code is 2. If the request points to a CAMLST, the return code is 24 for a locate function or 28 for a non-locate function.

Application Programmer Response: Increase the region size available to the job step.

Source: DFSMSdfp
Routing Code: 11
Descriptor Code: 7

IEC342I  CATALOG ABEND OCCURRED CATALOG ABEND DIAGNOSTIC INFORMATION JOB=jobname,CAS ESTAE-566528418 R310 ABEND.xxx,modname=yyyy FMID=fmid,MAINT=level

Explanation: This message indicates an abend associated with another catalog module. This message also indicates that the catalog FRR/ESTAE recovery routine in the user address space received control.

Additional diagnostic information appears; this information matches that recorded in the SYS1.DUMP data set, under the heading 'Catalog Abend Diagnostic Information.'

In the message text:

jobname The job that was running when the abend occurred.

xxx The abend that occurred.

modname The name of the catalog module associated with the abend.

yyyy The offset of the abend.

fmid The FMID of the module.

level The maintenance level of the module.

When the abend occurred within a catalog module and the name of that module can be determined, the value of yyyy is the offset within the module where the abend occurred. However, when the abend occurred outside the module, the value of yyyy is the offset of the last code processed in the module. In some cases, offset cannot be determined; when this case is true, the value of yyyy is zero.

System action: The SYS1.DUMP data set contains the dump taken by the FRR/ESTAE in the user address space. The system also writes a LOGREC record.

Application Programmer Response: For DFP Version 2, print the SYS1.DUMP data set and then contact your programming support personnel.

For DFP Version 3, contact your programming support personnel.

246 to the issuer of SVC 26.
personnel; this message already displays the diagnostic information you need.

**Source:** DFSMSdfp

**Routing Code:** 11

**Descriptor Code:** 7

---

**IEC343I**

**Explanation:** The catalog FRR/ESTAE recovery routine in the user address space was unable to continue processing after an abnormal end. Either (1) the routine was unable to pass the FRR/ESTAE an SDWA or (2) due to an overlay, a catalog CIFWA block was incorrect. No FRR/ESTAE processing is possible.

**System action:** Percolation to the next FRR/ESTAE occurs.

**Application Programmer Response:** Contact your programming support personnel.

---

**IEC347I**

**Explanation:** Where text is:

<table>
<thead>
<tr>
<th>Flags</th>
<th>Task Address</th>
<th>Jobname</th>
<th>Stepname</th>
<th>Elapsed Time</th>
<th>Id</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **FLAGS**:
  - O: The task is the oldest active request.
  - W: The task is waiting (such as, for ENQ).
  - A: The task is abending.
  - E: The task is in ENQ wait.
  - R: The task is in RECALL wait.
  - L: The task is suspended waiting for a response from the RLS address space for a request for an RLS function. When this flag displays, you should follow the RLS-specific diagnostic procedures for gathering information to report this problem.

The MODIFY command was issued for the catalog address space (CAS), requesting a list of CAS service tasks. The message display contains the following information for each service task:

- The task’s hexadecimal address.
- The jobname and stepname that the task is currently processing. If no CAS service tasks are active, NOACTIVE replaces the jobname and NONE replaces the stepname.
- The amount of time the request has been active in the CAS.
- The task ID.

The following indicators provide additional information about the status of a task:

- **O**: The task is the oldest active request.
- **W**: The task is waiting (such as, for ENQ).
- **A**: The task is abending.
- **E**: The task is in ENQ wait.
- **R**: The task is in RECALL wait.
- **L**: The task is suspended waiting for a response from the RLS address space for a request for an RLS function. When this flag displays, you should follow the RLS-specific diagnostic procedures for gathering information to report this problem.

For additional information on the MODIFY CATALOG, LIST command, see Interpreting MODIFY CATALOG, LIST Output or Interpreting MODIFY IEC Messages.
CATALOG, LIST J (jobname) DETAIL Output in the DFSMS Managing Catalogs

System action: The system issues a multi-line message with the appropriate information about active CAS service tasks.

Source: DFSMSdfp
Detecting Module: IGG0CLGB
Routing Code: 2,10,11
Descriptor Code: 9

IEC348I ALLOCATED CATALOGS

text

Explanation: A DFSMS MODIFY CATALOG,ALLOCATED command was issued for the catalog address space (CAS), requesting a list of allocated catalogs. In the message text, the value of text provides the following information:

FLAGS - VOLSER-USER-CATALOG NAME %
abbbbb volser count cname allext %
.
.
Y/N-ALLOCATED TO CAS, S-SMS, V-VLF, I-ISC,
C-CLOSED, D-DELETED, R-SHARED, A-ATL,
E-ECS SHARED, K-LOCKED

For each catalog, text includes the following information:

a The allocation status of the catalog:
  Y The catalog is allocated to CAS.
  N The catalog is not allocated to CAS.

b A letter that represents information about the catalog:
  S SMS manages the catalog.
  V The catalog data space (VLF) cache is active for the catalog.
  I The in-storage catalog (ISC) cache is active for the catalog.
  C The catalog has been closed. The catalog might have been closed either by the F CATALOG, CLOSE(nnnnn...) command or by CAS recovery functions that caused control-block rebuild, freed CAS resources, or did both. At the next access, the catalog is opened with a new set of record-management control blocks.
  D The catalog has been deleted.
  R The catalog is using cross-system sharing.
  E The catalog is using enhanced catalog sharing.
  A The catalog is a tape-volume catalog.
  K The catalog has been locked by the IDCAMS ALTER LOCK command.

Indicators I, C, and D are mutually exclusive, and indicators R and E are mutually exclusive.

volser The volume serial number.

count The usage count, in hexadecimal format.

cname The catalog name, up to 44 characters long.

allext% The percentage of allocated extents for each catalog in the list. This percentage indicates the extent usage by either the data or index component, whichever is higher, for that particular catalog. For catalogs that are marked as closed or deleted, this value is N/A.

System action: The system issues a multiline message with the volume serial number, the hexadecimal usage count, and the name of each catalog.

Operator response: None

System programmer response: None

NAME ADDRESS FMID/LEVEL

Then the following line appears at least once:

name address fmid/level

Then the following line appears:

END DISPLAY ENTRY POINT ADDRESS

The MODIFY command was issued for the catalog address space (CAS), requesting a list of entry points for CAS modules. The message display for each entry point contains the following information:

- the CAS module name;
- the hexadecimal starting address;
- the FMID value; and
- the maintenance level.

The display may contain every entry point in catalog load modules IGG0CLX0 and IGG0CLHA.
System action: The system issues a multi-line message with the appropriate information about module entry points.

Source: DFSMSdfp

Detecting Module: IGG0CLGA

Descriptor Code: 9

**IEC350I**  CATALOG ADDRESS SPACE MODIFY COMMAND AVAILABLE

Explanation: The MODIFY command interface task for the catalog address space (CAS) is initialized and can accept MODIFY commands.

System action: The system continues processing.

Source: DFSMSdfp

**IEC351I**  CATALOG ADDRESS SPACE MODIFY COMMAND ACTIVE

Explanation: The MODIFY command was issued for the catalog address space (CAS) and the CAS MODIFY task received the command.

System action: The system continues processing.

Source: DFSMSdfp

**IEC352I**  CATALOG ADDRESS SPACE MODIFY COMMAND COMPLETED

Explanation: The MODIFY command was issued for the catalog address space (CAS) and the CAS MODIFY task completed the requested function.

System action: The system performs the requested function.

- If you requested a restart of CAS, the CAS job step task abends. The system issues system completion code 81A and then restarts CAS.
- If you requested an abnormal end of the service task, the system issues system completion code 91A. The system also takes a complete dump of CAS.

Source: DFSMSdfp

**IEC353I**  CATALOG ADDRESS SPACE MODIFY UNSUCCESSFUL

Explanation: The MODIFY command was issued for the catalog address space (CAS), but CAS MODIFY cannot process the request. This command might fail for any of the following reasons:

- TASK SPECIFIED NOT FOUND — The task ID or task control block (TCB) address specified in the command was not located as a valid task.
- NO CAS MODULE MAP AVAILABLE — The request to list a module and address could not be satisfied because the module map was not built.
- MODULE SPECIFIED NOT FOUND — The module requested in the ENTRY function was not located and might not be a valid module name.
- INVALID RETURN CODE VALUE — The specified return code value was either nonnumeric or greater than 255.
- INVALID REASON CODE VALUE — The specified reason code value was either nonnumeric or greater than 255.
- INVALID COUNT VALUE — The count value in the DUMPON specification was either nonnumeric or greater than 255.
- INVALID COMMAND FORMAT — Either the requested function name was unrecognizable, or the specification of additional operands for a particular function were misspelled or contained a syntax error (for example, unbalanced parentheses).
- INVALID DATA VALUE — The data value specified for the function was either nonnumeric or outside the allowable range.
- INVALID PDF — PDF code entered was either nonnumeric or greater than 255.
- INVALID COMPONENT CODE — The component code was either nonnumeric or greater than 255.
- CATALOG SPECIFIED NOT FOUND — The catalog named in the MODIFY command either could not be located, was not available for use, or was not a user catalog.
- SERVICE proc RETURNED mm-rc-rsn — An invoked catalog function returned a failing module ID, return code, and reason code.

In the message text:

- proc: The last four characters of the CSECT name
- mm: The module ID of the detecting catalog module
- rc: The return code of the detecting catalog module
- rsn: The reason code of the detecting catalog module

- ALL VALUES MAY NOT BE GENERIC — The return code, reason code, and module ID might not all be generic for the DUMPON function.
- UNABLE TO PERFORM RESET — All current activity that might be updating the statistics was not completed within nine seconds. The statistics information was not reset.

System action: System operation continues normally.

Operator response: Reissue the command.

System programmer response: Enter the MODIFY command with corrected format, keyword, or address input.

**Descriptor Code:** 2

**IEC359I (form 1 of 4) CATALOG REPORT OUTPUT**

**text**

**Explanation:** DFSMSdfp issues this message in response to a DFSMS MODIFY command that requests status information about the catalog address space (CAS). The catalog report output, text, contains the following information:

- **CATALOG COMPONENT LEVEL** = complvl
- **CATALOG ADDRESS SPACE ASN** = asn
- **SERVICE TASK UPPER LIMIT** = uppr
- **SERVICE TASK LOWER LIMIT** = lowr
- **HIGHEST # SERVICE TASKS** = hnum
- **CURRENT # SERVICE TASKS** = cnum
- **MAXIMUM # OPEN CATALOGS** = maxo
- **ALIAS TABLE AVAILABLE** = {YES|NO}
- **ALIAS LEVELS SPECIFIED** = n
- **SYS% TO SYS1 CONVERSION** = {ON|OFF}
- **CAS MOTHER TASK** = address
- **CAS MODIFY TASK** = address
- **CAS ANALYSIS TASK** = address
- **CAS ALLOCATION TASK** = address
- **VOLCAT HI-LEVEL QUALIFIER** = system
- **NOTIFY EXTENT** = per
- **DEFAULT VVDS SPACE** = {PRI|SEC} TRKS
- **ENABLED FEATURES** = enabled_features
- **DISABLED FEATURES** = disabled_features
- **INTERCEPTS** = intercepts

**In the message text:**
- **complvl** The FMID value. HDZ11H0 is for z/OS Version 1 Release 5 DFSMS.
- **asn** The current ASID for CAS.
- **uppr** The service task upper limit. The default for **uppr** is 180, but can be set to another value by...
using the TASKMAX command format of MODIFY CATALOG. The value of upper can never be less than the service task high-water mark, \textit{hnum}.

\textit{lowr} The service task lower limit. This limit is a constant that is set at IPL. However, CAS will gradually reduce the number of tasks to maintain this lower limit if the rate of catalog requests decreases.

\textit{hnum} The high-water mark for service tasks. This value can never be less than the number of service tasks currently attached, \textit{cnum}.

\textit{cnum} The number of service tasks currently attached. This number can be less than the lower limit for service tasks, \textit{lowr}, if either of these conditions exists:

- CAS has not yet processed the number of requests represented by \textit{lowr}.
- One or more tasks have abnormally ended.

As requests are processed, CAS creates new tasks to maintain the lower limit, and \textit{cnum} increases.

\textit{maxo} The maximum number of catalogs that can be open concurrently in CAS. You can set this number by using the CATMAX command format of MODIFY CATALOG. The maximum value is 9999.

\textit{n} The number of alias level qualifiers currently being used by catalog search logic (MLA). Valid values for \textit{n} are 1, 2, 3, and 4.

\textit{address} The hexadecimal task-control-block (TCB) address of various CAS tasks.

\textit{per} The percentage of maximum extents at and above which message IEC361I will be issued. The system always issues message IEC361I whenever the percentage utilization for a catalog exceeds 90%. If this value is zero, it is displayed as \texttt{(NONE)}, which means that no messages will be issued until 90% is reached or exceeded.

\textit{pri} is the primary space allocation for an implicit VVDS definition

\textit{sec} is the secondary space allocation for an implicit VVDS definition

\textit{enabled_features} One or more of the following features specified in the MODIFY CATALOG,ENABLE command or set by default:

**DSNCHECK** The data-set name-syntax checking for new cataloged data sets will not be done.

**DELFORCEWING** This feature specifies that message IDC1997I should not be issued if a DELETE CATALOG FORCE or DELETE VVDS RECOVERY command is attempted.

**SYMREC** This feature specifies that SYMREC records will be not written for specific detected errors.

**VVRCHECK** This feature specifies that only basic validation will be done for VVR records.

**AUTOTUNING** Catalogs will not be automatically tuned for string numbers and buffer numbers.

The line that lists disabled features might occur more than once, depending on the number of enabled features.

\textit{disabled_features} One or more of the following features specified in the MODIFY CATALOG,DISABLE command or disabled by default:

**DSNCHECK** The data-set name-syntax checking for new cataloged data sets will not be done.

**DELFORCEWING** This feature specifies that message IDC1997I should not be issued if a DELETE CATALOG FORCE or DELETE VVDS RECOVERY command is attempted.

**SYMREC** This feature specifies that SYMREC records will be not written for specific detected errors.

**VVRCHECK** This feature specifies that only basic validation will be done for VVR records.

**AUTOTUNING** Catalogs will not be automatically tuned for string numbers and buffer numbers.

The line that lists disabled features might occur more than once, depending on the number of enabled features.

\textit{intercepts} A description of entry points to catalog services that have been intercepted by another product. The value of \textit{intercepts} is one or more of the following keywords:

**IGGOCLHA** The branch entry point to catalog services has been overlaid.

**IGC0002F** The SVC entry point to catalog services has been overlaid.

**SIGG26DU** The DFSMS/SHM routine in IGC0002F.
NONE None of the preceding entry points has been replaced or overlaid.

System action: The system issues a multiline message with the appropriate general information about the status of the catalog address space (CAS).

Operator response: None

System programmer response: None

IEC359I (form 2 of 4) CATALOG CACHE REPORT

Explanation: The MODIFY CATALOG, REPORT, CACHE command was issued to request status about the catalogs being cached by the catalog address space (CAS). The message display contains the following:

```
HH% RECORDS --SEARCHES-- FOUND-- DELETES-- SHR UPD-- PURGE--
catalog-name [cachetype] hh% rr ss ff dd uu pp
```

The message display contains the following information:

- `catalog-name` The name of the catalog that is being cached
- `cachetype` Optional field indicating the type of caching being used, either ISC or VLF
- `hh%` The percentage of searches that found a record in the cache.
- `rr` The number of records, in decimal, currently contained in the cache. If the catalog is using VLF, VLF may have trimmed records and the actual number cached may be less than this.
- `ss` The number of searches, in decimal, made against this catalog
- `ff` The number of records, in decimal, found in the caches when searched.
- `dd` The number of records, in decimal, currently deleted in the cache.
- `uu` The number of updates, in decimal, made to the cache as a result of changes on other systems sharing this catalog.
- `pp` The number of times, in decimal, this cache was purged as a result of changes on other systems sharing this catalog.

System action: The system issues a multi-line message with the appropriate general information about CAS status.

Source: DFSMSdfp

Routing Code: 2,10,11

Descriptor Code: 9

IEC359I (form 3 of 4) CATALOG PERFORMANCE OUTPUT

Explanation: The MODIFY CATALOG, REPORT, PERFORMANCE command was issued to request status on the performance of specific services in the catalog address space (CAS). The message displays the following:

```
* Statistics since time_of_day on date *
* ------CATALOG EVENT---- --COUNT-- -----AVERAGE---- *
* EVENTS TO CATALOG svc_count average_time *
* event count average_time *
* event count average_time *
* *
*CAS***************************************************
```

The message displays the following:

- `time_of_day` Time that the statistics were last reset, in `hh:mm:ss.milliseconds` format.
- `date` Date that the statistics were last reset, in `mm.dd.yyyy` format.
- `svc_count` Number of times that the catalog SVC has been issued.
- `average_time` Average time for the catalog entries or catalog events. The times appear in one of the following forms:
  - `xxx.xxx MSEC-milliseconds`, used for times up to 999.999 milliseconds.
  - `xxx.xxx SEC-second`, used for times from 1.000 seconds up to 999.999 seconds.
  - `hh:mm:ss-hours, minutes, and seconds`, used for times greater than 999.999 seconds.
- `event` The internal event, a z/OS service, that was invoked by the CAS during processing.
- `count` The number of times that the event occurred.

System action: The system issues a multi-line message with the appropriate general information about CAS status.

Routing Code: 2,10,11

Descriptor Code: 9

IEC359I (form 4 of 4) CATALOG VSAM DUMP OPTIONS

Explanation: The MODIFY CATALOG, VDUMPON command was issued to request status on the performance of dumping by the catalog address space (CAS). When the user sets an automatic dump through
command MODIFY CATALOG, VDUMPON(pdf,rc,compid,error), the report will display what codes are being monitored by the system. text contains the following:

*CAS****************************************************
* TATUS FUNC CODE RETURN CODE COMPONENT ERROR CODE *
* ON pdf rc compid error *
*CAS****************************************************

The message displays the following:

`pdf` Specifies the VSAM Problem Determination Function code (one to three characters from 0 to 255), or * (asterisk).

`rc` Specifies the VSAM return code in decimal format (one to three characters from 0 to 255), or * (asterisk).

`compid` Specifies the component code (0 - 5), or * (asterisk).

`error` Specifies the VSAM error code in decimal format (one to three characters from 0 to 255), or * (asterisk).

**System action:** None.

**Source:** DFSMSdfp

**Routing Code:** 2,10,11

**Descriptor Code:** 9

---

**IEC360I** SERVICE TASK IN RECALL. USER JOB MUST BE CANCELLED

**Explanation:** A user attempted to issue a MODIFY CATALOG,END or MODIFY CATALOG,ABEND to end a catalog service task. The system cannot end the task however, because it is performing a necessary function in the user address space.

**System action:** The system ends the command.

**Application Programmer Response:** Enter the MODIFY CATALOG LIST command to obtain the name of the user job associated with the catalog service task. Enter the CANCEL command to cancel the user job. The CANCEL command also ends the associated catalog service task.

**IEC363D** IS THIS RESTART RELATED TO AN EXISTING CATALOG PROBLEM (Y OR N)?

**Explanation:** Catalog issues this message in response to a MODIFY CATALOG, RESTART command.

**System action:** When Y is entered, message IEC363D is issued. When N is entered, restart processing continues.

**Operator response:** Enter Y if the RESTART is being issued due to a problem you are trying to clear, or N, if not.

---

**IEC361I** CATALOG `catalogname (comptype)` HAS REACHED `xxx%` OF THE MAXIMUM EXTENTS

**Explanation:** The catalog named `catalogname` has been opened or extended to a new extent, and the current percentage of allocated extents exceeds the threshold set by the NOTIFYEXTENT keyword of the MODIFY CATALOG command. The component exceeding the threshold is indicated by `comptype`, which might be either DATA or INDEX.

In the message text:

`catalogname` The catalog name.

`comptype` The component type, either DATA or INDEX.

`xxx` The percentage of allocated extents, out of a maximum of 123 extents.

DFSMSdfp issues this message once for each catalog in either of the following cases:

- The catalog address space has opened the catalog and the percentage of usage exceeds the current NOTIFYEXTENT percentage.
- The catalog has just extended into a new extent and the percentage of usage exceeds the current NOTIFYEXTENT percentage.

The percentage of usage is calculated as the number of extents allocated divided by 123 and multiplied by 100.

**System action:** System operation continues normally.

**Operator response:** You might need to initiate local procedures that are designed to prevent catalogs from exhausting all of the available extents.

Chapter 3. IEC Messages  3-147
**IEC364D**  HAS AN SVC DUMP OF THE CATALOG ADDRESS SPACE ALREADY BEEN TAKEN (Y OR N)?

**Explanation:** Catalog issues this message in response to a Y respond to message IEC363D.

**System action:** When Y is entered, restart processing continues without taking a dump. When N is entered, an SVCDUMP of the Catalog Address Space and related data is taken before restart processing resumes.

**Operator response:** Enter Y if an SVC dump has already been taken of the system in its current state. Enter N if a dump of the system in its current state has not already been taken.

**System programmer response:** None

**Source:** DFSMSdfp

**Detecting Module:** IGG0CLGA

**IEC365I**  CATALOG ADDRESS SPACE STORAGE SHORTAGE - TASKMAX RESET.

**Explanation:** There is not enough storage in the catalog address space currently available to process all the active service tasks. The maximum number of service tasks that might process simultaneously in the catalog address space has been lowered to ensure the availability of storage for task termination.

**System action:** The system continues processing.

**System programmer response:** It is possible that contention exists for a system resource that is causing a backup of requests in the catalog address space. When this contention is resolved, the limit on the number of active catalog service tasks can be raised using the MODIFY CATALOG,TASKMAX command.

**Source:** DFSMSdfp

**IEC368I**  CATALOG INITIALIZATION THE MULTI-LEVEL ALIAS FACILITY HAS BEEN INITIALIZED. THE NUMBER OF LEVELS OF QUALIFICATION IS n

**Explanation:** The multi-level alias facility has successfully initialized.

In the message text:

n  The number of levels of qualification, which can be any value from 1 to 4.

**System action:** The system continues processing.

**Source:** DFSMSdfp

**Routing Code:** 2,4,10,11

**Descriptor Code:** 4

**IEC370I**  CATALOG MULTI-LEVEL ALIAS FACILITY IS NOT INITIALIZED

**Explanation:** An error occurred during initialization of the multi-level alias facility. Other operator messages that indicate the cause of the error have already been issued. Until this situation is corrected, all requests which must access the multi-level alias table will fail.

**System action:** The system has not built the multi-level alias in-storage tables. If the error was due to reading a bad master catalog record, then the system took a dump to SYS1.DUMP dataset.

**Operator response:** Determine and correct the problem which caused the failure of multi-level alias facility initialization. If the problem affects only catalog, then re-initialize the facility by issuing MODIFY CATALOG,RESTART to restart the catalog address space.

**Source:** DFSMSdfp

**Routing Code:** 2,4,10,11

**Descriptor Code:** 4

**IEC371I**  THE MULTILEVEL ALIAS TABLE WAS NOT BUILT DUE TO UNEXPECTED ERROR WHILE READING THE MASTER CATALOG

**Explanation:** During initialization of the multi-level alias facility, an unexpected error occurred while reading the master catalog. The multi-level alias facility did not correctly initialize.

**System action:** The system took a dump to SYS1.DUMP dataset.
Operator response: Determine and correct the problem which caused the failure of multi-level alias facility initialization. If the problem affects only catalog, then re-initialize the facility by issuing MODIFY CATALOG,RESTART to restart the catalog address space.

Source: DFSMSdfp
Routing Code: 2,4,10,11
Descriptor Code: 4

IELC372I CATALOG SEARCH FUNCTION
CATALOG text

Explanation: text is one of the following:
• MULTI-LEVEL ALIAS HAS DETECTED AN INVALID MASTER CATALOG RECORD NAMED recname
• MULTI-LEVEL ALIAS FACILITY HAS DETECTED A DUPLICATE ALIAS: aliasname

During a multi-level alias facility initialization or rebuilding an incorrect alias or user catalog record was found in the master catalog. The multi-level alias facility did not correctly initialize or rebuild, and the catalog search function is now impaired.

In the message text:
recname The incorrect record name.
aliasname The alias entry in the catalog that occurs more than once.

System action: For the invalid master catalog record, the system creates a SYS1.DUMP data set and then corrects the multi-level alias table.

For the duplicate alias, no dump is created and the duplicate alias remains in the table.

Operator response: Notify your system programmer; after the programmer corrects the incorrect record, issue the command MODIFY CATALOG,MLA(REFRESH) to restart the catalog address space.

System programmer response: These messages indicate an error in the master catalog. Perform a DIAGNOSE of the master catalog and correct any errors discovered. Duplicate alias names listed are a result of the alias name in the association list of more than one catalog user connector record. While the actual alias record in the catalog may point to a specific user catalog, there is at least one other user catalog whose association list contains the same alias. To correct this error you can delete the alias name, define it relating to the incorrect user catalog name, then delete the alias again and define it relating to the correct user catalog name.

Source: DFSMSdfp
Routing Code: 2,4,10,11
Descriptor Code: 4

IELC374I INSUFFICIENT STORAGE FOR CATALOG MULTI-LEVEL ALIAS FACILITY

Explanation: The multi-level alias facility issued a conditional GETMAIN for storage to hold the multi-level alias table; the GETMAIN failed due to lack of storage. The catalog search function is now impaired.

System action: For the catalog search function, the system will read the master catalog instead of using the multi-level alias table.

Operator response: Issue the command MODIFY CATALOG,RESTART to restart the catalog address space. If this message appears again, notify your system programmer.

Application Programmer Response: Determine the problem that is causing the GETMAIN to fail, and correct that problem. Then have the operator issue the command MODIFY CATALOG,RESTART.

Source: DFSMSdfp
Routing Code: 2,4,10,11
Descriptor Code: 4
CATALOG SEARCH FUNCTION THE CATALOG MULTI-LEVEL ALIAS
FACILITY IS RUNNING WITH AN INVALID NUMBER OF LEVELS OF QUALIFICATION (NOT 1 THRU 4)

Explanation: The system level of qualification was altered because the AMCBS was overlaid. Until this situation is corrected, all requests that must access the multi-level alias table will fail.

System action: The system continues processing.

Operator response: Determine the correct number of levels of qualification; then reset the number by using the command MODIFY CATALOG,ALIASLEVEL(n) (make sure n is a number in the range 1 to 4).

Source: DFSMSdfp

Routing Code: 2,4,10,11

Descriptor Code: 4

CAS ALLOCATION TASK IS WAITING FOR ALLOCATION

Explanation: A request to allocate a VVDS dynamically has been issued, and SVC 99 has not completed. Possible reasons for this situation are that a mount was issued, or a VARY OFFLINE command is waiting.

System action: The system issues this message two minutes after issuing SVC 99, and every ten minutes thereafter.

System programmer response: Enter F CATALOG,LIST to determine which task is waiting. That task will return a nonzero return code to its caller.

Source: DFSMSdfp

ENHANCED CATALOG SHARING: \{text\}

Explanation: text is one of the following:

- \{ADDED catname\}
- ALL CATALOGS REMOVED
- AUTOADD ENABLED
- AUTOADD NOT ENABLED-SYSTEM IS QUIESCING
- CONNECT COMPLETE
- DISCONNECT COMPLETE
- ERROR: rc-rsn(sfi),mm
- ERROR ADDING catname: rc-rsn(sfi),mm
- NOT CONNECTED: rc-rsn(sfi),mm
- RENOVED catname
- SYSPLEX QUIESC COMPLETE
- WAITING FOR ISQAT TO INITIALIZE
- WAITING FOR SYSPLEX QUIESC COMPLETE

This is a general status message for ECS.

ADDED catname
Issued to acknowledge an ECHSR(ADD,catname) request that was successful.

In the message text:

- catname
  The name of a catalog

AUTOADD ENABLED
Issued to acknowledge an ECHSR(AUTOADD) request that was successful.

AUTOADD NOT ENABLED-SYSTEM IS QUIESCING
Issued as a result of processing a MODIFY CATALOG command to turn on AUTOADD. However, the system is currently quiescing, so the AUTOADD function cannot be enabled. Repeat the request once the sysplex has completed quiescing.

CONNECT COMPLETE
Issued to acknowledge the successful connection of enhanced catalog sharing (ECS) to the ECS structure in the coupling facility. This message is issued during IPL, during a CAS restart, or when requested through a MODIFY CATALOG command with the ECHSR(CONNECT) parameter.

ERROR: rc-rsn(sfi),mm
A situation has occurred that caused catalog sharing through ECS to fail or to be stopped. This message is also issued for an unsuccessful CONNECT, DISCONNECT, or AUTOADD request by a MODIFY CATALOG(ECHSR) command.

In the message text:

- rc The return code of the detecting catalog module
- rsn The reason code of the detecting catalog module
- sfi If the problem was detected by another service, subfunction information related to the error
- mm The module ID of the detecting catalog module

For information on obtaining descriptions of these codes, see message IDC3009I.

ERROR ADDING catname: rc-rsn(sfi),mm
Issued to acknowledge an ECHSR(ADD) request that was unsuccessful. ECS is not activated for the named catalog.

In the message text:

- catname
  The name of a catalog
- rc The return code of the detecting catalog module
- rsn The reason code of the detecting catalog module
- sfi If the problem was detected by
another service, subfunction

mm The module ID of the detecting catalog module

For information on obtaining descriptions of these codes, see message IDC3009I.

**NOT CONNECTED:** rc-rsn(sfi),mm

Issued during IPL or CAS restart when the system automatically tries but cannot connect to the ECS structure.

In the message text:

rc The return code of the detecting catalog module

rsn The reason code of the detecting catalog module

sfi If the problem was detected by another service, subfunction

mm The module ID of the detecting catalog module

For information on obtaining descriptions of these codes, see message IDC3009I.

**REMOVED** catname

Issued to acknowledge an ECSHR(REMOVE,catname) request that was successful.

In the message text:

catname The name of a catalog

**SYSPLEX QUIESCE COMPLETE**

Indicates that this system has been informed that all other systems have completed their quiesce processing.

**WAITING FOR IOSAS TO INITIALIZE**

Indicates that an attempt to use IOS services cannot proceed because the IOSAS is not yet initialized and available. This message will be issued every 30 seconds until IOSAS completes initialization or until three minutes have passed. If IOSAS is not initialized after three minutes, the attempt to add the catalog to the coupling facility will fail with catalog return code 228, reason code 35.

**WAITING FOR SYSPLEX QUIESCE TO COMPLETE**

Issued to indicate that this system has been waiting for 5 minutes for a sysplex quiesce to complete. Issue the MODIFY CATALOG,ECSHR(STATUS) on each system to monitor the progress of the quiesce on each system. (Note that the ECS system status on a quiesced system should be CONNECTED.) If, after a period of time, the sysplex still has not completed the quiesce, the quiesce can be forcefully ended by issuing the MODIFY CATALOG,ABEND(ANALYSIS) command on the system waiting for the quiesce to complete.

If all of the systems do not show a status of CONNECTED, then you MUST NOT attempt to re-enable AUTOADD.

**System action:** In the case of stopping ECS at the system level, CAS disconnects from the coupling facility, and sharing for all sharers through the ECS method is stopped. Catalog sharing reverts to the non-ECS method.

In the case where the system lost its coupling facility connection, all catalogs are removed from the ECS structure, and the AUTOADD function is disabled.

In the case of an ECS failure for an individual catalog, ECS is not activated for this catalog. The sharing method for this catalog remains the non-ECS method.

**Operator response:** Correct the situation that caused the error or failure and retry the request.

In the case of a lost coupling facility connection, after the connection has been restored, issue the MODIFY CATALOG command with the ECSHR(AUTOADD) parameter to re-enable automatic activation.

**System programmer response:** None

Detecting Module: IGG0CLSH or IGG0CLSI

---

**IEC378I (form 1 of 2)** catname IS NOT USING ENHANCED CATALOG SHARING.

**Explanation:** This message is issued when the system is processing a shared catalog request and discovers for the very first time or the first time since the last time the catalog was ECS-active, that the desired sharing method as defined for the named catalog is ECS but either (1) a down-level system is already accessing the catalog, (2) another system has explicitly stopped ECS for this catalog via the MODIFY CATALOG command with the ECSHR(REMOVE) parameter, or (3) either of the above conditions existed when the system went down.

In the message text:

catname The catalog the system is accessing.

**System action:** Sharing will continue with the non-enhanced method of catalog sharing. This may result in decreased performance for this catalog.

**Operator response:** Verify if ECS is desired for this catalog. If so, then issue the MODIFY CATALOG command with the ECSHR(ADD,...) parameter to start ECS for this catalog. For more information, see the z/OS DFSMShsm Managing Catalogs manual.

Source: DFSMShsm

Detecting Module: IGG0CLSJ
IEC378I (form 2 of 2) • IEC380I

IEC378I (form 2 of 2)  catname HAS BEEN REMOVED FROM ECS DUE TO A DDR SWAP

Explanation: A DDR SWAP event occurred. The named catalog is currently being shared by ECS and is located on the volume that was swapped.

In the message text:

**catname** The name of a catalog

**System action:** The catalog has been removed from the coupling facility structure for ECS on the system that issued the message. The message might be issued from more than one system because the catalog is shared with other systems. The catalog is marked temporarily ineligible and will not automatically be added to the coupling facility on next use.

**Operator response:** This message should be issued from all systems that are sharing the named catalog. Issue a MODIFY CATALOG,ECSHR(STATUS) command from all systems in the sysplex. When the resulting displays from all systems that list the named catalog show a status of Inact(NonECSAcc), enter the command MODIFY CATALOG,ECSHR(ENABLE,catname) to make the catalog available for sharing by ECS again.

**System programmer response:** None

**Source:** DFSMSdfp

**Detecting Module:** IGG0CLSJ

---

IEC380I  ENHANCED CATALOG SHARING

Explanation: This message is issued in response to a MODIFY CATALOG command with the ECSHR(STATUS) parameter. It displays the status of the CF connection as well as the ECS status of each open catalog.

The possible values for the ECS system status are:

**AUTOADD**

The system is connected to the ECS structure and the automatic add function is enabled.

**Connected**

The system is connected to the ECS structure in the coupling facility; AUTOADD is disabled.

**Connect Failure**

While attempting to connect to the ECS structure, an error was returned from IXLCONN. The return and reason codes from IXLCONN are also displayed.

**Inact(CFail)**

The system has disconnected because a coupling facility failure was detected.

**Inact(Disconnect)**

ECS is disconnected from the ECS structure in the coupling facility due to a MODIFY CATALOG command with the ECSHR(DISCONNECT) parameter.

**Inact(Restart)**

The system disconnected while processing a CAS restart.

**Quiescing**

ECS is currently active but is in the process of disconnecting.

**Unknown**

The system status of ECS is unknown.

The possible values for a catalog's status are:

**Active**

ECS is active for the catalog.

**Inact(CFail)**

The catalog is inactive because the coupling facility failed.

**Inact(CFull)**

An attempt was made to activate the catalog but the ECS structure in the coupling facility is full.

**Inact(Disconnect)**

The catalog is inactive because the system disconnected from the ECS structure.

**Inact(MaxCats)**

An attempt was made to activate the catalog but the maximum number of catalogs allowed in the ECS structure has been reached.

**Inact(NeverConn)**

The catalog is inactive because the system is not connected to the ECS structure in the coupling facility.

**Inact(NonECSAcc)**

The catalog is inactive because the last system to access the catalog was non-ECS 1.5. system.

**Inact(NotElig)**

The catalog is inactive because it does not have the ECSHARING attribute.

**Inact(NotShrable)**

The catalog is inactive because it cannot be cross-system shared because it either does not have SHAREOPTIONS(3 4) or the volume is not marked as shared.

**Inact(Removed)**

The catalog is inactive due to a MODIFY CATALOG command with the ECSHR(REMOVE,...) parameter.

**Inact(Unknown)**

The ECS status of this catalog has never been set or is otherwise unknown.
Unavailable

The status of this catalog is unavailable due to one of the following:

- This catalog has not been opened since the last IPL.
- This catalog has been deleted.
- This catalog is not currently allocated and open in the catalog address space (CAS).

System action: System operation continues normally.

Operator response: None. For additional information on the interpretation of the output from this command, see z/OS DFSMS Managing Catalogs.

Source: DFSMSdfp

Detecting Module: IGG0CLGB

IEC381I (form 1 of 3) ENHANCED CATALOG SHARING HAS BEEN QUIESCED DUE TO A COUPLING FACILITY FAILURE ON ANOTHER SYSTEM.

Explanation: This message is issued on an ECS-active system when another system in the sysplex that was also ECS-active, lost its connection to the ECS coupling facility structure.

System action: All ECS-active catalogs are deactivated and the AUTOADD function is disabled. However, the system remains connected to the ECS structure.

Operator response: Once the situation causing the quiesce is resolved, issue the MODIFY CATALOG command with the ECSHR (CONNECT) parameter on any system whose connection to the coupling facility structure was dropped. Then issue the MODIFY CATALOG command with the ECSHR (AUTOADD) parameter on any one of the systems in the sysplex to re-enable automatic activation. Catalogs not referenced can be explicitly activated using the MODIFY CATALOG command with the ECSHR (ENABLE,...) parameter.

Source: DFSMSdfp

Detecting Module: IGG0CLSI

IEC381I (form 2 of 3) ENHANCED CATALOG SHARING HAS BEEN QUIESCED DUE TO A DISCONNECT ISSUED ON ANOTHER SYSTEM.

Explanation: This message is issued on an ECS-active system when another system in the sysplex that was also ECS-active, is disconnected, usually by a MODIFY CATALOG,ECSHR(DISCONNECT) command.

System action: All ECS-active catalogs are deactivated and the AUTOADD function is disabled. However, the system remains connected to the ECS structure.

System programmer response: This message is to alert you that an inflight VSAM request to update a
catalog has been terminated. The request may be incomplete and the catalog may contain inconsistent data. You should run an IDCAMS DIAGNOSE and EXAMINE against the catalog to identify any potential corruption or inconsistent data, and correct any errors detected by the DIAGNOSE or EXAMINE.

Source: DFSMSdfp

IEC391I  CATALOG  catname  HAS  BEEN  AUTOTUNED  TO:

IEC391I  BUFNI:  n1  BUFND:  n2
STRNO:  s1

Explanation: This message is informational indicating that the catalog named  catname  has been reopened on the current system with enhanced parameters designed to improve performance of the catalog.

In the message text:

 catname  is the name of the catalog whose parameters have been temporarily updated on the current system

 n1  is the number of new index buffers assigned to this catalog

 n2  is the number of new data buffers assigned to this catalog

 s1  is the number of strings assigned to this catalog

System action: The system continues processing.

Operator response: None.

Application Programmer Response: None. This is an informational message only.

System programmer response: Determine whether or not the jobs listed are holding resources. Note that the issuance of this message does not necessarily mean that an error or problem exists. Repeated issuance of this message may indicate that jobs are not releasing catalog resources. You may need to increase the maximum number of service tasks allowed or cancel one or more of the jobs listed. If you cancel any of the jobs you should take a dump of the catalog address space and the jobname listed prior to cancelling the job.

Problem determination: None.

Source: None.

Detecting Module: None.

IEC400A  M  dev,ser/dsname

Explanation:  M  indicates that a tape volume is to be mounted on the device for the data set.

In the message text:

dev  The device number of the specified device.

ser  The six-digit volume serial number.

dsname  The data set name.

Operator response: Mount the volume on the device. Then, ready the device.

Source: DFSMSdfp

Detecting Module: IGC0K05B

IEC401A  F  dev,ser/dsname

Explanation:  F  indicates that the volume on the device for the output data set is file protected. That is, its file protection ring is not inserted or its tab is set to prevent a write, so it can only be read. However, the volume is to be written on.

In the message text:
The device number of the specified device.

The six-digit volume serial number.

The data set name.

System action: The system rewinds and unloads the volume.

Operator response: Insert a file protection ring in the volume, mount the volume, and ready the device.

Source: DFSMSdfp

Detecting Module: IGC0K05B

Routing Code: 3

Descriptor Code: 2

IEC402D

F dev,ser,dsname

Explanation: F indicates that the volume on the device for the input/output data set is file protected. That is, its file protection ring is not inserted or its tab is set to prevent a write, so it can only be read.

In the message text:

dev The device number of the specified device.

ser The six-digit volume serial number.

dname The data set name.

Operator response: If the volume should be file protected, enter REPLY xx,'U'.

If the volume should be written on, enter REPLY xx,'F'; the system will rewind and unload the volume. Then insert file protection ring or move the tab in the volume, mount the volume, and ready the device.

Descriptor Code: 2

IEC404E

D dev,ser,rsn

Explanation: D indicates that a tape volume is to be dismounted on the specified device.

In the message text:

dev The device number of the specified device.

ser The six-digit tape volume serial number.

rsn Indicates the reason to dismount the tape volume. The possible rsn values and their meanings are:

1 - The internal serial number on the tape volume did not match the requested tape volume serial number
2 - The system detected an error while trying to verify the tape volume labels
3 - A Perform Subsystem Function (PSF) activate request failed
4 - A Perform Subsystem Function (PSF) deactivate request failed
5 - The system needs the device to mount another tape volume

System action: Processing continues.

Operator response: Dismount the volume from the device.

dev,ser,[labtyp],[trtch],jjj,sss [dsname],[media678],[no worm]

Explanation: Please refer to the explanation in message IEC501E on page 3-155

Routing Code: 3,5/4,6

Descriptor Code: 2

Note: For Automated Tape Library dataservers (including Virtual Tape Servers), messages IEC501A and IEC501E are not issued to any operator console. They are only issued to the System Log.
M indicates that a volume is to be mounted on the device:

- If **ser** is a 6-digit serial number, the volume with that serial number is to be mounted on device **dev**.
- If **ser** is SCRTCH, a public scratch volume is to be mounted. SCRTCH is used when the dataset being created on the non-specific volume is temporary ([DISP=NEW,DELETE] or DSN=&&tempname).
- If **ser** is PRIVAT, a private scratch volume is to be mounted. PRIVAT is used for all other cases of non-specific volumes.
- If **ser** begins with L, the volume to be mounted is unlabeled; the number after the first character is an internal serial number assigned by the system to an unlabeled volume. The internal serial is of the form Lxxxxy where xxx is the data set number (0-999) and yy is the volume sequence number (0-99). The numbers are recycled after they reach the limit.

**IEC501A** is issued by Open when Allocation has not issued a mount message (that is, when no IEF233A or IEF233D has been issued -- for example, mounts with DEFER coded) and the volume is needed immediately.

**IEC502A** is issued by EOV when the end of a volume has been reached and the next volume to be processed is needed immediately.

**IEC502E** is issued by Open or EOV when the volume to be mounted is not needed immediately (this is referred to as a "look-ahead" mount). The volume indicated by **ser** is the next volume to be processed after the system finishes processing the current volume.

In the message text:

**labtyp** Indicates the label type of the mounted volume (either SL, NL, AL, NSL, or BLP) and will appear for tape volumes only.

**den** Indicates the density of the volume to be mounted and will appear for tape volumes only.

**trtch** Indicates the recording mode as COMP (compaction) or NOCOMP (non-compaction) and will appear for tape volumes only.

**jjj** Indicates the job requesting the volume.

**sss** Indicates the job step requesting the volume.

**dev** The device number of the specified device.

**ser** The volume serial number.

**dsname** If a MONITOR DSNAME command is active, the **dsname** is of a nontemporary data set requiring the volumes. The data set name will not be specified for data sets being deleted. If the data set name causes the message to exceed 70 characters, the data set name will appear on the second line of the message text.

**media</sub>6</sub>|7</sub>|8**

A media type.

**System action:** If the message ID is IEC501A, the job step waits for the volume to be mounted or until the task reaches time-out. This is independent of whether the original allocation was batch (JCL) or dynamic.

If the message ID is IEC501E, the job step does not wait for the volume to be mounted. If the data set is multi-volume and more than one unit is allocated, but fewer units are allocated than volumes, then all volumes after the first may be requested by EOV via message IEC501E. For example, if a data set consists of three volumes, and two tape drives are requested by UNIT=(TAPE,2), then as soon as End of Volume is reached on volume 1, message IEC502E is issued for volume 1, message IEC501E is issued for volume 3 on that same drive, and the job then starts processing volume 2 immediately, without waiting for the mount for volume 3 to be satisfied. This is independent of whether the original allocation was batch (that is, JCL) or dynamic.

**Operator response:** If **ser** is SCRTCH or PRIVAT and the device is a tape unit, make sure that the file protection ring has been inserted in the volume.

Mount the volume on the device. If **ser** is SCRTCH or PRIVAT and a scratch volume is already on the device, mount another scratch volume. Then ready the device.

**Source:** DFSMSdpf

**Detecting Module:** IFG0193D, IFG0193E, IFG0194A, IFG0194F, IFG0194K, IFG0195H, IFG0196N, IFG0196T, IFG0196U, IFG0552B, IFG0552F

**IEC502E  n  dev,ser [labtyp] [ddn-c]  
[ ,SPACE=cccccc|lttt|tttt|aaaal|ccccc|tttt|jjj|ssss|dsname[]|,mediatype], WORM WRITE VIOLATION]**

**Explanation:**

**Note:** For Automated Tape Library dataservers (including Virtual Tape Servers), message IEC502E is not issued to any operator console. It is only issued to the System Log.

The volume on the device is to have the indicated disposition. The disposition (n) is one of the following:

**K** - Implies PRIVATE volume; the volume is to be demounted and returned to the library.

**D** - Implies PUBLIC volume; the volume is to be demounted and used as a scratch volume when the job ends.

**RK** - Implies PRIVATE-RETAIN volume; the volume is to be demounted and retained near the system for future use. In the event that the job ends and the volume has not been remounted, return it to the library.
RD-  Implies PUBLIC-RETAIN volume; the volume is to be demounted and retained near the system for future use. In the event that the job ends and the volume has not been remounted, it may be used as a scratch volume.

R  -  Implies RETAIN volume; the volume is to be demounted and retained near the system for future use. In the event that the job ends and the volume has not been remounted, the operator must determine what disposition to give to the volume. This message will appear if a volume is rejected because it is not the volume requested (for example, a conflict in the label, label type, or density).

If the serial number is blank, O/C/OEV look ahead mount has found a premounted and unverified (UCBVOL=ZEROS) volume on the next available unit. Operator intervention is required to verify that the proper volume is mounted.

If the serial number is a 6-digit serial number, the volume with that serial number is to be demounted from the device.

If the serial number begins with L, the volume to be demounted is unlabeled; the number after the first character is an internal serial number assigned by the system to an unlabeled volume. The internal serial number is of the form Laaabb where aaa is the data set number (0-999) and bb is the volume sequence number (0-99). The numbers are recycled after they reach the limit.

In the message text, labtyp indicates the label type of the demounted volume (either SL, AL, NL, or NSL) and will appear for tape volumes only.

The reason for demounting is as follows:

c  Reason for Demounting

1  For ISO/ANSI Version 1:

The accessibility field of the volume label contains a nonblank character, which means the volume is data set password protected and may not be processed by the operating system.

For ISO/ANSI Version 3 or Version 4:

The accessibility code in the volume label is not acceptable for further processing because of one of the following:

1. It is not a blank.
2. It is not an "uppercase A through Z.
3. It was rejected by the volume access exit "(for A through Z).

Note: *For Version 4, the allowable characters are: Uppercase A-Z, number 0-9, and special characters ! * % & ' ( ) + , - . / : ; < = > ? _

2  For ISO/ANSI Version 1:

The accessibility field of the volume label contains a nonblank character other than the character 1, which means the file may not be processed by the operating system.

For ISO/ANSI Version 3 or Version 4:

The accessibility code in the first data set label (for example, HDR1) is:

• A character that is not acceptable for further processing because:
  – It is not a blank, not an "uppercase A through Z, or not an MVS-recognized numeric, that is, a 1 or 3 with system code IBMZLA.
  – It was rejected by the file access exit "(for A through Z).
  – It was accepted, but the ACCODE value "(A through Z) was rejected by the file access exit.
  – Blank, but the ACCODE value for an output data set was rejected by the file access exit.

Note: *For Version 4, the allowable characters are: Uppercase A-Z, number 0-9, and special characters ! * % & ' ( ) + , - . / : ; < = > ? _

3  For ISO/ANSI Version 1:

The system cannot process the volume which is recorded in ASCII. The system has been modified when the CVTASCII bit was set to zero.

For ISO/ANSI Version 3 or Version 4:

The control program has determined that conflicting data control block (DCB) attributes have been used to define the data set on the volume. Some of the conflicting attributes are:

• BUFOFF greater than 99.
• BUFOFF equal to L on OUTPUT or OUTIN.
• BUFOFF equal to L and RECFM not equal to D.
• OPTCD not equal to Q and LABEL equal to AL or AUL.
• OPTCD not equal to Q and RECFM equal to D.
• OPTCD equal to Q and DSORG not equal to PS.
• OPTCD equal to Q and RECFM equal to V.
• LABEL equal to AL or AUL specified for a 7-track tape device.

4  This message follows IEC512I when the system detects violation of a label standard
and the installation label validation exit issues a return code indicating the volume should be rejected. An abnormal end follows.

6 The volume contains an ISO/ANSI volume label that is not supported. To be processed as an ISO/ANSI volume, the volume label must contain a 1, 3, or 4 to specify Version 1, Version 3, or Version 4 in character position 80. An output request to a data set other than the first data set of an ISO/ANSI Version 1 tape is not supported.

7 The volume was rejected by the operator in response to a WTOR.

8 A volume label conflict was detected during manual-mode processing in an IBM 3495 Tape Library Dataserver. A subsequent mount will be issued to allow verification of the tape volume.

9 The volume serial number of the mounted or operator supplied volume serial to be used in labeling a scratch volume in an MTLDS is not defined in the tape configuration database. The volume is dismounted and a mount message reissued.

10 The volume serial number of the mounted or operator supplied volume serial to be used in labeling a scratch volume in an MTLDS is defined in the tape configuration database but does not reside in this MTLDS. The volume is rejected and another mount request is issued.

11 The volume serial number of the mounted or operator supplied volume serial to be used in labeling a scratch volume in an MTLDS is defined as a private volume in the tape configuration database.

12 NL specific volume serial was requested for input, but the volume is a labeled volume (either ISO/ANSI or IBM) and the ATL is in manual mode. Verify that the correct volume is mounted.

13 The volume serial number of the mounted volume is already enqueued. Verify that the volume mounted matches the volume requested.

14 The mounted 3590 cartridge is either an unsupported media type or medium length. If the tape mounted was for a non-specific mount request, SCRATCH, demount the cartridge and select another. Verify that the mounted volume is the correct for a specific mount request, private. If it was the correct volume the mount request may have to cancelled.

15 The mounted 3590 cartridge is unformatted and it must be formatted prior to its use. The mounted volume will be demounted and a subsequent mount reissued.

If the tape mounted was for a non-specific mount request, SCRATCH, demount the cartridge and select another. Verify that the mounted volume is the correct for a specific mount request, private. If it was the correct volume the mount request may have to cancelled.

60 A private labeled (SL or AL) IBM 3494 (ATL) volume is mounted for input processing and the request was for a NL volume while the ATL is in automatic mode.

In the message text, jjj indicates the job demounting the volume and sss indicates the job step demounting the volume.

If a MONITOR DSNAME command is active, dsname indicates the data set requesting the volume.

If a MONITOR SPACE command is active and the device is a direct access device, the SPACE parameter will appear:

cccc Total number of free cylinders on the volume.

tttt Total number of tracks in addition to free cylinders.

aaaa Total number of free extents.

ccc,tttt Largest contiguous free area in cylinders and tracks.

ddname Specifies the DDNAME of the JCL requesting the volume.

c Specifies the reason for demounting.

If the error occurred during the listing of the parameters in the SPACE field, one of the following messages is specified:

- LSPACE-PERMANENT I/O ERROR
- LSPACE-NON-STANDARD OS VOLUME
- LSPACE-NOT A DIRECT ACCESS VOL
- LSPACE-INVALID PARAMETER

System action: The volume is unloaded if the device is a tape drive. If the device is a direct access unit, I/O to the device is inhibited.

Operator response: Demount the volume and mark the serial number and label type on the volume and perform the indicated disposition. If LSPACE-PERMANENT I/O ERROR appears in the message text, a permanent I/O error was encountered while trying to read the VTOC. Run the IEHLIST utility program to list the VTOC of the volume specified by ser or dev.

Application Programmer Response: If ddn-c appears in the message text, the volume was probably demounted due to a programming error or operator error. Respond as follows, if:
c=1 Insure that the indicated JCL statement indicated the correct volume.
c=2 Make sure that the correct file and volume are being mounted.
c=3 Determine how the CVT was modified and correct the error.
c=4 Insure that the data control block attributes do not conflict.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

IEC503I Automated Tape Library Error dev,ser, jjj [, , sss ]

Explanation: The CBRXLACS service returned an unsuccessful return and reason code. This message will be accompanied by other messages describing the nature of the error detected by CBRXLACS.

System action: Abnormally ends the task.

System programmer response: Contact the IBM Support Center.

Source: DFSMSdfp
Detecting Module: IFG0194J
Routing Code: 4
Descriptor Code: 2, 10

IEC504I CBRXLACS DETECTED AN ERROR
LACS RC = rtncde LACS RS = reasoncde [SERVICE RC = rtncde ] [SERVICE RS = reasoncde ]

Explanation: The system encountered an error in the ERRTEXT function of the CBRXLACS service. The error occurred while the system was trying to retrieve text associated with a previous error in the CBRXLACS service.

In the message text:
rtncde The return code
reasoncde The reason code

IEC507D E dev,ser, jjj, sss, dsname[,NEVEREXPIRE] REPLY 'U'-USE OR 'M'-UNLOAD

Explanation: E indicates that a program intended to write on the volume indicated on the device. However, the expiration date for the data set has not occurred. If NEVEREXPIRE appears in message text, the expiration date for the data set is set to never expire (for example, set to 99365 or 99366).

In the message text:
jjj Indicates the job requesting the volume.
sss Indicates the job step requesting the volume.
dev The device number of the specified device.
ser The volume serial number. One of the following:
• a specific tape volume serial number
• SCRTCH
• PRIVAT

SCRTCH or PRIVAT indicate non-specific volume requests. SCRTCH is used when the dataset being created on the non-specific
volume is temporary [DISP=(NEW,DELETE) or DSN=&&tempname], PRIVAT is used for all other cases of non-specific volumes.

dname
The data set name.

System action: The job step waits for the operator to reply U or M, or until the task reaches time-out.

Operator response: If the expiration date of the indicated data set is to be ignored and the program has authorization to write on the data set, enter REPLY xx,'U' in response to this message.

If the expiration date of the indicated data set is to be honored or if the program is not authorized to write on the data set, enter REPLY xx,'M' in response to this message. If another volume can be used, that is, if the program originally requested a SCRTCH or PRIVAT volume, the system will then request that a new volume be mounted. However, if another volume cannot be used, the system will end the job step. Attention: If dev is a direct access device, do not enter REPLY xx,'M' unless you have the proper authorization. Instead, use the CANCEL command to end the job step and notify the system programmer that the expiration date on the data set has not been reached.

Normally, the operator should end any job attempting to update a system data set or otherwise authorized data set if this message is issued. However, the operator may respond with REPLY xx,'U' if so instructed by a programmer with proper authorization. An authorized programmer desiring to update a system data set should notify the operator of his intentions and make sure that no other concurrently running job can have access to the data set. If you want to remove expiration date protection from the data set, specify LABEL=RETPD=0 in the JCL next time the data set is created. Subsequently, the message will not appear.

Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with: TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:
DCB=DIAGNS=TRACE

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

Detecting Module: IFG0194C

Routing Code: 1

Descriptor Code: 2

IEC509A

F dev,ser,iii,sss [,dsname]

Explanation: F indicates that the tape volume indicated on the device is file-protected. That is, a program attempted to write on the volume but its file protection ring is not inserted or the tab is set to prevent a write, so it can only be read.

If a MONITOR DSNNAME command is active, dsname indicates the data set requesting the volume.

In the message text:

iii Indicates the job requesting the volume.

sss Indicates the job step requesting the volume.

dev The device number of the specified device.

ser The volume serial number. One of the following:
- A specific tape volume serial number
- SCRTCH
- PRIVAT

SCRTCH or PRIVAT indicate non-specific volume requests. SCRTCH is used when the dataset being created on the non-specific volume is temporary [DISP=(NEW,DELETE) or DSN=&&tempname], PRIVAT is used for all other cases of non-specific volumes.

dname The data set name.

System action: The volume is rewound, the device is unloaded and the job step waits for the operator to remount the volume or until the task reaches time-out. If a volume is mounted without its file protect ring, it will again be unloaded, and this message will be reissued.

Operator response: If the volume specified by ser was mounted in response to a request for SCRTCH or PRIVAT, determine if the volume mounted was in fact a scratch volume. If so, insert a file-protect ring or set the tab, remount the volume, and ready the device. If the volume is not a scratch volume, obtain one and mount it on the device with its file-protection ring inserted.

If the volume specified by ser was not mounted in response to a request for SCRTCH or PRIVAT and if the program is authorized to write on the volume, the CANCEL command should be used to end the task and the installation's system programmer notified.

Normally, the operator should end any job attempting to update a system data set or otherwise authorized data set, if this message is issued. However, the operator may insert the file-protect ring and remount the volume if so instructed by a programmer with proper authorization. An authorized programmer desiring to update a system data set should notify the operator of his intentions.
System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

IEC510D F dev,ser,iii,sss,[,dsname] REPLY 'U'-USE OR 'F'-UNLOAD

Explanation: F indicates that the tape volume indicated on the device is file-protected. That is, a program may be attempting to write on the volume but its file-protection ring is not inserted or the tab is set to prevent a write, so it can only be read.

If a MONITOR DSNAME command is active, dsname indicates the data set requesting the volume.

In the message text:

iii Indicates the job requesting the volume.

sss Indicates the job step requesting the volume.

dev The device number of the specified device.

ser The volume serial number. One of the following:
- A specific tape volume serial number
- SCRTCH
- PRIVAT

SCRTCH or PRIVAT indicate non-specific volume requests. SCRTCH is used when the dataset being created on the non-specific volume is temporary [DISP=(NEW,DELETE) or DSN=&&tempname]. PRIVAT is used for all other cases of non-specific volumes.

dsname The data set name.

System action: The job step waits for the operator to reply 'U' or 'F' or until the task reaches time-out.

Operator response: Determine which one of the following conditions applies to the volume specified by ser and then complete the instructions for that specific condition:
1. The volume is mounted on an Automatic Cartridge Loader (ACL);
2. The volume is not mounted on an ACL became mounted due to a SCRTCH or PRIVAT request; or
3. The volume is not mounted on an ACL and became mounted due to a request other than SCRTCH or PRIVAT.

For condition 1, determine if the program is authorized to write on the volume. If the program is authorized, set the Automatic Cartridge Loader in manual mode, and follow these instructions in order:
- Enter REPLY xx,'F' to rewind the volume and unload the device;
- Insert a file-protection ring into the volume; and
- Remount the volume and ready the device to its previous mode.

If the program is not authorized to write on the volume, enter REPLY xx,'U'. If the volume is being opened for inout processing, the system will use the volume for input processing only. If the volume is being opened for output or outin processing and this is a scratch volume, the system will rewind the volume, unload the unit, and request a new volume be mounted. Otherwise, the system will terminate the jobstep.

If the tape cartridge is mounted on a manual tape library dataserver device, make the device 'not ready' and follow these instructions in order:
- Manually unload the tape cartridge.
- Unprotect the tape cartridge by rotating the file protect thumbwheel.
- Remount the volume and ready the device to its previous mode.
- Reply 'U' to use the tape cartridge.

For condition 2, determine if the program is authorized to write on the volume. If the program is authorized, determine whether ser is a scratch volume and follow these instructions in order:
- Enter REPLY xx,'F' to rewind the volume and unload the device;
- If ser is a scratch volume,– Insert a file-protection ring into the volume; and
- Remount the volume and ready the device.
- If ser is not a scratch volume,
  – Obtain a scratch volume with its file-protection ring inserted; and
  – Mount the scratch volume and ready the device.

If the program is not authorized to write on the volume, enter REPLY xx,'U'. The system will use the volume for input processing only.

If the serial number is not a scratch volume, obtain one with its file-protection ring inserted, and mount it on the device.

For condition 3, determine whether the program is authorized to write on the volume. If the program is authorized, follow these instructions in order:
- enter REPLY xx,'F' to rewind the volume and unload the device;
- insert a file-protection ring into the volume; and
- remount the volume and ready the device.
If the program is not authorized to write on the volume, enter REPLY xx,'U'. The system will use the volume for input processing only. If the user is not authorized to write on the volume and the response is REPLY XX,'U' and the program is attempting to write on the volume, the system will repeat message IEC510D.

An authorized programmer desiring to write on a file-protected volume should notify the operator of his intentions.

Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with: TRACE=SYS,USR,SLIP.

On the DD statement for the data set in error, specify: DCB=DIAGNS=TRACE

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

**Source:** DFSMSdfp

**Detecting Module:** IFG0194F

**Routing Code:** 3.5

**Descriptor Code:** 2

**Explanation:** An error has been detected processing the volume on the device.

If I/O ERR appears in the message text, an uncorrectable input/output error occurred while processing labels on the volume. If this is an uninitialized tape and tapevol protection is active, this message will be issued and the volume will be rejected because the system is not capable of identifying the tape for a protection check. In this case, a not capable error also will be received (IOS000I NCA).

If the tape is an output tape, the tape label has probably been destroyed. The tape must be relabeled or reinitialized with a tape mark before it can be used again.

If LBL ERR appears in the message text, the mounted volume has a different volume serial number or label attribute than the requested volume. The mounted volume is identified by the first ser in the message and the requested volume is identified by the second ser. If UNI appears in the message text, an uninitialized or degaussed tape cartridge is mounted. Additional messages will be issued to change the label or dismount the tape. When VRSN is specified, an ISO/ANSI version conflict has been detected. Either the version is not a supported version, or there is a conflict between the mounted version and the requested version. The supported versions are 1, 3, and 4.

If SEC VOL appears in the message text, data set password protected tape volume ser was mounted on tape device dev. One of the following occurred:

- The program was attempting to process the volume as NL or NSL; LABEL=NL or LABEL=NSL was specified on the JCL.
- The data set name on the tape did not match the data set name specified by the DSN parameter in the JCL.
- The label is ISO/ANSI Version 1 or version x, but the accessibility code is not blank.
- The label is ISO/ANSI Version 3 or Version 4, but the accessibility code is an incorrect character *(not uppercase A through Z).

**Note:** *For Version 4, the allowable characters are: Uppercase A-Z, number 0-9, and special characters ! * ( ) + - / ; < > ? _*

- The label is ISO/ANSI Version 3 or Version 4, but the VOL1 accessibility code was rejected by the ISO/ANSI volume access exit.
- The label is ISO/ANSI Version 3 or Version 4, but the HDR1 accessibility code was rejected by the ISO/ANSI file access exit.
- The label is ISO/ANSI Version 3 or Version 4, but the HDR1 accessibility code indicated password protection.
- The label is ISO/ANSI Version 3 or Version 4, but RACF or RACHECK installation exits did not authorize access.

If DUP VOL appears in the message text, end-of-volume has detected that the volser of the volume mounted to satisfy a non specific mount request already exists in the JFCB volume list. End-of-volume will demount the volume and reissue the non specific mount request.

If DUP VOL appears in the message text, the mounted volume has previously been mounted in the same job to satisfy a nonspecific mount request. Duplicate volume serial numbers in the JFCB volume list are not allowed. Subsequent messages indicate the disposition and ask that a volume be mounted.

If a MONITOR DSNAME command is active, dsname indicates the data set requesting the volume.

If LBL STD appears in the message text, an error was detected during validation of a label. The error is a direct violation of, or a conflict in system support for, the
published standards for the label and its associated file structure. *DFSMS/MVS Using Magnetic Tapes* describes the specifications and processing of tape labels.

In the message text, reason is one of the following:

**Reason Validation Error Detected**

**DATA** An incorrect character type. For example, an alphabetic character is found in a numeric field.

**RANG** A value out of bounds, unknown, or unsupported. For example, the specified block size is unsupported.

**ALGN** Data incorrectly aligned. For example, an alphabetic field is not left-justified.

**SEQU** A label out of sequence.

**VRSN** A label version that is not supported. That is, the label on a mounted tape is not compatible with the system's tape labeling requirements.

**DUPL** A duplicate data set name found during data set positioning.

**DATE** A file set contains a data set immediately before the requested data set on the same volume with an expiration date lower than the expiration date of the data set to be written.

**SYMM** A request that will result in an unmatching or unsymmetrical set of labels and/or inconsistent file structure.

*labid* is the label identifier, for example, VOL1. The identifier is followed in the message text by a slash (/) to signify that the label was about to be written when the error was detected.

The *labid* field is blank when a reliable label is not available, for example, when reason is SYMM.

For DATA, RANG, or ALGN reasons, *postn* in the message text is the character position within the label when a validation error is detected. The *postn* value can indicate an error in an existing label or in data used to construct a new label.

For DUPL, DATE, or SEQU reasons, *postn* is the file sequence number relative to the beginning of the current volume.

For a VRSN reason, *postn* is the version character from VOL1 position 80.

*postn* is ACCODE if the file accessibility code supplied by the user job step is incorrect. A value of 254+ in the message indicates a file sequence number greater than 254.

For a SYMM reason, *postn* is blank in the message text because a specific error location is not available. This can occur when a data set is opened for MOD (OLD OUTPUT/OUTIN), INOUT, OUTINX, or EXTEND.

In the message text:

**jjj** Names the job requesting the volume.

**sss** Names the job step requesting the volume.

**ser** The volume serial number. One of the following:

- A specific tape volume serial number
- SCRTCH
- PRIVAT

SCRTCH or PRIVAT indicate non-specific volume requests. SCRTCH is used when the dataset being created on the non-specific volume is temporary [DISP=(NEW,DELETE) or DSN=&amp;tempname]. PRIVAT is used for all other cases of non-specific volumes.

**dev** The device number of the specified device.

**dsname** The data set name.

**labtyp** The label type of the mounted volume (either SL, NL, AL, or NSL) and will appear for tape volumes only.

**labid-postn** The label identification and position.

**reason** The reason code.

**System action:** If I/O ERR or SEC VOL appears in the message text, the system rewinds the volume and unloads the unit. If the original request was for a SCRTCH or PRIVAT volume, the system requests a new volume. Otherwise, the system ends the job step.

If LBL STD appears in the message text and VRSN does not, the installation label validation exit is entered to determine further processing. If both LBL STD and VRSN appear in the message text, the system does one of the following:

- Enters the volume label editor, if the volume is being used for output to the first data set (except extending the data set, such as DISP=MOD).
- Rejects the volume for all other output requests.
- Rejects the volume for all input requests. Input volumes with label versions other than the supported versions are rejected.

**Operator response:** If I/O ERR, LBL ERR, or SEC VOL appears in the message, respond as indicated in subsequent messages.

**Application Programmer Response:** If LBL STD
appears in the message, reasons DATA, RANG, or ALGN indicate an ISO/ANSI Version 3 or Version 4 standards violation in label labid at position postn. Correct the label before rerunning the job.

Reason RANG with postn ACCODE indicates that the ACCODE value specified in the JCL is not a valid character. Specify only uppercase alphabetic characters (A-Z) for an ACCODE value. ACCODE from JCL can be one to eight characters, but only the first character is processed.

Note: *For Version 4, the allowable characters are: Uppercase A-Z, number 0-9, and special characters ! * " % & ' ( ) + , / : ; < = > _

If LBL STD appears in the message text, reasons SEQU, DUPL, or DATE indicate an error during positioning of the tape to the requested data set. The error was detected at the file number indicated in postn, relative to the beginning of the volume. A postn value of 254+ means that the problem occurred at a data set beyond the 254th data set on the volume. The labid with a DATE reason is the label identifier of the previous data set’s trailing label, which was used to compare the expiration date sequence. Correct the source of the violation before rerunning the job.

If LBL STD appears in the message text, reason SYMM indicates that specifications for the data set will produce unsymmetrical ISO/ANSI labels framing the data set, or that the ISO/ANSI label will not match its counterpart at the end of the data set. Some mismatches are allowed by the ISO/ANSI standard, such as block length and reserved for system use. In the message, labid and postn are blank. A SYMM violation results from:

- DISP=(MOD,...) for an existing output data set, including OUTIN.
- Open for EXTEND, OUTINX, or INOUT.
- Using an EXCP DCB without at least a four-word device-dependent area, to maintain a tape block count.

Correct the violation, and rerun the job.

If LBL STD appears in the message text, reason VRSN indicates that the system cannot process the mounted volume, which contains an ISO/ANSI label with a version other than 3 or 4 indicated. The version code contained in the VOL1 label on the mounted volume is displayed as postn in the message. An ISO/ANSI labeled volume cannot be processed when:

- The volume is being processed for input and the version number is not 1, 3, or 4.
- The volume is being processed for output to other than the first data set and the version is not 3 or 4.

Correct the violation and rerun the job. A version 3 or version 4 ISO/ANSI label can be created by using the IEHINITT utility program.

Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:

DCB=DIAGNS=TRACE

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

**Routing Code:** 1,10

**Descriptor Code:** 2

---

**IEC514D** DCK OR LBL ERR, dev,ser,ji,ss

[*,dsname]

**Explanation:** One of the following caused the error:

- During tape volume verification, a data check occurred in open or end of volume (EOV) processing.
- The wrong volume (label type or volume serial number) was mounted.

In both cases the mount request is for a specific labeled tape volume. When the error is for a label, two specific mount requests have previously been issued for the volume specified by `ser`.

In the message text:

- `dev` The device number of the specified device.
- `ser` The volume serial number.
- `ji` The job requesting the volume.
- `ss` The job step requesting the volume.
- `dsname` Appears when a MONITOR DSNAME command is active to indicate the data set requesting the volume.

**System action:** The job step waits for the operator to reply or until the task reaches the maximum time limit.

**Operator response:** Reply M for open or EOV processing to continue to process the mounted volume. If another data check or label error is detected, this may result in a volume demount followed by another MOUNT request for the volume specified by `ser`.

Reply A to abend the task, abend X'413' with a return code of X'OC' for OPEN processing, abend X'637' with a return code of X'34' for EOV processing. The abend option provides an alternative to cancelling the job when the specific labeled tape mount request cannot be satisfied.

**Note:** If the message is issued because of a data check, and if writing to file sequence 1, the label editor routines can be entered to allow relabeling the volume.

**Source:** Data Facility Product (DFP)

---

**IEC515I** HIPERBATCH CACHING IS QUIESCED FOR ALL DATA SETS. MAX NUMBER OF Cached DATA SETS HAS BEEN REACHED.

**Explanation:** All of the data set entries in the hiperbatch caching global table (GCT) have been filled. No additional data sets can be cached except retained Virtual Storage Access Method (VSAM) data sets in CREATE (LOAD) mode, and those only after a data set entry becomes available. Caching will continue for those data sets already opened and connected. Caching will also be done for new opens if the CGT already contains an entry for that data set.

**Operator response:** To re-establish full hiperbatch caching capabilities, you must re-IPL the system.

**System programmer response:** You can change the size of the CGT to allow for more data set entries using the data lookaside facility (DLF) installation exit routine. The change would take effect after the next IPL.

**Source:** DFSMSdfp

---

**IEC516E** HIPERBATCH IS QUIESCED FOR ALL DATA SETS. HIPERBATCH RECOVERY LIMIT HAS BEEN EXCEEDED.

**Explanation:** Hiperbatch has failed and attempted to recover more times than it is allowed. Caching via Hiperbatch is now stopped for all data sets.

**System action:** The system stops caching via Hiperbatch for all data sets, but the system continues processing.

**System programmer response:** To re-establish full Hiperbatch caching capabilities, reIPL the system.

**Source:** DFSMSdfp

---

**IEC517E** HIPERBATCH IS QUIESCED FOR ALL DATA SETS. HIPERBATCH RECOVERY LIMIT HAS BEEN EXCEEDED.

**Explanation:** Hiperbatch has failed and attempted to recover more times than it is allowed. Caching via Hiperbatch is now stopped for all data sets.

**System action:** The system stops caching via Hiperbatch for all data sets, but the system continues processing.

**System programmer response:** To re-establish full Hiperbatch caching capabilities, reIPL the system.

Detecting Module:  IGGQVUTL, IGGQJOPN, IGGQJCLS, IGGQJSIO, IGGQJIOC, IGGQJSTL, IGGQJMRRM

IEC518I  SOFTWARE ERRSTAT;  errstat

Explanation:  The SMS tape volume identified by 'volser' in the message text is associated with the error status identified by 'errstat' in the message text.

In the message text:

errstat  The volume error status, as follows:

ANSILAB  ANSI label not supported.
CHECKPT  Attempt to access secure checkpoint volume.
DAMAGED  Cartridge is physically damaged and leader block may be missing.
DUPMOUNT  Volume with same volser already mounted.
INTLABEL  Volume label cannot be read.
LABTYPE  Invalid volume label type, neither standard nor ANSI.
LBLNOEQ  Private internal volser does not match the specifically requested MTL volser.
LNGTHERR  Cartridge length exceeds maximum volume length.
MEDIAMNT  Media type does not match the type specified for the scratch volume mount request.
MED2MNT  Media 2 cartridge mounted on non-media 2 capable device.
MLNOMTL  Volume does not reside in this Manual Tape Library.
MLNOSCR  MTL volume use attribute is not scratch.
MLNOTVR  No TCDB TVR entry exists for this MTL volume.
NOMATCH  Internal and external volume labels do not match.
PASSPROT  Attempt to access password-protected volume.
RACFPROT  Attempt to access SAF/RACF-protected volume.
REJTMS  Volume rejected by the tape management system.
REJUSER  Volume rejected by the user's DCB exit or label editing routine.
UNEXPIR  Attempt to write over unexpired data.

UNFORMAT  Volume has not been formatted with servo tracks.
WRITPROT  Attempt to write on write-protected volume.
WRONGVOL  Library mounted different volume when this volume was requested.
18TRKMNT  18 track recorded media mounted on 36 track device and attempting to write beyond load point.
36TRKMNT  36 track recorded media mounted on 18 track device.

ddd  The device name.
volser  The volume serial number.
labtyp  The label type of the mounted volume (either SL, NL, AL, or NSL).
jjj  The job name.
sss  The step name.

System action:  Processing continues. The system may demount the volume and issue another mount, or an abend may be detected depending on prevailing job characteristics.

Application Programmer Response:  Report software error category to library subsystem administrator.

System programmer response:  Validate error category as expected and determine if error category describes a media problem or library subsystem error. System command D SMS,VOLUME(volser) will provide additional volume status. Resetting the scratch error status reactivates the volume's scratch pool status. Changing the volume use attribute from scratch to scratch will reset the scratch error status. See section "TCDB Volume Error Status and Software Error Category" in z/OS DFSMS OAM Planning, Installation, and Storage Administration Guide for Tape Libraries.

IEC519A  dev, jjj, sss, dsname MTL SCRATCH MOUNT:  VOLSER REQUIRED

REPLY 'EXTERNAL SERIAL' THEN REMOUNT THE SAMEVOLUME

Explanation:  The external volume serial number of the volume mounted on the MTL (Manual Tape Library) tape drive is required.

In the message text:

dev  The tape device number.
jjj  Indicates the job name.
Indicates the job step name.

dsname

The data set name.

**System action:** The job step waits for the operator to reply with the external volume serial number, or until the task reaches time-out.

**Operator response:** The volume has just been unloaded. Note the external volume serial number on the outside of the cartridge and reply with this volume serial number. Remount this volume when prompted through message IEC501A.

**Detecting Module:** IFG0194K

---

**IEC520I**

**dev, jjj, sss, volser WARNING: TAPE VOLUME CONTAINS DATA BEYOND THE NON-EXTENDED CAPACITY LIMIT.**

**Explanation:** The volume mounted on a 3590 device in 3490-E emulation contains data beyond the compatibility capacity limit. The device is capable of extended capacity operation, but the application did not request extended capacity mode through the DCBE macro.

In the message text:

- **dev** The device number.
- **jjj** The job name.
- **sss** The step name.
- **volser** The volume serial number

**System action:** Processing continues, but the system will issue an ABEND 137-0C code if the application attempts to read data beyond the capacity of the device being emulated.

**Operator response:** None

**Application Programmer Response:** To access this data on a 3590 device in 3490-E emulation, the application must either request extended capacity through the CAPACITYMODE parameter of the DCBE macro or use QSAM to read the data.

**System programmer response:** None

**Source:** DFSMSdfp

**Detecting Module:** IFG0194J

---

**IEC522I**

**dev, jjj, sss, ser Warning: Library default policy names assigned. Previous volser=volser**

**Explanation:** During tape end-of-volume verification processing, the library was unable to assign the automatic class selection (ACS) routine construct names. All volumes of a multivolume data set are to be assigned the same policy names; however, due to an internal processing error at the library, the policy names assigned to the previous volume could not be assigned to the next volume of the multivolume data set. Consequently, the library sets policy names for the mounted volume to the default policy name.

In the message text:

- **dev** The device number.
- **jjj** The job name.
- **sss** The step name.
- **ser** The volume serial number.
- **sg** A storage group.
- **sc** A storage class.
- **dc** A data class.
- **mc** A management class.

**System action:** The mount proceeds with the default policy name (blanks) and actions being used for the volume. The default policy name is assigned and used for each construct.

**Operator response:** Contact your system programmer.

**Application Programmer Response:** Contact your system programmer.

**System programmer response:** If the failure was due to a limitation being reached on the number of unique construct names allowed for the library, determine the necessary adjustments to your ACS routines. You can later use the LIBRARY LMPOLICY command to reassign policy names to the volume.

**Problem determination:** Determine whether an internal processing error or construct limitation has been reached. For an internal processing error, contact the IBM Support Center to determine the cause of the internal processing error at the library.

**Source:** DFSMSdfp
dev
The device number.

jjj
The job name.

sss
The step name.

ser
The volume serial number.

volser
The previous volume serial number.

System action: The mount proceeds with the default policy name (blanks) and actions being used for the volume. The default policy name is assigned and used for each construct. From this point forward, all volumes of the multivolume data set might not have the same policy names assigned.

Operator response: Contact your system programmer.

Application Programmer Response: Contact your system programmer.

System programmer response: You can later use the LIBRARY LMPOLICY command to reassign policy names to the volume.

Problem determination: Contact the IBM Support Center to determine the cause of the internal processing error at the library.

Source: DFSMSdfp

IEC534D
A dev,ser [,labtyp], jjj,sss [,dsname]
REPLY 'U'-USE OR 'M'-UNLOAD

Explanation: A indicates that the tape volume on the unit bears a label that is incompatible with the label type specified in the LABEL parameter of the JCL.

Permission is being requested to destroy the present label by overwriting it with a Tape Mark. A new label, if required, may be written during further processing.

If a MONITOR DSNAME command is active, dsname indicates the data set requesting the volume.

In the message text:

jjj
Names the job requesting the volume.

sss
Names the job step requesting the volume.

ser
The volume serial number. One of the following:
• a specific tape volume serial number
• SCRTCH
• PRIVAT

SCRTCH or PRIVAT indicate non-specific volume requests. SCRTCH is used when the dataset being created on the non-specific volume is temporary [DISP=(NEW,DELETE) or DSN=&&tempname]. PRIVAT is used for all other cases of non-specific volumes.

dev
The device number of the specified device.

dsname
The data set name.

labtyp
The label type of the mounted volume (either SL, NL, AL, or NSL).

System action: The job step waits for the operator to reply U or M, or until the task reaches time-out.

Operator response: If the volume specified by ser was mounted in response to a request for SCRTCH or PRIVAT, determine if the volume mounted was in fact a scratch volume. If so, determine if it is desirable to destroy the label on the volume and create a new label that is compatible with the programmer’s request. Enter REPLY xx,'U' to allow the program to destroy the current label on the volume. Enter REPLY xx,'M' to allow the program to reject the currently mounted volume and mount a new volume.

Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:

DCB=DIAGNS=TRACE

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp

IEC537I
BLOCK COUNTS: DEVICE |
TLABEL=xxxx DCB=yyyy

Explanation: At EOV time, a block count mismatch was detected. The count computed from hardware device information does not match the count computed by the access method or application program. A block count mismatch results in one of three system completion codes:
• abend 237, reason code 0C;
• abend 214, reason code 10; or
• abend 117, reason code 3C.

In the message text:

xxxx
The count computed from either the hardware device information or recorded in the tape label.
yyyy The count computed by the access method or application program.

System action: The system abnormally ends the task, and issues an accompanying message that further describes the error condition. For abend 237, the system issues IEC023I; for abend 214, IEC210I; and for abend 117, IEC218I.

Application Programmer Response: Refer to IEC023I, IEC210I, or IEC218I for an appropriate response.

Detecting Module: IFG0200Y
Routing Code: 11
Descriptor Code: -

IEC601D M dev,ser,iji,sss - REPLY U OR M

Explanation: M indicates that the volume is to be mounted on the device, so that a data set can be scratched or renamed.

In the message text:
dev The device number of the specified device.
ser The volume serial number.
iji The job name.
sss The step name.

System action: The system waits for the operator to reply.

Operator response: If the volume can be mounted, enter REPLY xx,'U'. Then mount the volume and ready the device.

If the volume cannot be mounted but the job step is to continue, enter REPLY xx,'M'. The system will skip the Scratch or Rename function on this volume.

If the volume cannot be mounted, and the job must not continue unless the data set is scratched or renamed, or unless the volume is scratched, end the job step.

Source: DFSMSdfp
Detecting Module: IGG0290F
Routing Code: 4
Descriptor Code: 2

IEC602I text

Explanation: text is

[ VTOC NOT CONVERTED ON dev,ser,cde ]
[ VTOC NOT CONVERTED ON dev,ser,0,
   , (EXTENT=cchh,DSCB=cchhr-cchhr) ]

When the system tried to allocate DASD space on volume ser on unit dev, the volume table of contents (VTOC) conversion routine entered, but failed to convert or repair the VTOC.

In the message text:

dev The device number of the specified device.
ser The volume serial number.
cde The code.

If the message received matches the first variant of IEC602I, then the value of cde indicates the reason VTOC conversion failed.

Cde 1C There were insufficient DSCBs available to rebuild the free space chain. The VTOC is full.

Cde 1D An I/O error occurred.

If the message received matches the second variant of IEC602I, then either the same DASD track or set of tracks are allocated to multiple data sets, or Format 3 DSCBs are incorrectly chained, which can make it appear that the same track or set of tracks are allocated to multiple data sets. This condition can occur if a prior Data Facility Data Set Service (DFdss) defrag operation was abnormally terminated. This can be identified by the existence of a data set on the volume whose name is 'SYS1.DFDSS.DEFRAG.xxxxxxxx, where xxxxxxxx is eight bytes if 'FF'X. For this variant, in the message text:

EXTENT=cchh Specifies the first track that appears to be multiply allocated.

DSCB=cchhr-cchhr Specifies a range of DSCB addresses. Within this range is one of the DSCBs that contains the multiply allocated track(s).

If the message received matches the third variant of IEC602I, then a format-1 or format-3 DSCB was found to have an extent that is invalid. The value of cde describes the error found:

Cde 12 DSCB contains an extent that is above the 65,520 Cylinder line but is not a multiple of 21 Cylinders. This indicates an extent error.

Cde 16 DSCB contains a split-cylinder extent. This type of extent is no longer supported.

EXTENT=cchh Specifies the first track of the extent in error.

DSCB=cchhr Specifies the address of the DSCB in error.

System action: For Cde 0, 8, and 16, if the error occurred during allocation, the system ends the job; if
the error occurred in the middle of a job extending the space allocation to a data set, the system abnormally ends the job.

For Cde 12, the system ends the job.

**Operator response:** Notify the system programmer.

**Application Programmer Response:** Analyze the volume to determine the cause of the error.

For Cde 0, if two data sets were allocated to the same space and the overlapping extent is mapped by SYS1.DFDSS.DEFRAG:xxxxxxx, rerun the DFDSS DEFRAG job. DFDSS will correct the error. Then rerun the job that was ended with this message. If the overlapping extent is not mapped by SYS1.DFDSS.DEFRAG:xxxxxxx, scratch one of the data sets allocated to the same space, and run the job again.

For Cde 12 or Cde 16, scratch the data set that is creating the error, and run the job again.

**Note:** The volume can not be used by MVS until the offending split-cylinder data set has been scratched.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Source:** DFSMSdfp

**Detecting Module:** IGG0325P, IGG0325Q, IGG0325R, IGG0325U, IGG0325V, IGG0325W, IGG0325Z

**Routing Code:** 4,10

**Descriptor Code:** 4

**IEC603I**

**VTOC ERRORS MAY EXIST ON dev,ser,cde, rsnc**

**Explanation:** An unusual condition was encountered in the system routines that update the VTOC on device ddd, volume ser, which caused the DIRF bit to be set to one, or caused active VTOC recording facility (VRF) data to be left in the VTOC index map, indicating that the VTOC may contain errors:

**Cde 0** An I/O or unexpected CVAF error return code error occurred in the DADSM routines Allocate, Extend, Scratch or Partial Release. The routine ended processing, thereby leaving the VTOC in a partially updated state.

**Cde 4** The Scratch or Partial Release function of DADSM discovered that the space it was returning to the chain of Format-5 DSCBs which describe the free space on the volume was already present in a format-5 DSCB. Although Scratch or Partial Release was able to successfully process this incorrect data, thereby correcting the situation, other problems may exist on the VTOC.

**Cde 8** An I/O error or unexpected CVAF error return code occurred in the DADSM routines (Allocate, Extend, Scratch, Partial Release, Rename) during updating of the VTOC index or the VTOC on an indexed VTOC volume, thereby leaving the indexed VTOC in a partially updated state. DADSM processing is ended.

There is only one decimal reason code rsnc associated with message IEC603I.

<table>
<thead>
<tr>
<th>rsnc</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>027</td>
<td>The index data set is full.</td>
</tr>
</tbody>
</table>

In the message text:

**dev** The device number of the specified device.

**ser** The volume serial number.

**cde** The code.

**rsnc** The reason code.

**System action:** For codes 0 and 8, if the error occurred during allocation, the job is ended. If the error occurred in the middle of a job extending the space allocated to a data set, or a job releasing unused allocated space while closing a data set, the job is abnormally ended. If the error occurred while scratching or renaming a data set, an I/O error is returned. For code 0 the DIRF bit in the format-4 DSCB is set to one; for code 8 the VRF data set is left in the VTOC index map to indicate that Active VTOC Recording Facility (VTOC) may be in error. A system dump is taken if the cause of the error is an unexpected CVAF error return code.

If code is 4, VTOC updating continues, and if no further errors are encountered, the job continues processing. The DIRF bit in the format-4 DSCB is set to one.

**Operator response:** Report this message to the system programmer.

For error code 0 or 4, either message IEC602I or message IEC604I will be issued the next time allocation is attempted on this volume. For code 8, which refers to an indexed VTOC, message IEC605I will be issued when the next DADSM VTOC updating function (Allocate, Extend, Scratch, Partial Release, Rename) is performed.

**Application Programmer Response:** Some attempt should be made to analyze the state of the VTOC on the affected volume.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.
IEC604I  VTOC CONVERT ROUTINE ENTERED ON dev,ser,cde[,DEVMAN]

Explanation: The VTOC conversion function has been entered for volume ser on device dev. The VTOC conversion function either converts a VTOC from indexed (IXVTOC) format to unindexed (OSVTOC) format or repairs a VTOC in unindexed format that contains incomplete information, or has been damaged.

The VTOC conversion function might be entered during any DASD space allocation request for a new data set, or during any request for additional DASD space for an existing data set. The value of cde (the code) indicates the reason why VTOC conversion was entered. If the code is DOS, this indicates that VTOC conversion was entered because either a previous allocation was made on the volume using the VSE operating system, or the VTOC was indexed but the Index was disabled. In the former case, the VSE operating system does not maintain all the VTOC information required by MVS; VTOC conversion will repair the VTOC by establishing the incomplete information. In the latter case, one of the following messages might have preceded this message: IEC606I, IEC608I, IEC609I. If the code is DIRF, this indicates that VTOC conversion was entered because the last request against this volume was prematurely interrupted, leaving the VTOC in a partially updated state.

The VTOC conversion function will repair any inconsistencies within the partially updated VTOC. Message IEC999I might have preceded this message. If the code is anything other than DOS or DIRF, this indicates that the VTOC might have been damaged. VTOC conversion will repair any inconsistencies within the VTOC. In this case, the code value indicates the state of fields within the format 4 DSCB. This information might be of value in determining the cause of the damage to the VTOC. If the code contains the character D, this indicates field DS4DVTOC is on, otherwise field DS4DVTOC is off. If code contains the character I, this indicates field DS4IVTOC is on, otherwise field DS4IVTOC is off. If the code contains the character G, this indicates field DS4EFVLD is on, otherwise field DS4EFVLD is off. If the code contains the character C, this indicates field DS4DOSBT is on, otherwise field DS4DOSBT is off. The character - has no meaning, and serves merely as a place holder.

If the DEVMAN keyword is present, this indicates that conversion is taking place in the Device Manager Address Space.

In the message text:

dev   The device number of the specified device.
ser   The volume serial number.
cde   The code.

System action: The VTOC is converted to reestablish certain control information necessary for the operation of the DADSM routines. If this is successful, the requested space is allocated. If VTOC conversion fails, the system issues message IEC602I.

Detecting Module: IGG020P3
Routing Code: 4,10
Descriptor Code: 4

IEC605I  DADSM VRF RECOVERY ROUTINE ENTERED ON dev,ser,cde

Explanation: The VTOC recording facility (VRF) recovery routine is invoked to recover a DADSM function that was interrupted by a system failure or a permanent I/O error on the device with the indicated volume serial number. The functions for which recovery is attempted are Allocate, Extend, Scratch, Partial Release, and Rename. The interrupted function is indicated by the value of cde, as follows:

1. Allocate
2. Extend
3. Scratch
4. Partial Release
5. Rename
6. Function name from DFDSS

In the message text:

dev   The device number of the specified device.
ser   The volume serial number.
cde   The code.

System action: The VRF data saved in the VTOC index map is used to recover the interrupted function. The interrupted function either is completed or it is backed out to allow the request which invoked the VRF recovery process to complete its processing.

Operator response: Notify the system programmer.

Application Programmer Response: Identify and correct the system problem or the I/O error that interrupted the DADSM function.

Source: DFSMSdfp
Detecting Module: IGG020P1
Routing Code: 4,10
Descriptor Code: 4

IEC606I  VTOC INDEX DISABLED ON dev,ser,cde

[rba[secno,ofst]]

Explanation: The common VTOC access facility detected an error in VTOC index structure.
In the message text:

- **dev**: Device number.
- **ser**: Volume serial number.
- **cde**: One of the following error codes:

  129 The first high-level VIER indicated in the VTOC index map (VIXM) does not have the flag bit set to show that it is the first high-level VIER.

  130 A horizontal or vertical VIER pointer is outside the RBA range of the VTOC index.

  131 A vertical VIER pointer points to a VIR which is not a VIER. There is an incorrect ID in the header.

  132 A level N vertical index entry pointer points to a VIER that is not at level N-1.

  133 A level N horizontal index entry pointer points to a VIER that is not at level N.

  134 A horizontal VIER or map pointer points to a VIR which is not a VIER or map. There is an incorrect ID in the header.

  135 A horizontal map pointer points to a VIR that is not one of the first N VTOC index records (N is recorded in the VIXM field VIMRCDS); or the first record in the VTOC index is not a VIXM.

  136 A level-1 index entry contains a CCHHR pointer which is outside the VTOC extent.

  137 The first high-level VIER, as indicated in the VIB, does not have the flag bit set indicating that it is the first high-level VIER. The error is recovered from either by updating the VIB from the VIXM, or by changing the error code to 129.

  138 The RBA of the VTOC index VIR does not match the RBA recorded in the header of the record.

  139 The first record of a map (VIXM, VPSM, or VMDS) is not one of the first N VTOC index records. (N is recorded in the VIXM field VIMRCDS.)

  140 The data set name in the level N+1 VIER entry is lower than the high key of the level N VIER pointed to by the level N+1 entry.

  141 The VTOC index structure error bit was found set to one in the first high-level VIER.

  142 There is an I/O error indicating that the VTOC index is not formatted correctly.

  143 Either the index bit is zero or the DOS bit is zero in the format-4 DSCB of a VTOC previously found to be an indexed VTOC.

  144 There is no SYS1.VTOCIX.nnn data set name in a VTOC whose format-4 DSCB has the index bit on.

  145 The data set name in a level N+1 VIER entry is higher than the high key of the level N VIER pointed to by the level N+1 VIER entry.

  146 Four or more high-level VIERs were encountered.

  147 There are too many levels in the VTOC index. The search list length, defined in the static text module ICVIXST0, was exceeded.

  148 A VIER is incorrect: the offset to the last section is incorrect.

  149 A VIER is incorrect: the offset to the last entry in a section is incorrect.

  150 Initialization of the media manager failed.

  151 A level 2 or higher VIER contains less than two entries.

  152 RECOVER=YES was specified, but the static text module ICVIXST0 indicates that recovery is not permitted.

  153 The format-4 DSCB on an indexed VTOC is written with either the index bit or the VSE bit zero.

  154 A space map extends over more than 10 VTOC index records.

  155 DSN was not found in the section with high key greater than or equal to the DSN key being searched. This section in the VIER is incorrect.

  156 The horizontal pointer of VIER1 points to a VIER2 whose high key is lower than or equal to the high key of VIER1.

  157 Could not find an entry in a level-2 or higher VIER that matches the high key of the VIER.
The VIER header has an incorrect section length or an incorrect number of sections.

The first high-level VIER pointed to by the VIB has an incorrect ID in the header.

rba Relative byte address of the VTOC index record (VIR) that contains a structure error indicated by cde.

secno If the VIR is a VTOC index entry record (VIER), the number of the VIER section that contains the VIR pointing to the incorrect record.

ofst Offset into the VIER section of the index entry pointing to the incorrect record.

System action: The VTOC index for the volume is disabled by setting the index bit in the format-4 DSCB to zero and, optionally, the structure error bit in the first high-level VIER to one, indicating an incorrect VTOC index structure. A system dump is taken to the SYS1.DUMP data set, and an entry is made in the logrec data set if the error code is not 141, 143, or 144.

At the next access by DADSM routines to allocate space on the volume, the VTOC is converted to non-indexed format and message IEC604I will be issued. When the system converts the VTOC to non-indexed format, the VSE bit is set to zero and message IEC604I is issued. If the volume is shared with another system, the other system will not reconvert the VTOC because both the VSE bit and the index bit are off. Instead, message IEC606I with error code 141 or 143 is issued and the VTOC is accessed as an MVS VTOC.

System programmer response: Examine the system dump and a print of the VTOC index, and use the information in message IEC606I to determine the cause of the VTOC index structure error.

If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the logrec data set error record.

Source: DFSMSdfp
Routing Code: 4,10
Descriptor Code: 4

IEC607I SPACE NOT RELEASED ON dev,ser,fctn, dsname

Explanation: The system has enforced the single mode regarding rules or has recognized a non-supported recording mode. Single mode recording rules require that all data on a tape volume is written only in COMP mode or only in NOCOMP mode. The mode of the first data that is written on the volume determines the mode for all other data written on the volume.

In the message text:

- **dev** The device number.
- **ser** The volume serial number.
- **fctn** May contain a 1 for scratch or a 2 for partial release.
- **dsname** The data set name.

System action: The system ends the scratch or partial release function.

Application Programmer Response: You may take either one of the following two actions:
1. Resubmit the request.
2. First overwrite any secure data or determine if you need erasure, second, resubmit the request without the erase option.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

Source: DFSMSdfp
Routing Code: 9,11
Descriptor Code: 4

IEC608I DADSM FUNCTION DISABLED THE VTOC INDEX ON dev, ser, cde, cchhr

Explanation: The VTOC index on the device for the indicated volume serial number was disabled by the DADSM, Allocate, Extend, Scratch or Partial Release function because an error was detected. The error codes and the associated values of cchhr are as follows:

- **Cde 4** The Scratch or Partial Release function discovered that the space to be released is already described as free in the volume pack space map of the indexed VTOC. The cchhr is that of the format-1 DSCB that describes the data set to be scratched or released.

- **Cde 8** The Scratch or Partial Release function discovered that the DSCB to be released is already described as free in the VTOC map of DSCBs in the VTOC index. The cchhr is that of the format-1, format-2, or format-3 DSCB to be released.

- **Cde 12** The Scratch function discovered that the CCHHR retrieved from the VTOC index points
IEC609I

to a DSCB whose data set name is different from the one retrieved from the index. The cchhr is that of the DSCB.

**Cde 16** The Scratch function discovered that the data set to be scratched has more than 16 extents. The cchhr is that of the format-1 DSCB for the data set to be scratched.

**Cde 20** The Allocate or Extend function discovered that a DSCB marked unallocated in the VTOC Index, indicating that the DSCB is a Format 0, is not a Format 0 DSCB. The cchhr is that of the DSCB.

In the message text:

**dev** The device number of the specified device.

**ser** The specified volume serial number.

**cde** The code.

**cchhr** Describes the data set to be scratched or released.

**System action:** The index bit in the format-4 DSCB is set to zero causing the VTOC index to be disabled and message IEC606I to be issued. For codes 4, 8, and 16, the request is processed without updating the format-5 DSCBs. If no further error is encountered, the job continues to run.

For codes 12 and 20, processing of the request is ended with an I/O error return code, after disabling the VTOC index. The VSE bit is left on to cause the VTOC conversion routine to be called the next time the Allocate or the Extend function is invoked and message IEC604I to be issued.

**System programmer response:** Take a print of the VTOC and the VTOC index to determine the cause of the error. The problem can be caused by the volume being processed on another system without Indexed VTOC support, without first converting the volume from an Indexed VTOC volume to a non-Indexed VTOC volume.

If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**IEC609I**

| DASDM VRF RECOVERY ROUTINE DISABLED THE VTOC INDEX ON |
| dev,ser,ftctn,cde |

**Explanation:** The DASDM VTOC recording facility (VRF) recovery routines detected an error in the VRF data in the VTOC index map during recovery of an interrupted DASDM function. The VTOC index is disabled on the device for the volume serial number. The function the VRF recovery routine was trying to recover from is indicated by the function indicated, as follows:

1. Allocate
2. Extend
3. Scratch
4. Partial Release
5. Rename
6. Function name from DFDSS

The code field contains one of the following error codes:

**IEC609I**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>DSN in the format-1 DSCB is not the same as DSN in the VRF data.</td>
</tr>
<tr>
<td>4</td>
<td>The format-3 CCHHR in the format-1 or format-2 DSCB is not the same as the format-3 CCHHR in the VRF data.</td>
</tr>
<tr>
<td>8</td>
<td>The number of extents shown in the format-1 DSCB does not agree with the number of extents in the VRF data extent table.</td>
</tr>
<tr>
<td>12</td>
<td>The number of extents shown in the format-1 DSCB is less than the number of primary extents in the VRF data.</td>
</tr>
<tr>
<td>16</td>
<td>The CCHHR in the VTOC index for the format-1 DSCB is not the same as the format-1 CCHHR in the VRF data.</td>
</tr>
<tr>
<td>20</td>
<td>The VRF function code is incorrect, or the module required for the function is not available.</td>
</tr>
<tr>
<td>24</td>
<td>An unexpected return code (4) was received from a CVAF call. The probable cause is erroneous VRF data.</td>
</tr>
<tr>
<td>28</td>
<td>An unexpected return code (4 or 12) was received from a CVAF call. The probable cause is a logic error in a VRF recovery routine.</td>
</tr>
<tr>
<td>32</td>
<td>The VRF recovery routine was called but no VRF data exists.</td>
</tr>
<tr>
<td>36</td>
<td>A format-2 CCHHR in VRF data does not point to a format-2 DSCB.</td>

<td>The format-2 CCHHR in the VRF data is not the same as the format-2 CCHHR in the format-1 DSCB.</td>
</tr>
<tr>
<td>48</td>
<td>The format-2 CCHHR is incorrect. The data set organization is not ISAM.</td>
</tr>
</tbody>
</table>
The format-3 CCHHR in VRF data is incorrect. There are less than four extents.

The format-3 CCHHR in VRF data is zero, but there are more than three extents.

The format-1 CCHHR in VRF data does not point to a format-1 DSCB for an Extend function.

VRF data points to a format-3 DSCB but the number of extents is less then or equal to the maximum number of extents that can be described by a format 1/8 DSCB.

VRF data has no format 3-DSCB pointer but the number of extents as described in the format 1-DSCB is greater than the maximum extents that a format 1/8 DSCB can describe.

VRF data does not point to a format-1 or format-8 DSCB.

VRF data pointer(s) to the format 9-DSCB(s) is incorrect.

The format-9 DSCB chain pointer to the next DSCB is found to be not valid.

The format-9 DSCB number of format-3 DSCBs is found to be not valid.

In the message text:

**dev** The device number of the specified device.

**ser** The specified volume serial number.

**fctn** The specified function.

**cde** The code.

**System action:** The index bit in the format-4 DSCB is set to zero causing the VTOC index to be disabled and message IEC606I to be issued. If the current request is for the Allocate or the Extend function, the VTOC conversion routine is invoked to rebuild the format-4 and format-5 DSCBs and message IEC604I will be issued; the request is processed as a non-indexed VTOC request and if no further errors are encountered, the job continues to run. If the current request is Scratch, Partial, Release, or Rename, the request is processed and if no further errors are encountered, the job continues to run.

**Application Programmer Response:** Take a print of the VTOC index and analyze the data in the VTOC index map. Use the dump to determine the cause of the error in the VRF data.

**System programmer response:** If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

**Source:** DFSMSdfp

**Detecting Module:** IGGVRF01

**Routing Code:** 4,10

**Descriptor Code:** 4

---

**IEC610I ERROR BEFORE WRITE OF A rec,dev,ser,cde,rba**

**Explanation:** Validation of fields in a VTOC or VTOC Index Record detected an error just before the record was written.

In the message text:

**rec** The type of record, either DSCB1, DSCB4, VIR, or VIER.

**dev** The device number.

**ser** The volume serial number.

**cde** An error code, which is one of the following:

- **167** A beginning extent was larger than an ending extent in a Format 1 DSCB.
- **168** One or more of the following fields in the Format 4 DSCB is invalid:
  - Number of logical cylinders on the volume (DS4DSCYL)
  - Number of tracks in a logical cylinder (DS4DSTRK)
  - Device track length (DS4DEVTK)
- **169** A VIR or VTOC Index Record did not have a valid ID on the front of the record. The ID should be VIXM, VPMS, VMDS, OR VIER
- **170** One or more of the fields in the first high-level VIER is not valid.

**rba** Relative byte address of the VTOC index record (VIR) that contains a structure error indicated by the error code in the **cde** field.

**System action:** The record will not be written to the VTOC or VTOC Index. The system issues abend code X'18B' and issues a system dump to the SYS1.DUMP data set. The caller may or may not abend, depending on whether or not the VTOC recording facility (VRF) recovery routine is successful. These actions should prevent any corruption to the VTOC or VTOC Index, but does not guarantee that the VTOC Index will not become disabled.

**System programmer response:** Examine the system dump and a print of the VTOC and the VTOC index, and use the information in message IEC610I to determine the cause of the error. The most likely cause is an overlay of the area in storage where the record

---

**Chapter 3. IEC Messages** 3-175
resided before it was written.

If you cannot find the cause of the problem contact the IBM Support Center. Provide the Dump and the print of the VTOC and the VTOC Index as well as information about the job that was running at the time of the failure.

**Source:** DFSMSdfp

**Detecting Module:** ICVDSD03 or ICVCMI03

---

**IEC613A**

**Explanation:**

For the step of the job, open processing is trying to position a tape volume serial number on a device to a specific file in order to open that file. Open processing has retried positioning the tape to the correct file (at least once), but cannot find the file because the file is not known. Open processing issued this message to ask if it should retry positioning the tape to the correct file again.

In the message text:

- **jjj** The job name.
- **sss** The step name.
- **dev** The device number of the specified device.
- **ser** The volume serial number.

**Operator response:** If you wish open processing to retry positioning the tape to the correct file, enter REPLY xx, ‘R’. Otherwise, to continue with the ABEND already in progress, enter REPLY xx, ‘U’. xx is the message reply identification for this message.

**Source:** DFSMSdfp

**Detecting Module:** IFG0199I

---

**IEC614I**

**Explanation:**

The specified DADSM function failed due to the error described by the function return code and the diagnostic information. The failure occurred in the step, operating on the volume, on the data set.

In the message text:

- **func** The function specified.
- **rc** The return code.
- **diaginfo** The indicated information referring to diagnostics.
- **sss** The step name.
- **ser** The volume serial number.
- **dsname** The data set name.

**System action:** The function does not complete; however, the job step might have completed successfully.

**Operator response:** Notify your system programmer.

**Application Programmer Response:** If the job step failed, refer to the [z/OS DFSMSdfp Diagnosis] for an explanation of the failing function’s return code, and of the associated diagnostic information. If the function is CREATE or EXTEND, look at the book’s explanation for the same return code under REALLOC.

If you cannot correct the error as indicated in [z/OS DFSMSdfp Diagnosis], contact your programming support personnel.

**Source:** DFSMSdfp

**Routing Code:** 11

**Descriptor Code:** 4

---

**IEC701D**

**Explanation:** M indicates that a volume is to be mounted on the device. If the serial number is 6-digits, a standard label containing the serial number will be written on the volume. If the serial number is absent, a nonstandard label will be written on the volume.

In the message text:

- **dev** The device number of the specified device.
- **ser** The volume serial number.

**Operator response:** For the first appearance of this message mount a volume on device dev, ready the device, and enter REPLY xx, 'M'. The volume mounted should be a scratch volume, unless the programmer supplied a volume to be used. If this message is repeated immediately after message IEC702I, the system attempted to write a label on the volume but the label could not be verified. Inspect the tape for irregularities.
IEC702I • IEC704A

- If irregularities appear, remove the bad section of
tape or, if the volume was a scratch volume,
substitute another volume. Then, mount the correct or
substituted volume, ready the device, and enter
REPLY xx,'M'.
- If the irregularities are uncorrectable and the volume
was supplied by the programmer, enter REPLY xx,'S'.
- If no irregularities are found, mount the tape volume
again, ready the device, and enter REPLY xx,'M'.
- If only this message is repeated, enter REPLY xx,'S'.
  Report the message sequence to the programmer,
  asking him to check the program for improper
  recording characteristics. If the program is not at
  fault, a customer engineer should be called to check
  the tape drive.

If this message is repeated immediately after message
IEC703I a label cannot be written on the volume
because the volume is file protected:
- If the volume is to be labeled, insert a file protection
  ring in the volume, mount the volume, ready the
device, and enter REPLY xx,'M'.
- If the volume is not to be labeled, demount the
  volume, mount a new scratch volume with a file
  protection ring, ready the device, and enter REPLY
  xx,'M'.
- If only this message is repeated, enter REPLY xx,'S'.
  Report the message sequence to the programmer.

System programmer response: If the error recurs
and the program is not in error, look at the messages in
the job log for more information. Search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the
program listing for the job and the associated volume.

IEC702I  \( \text{dev}, \text{VOLUME LABELS CANNOT BE VERIFIED} \)

Explanation: The system attempted to write a label on
the volume on the device. The label could not be verified.

In the message text:

\( \text{dev} \) The device number of the specified device.

System action: The system rewinds and unloads the
volume. Immediately or in a short time, the system
issues message IEC701D which follows this message.

Operator response: Respond as indicated for
message IEC701D, which follows this message.

Source: DFSMSdfp

IEC703I  \( \text{dev}, \text{VOLUME IS FILE PROTECTED} \)

Explanation: The volume on the device is file
protected; that is, its file protection ring is not inserted,
so it can only be read. A label cannot be written on the
volume.

In the message text:

\( \text{dev} \) The device number of the specified device.

System action: The system rewinds and unloads the
volume. Immediately or in a short time, the system
issues message IEC701D.

Operator response: Respond as indicated for
message IEC701D, which follows this message.

Source: DFSMSdfp
Detecting Module: IGC0003I
Routing Code: 3
Descriptor Code: 4

IEC704A  \{\text{LIL,UVL,L VOL2-9C|C UVL}\}  \text{dev[,ser]}\[\text{,labtyp}][\text{,den}][\text{,jji,ssss}][\text{,dsname}]\{\text{LIL UVL|C UVL}\}\text{dev[,ser]}\[\text{,labtyp}][\text{,trtch}][\text{,jji,ssss}][\text{, dsname}][*,S]\text{REPLY}
\text{‘VOLSER,OWNER INFORMATION’ OR ‘M’ REPLY ‘VOLSER,OWNER INFORMATION’,’M’ OR ‘U’ REPLY}
\text{‘VOLSER,OWNER INFORMATION,ACCESS’ OR ‘M’ REPLY}
\text{‘VOLSER,OWNER INFORMATION,ACCESS’,’M’ OR ‘U’ REPLY}
\text{‘U,OWNER INFORMATION,ACCESS’ OR ‘M’}

Explanation: The message display may be in one of
the following forms:

- If \( \text{L} \) appears in the message display then the tape
  volume on the unit requires label information. The
  label is to be written as the type indicated in the
density indicated.
- If \( \text{L UVL} \) appears in the message display then the
  tape volume on the unit is about to be rewritten on
  the volume specified. The volume contains ISO/ANSI
  Version 3 user volume label(s) that will be lost if the
  volume header label (VOL1) is rewritten. If this
  message is issued to rewrite a VOL1 label to a new
density, the contents of the label will be unchanged
from the contents currently on the volume. If \( \text{L}
\) VOL2-9 appears in the message display, then the
tape volume on the unit is about to be rewritten on
the volume specified. The volume contains ISO/ANSI
Version 4 VOL2-9 volume label(s) that will be lost if the
volume label (VOL1) is rewritten.
If C appears in the message display then the tape volume mounted on the unit is an ISO/ANSI Version 1 (or other unsupported version level) volume that must have its label converted to the latest supported version level. You must supply label information to rewrite the volume header label (VOL1). The label is written as the type indicated in the density indicated.

If C UVL appears in the message display then the ISO/ANSI tape volume mounted on the unit is about to be rewritten on the volume specified and contains user volume labels (UVLs) that will be lost if the volume header label is rewritten.

The following fields may also appear in the message display:

- **dev** The device number.
- **ser** If this appears in the message text, this is the volume serial number and may contain up to 6 characters.
- **labtyp** The label type of the mounted volume (either SL, NL, AL, or NSL).
- **den** The density of the volume to be mounted.
- **jjj** This indicates the job requesting the volume.
- **sss** This indicates the job step requesting the volume. It indicates a specific volume serial was requested.
- **dsname** This may appear if a MONITOR DSNAME command is active. If this is the case, dsname indicates the data set requesting the volume.
- **trtch** This indicates the recording mode as COMP (compaction) or NOCOMP (non-compaction).
- **S** The tape is in a system managed library.

**Operator response:** If the message display contains L or L UVL there are a series of responses you may make. First, the following is a list of variables that you may use in your response:

- **volser** This is the volume serial number and may contain up to 6 characters.
- **ownerinfo** This is the owner information and may be up to 14 characters long.
- **a** This is the volume access code and is a 1 character code from A to Z.

**Note:** For Version 4, the allowable characters are: Uppercase A-Z, number 0-9, and special characters !, %, & , ' ( ) + , - . / : ; < = > ? _

The following is a list of the possible responses you may make:

- If you want to use the serial number, owner information and access code from the old label for the new label, enter:
  
  \[ \text{REPLY xx,'U[\text{ownerinfo}][a]'} \]

  The system will then copy the old label into the new label, except for version level which must reflect the latest supported level.

- If you want to specify different owner information and/or an access code, enter
  
  \[ \text{REPLY xx,'U[\text{ownerinfo}][a]'} \]

  In this instance, the system uses the serial number from the old volume label. If you skip one of these fields, the value used in the old label will be used for the new label.

- If you want to cause the volume to be demounted, followed by a label rewrite abend for the job step requesting the volume, enter:
  
  \[ \text{REPLY xx,'M'} \]

- If you want to use the volume, enter
  
  \[ \text{REPLY xx,'volser[\text{ownerinfo}][a]'} \]

  The owner information and access code are optional but will be left blank if you do not supply them.

- If you want to reject the volume, enter
  
  \[ \text{REPLY xx,'M'} \]
The volume will be demounted, followed by a mount request for another scratch volume.

- If C UVL appears in the message text, a reply other than ‘M’ allows the system to proceed with the rewriting of the VOL1 label, but all user volume labels will be destroyed. If L VOL2-9 appears in the message text, a reply other than ‘M’ allows the system to proceed with the rewriting of the VOL1 label, but all VOL2-9 volume labels will be destroyed.

Source: DFSMSdfp
Detecting Module: IFG0193E
Routing Code: 1
Descriptor Code: 2

Explanation: The volume label of the tape volume whose serial number is ser, on device dev, has been rewritten to conform to the label type indicated by labtyp: either SL, AL, or NL and to the density indicated by den. For NL, this message is only issued if the tape formerly contained labels which have now been written over. If the tape was originally NL and is now still NL, this message is not issued.

In the message text:

trtch Indicates the recording mode as COMP (compaction for hardware) or NOCOMP (non-compaction for hardware).

jjj Indicates the job requesting the volume.

sss Indicates the job step requesting the volume.

dev The device number of the specified device.

ser The volume serial number.

labtyp The label type.

den The density.

dsname The data set name.

mediatype The media type.

If a MONITOR DSNAME command is active, dsname may appear and indicates the data set requesting the volume.

This message is issued only when the volume label of a tape is rewritten, which means that it is issued only for the first data set written onto an output tape volume. The following example describes when message IEC705I is issued when creating a tape multi-data set, multi-volume collection:

- Start of data set 1 on volume 1 - IEC705I is issued.
- Continuation of data set 1 onto volume 2 - IEC705I is issued.
- Start of data set 2 on volume 2 - IEC705I is not issued.
- Continuation of data set 2 onto volume 3 - IEC705I is issued.

System action: The job step continues processing.

Operator response: Record the indicated information for use of the volume in conjunction with subsequent requests.

System programmer response: None

IEC706I (TRTCH|DENSTY) (OVERRIDDEN|IGNORED) dev,ser,labtyp,den, trtch,jjj,sss,dsname

Explanation: The system has enforced the single mode recording rules or has recognized a non-supported recording mode. The message display may be in one of two forms:

- When OVERRIDDEN appears in the message display, the den or trtch fields indicate the value selected by the system.
- When IGNORED appears in the message display, the den or trtch fields are omitted.

In the message text:

dev Device number.

ser Volume serial number.

labtyp The label type of the mounted volume (either SL, NL, AL, or NSL).

den The density of the volume to be mounted.

trtch This indicates the recording mode as COMP (compaction) or NOCOMP (non-compaction).

Note: The COMP restriction applies only to IBM standard labels.

jjj Job name.

sss Step name.

dsname Data set name.

System action: The job step continues processing.

Operator response: Record the indicated information for use of the volume in conjunction with subsequent requests.

Start a generalized trace facility (GTF) trace, and
re-create the problem. Reply to message AHL100A with:
TRACE=SYS,USR,SLIP

On the DD statement for the data set in error, specify:
DCB=DIAGNS=TRACE

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL, the SYSOUT output, the program listing for the job, and all printed output and output data sets related to the problem.

**IEC708I**

ddd, volser, jjj, sss, ddn{-#} DUP VOLSEQ: nnnn AND: nnnn

**Explanation:** A duplicate volume serial number, VOLSER, has been detected in the volume list for a tape or DASD multivolume data set. All serial numbers in the volume list should be unique. The message text includes the volume sequence positions in the volume list of the duplicated volume serial number.

In the message text:

ddd The device name.
volser The duplicated volume serial number.
jjj The job name.
sss The step name.
ddn{-#} The DD name and concatenation number if applicable.

**System action:** Processing continues. The system will ignore the duplicated volume in the volume list.

**User response:** None

**Operator response:** None

**Application Programmer Response:** Probable user error. Check whether duplicating volume serial numbers in the volume list is intentional.

**System programmer response:** Probable user error. If the system administrator determines this condition should always be considered an error, the MPF (Message Processing Facility) can be used to detect the message and abend the job before data is overwritten or reread.

**Source:** DFSMSdfp

**Detecting Module:** IFG0551H

**Routing Code:** 2,11
Descriptor Code:  4

IEC709I  ddd,volser,jn,sn,ddn-nu EXPECTED
VOLSEQ:  nnnn FOUND:  nnnn

Explanation:  The numeric volume sequence value in the tape data set label is not as expected. The system expects it to be 1 greater than on the previously read volume when reading forward or 1 less when reading backward. The system does not expect each volume's label 1 to correspond to the number of the volume in the data set's volume list, but it expects the volume sequence number to be one greater than on the previous volume when the data set was being written. The difference between the expected and found volume sequence represents the number of volumes missing.

In the message text:

- **ddd**: Device
- **volser**: volume serial
- **jn**: job name
- **sn**: Step name
- **ddn-nu**: JCL DD name and concatenation number, if applicable

System action:  Processing continues.

Application Programmer Response:  Possible error. Check whether the volumes on the DD statement or the dynamic allocation are complete.

IEC710I  ddd,volser,jn,sn,ddn-nu ANOTHER
VOLUME EXPECTED

Explanation:  The program has read forward all the specified volumes of the standard tape label data set or DASD data set, starting from the volume that was selected during OPEN processing. None of the processed volumes end with EOF (end of file) labels. EOF labels would indicate the end of the last volume for the data set.

In the message text:

- **ddd**: Device
- **volser**: volume serial
- **jn**: job name
- **sn**: Step name
- **ddn-nu**: JCL DD name and concatenation number, if applicable

System action:  The system calls the label anomaly installation exit routine. The installation exit provided by IBM takes no action, and therefore the system ignores the condition. The label anomaly exit of your installation might cause the system to issue ABEND 413 rc 08 and message IEC145I, or ABEND 637 rc 2C and message IEC026I.

Application Programmer Response:  Possible error. Check whether the volumes on the DD statement or the dynamic allocation are complete.

IEC711I  ddd,volser,jn,sn,ddn-nu RDBACK - NOT LAST VOLUME OF DATA SET

Explanation:  The program has opened the standard labeled tape data set to read it backwards, but the last specified volume for the standard labeled data set ends with EOF labels. When a standard labeled tape data set is opened to read it backward, the system expects the last volume in the list of volumes associated with the data set to end with EOF labels.

In the message text:

- **ddd**: Device
- **volser**: volume serial
- **jn**: job name
- **sn**: Step name
- **ddn-nu**: JCL DD name and concatenation number, if applicable

System action:  The system calls the label anomaly installation exit routine. The installation exit provided by IBM takes no action, and therefore the system ignores the condition. The label anomaly exit of your installation might cause the system to issue ABEND 413 rc 08 and message IEC145I, or ABEND 637 rc 2C and message IEC026I.

Application Programmer Response:  Possible error. Check whether the volumes on the DD statement or the dynamic allocation are complete and in the correct order.

IEC712I  ddd,volser,jn,sn,ddn-nu READ - NOT FIRST VOLUME OF DATA SET

Explanation:  The program has opened the standard labeled tape data set to read it forward but the volume that open has positioned the data set to is not the actual first volume of the data set. This message can also be issued during EOV concatenation processing.

In the message text:

- **ddd**: Device
- **volser**: volume serial
- **jn**: job name
- **sn**: Step name
- **ddn-nu**: JCL DD name and concatenation number, if applicable

System action:  The system calls the label anomaly installation exit routine. The installation exit provided by IBM takes no action, and therefore the system ignores the condition. The label anomaly exit of your installation might cause the system to issue ABEND 413 rc 08 and message IEC145I, or ABEND 637 rc 2C and message IEC026I.
The installation exit routine. The installation exit provided by IBM takes no action, and therefore the system ignores the condition. The label anomaly exit of your installation might cause the system to issue ABEND 413 rc 08 and message IEC145I, or ABEND 637 rc 2C and message IEC026I.

**Application Programmer Response:** Possible error. Check whether the volumes on the DD statement or the dynamic allocation are complete and in the correct order. Check whether the numeric values in the standard header and trailer label 1, volume sequence fields are valid (example, incremented by 1 relative to the previous volume of the data set). Determine whether the data set serial number field in the first specified volume's label 1 should in fact contain that volume's serial number.

**Explanation:** This message is issued during OPEN/EOV processing whenever an ANSI Version 4 tape has user data that is going to be converted using CCSID information. If input processing the TAPE CCSID, nnnn, data is going to be converted to the USER CCSID, mmmmm. If output processing the USER CCSID, mmmmm, data is going to be converted to the TAPE CCSID, nnnn.

In the message text:
- `dev` The device number.
- `ser` The volume serial number.
- `jjj` The job name.
- `sss` The step name.
- `ddn(-#)sss` DDname (followed by a concatenation number if it is part of a concatenation and not the first DD statement in the concatenation).
- `mmmmm` Coded Character Set Identification number (CCSID).
- `nnnnn` Coded Character Set Identification number (CCSID).

**System action:** Processing continues.

**Source:** DFSMSdfp

---

The media being initialized requires initialization of its servo tracks. This type of initialization can require up to 7 minutes to complete. Permission of the operator is required.

In the message text:
- `dev` The device number.

**System action:** The system waits for a response from the operator.

**Operator response:** Respond Y to allow the initialization of this media to proceed or N to terminate initialization of this media. Any other response causes this message to be reissued.

**Source:** DFSMSdfp

---

The media being initialized requires initialization of its servo tracks. This messages informs the operator that this type of initialization can require up to 7 minutes to complete.

In the message text:
- `dev` The device number.

**System action:** The system initializes the servo tracks on the tape volume.

**Operator response:** Wait until processing completes.

**Source:** IGC0003I (Label SVC 39)

IEC804A

Ina CONTROL UNIT NOT OPERATIONAL REPLY CONT OR DROP

--or--

Ina DEVICE NOT OPERATIONAL REPLY CONT POST OR DROP

Explanation: A not operational SIO condition occurred in a line during BTAM processing. In the message text, Ina is the line address.

In the message text:

*Ina*  The hexadecimal line address.

Operator response: Make sure the control unit is operational. Enter one of the following replies:

- **REPLY xx,'CONT'.** The system retries the condition. If the retry is successful, processing continues. If the retry is not successful, if CONTROL UNIT NOT OPERATIONAL appears in the message text, this message is issued again.
- **REPLY xx,'POST'.** The operation is posted complete with error. The not-operational SIO bit will be on in the DECERRST field of the (DECB) data event control block.
- **REPLY xx,'DROP'.** The DROP reply discontinues issuance of messages for the duration of open processing.

If a reply is not entered before the requesting job is canceled, the system may enter wait state. If the problem recurs, contact your hardware support personnel.

Source: Basic telecommunications access method (BTAM)

IEC805I

I/O ERROR - CHECKPOINTS TERMINATED

Explanation: An uncorrectable input/output error occurred while writing the current checkpoint record in the checkpoint data set. The record could not be written.

System action: Processing continues, but no checkpoint records are written.

Operator response: Either allow the job to continue, or restart the job at the last checkpoint by reloading the program. If the job is restarted, processing will continue as usual and checkpoint records will be written as specified.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

IEC813I  [EDI | PDS] OWNER: JN=jjj, SYSNAME=sysname, TCB=tcb, ASID=id

Explanation: For EDI, message IEC813I is issued before message IEC984I, message IEC985I, or abend 213-FD to document the owner of the data set that is causing the enhanced data integrity violation on open for output.

For PDS, the system is in the process of issuing abend 213-30 because an attempt has been made to open a PDS for OUTPUT, DISP=SHR, but the PDS is already open in this condition. This is an informational message to document that job jji on system sysname under TCB address tcb, address space identifier id, owns this PDS resource. DFSMSdfp also issues message IEC143I, following message IEC813I, to document more specific information about the abend situation, such as the name of the PDS.

In the message text:

jjj The job name.
sysname The system name.
tcb The TCB address.
id The address space identifier.

System action: The system continues processing and issues message IEC984I, message IEC985I, abend 213-FD, or message IEC143I 213-30.

Operator response: None

Application Programmer Response: For the enhanced data integrity function, this is an informational message to document which job currently has the data set open for output, resulting in message IEC984I, message IEC985I, or abend 213-FD.

For PDS, this is probably a user error. Use the information in message IEC813I to help determine the cause of the IEC143I message, and correct the error.

System programmer response: None

Problem determination: Not applicable

IEC815I  text

Explanation: text is one of the following:

device-number tttt yy ERS z
device-number xx tttt THRESHLD
device-number xx tttt yy eeee zzzz yy eeee zzzz yy eeee zzzz yy eeee zzzz

device-number xx tttt yy eeee zzzz yy eeee zzzz yy eeee zzzz

Source: If G019RD
Routing Code: 4
Descriptor Code: 7
This message provides the results of a scan of the error file of an IBM 2715 Transmission Control Unit. The scan occurs when the error threshold for one of the area stations connected to the 2715 is exceeded (threshold value is eight) or when manually requested at the 2715, the 2740 terminal attached to the 2715, or the central system console. BTAM prints the message on the operator’s console, the teleprocessing console, or the system maintenance console, depending on the routing code specified at the 2715.

In all four formats of the message text, device-number is the address in EBCDIC of the communications line, xx is the address in hexadecimal of the area station for which the error scan is reported, tttt is the time (0001 - 2400) when the error occurred, and wwww is the address in hexadecimal of a particular adapter within the 2715. Fields appearing uniquely within a message format are described below.

The first format of the message is issued when five or more of the eight errors involved a particular one of the devices attached to the area station. In the message text, yy is the address in hexadecimal of the device for which the errors occurred, and z is the number of errors (from decimal 5 to 8) that occurred for the device.

The second format of the message indicates that the threshold value of eight has been reached for the area station whose address is xx, but that no one device attached to the station accounted for as many as five of the errors.

The third format of the message is issued twice whenever an error scan for a particular area station is manually requested at the 2715, the 2740 terminal attached to the 2715, or the central system console. The address of device yy for which the error data eeee was recorded at time zzzz is given four times in each message; the two messages together thus provide information about the eight most recent error occurrences for area station xx.

The fourth format of the message is issued twice whenever an error scan for a particular 2715 adapter is manually requested at the 2715, the 2740 terminal attached to the 2715, or the central system console. The error data eeeeee for adapter wwww recorded at time zzzz is given four times in each message; the two messages together thus provide information about the eight most recent error occurrences for adapter wwww.

Routing Code: 2,8,10
Descriptor Code: 4
### Cleanup Code | Explanation
--- | ---
01 | Cleanup not attempted. The request for which the SVC was entered is unfulfilled. All control blocks remain as they were before the SVC was issued.
02 | An attempt was made to complete processing if the current request was to get or release exclusive control. If a user error was determined, the current request was removed from all queues. If not a user error, processing of the current request was completed. The DCB associated with the request should be reusable.
03 | A request to get exclusive control failed; the block was not enqueued. An attempt was made to restore all control blocks to the state they were in before SVC 53 was issued. The DCB associated with the request should be reusable.
04 | No cleanup was done for the request to get or release exclusive control. It was determined that none was required, as all SVC processing had completed. The DCB associated with the request should be reusable.
05 | No cleanup was done for the request to get or release exclusive control. The abnormally ending task is enqueued on a block which is inaccessible to other users. Use of exclusive control is unpredictable.
06 | No cleanup was attempted for the request to release exclusive control. The block for which the abnormally ending task had control was dequeued from the system queue but remains on the exclusive control list. This block is inaccessible to other users.
07 | Cleanup not attempted because DEBCHK found an incorrect DEB, audit trail bit was incorrect, or the condition is unknown. Results are unpredictable.
08 | While cleaning up exclusive control resources, the recovery routine program checked. Condition is unknown. Results of future use of the exclusive control function with this DCB are unpredictable.

**System action:** Those control blocks indicated by the particular return code (as specified above) are written to the GTF data set. The task is ended.

**Operator response:** Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:** Ensure the validity of the control block from which the address of the block in error was taken. For example, ensure that the input specified in the RELEX macro instruction, the BLKREF address, is valid and in the correct format and that the DCB address passed is valid. If the RELEX macro was not issued, ensure that the IOB related to the exclusive control request is correct and contains the correct DECB address (IOBECBPT) and DCB address (IOBDCBPT). In addition, check the DCBDEBAD field in the DCB to ensure that it contains the correct DEB address, and that the DEB (DEBDCBAD) points back to this DCB. If the next IOB is found to be in error, find the entry in the read exclusive list associated with the requested block and ensure that the RDXIOBUQ field is correct.

**System programmer response:** If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.
Explanation: An error occurred during processing associated with a DFP program that gets and releases exclusive control of a resource associated with a BDAM data set. The task recovery routine determined that all user control blocks required as input were in the user's region and key; hence the error could not be ascribed to any user control block.

In the message text:

rc The return code.
cc The cleanup code.
jjj job name
sss step name
ddname DDName

The hex return code indicates the results of a system dump request to the SYS1.DUMP data set. The values and their meanings are as follows:

<table>
<thead>
<tr>
<th>Return Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>04</td>
<td>SYS1.DUMP taken successfully.</td>
</tr>
<tr>
<td>08</td>
<td>Partial SYS1.DUMP taken.</td>
</tr>
<tr>
<td>0C</td>
<td>SYS1.DUMP unsuccessful.</td>
</tr>
</tbody>
</table>

The hex cleanup code identifies the results of attempting to cleanup the processing left in partial stages of completion.

<table>
<thead>
<tr>
<th>Cleanup Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Cleanup not attempted. The request for which the SVC was entered is unfulfilled. All control blocks remain as they were before the SVC was issued.</td>
</tr>
<tr>
<td>02</td>
<td>An attempt was made to complete processing if the current request was to get or release exclusive control. If a user error was determined, the current request was removed from all queues. If not a user error, processing of the current request was completed. The DCB associated with the request should be reusable.</td>
</tr>
<tr>
<td>03</td>
<td>A request to get exclusive control failed; the block was not enqueued. An attempt was made to restore all control blocks to the state they were in before SVC 53 was issued. The DCB associated with the request should be reusable.</td>
</tr>
</tbody>
</table>

System action: A system dump is taken to SYS1.DUMP data set and the task is ended.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job and all printed output and output data sets related to the problem.

<tr>
<td>83</td>
<td>BCB (the DCB and DECB were written to the GTF data set).</td>
</tr>
<tr>
<td>84</td>
<td>USL (the DCB, DECB, and BCB were written to the GTF data set).</td>
</tr>
<tr>
<td>85</td>
<td>Next IOB to get a buffer (the DCB, DECB, and BCB were written to the GTF data set).</td>
</tr>
</tbody>
</table>

The hex cleanup code identifies the results of attempting to clean up the processing left in partial stages of completion.

<table>
<thead>
<tr>
<th>Cleanup Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>Cleanup was unsuccessful. While attempting to clean up the buffer and IOB queues the recovery routine program checked. Results of future use of dynamic buffering with this DCB are unpredictable.</td>
</tr>
<tr>
<td>02</td>
<td>Cleanup was successful. The DCB with dynamic buffering should be reusable.</td>
</tr>
<tr>
<td>03</td>
<td>Cleanup not attempted. It was determined unnecessary as all processing was completed before the abnormal end. The DCB with dynamic buffering should be reusable.</td>
</tr>
<tr>
<td>04</td>
<td>Cleanup not attempted because DEBCHK found an incorrect DEB or the audit trail bit was incorrect. Results of future use of dynamic buffering with this DCB are unpredictable.</td>
</tr>
</tbody>
</table>

System action: Those control blocks indicated by the particular return code (as specified above) are written to the GTF data set. The task is ended.

Operator response: Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

Application Programmer Response: Ensure the validity of the control block from which the address of the block in error was taken. The DECB and DCB were specified in the FREEDBUF macro as input to the SVC. Ensure that the DCBBUFCB field in the DCB contains the correct address of the buffer control block and the DCBDYNB field contains the correct address of the unscheduled list (if address space is virtual). The BCB or USL contain the address of the next IOB waiting to get a buffer, if one was not available. Ensure that this address has not been overlaid. Ensure also that the input DECB contains the address of the buffer being freed (DECAREA field) and, if a buffer was requested for keys also, that the DECKYADR field contains the correct address.

System programmer response: If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SYSOUT output for the job.

IEC919I 169-rc,jjj,sss
Explanation: The error occurred during the processing of IMGLIB with the CLOSE option. The DCB address passed to IMGLIB in register 1 was incorrect.

In the message text:
rc Associates this message with system completion code 169 and with the return code.
jjj Job name.
sss Step name.

The explanation for the hex return code is as follows:

Return Code Explanation
01 DCB address is outside of the user's region.
02 The DCB does not point to a valid DEB, or the DEB does not point back to the DCB.
03 The DCB does not point to a valid DEB, or the DEB does not point back to the DCB; the DCB was written to the GTF trace data set.

System action: The system issues an SVC Dump and writes a software error record to logrec data set. The task is ended.

Application Programmer Response: Make sure that the IMGLIB macro instruction is correctly coded.

System programmer response: If the error recurs and the program is not in error, look at the messages in the job log for more information. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the JCL and the program listing for the job.

IEC921I cde-rc,jjj,sss,ddname
Explanation: A trace record has been written to the GTF trace data set.

In the message text:
**cde**  Associates this message with the system completion code.

**rc**  Associates this message with the return code. For a description of the data which has been traced refer to the description of the completion, its corresponding return code, and the associated message.

**jjj**  Job name.

**sss**  Step name.

**ddname**  DDname.

**System action:**  A trace record is written to the GTF trace data set.

**Operator response:**  Start a generalized trace facility (GTF) trace, and re-create the problem. Reply to message AHL100A with:

```
TRACE=SYS,USR,SLIP
```

On the DD statement for the data set in error, specify:

```
DCB=DIAGNS=TRACE
```

**Application Programmer Response:**  Respond as indicated in the explanation of the system completion code cde, and its associated message.

**System programmer response:**  If the error recurs and the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IEC980A SPECIFY TRACE KEYS: DSN=,DDN=,JN=,DELETE,DISABLE, ALLNUM,END

Explanation: The IFGOCETR task has been started by the operator. The task requires keys be provided by the operator in order to know what functions to perform. The explanation of these keys is documented in z/OS DFSMSdfp Diagnosis.

System action: The task waits for the operator to reply or until the task reaches time-out.

User response: None

Operator response: The operator must respond with one or more of the valid keys documented in the message text. The meaning of each key is documented in the Diagnosis Reference for DFSMSdfp, LY27-9606.

Application Programmer Response: None

System programmer response: None

Source: DFSMSdfp

Detecting Module: IFG0OCET

IEC981I INVALID REPLY

Explanation: text is one of the following:

- INVALID REPLY
- NO ACTIVE ENTRY(S) FOUND
- MAXIMUM TRACES ACTIVE. DELETE 1 OR ALL OR REPLY END
- START GTF TO ACTIVATE OCE TRACE

The IFGOCETR started task has:
- been passed an invalid key.
- been asked to display active trace entries, but none were found.
- been asked to add a trace entry but the maximum number of trace entries are already active.
- successfully added all trace entries requested. In order to actually trace those entries, GTF needs to be started if it isn’t already.

System action: The IFGOCETR task will issue message IEC980A in all cases except if the text is ‘START GTF TO ACTIVATE OCE TRACE’. In that case, the system continues processing.

User response: None

Operator response: The operator must:
- enter the correct key when message IEC980A is reissued.
- enter the next key when message IEC980A is reissued.
- enter the DELETE or END key when message IEC980A is reissued to either delete one or all of the current trace entries or to end the started task.

Application Programmer Response: None

System programmer response: None

Detecting Module: IFG0OCET

IEC982I ENHANCED DATA INTEGRITY DATA SET NAME TABLE (NOT BUILT/REBUILT I WAS DISABLED).

Explanation: A system operator issue the S IFGEDI command. If the message says NOT BUILT/REBUILT, then no valid records were found in the PARMLIB member IFGPSEDI. Therefore, the enhanced data integrity table was not built or rebuilt.

If the message says WAS DISABLED, then the enhanced data integrity function has been disabled because the PARMLIB member IFGPSEDI specified MODE(Disable).

System action: No enhanced data integrity table was built.

System programmer response: If the message contains NOT BUILT/REBUILT, then check the PARMLIB member IFGPSEDI. It must have at least one valid record, and the first parameter specified in the first record must be MODE(WARN) or MODE(ENFORCE). Also, verify that the SYSIN DD statement in the IFGEDI cataloged procedure refers to a partitioned data set (PDS) or partitioned data set extended (PDSE) member.
that contains the following control statements:

```
  GENERATE
  EXITS DATA=IFG0BLDT
```

**IEC983I** ENHANCED DATA INTEGRITY DATA SET NAME TABLE BUILD COMPLETED IN MODE {WARN | ENFORCE}.

**Explanation:** The enhanced data integrity table has been successfully built in WARN or ENFORCE mode.

**System action:** The started task IFGEDI built the enhanced data integrity table.

**Problem determination:** Not applicable

**Source:** DFSMSdfp

**Detecting Module:** IFG0DSNT

**Routing Code:** 2

**Descriptor Code:** 5

---

**IEC984I** jjj, dev, volser, dsn NOT EXCLUDED BUT HAD AN ENHANCED DATA INTEGRITY {INPUT | OUTPUT} VIOLATION

**Explanation:** The enhanced data integrity function is active and running in warning mode (MODE(WARN)). Either the data set dsn on volume volser is in the enhanced data integrity exclude list table, or enhanced data integrity bypass was requested. The data set is being opened for input or output when it is already open for output.

In the message text:

- **jjj** The job name.
- **dev** The device number of the specified device.
- **volser** The volume serial number.
- **dsn** The data set name.

**System action:** OPEN processing of the data set is allowed to continue.

**Operator response:** None

**System programmer response:** The enhanced data integrity table was created with the MODE(WARN) keyword and, therefore, enhanced data integrity is running in warning mode. This mode is primarily for debugging or conversion, or both. If exclusion of the data set is valid, either because it is in the enhanced data integrity exclude list or because the exclude flags are set by an authorized program in the DCBE, program properties table options, or dynamic allocations options, then no action is necessary. If the data set should not
be excluded, then ensure that the data set is no longer excluded from enhanced data integrity processing.

**Problem determination:** Not applicable  
**Source:** DFSMSdfp

**IEC998I**  
**mod EXIT return code RETURN CODE INVALID, JOB IS ABENDED**

**Explanation:** The indicated tape exit passed an invalid code back to OPEN/CLOSE/EOV.

In the message text:

- **mod** Name of the exit that was disabled.
- **return code** Invalid return code in four hexadecimal digits.

**System action:** The job is abended.

**System programmer response:** Correct the tape management exit.

**Source:** DFSMSdfp

---

**IEC999I**  
**text**

**Explanation:** **text** is one of the following:

- **mod,sub,debaddr=xxxxxx**  
- **mod,sub,workarea=xxxxxx**  
- **mod,iji,sssdn,dev,volser,dsname,nnn LOST BLOCKS**  
- **mod,iji,ssserrtext**

This message is issued due to a failure during OPEN/CLOSE/EOV, DADSM, or task close processing.

In the message text:

- **mod** The name of the module in which the error occurred.
- **sub** The subroutine of the CSECT within the module in error.
- **debaddr** The address of a DEB that could not be properly closed. The DEB has been removed from the TCB DEB chain.
- **xxxxxx** A text string.
- **workarea** The address of the work area for the module in error, which should appear in an SDUMP.
- **iji** The job name.
- **sss** The step name.

---

Chapter 3. IEC Messages 3-201
**dev** The device number.

**volser** The volume serial number.

**dsname** The data set name.

**nnn** The number of blocks written to the hardware buffer but not written to the tape medium.

**errtext** Text which describes the error which will result in O/C/EOV issuing the following ABENDOC1.

The error message includes the unit address, volume serial number, and data set name only if the error occurred during DADSM processing.

**System action:** The task is ended. If *errtext* is specified an ABENDOC1 will be issued.

**Operator response:** None

**Application Programmer Response:** Check previous messages or abends to help determine the reason for the failure.

If *debaddr* = is specified, the failure occurred during task close. The problem is probably with the program that opened the data set. The most common problem is the program modifying or freeing the storage that contains an open DCB. A ‘-1’ after the DEB address means the open DCB or ACB storage is not accessible. Correct the problem and run the job again.

If *workarea* = is specified, a system problem was encountered. Prior to contacting hardware support personnel for help, make the SDUMP and failing job available. For ISO/ANSI tape labels, the system might have detected an incorrect IECIEPRM parameter list passed by an MVS routine.

If job name (*jjj*) and step name (*sss*) are specified, an indeterminate error (a program check or a machine check) was encountered during OPEN/CLOSE/EOV or DADSM processing.

If this message is accompanied by a CO3 abend and a slip dump is obtained, searching the system trace table for the DEB address and corresponding DCB address might help determine the cause of the problem. For this to be effective, the system trace table might need to be enlarged and branch tracing turned off. A trace table size of 256K should be sufficient.

If *errtext* is specified, a system problem was encountered during O/C/EOV processing. Before calling the IBM Support Center make the 0C1 dump and failing job available.

Chapter 4. IEE Messages

IEE012A  NO LONGER SAVING MESSAGES FOR HARDCOPY, LOGLIM REACHED

Explanation: A VARY SYSLOG,HARDCOPY,OFF,UNCOND has previously been issued. MVS has saved messages to be hardcopied later, but the limit of LOGLIM has been reached or the buffer storage has been exhausted.

System action: Messages issued after this point will not be sent to SYSLOG, unless SYSLOG is re-activated. If SYSLOG is re-activated the LOGLIM will be defaulted to the value of 1000. If this limit is not desired it can be increased with the CONTROL M,LOGLIM command.

Operator response: Activate SYSLOG and specify the value of LOGLIM with the CONTROL M,LOGLIM command.

Note: You can display the LOGLIM value and the number of buffers in use, by issuing the D C,HC command.

IEE021A  AMOUNT OF CENTRAL STORAGE EXCEEDS nT MAXIMUM. CENTRAL STORAGE IN EXCESS OF MAXIMUM IS IGNORED. RECONFIGURATION FUNCTIONS ARE NOT AVAILABLE.

Explanation: There is too much central storage. In z/Architecture® mode, the maximum amount of storage is 4 terabytes.

In the message text:

nT  The maximum amount of storage allowed.

System action: Central storage reconfiguration is disabled, and the Display Matrix command may produce unpredictable results. The system issues message IEE021A and continues its initialization process.

Operator response: Contact the system programmer.

System programmer response: Reduce the installed storage to the maximum allowed (4 TB for z/Architecture mode), then re-IPL the system to enable storage reconfiguration.

Source: Reconfiguration.

Detecting Module: IEEERX

Routing Code: 1,2

Descriptor Code: -

IEE022I  IEE1022I

Explanation: While a CHPID was being reconfigured offline or a Path was being varied offline, a swap occurred causing the respective function to be canceled. For this type of cancel, paths that were already processed are not brought back online, thus possibly leaving the paths in an inconsistent state.

For a CONFIG CHP,OFFLINE command, some or all of the paths may have already been taken logically offline. However, the channel path will still be physically online.

For a VARY PATH,OFFLINE command, the device path
displayed will still be logically online.

In the message text:

xx  The channel path identifier.

dev  The device number.

System action:  The system performs one of the following actions:

- For a CONFIG CHP OFFLINE, if a swap is detected while the paths are being taken logically offline, the system ends processing such that any device path that has already been taken offline is left offline and any device path that has not yet been taken offline is left online. The system leaves the channel path configured physically online. If there are other channel paths referenced on the CONFIG command that have not yet been processed, the system completely bypasses processing these channel paths and message IEE022I is issued for each.

- For a VARY PATH OFFLINE command, when a swap is detected for a device being processed, the system leaves the path online and ends processing such that any device path referenced on the VARY PATH OFFLINE command that has not yet been taken offline is bypassed and left online. Message IEE022I is issued for each device path that is not taken offline. Also, any device path referenced on the VARY PATH OFFLINE command that has already completed its offline processing is not brought back online.

Operator response:  If a Hyperswap was in progress, wait for the Hyperswap to complete and then reissue the CONFIG or VARY command.

**IEE037D** LOG NOT ACTIVE

**Explanation:** The system log (SYSLOG) is not active for one of these reasons:
1. The system failed to initialize the system log. The system issues message IEE533E before this message to indicate that this is the problem.
2. Recursive abends have occurred in more than one system log data set. The system issues message IEE769E before this message to indicate that this is the problem.
3. The SYSLOG function is ending because of a WRITELOG CLOSE or HALT command. The system issues message IEE043I before this message to indicate that this is the cause.

**System action:** The system makes the system log unavailable. The system converts any WTL macros to WTO macros and sends the messages to the console with master authority under message IEE147I.

**Operator response:** Depending on the reason for the failure, perform the following:
- In case 1, the system tries to initialize the log with a WRITELOG START command. Look for messages that indicate that the system log has started. If these do not appear, enter a WRITELOG START command to start the system log (followed by VARY SYSLOG,HARDCPY if the system log is to be the hardcopy medium). If the system issues message IEE037D again and use of the system log is critical, re-IPL.
- In case 2, contact the system programmer. If the system log function is desired, initialize the system log again by entering a WRITELOG START command (followed by VARY SYSLOG,HARDCPY if the system log is to be the hardcopy medium).
- In case 3, if the system log function is desired, initialize the system log again by entering a WRITELOG START command (followed by VARY SYSLOG,HARDCPY if the system log is to be the hardcopy medium).

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

---

**IEE038E** AMOUNT OF EXPANDED STORAGE EXCEEDS nnG MAXIMUM. EXPANDED STORAGE IN EXCESS OF MAXIMUM IS IGNORED. RECONFIGURATION FUNCTIONS ARE NOT AVAILABLE.

**Explanation:** There is too much expanded storage. In
ESA/390 mode, the maximum is 64 GB. In
z/Architecture mode, expanded storage is not needed
and is not supported (the message shows a maximum
of 0 GB).

In the message text:

nnG

The maximum amount of expanded storage
allowed.

**System action:** Expanded storage reconfiguration is
disabled, and the Display Matrix command may produce
unpredictable results. The system issues message
IEE039A and continues its initialization process.

**Operator response:** Contact the system programmer.

**System programmer response:**

- In ESA/390 mode, reduce the installed expanded
  storage to the maximum allowed (64 GB), then re-IPL
  the system to enable expanded storage
  reconfiguration.
- In z/Architecture mode, reduce the installed
  expanded storage to 0 GB, then re-IPL the system.

**Source:** Reconfiguration.

**Detecting Module:** IEERMAXW

---

**IEE039A**  
**REPLY TO ACKNOWLEDGE MESSAGE**  
**IEE038E**

**Explanation:** This message is issued following
message IEE038E, and allows the system operator to
respond.

**System action:** The system continues its initialization
process.

**Operator response:** To acknowledge message
IEE039A, reply with any single character. If expanded
storage reconfiguration is required, then the amount of
expanded storage must be reduced and the IPL process
restated.

**Source:** Reconfiguration.

**Detecting Module:** IEERMAXW

---

**IEE042I**  
**SYSTEM LOG DATA SET INITIALIZED**

**Explanation:** The system created a new system log
(SYSLOG) data set for one of the following reasons:

- The system is being initialized and the system has
  just created the SYSLOG data set.
- The current SYSLOG data set is full. The maximum
  number of SYSLOG records, as specified in the limit
  parameter, has been reached. The system issues a
  WRITELOG command to close the current SYSLOG
  data set. The system initializes a new SYSLOG data
  set.
- The operator entered a WRITELOG command to
  create a new SYSLOG data set.

**System action:** The system places this message in
the first records in the SYSLOG data set. The system
does not send this message to a console.

**Source:** Master scheduler

**Detecting Module:** IEEMB803

**Routing Code:** 2

**Descriptor Code:** 4

---

**IEE041I**  
**THE SYSTEM LOG IS NOW**  
**ACTIVE[-MAY BE VARIED AS**  
**HARDCOPY LOG]**

**Explanation:** The system log (SYSLOG) data set has
now been opened and is ready to receive messages
through WTL macros and LOG commands.

In the message text:

**-MAY BE VARIED AS HARDCOPY LOG**
The SYSLOG data set is available for use as the
hard-copy log. JES has restarted after an outage,
allowing the SYSLOG data set to receive the
hard-copy log. However, the system has not

activated hard-copy logging to the SYSLOG
because the operator varied the SYSLOG data set
offline earlier.

**System action:** For the following message text, the
following occurs:

**-MAY BE VARIED AS HARDCOPY LOG**
The system makes the system log unavailable for
current processing. Any WTL macros issued are
converted to WTO macros.

**Operator response:** For the following message text,
do the following:

**-MAY BE VARIED AS HARDCOPY LOG**
Enter the VARY SYSLOG,HARDCPY command to
have the SYSLOG receive the hard-copy log.

**System programmer response:** For the following
message text, do the following:

**-MAY BE VARIED AS HARDCOPY LOG**
The hard-copy log was not automatically directed to
the SYSLOG data set since the operator had
previously entered the VARY
SYSLOG,HARDCPY,OFF command. If the log is to
be directed to SYSLOG automatically upon a JES
restart, do not vary SYSLOG offline.

**Source:** Master scheduler

**Detecting Module:** IEEMB803

**Routing Code:** Note 10

**Descriptor Code:** -

A SYSTEM LOG DATA SET HAS BEEN QUEUED TO SYSOUT CLASS class

Explanation: The system closed the system log (SYSLOG) data set and queued the data set to a SYSOUT class. The SYSLOG data set might not be immediately available for subsequent processing, because the data set does not become usable again until the job entry subsystem (JES) processes the data set to make it available. The system queued the data set to a SYSOUT class for one of these reasons:

1. The SYSLOG data set is full. The maximum number of SYSLOG records, as specified in the limit parameter, has been reached. The system issues an internal WRITELOG command to close the current SYSLOG data set.
2. The operator entered a WRITELOG command to close the SYSLOG data set.
3. The operator entered a WRITELOG CLOSE or HALT command after the SYSLOG data set was opened in response to message IEE037D.

In the message text:

class

The SYSOUT class to which the SYSLOG data set has been queued.

System action: Depending on the reason why the message was issued, the system does the following:

- For case one or two, the system closes the currently recording SYSLOG data set and obtains a new data set.
- For case three, the system closes the currently recording SYSLOG data set and makes the SYSLOG unavailable.

Operator response: Periodically, enter the appropriate JES command ($D OUTCLASS(n) for JES2 or ‘I,U,CL=class for JES3) to view the SYSOUT class. When JES indicates that the SYSLOG data set is available once again, the data set can be used for subsequent processing. At this point, if you want to print the SHSLOG data set, start a SYSOUT writer to the class names in this message or change the class for a currently active writer.

cccccccc COMMAND REJECTED - CONSOLE IS ACTIVE

Explanation: The cccccccc command was rejected because it specified a console that is active. The system might not issue the command against an active console.

System action: The command is not executed.

Operator response: VARY the console OFFLINE before issuing the command.

Source: Master Scheduler
Detecting Module: IEECB854
Routing Code: ‘
Descriptor Code: 5

cccccccc COMMAND REJECTED - CONFLICT WITH STATUS OF ANOTHER SYSTEM

Explanation: The cccccccc command was rejected because of a conflict with another system. In the case of the CONTROL command, it is likely that the APPLID specified on the command is in use on another system in the sysplex.

System action: The command is not executed.

Operator response: Attempt to issue the command again. In the case of the CONTROL command, specify a different APPLID.

System programmer response: In the case of the CONTROL command, each system must have a unique APPLID. Have the operator specify an APPLID that is not in use on another system.

cccccccc COMMAND REJECTED - ONLY VALID FOR SMCS CONSOLES

Explanation: The cccccccc command was rejected because the command or one of its parameters is only valid for SMCS consoles. It is not valid for any other types of consoles.

System action: The command is not executed.

Operator response: Verify that the console specified on the command is really a SMCS console.

Source: Master Scheduler
Detecting Module: IEECB854
Routing Code: ‘
Descriptor Code: 5

hh.mm.ss CONSOLE DISPLAY

Explanation: Where text is:
This message is in response to a DISPLAY CONSOLES,SMCS command. This displays the systems in the sysplex or the current system if not in a sysplex. For each system, the SecureWay® Communications Server APPLID (smcsappl) for SMCS and the SMCS status (smcsstatus) are displayed. Possible values for the smcsstatus are:

**ACTIVE**
SMCS is connected to SecureWay Communications Server and SMCS consoles may be used.

**INACTIVE**
SMCS is not active at this time. SMCS has failed and has completed termination cleanup processing.

**INITIALIZING**
SMCS is beginning to initialize.

**WAITING FOR VTAM**
SMCS is attempting to communicate with VTAM but VTAM is not available at this time.

**WAITING FOR SMCS APPLID ACTIVATION**
SMCS is communicating with VTAM but one of the following has occurred to the APPLID that SMCS is to use:
- The APPLID has not been activated by VTAM.
- The APPLID was some other VTAM resource, not a valid APPLID.
SMCS is waiting for VTAM or the operator to activate the APPLID.

**SHUTTING DOWN**
SMCS has been requested to shut down. SMCS will cleanup and wait for the SMCS APPLID to become active.

**NOT INSTALLED**
No SMCS APPLID was specified in the CONSOLxx member of Parmlib so SMCS consoles may not be used on this system.

**SMCS TERMINATING - FAILURE**
SMCS has failed and is attempting to clean up. Depending on the error, SMCS may attempt to restart itself.

If SMCS is not installed, smcsappl will be blank. The APPLID* and GENERIC* columns are optional. If the generic id on any one system (smcsgeninuse) is different from genname, or if an APPLID for a system (smcsapplinuse) is different from smcsappl, the APPLID* and GENERIC* columns are present. The trailer line is also optional and is only present if APPLID* and GENERIC* are present. The systems in the sysplex are not listed in any order. If a VTAM

Generic Name is not in use by SMCS or the system is not in a sysplex, genname will be "NONE".

**Operator response:** Possible actions for the following values of smcsstatus:

**WAITING FOR VTAM**
If VTAM should be available and it is not, perform the necessary actions to activate VTAM.

**WAITING FOR SMCS APPLID ACTIVATION**
If SMCS is to be active, and VTAM has fully initialized, activate the SMCS APPLID (via the VARY NET,ACT,ID=smcsappl command). If the smcsappl has not been defined to VTAM, notify your system programmer to define the SMCS application.

**NOT INSTALLED**
If SMCS is to be active, have your system programmer specify an SMCS APPLID in the CONSOLxx member of Parmlib. The system will then have to be re-IPLed to activate SMCS.

### IEE049I SMCS IS ACCEPTING LOGONS

**APPLID:** aaaaaaaa [GENERIC: gggggggggg]

**Explanation:** SMCS has initialized and will accept logons (sessions). The SMCS APPLID for this system is displayed as aaaaaaaa. If VTAM Generic Resource is being used by this sysplex, the SMCS generic name is displayed as gggggggggg.

**System action:** SMCS waits for sessions to be started.

**Operator response:** SMCS consoles can be activated.
IEE050I • IEE052I

**Explanation:** SMCS has been requested to shut down. There are still some consoles using SMCS on this system and those consoles need to be terminated before SMCS can complete shutting down. New sessions will not be accepted. The SMCS APPLID for this system is displayed as aaaaaaaa. The reason for the shutdown, xx, can be one of the following:

- **FE** A HALT NET command has been issued to terminate VTAM.
- **FD** A HALT NET,QUICK command has been issued to terminate VTAM or a VARY NET,INACT,ID=smcsapplid, or F has been issued to shutdown SMCS.
- **FC** A HALT NET,CANCEL command has been issued to terminate VTAM or VTAM is abending.

**System action:** SMCS will cause the active SMCS consoles on this system to be logged off.

**Operator response:** If SMCS does not complete shutting down, you may have to issue a different shutdown request (for example, VARY NET, INACT,ID=smcsapplid, or F has been issued to shutdown SMCS) to cause SMCS to complete termination.

**IEE052I • SMCS INITIALIZATION FAILURE**

**Explanation:** Where text is:

- OR ERROR BUILDING cntlblk. RC:xxxxxxxx RSN:yyyyyyyy
- OR service FAILURE. RC:xxxxxxxx RSN:yyyyyyyy
  ![RTNCD:rr FDBK2:ff SENSE:ssmmuuuu]

SMCS has experienced some type of error trying to initialize.

If message text is:

- ERROR BUILDING cntlblk. RC:xxxxxxxx RSN:yyyyyyyy

This text is displayed if there was an error building one of the VTAM control blocks. The return and reason codes from the GENCB macro are displayed. Possible values for cntlblk are:

- ACB, EXLIST, NIB, RPL

If message text is:

- service FAILURE. RC:xxxxxxxx RSN:yyyyyyyy

This text is displayed if a VTAM service fails. Possible values for service are:

- MODCB, OPEN, SETLOGON, SHOWCB

The contents of registers 15 (xxxxxxxx and 0 (yyyyyyyy) are displayed. If the service was OPEN, yyyyyyyy is the error code from the ACB describing why the OPEN failed. Depending on the service, the error data from the
RPL may be displayed. The sense data consists of System Sense (ss), System Sense Modifier (mm) and the User Sense (uuuu).

**System action:** A symptom record will be written to the Logrec data set, and ABEND 077 reason code 2D will be issued and SMCS will terminate. To restart SMCS, do an an IPL.

**Operator response:** Notify your system programmer.

**System programmer response:** Attempt to correct the errors if the return and reason codes indicate there is something you can do. If errors can be corrected, an IPL is needed to restart SMCS. Otherwise notify the IBM support center. The RTNCD, FDBK2 and Sense codes can be found in the z/OS Communications Server: SNA Programming and/or z/OS Communications Server: IP and SNA Codes publications.

**IEE053I** SMCS FAILURE FOR LU:LLLLLL

**Explanation:** Where text is:

- OR service FAILURE. RC:xxxxxxxx RSN:yyyyyyyy CODE:cccc
  [RTNCD:rr FDBK2:ff SENSE:ssmmuuuu]
  OR CODE:cccc

SMCS has experienced some type of error trying to start a session for a Logical Unit (LLLLLL).

If message text is:

- service FAILURE. RC:xxxxxxxx RSN:yyyyyyyy CODE:cccc
  RTNCD:rr FDBK2:ff SENSE:ssmmuuuu

This text is displayed if there was an error with one of the VTAM services. Possible values for service are:

CHECK, CLSDST, GENCB, INQUIRE, MODCB, OPNDST, RECEIVE, SEND, SHOWCB, TESTCB

Registers 15 (xxxxxxxx) and 0 (yyyyyyyy) from the service are displayed along with the data from the RPL if appropriate. The sense data consists of System Sense (ss), System Sense modifier (mm) and the User Sense (uuuu). The value for CODE is an indication of which SMCS module detected the error.

**CODE:cccc**

An internal SMCS error occurred while trying to establish a session with the LU.

The value for CODE is an indication of which SMCS module detected the error.

**System action:** A symptom record will be written to the Logrec data set. SMCS will not establish a session with the logical unit.

**Operator response:** Notify your system programmer.

**System programmer response:** Notify the IBM support center. The RTNCD, FDBK2 and Sense codes can be found in the z/OS Communications Server: SNA Programming and/or z/OS Communications Server: IP and SNA Codes publications.

**IEE054I** SMCS FAILURE FOR LU:LLLLLL

**Explanation:** Where text is:

- OR description OF X’xx’ FROM LOGMODE xxxxxxxx IS NOT SUPPORTED
- OR SCREEN SIZE OF xx ssss IS NOT SUPPORTED

SMCS has experienced some type of error trying to start a session for a Logical Unit (LLLLLL).

If message text is:

- description OF ‘xx’ FROM LOGMODE xxxxxxxx IS NOT SUPPORTED

This text is displayed if SMCS cannot use the BIND information for this session. What was unacceptable to SMCS is described in the message. Possible values for description are:

- LU TYPE, FUNCTION MANAGEMENT PROFILE, PRESENTATION SPACE SIZE
- SCREEN SIZE OF xx ssss IS NOT SUPPORTED

This text is displayed if the BIND data for the session indicated a row or column value that is not supported by SMCS. Possible values for ssss are:

- ROWS, COLS

**System action:** SMCS will not establish a session with the logical unit.

**Operator response:** Notify your system programmer.

**System programmer response:** Change the
LOGMODE entry to correct the errors or create a new LOGMODE entry for use by SMCS consoles.

**Source:** DIDOCS

**Detecting Module:** IEECVSLG

**Routing Code:** 10

**Descriptor Code:** 4

### IEE055I

**Explanation:** Where **text** is:

```
CONSOLE cccccccc (LU:llllllll) IS {ACTIVE } {INACTIVE}
```

An operator has started or stopped a session with SMCS where `ccccccc` is the console name and `lllllll` is the logical unit name.

**System action:** The operator may begin using the console if ACTIVE is indicated in the message.

**Operator response:** Depending on your system’s logon requirements, the operator at this console may have to issue or respond to the z/OS LOGON command to identify himself/herself to the system.

**Source:** DIDOCS

**Detecting Module:** IEECVSLG, IEECVSLR, IEECVSCU, IEECVSCR

**Routing Code:** 10

**Descriptor Code:** 4

### IEE056I

**Explanation:** Access to an SMCS console has been lost. An operator command may have been issued to VTAM to request termination of the logical unit or the connection to the console has been broken. The reason code `xxxxxxxx` is the reason code provided by VTAM to the LOSTERM exit. CODE indicates where the error was detected in SMCS.

**System action:** A symptom record has been written to the Logrec data set.

**Operator response:** If access is needed, issue the VARY NET,ACT,ID=`lllllll` to try and restore the connection.

**Source:** DIDOCS

**Detecting Module:** IEECVSLT

**Routing Code:** 10

**Descriptor Code:** 4

### IEE058I

**Explanation:** The CONSOLxx member of Parmlib indicated that a generic name is to be used for this sysplex. SMCS attempted to use that name but one of the following conditions may have prevented its use:

- There is no Coupling Facility attached to this sysplex.
- There is no VTAM structure defined in the Coupling Facility policy.
- VTAM was not started as an APPN node.

**System action:** SMCS continues initialization. Operators will have to use the system’s APPLID to access SMCS instead of the generic name.

**Operator response:** Notify your system programmer.

**System programmer response:** Modify CONSOLxx to remove the generic name if the above conditions cannot be satisfied.

**Source:** DIDOCS

**IEE066I SMCS FAILURE FOR LU:llllllll**

*text*

Explanation: Where *text* is:

```
LU IS IN USE BY CONSOLE cccccc ON SYSTEM ssssssss
```

SMCS has detected an error trying to start a session for a Logical Unit (llllllll). The Logical Unit is in use by an active SMCS console (cccccccc) on system ssssssss.

SMCS requires that all Logical Units in the sysplex have unique names. This error can occur when VTAM is started as a subarea node on each system within the sysplex, and multiple instances of VTAM define the same Logical Unit llllll.

System action: A symptom record will be written to the Logrec data set. An ABEND 077 reason code 2E is issued. SMCS will not establish a session with the logical unit.
Operator response: Notify your system programmer.

System programmer response: If the Logical Unit \textit{llllllll} is defined by more than one VTAM within the sysplex, change your VTAM definitions so that each VTAM defines unique Logical Units. Otherwise, contact the IBM support center.

Source: DIDOCS

Detecting Module: IEECVSLG

Routing Code: 10

Descriptor Code: 4

---

**IEE067I**

CONSOLE \textit{cccccccc} (LU: \textit{llllllll}) APPEARS HUNG AND WILL BE CLOSED

Explanation: SMCS has detected that I/O was issued to console \textit{cccccccc} at LU \textit{llllllll}, but it has taken too long for the I/O to complete.

System action: A symptom record will be written to the Logrec data set. The console will be deactivated to prevent WTO buffer shortages.

Operator response: Notify your system programmer. The SMCS console may be reactivated.

System programmer response: If the reason that the I/O did not complete in a timely manner cannot be determined, correct the problem and reactivate the SMCS console. Otherwise, contact the IBM support center.

**IEE068A**

AN ABEND \textit{xxx} OCCURRED. SMF SYNC PROCESSING IS NOW DISABLED

Explanation: An abend occurred during SMF interval processing. SMF synchronized interval processing was disabled due to this abend.

System action: The SMF interval synchronization scheduling function is disabled until the next IPL or SET SMF command. SMF continues to generate recording intervals, but SMF interval synchronization processing is disabled.

System programmer response: See the message text for the abend and take the proper corrective action.

**IEE075I**

CONFIGURING PROCESSOR( ) ONLINE IS NOT PERMITTED. WLM IS MANAGING THE PROCESSOR.

Explanation: A reconfiguration request asked the system to reconfigure a processor online. The system rejected the request because the processor had been taken offline by SRM.

System action: The system cancels the request.

Operator response: If the processor must be brought online, do one of the following:

- Turn off the VARYCPU option provided in a IEAOPTxx parmlib member. That will cause SRM to stop managing any processors and to bring online all processors that had been taken offline by SRM.
- Configure the processor offline by using a CF CPU(x),OFFLINE command. That will cause SRM to stop managing that particular processor, so that a CF CPU(x),ONLINE command will be accepted.

Note: If the processor is brought online, SRM will resume managing that processor.

**IEE076I**

CHP(\textit{xx}) NOT BROUGHT ONLINE, HARDWARE FAILURE

Explanation: In response to a reconfiguration request, the system brought a channel path physically online. When logical online processing completed, the system found that the channel path was physically offline. A hardware failure might have put the channel path physically offline. Message IEE148I may further describe the failure.

In the message text:

\textit{xx} The channel path that was brought physically offline.

System action: The system continues processing. In certain conditions, the system writes a logrec data set error record.

Operator response: Contact hardware support. Provide the logrec data set error record, if available.

Source: Reconfiguration

Detecting Module: IOSCFCHP

Routing Code: -

Descriptor Code: 5

---
**Explanation:** In response to a reconfiguration request, the system was trying to bring a channel path online. The channel path experienced a hardware failure. Recovery from the hardware failure was in progress when CONFIG command processing ended.

In the message text:

- **xx** The channel path identifier specified on the CONFIG command.

**System action:** The system continues processing. The system waits up to 45 seconds for CHP recovery to complete. If the waiting period elapses before the CHP recovery completes, the system issues this message.

**Operator response:** Contact hardware support.

**Source:** Reconfiguration

**Detecting Module:** IEEVCHPR

**Routing Code:** -

**Descriptor Code:** 5

---

**Explanation:** The command did not execute because the device specified is RESERVED. If you really want to vary the device offline, then issue the VARY OFFLINE,FORCE command.

In the message text:

- **xxxx** The device number.

**System action:** The system rejects the command.

**Operator response:** If you really want to vary the device offline, then issue the VARY OFFLINE,FORCE command.

**Source:** Master scheduler

**Detecting Module:** IEECB844

**Routing Code:** *

**Descriptor Code:** 5

---

**Explanation:** The operator entered the REPLY command in response to a message. The reply was incorrect.

**System action:** The system continues other processing while prompting the operator for a correct reply.

**Operator response:** Enter the correct reply. The cursor on the display screen points to the character where the correct reply should begin.

**Source:** Communications task (COMMTASK)

**Detecting Module:** IEEVDCMP

**Routing Code:** Note 12

**Descriptor Code:** -

---

**Explanation:** In response to a configuration request, the system issued this message to display the deviation between the configuration that actually exists and the configuration described in the CONFIGxx parmlib member.

In the message text:

- **hh.mm.ss** The time deviation
- **dev** The device
- **devn** The device
- **base** The base device
- **alias** The alias device
- **devp** The PAV
- **hypervp** The hyper PAV
- **altsdev** The alternate device
- **alsdev** The alternate device
- **bpsdev** The bps device

**text** is one of the following:

**INVALID REQUEST TYPE SPECIFIED BEGINNING**

**INVALID OPERAND SPECIFIED**

**INVALID INPUT, EXPECTING BLANKS**

In response to a reconfiguration display request, the system issued this message to display the deviation between the configuration that actually exists and the configuration described in the CONFIGxx parmlib member.

In the message text:
The time, in hours (00 through 23), in minutes (00 through 59), and seconds (00 through 59).

A decimal identifier used with the CONTROL C,D command to cancel status displays:
- That are written on typewriter or printer consoles
- That are displayed in-line (not in display area) on operator consoles

This identifier does not appear when the display is presented in a display area on a display console.

The first 16 characters of the incorrect record in the CONFIGxx parameter member, or the first 16 characters of the incorrect command.

This heading appears for each record in the CONFIGxx parmlib member in which the system detected an error. xx is the suffix of the CONFIGxx parmlib member.

The first non-blank characters in a record in the CONFIGxx parmlib member are not one of the following:
- CPU
- CPUAD
- CHP
- DEV
- DEVICE
- ESTOR
- STOR
- STORAGE
- VOL
- VOLUME
- HSA
- HIGH
- SIDE
- SWITCH

The system ignores the CONFIGxx record.

A record in the CONFIGxx parmlib member contains incorrect information. The system ignores the record. This form of the message can be issued when a storage address range is encountered in which the ending address is not greater that the starting address, either in a CONFIGxx member of parmlib (for a DISPLAY M=CONFIG(xx) command, or a CONFIG MEMBER(xx) command), or in a DISPLAY MATRIX command of the form DISPLAY M=STOR(address1 - address2), or in a CONFIG command of the form CF STOR(address1 - address2).

Possible errors include:
- The central processor address is greater than 'XF'.
- The channel path number, side number, or storage element number is greater than 'XFF'.
- The record contains an incorrect delimiter.

Note: Multiple DISPLAY M parameters must be enclosed in parentheses.

A non-blank character followed a valid request.

The first 16 characters of the incorrect record in the CONFIGxx parmlib member.

The name of the system element for which the actual status does not match the desired status. The possible system elements are:
- CPU or CPUAD
  Processor.
- CHP
  Channel path.
- CHP(ALL,x)
  All channel paths on side x.
- DEVICE
  Device.
- ESTOR(E=id)
  The expanded storage element.
- VOLUME
  Volume.
- STORAGE RANGE or STOR RANGE
  Central storage range.
- STOR AMOUNT
  Central storage amount.
- STOR(E=x)
  Central storage element.
- ESTOR RANGE
  Expanded storage range.
- PAV
  Parallel Access Volume.

The address of the system element with the incorrect status, or the volume serial number of a volume that is not correctly mounted. For storage, only one storage range or amount appears on each line:
- x-x
- xK-yK
- xM-yM
- xM

The desired status of the system element. Possible values are:
ONLINE Indicates that the central processor, channel path, device, storage range, or storage element should be online.

OFFLINE Indicates that the central processor, channel path, device, storage range, or storage element should be offline.

MANAGED Indicates that the channel path should be dynamically managed by the system.

STATIC Indicates that the channel path should not be dynamically managed by the system.

DCM Indicates that the switch port(s) identified are allowed to be dynamically managed by the system.

NODCM Indicates that the switch port(s) identified are not allowed to be dynamically managed by the system.

dev The device number of the device on which the volume should be mounted. An X in the number indicates that the digit can be any value. For example, if dev is XXX, the volume can be mounted on any direct access device.

actstat The actual status of the resource. Possible values are:

ONLINE Indicates that the central processor, channel path, device, storage range, or storage element is online.

OFFLINE Indicates that the central processor, channel path, device, storage range, or storage element is offline.

NOT AVAILABLE Indicates that the central processor, channel path, or storage element was in another partition.

NOT GENINOT GEND Indicates that the central processor, channel path, device, storage range, or storage element was not specified when the system was installed.

PARTIAL Indicates that only a portion of the requested amount of storage or some of the channel paths on a side were allocated.

UNCHANGED Indicates that the requested storage was not allocated.

NOT OPERATIONAL Indicates that the path was not operational.

SUBCHANNEL STATUS NOT AVAILABLE Indicates that the device is not defined in the I/O configuration data set (IOCDS).

SUBCHANNEL IN PERMANENT ERROR Indicates that the subchannel is broken.

DEVICE NOT AVAILABLE Indicates that the device is deferred.

BOXED Indicates that the device is boxed, that is, placed offline, because of a hardware problem.

NOT MNTDINOT MTD Indicates that the volume is not mounted.

MANAGED Indicates that the channel path is dynamically managed by the system.

STATIC Indicates that the channel path is not dynamically managed by the system.

DCM Indicates that the switch port(s) identified are allowed to be dynamically managed by the system.

NODCM Indicates that the switch port(s) identified are not allowed to be dynamically managed by the system.

NOT IMPLEMENTED Indicates that the port is not valid for the switch.

CHPID PORT Indicates that the port is not eligible for dynamic channel path management, as it is a channel path port.

INFORMATION NOT AVAILABLE Indicates that the switch or switch port is not defined.

alsdev BASE ALIAS OF basedev If a bound Parallel Access Volume (PAV) Alias device number is specified in the CONFIGGxx parmlib member, indicates the base device number.

alsdev PAV UNBOUND If the PAV keyword is specified in the CONFIGGxx parmlib member, indicates the unbound PAV-Alias device number.
devn BASE HYPERPAV ALIAS
Indicates that the device was supposed to be an online base device but was actually a HyperPAV alias device.

devn BASE HYPERPAV ALIAS OF bdev
Indicates that the device was supposed to be an online base device but was actually a HyperPAV alias device currently bound to base device bdev.

NO DEVIATION FROM REQUESTED CONFIGURATION
The system found no deviations.

NO DEVIATION COMPARISONS MADE
Either:
- DISPLAY command processing found that input parameters did not contain valid data.
- STOR(E=\textit{id}) is the only request.

CONFIG MEMBER CONTAINS NO VALID INPUT
The specified CONFIG\textit{xx} parmlib member exists, but contains records that are all blanks or comments.

DISPLAY M RESOURCE ‘PATH’ IS CURRENTLY IN USE
The system could not obtain the \texttt{SYSZVARY\textunderscore PATH} resource to serialize the \texttt{DISPLAY M=CONFIG} command with commands such as \texttt{CONFIG}; therefore, displayed information might be incorrect.

DISPLAY M RESOURCE ‘CPU’ IS CURRENTLY IN USE
The system could not obtain the \texttt{SYSZVARY\textunderscore CPU} resource to serialize the \texttt{DISPLAY M=CONFIG} command with commands such as \texttt{CONFIG}; therefore, displayed information might be incorrect.

System action: The system continues processing.

Operator response: If the message indicates \texttt{CHP OFFLINE} for the last path to a device, check the status of alternate paths and vary online any paths that should be online. Otherwise, defer configuration until an alternate processor is available.

If the message indicates \texttt{ALIASES-DEFINED} and \texttt{ALIASES-USABLE} for an online parallel access volume and the number of aliases defined is greater than the number usable, compare the hardware and software configuration definitions against the installed devices and correct the definition as necessary. You can format the base UCB with the IPCS LISTUCB subcommand to determine the device numbers and addresses of the usable and unusable alias UCBs.

System programmer response: Depending on the message text, do one of the following:

DISPLAY M RESOURCE ‘PATH’ IS CURRENTLY IN USE
To determine which jobs currently hold the \texttt{SYSZVARY\textunderscore CPU} resource, issue the \texttt{DISPLAY GRS,RES=(SYSZVARY,CPU)} command. Reissue the \texttt{DISPLAY M=CONFIG} command when the resource becomes available. For more information about these commands, see \texttt{z/OS MVS System Commands}.

DEVICE ALIASES-DEFINED ALIASES-USABLE
If the number of defined alias UCBs for a parallel access volume does not match the number of aliases usable (that is, available for I/O selection), compare the hardware and software configuration definitions against the installed devices and correct the definition as necessary. You can format the base UCB with the IPCS LISTUCB subcommand to determine the device numbers and addresses of the usable and unusable alias UCBs.

IEE098I MOUNT COMMAND FOR \texttt{volume} ON UNIT \texttt{dev} FAILED [\textit{text}]
Explanation: The system could not mount a volume on the device because the device could not be dynamically allocated.

In the message text:

\begin{itemize}
  \item \texttt{volume}
    The VOLSER of the volume to be mounted on the device.
  \item \texttt{dev}
    The device number.
  \item \texttt{text}
    Consists of a header message, accompanying error messages returned by dynamic allocation, and a trailer message.
\end{itemize}

System action: The volume is not mounted on the device. The system may issue error messages returned by dynamic allocation.

Operator response: Correct the condition described by the associated dynamic allocation messages and then reissue the MOUNT command to mount the volume on the device.

FOLLOWING JES3-ASSIGNED DEVICES ARE OFFLINE TO MVS. VARY THEM OFFLINE TO JES3.

dev[,dev1,dev2...]

Explanation:  A VARY channel offline command was entered with the FORCE option. VARY channel command processing found that the channel specified in the command is the last path to the specified device(s). The device had not been allocated in MVS, so it was marked offline.

In the message text:

dev
The device number.

System action:  The system continues processing.

Operator response:  Enter a JES3 VARY OFFLINE for the specified device(s).

Source:  JES3

Routing Code:  *
Descriptor Code:  3

CONFIG WILL FORCE OFFLINE LAST PATH TO ALLOCATED DEVICE[S]:
dev[,dev,dev...]

Explanation:  A reconfiguration request asked that the system take a specified channel path offline. The system determined that the specified channel path represents the last path to the device, which was allocated or assigned to JES3.

In the message text:

dev
The device number for which the specified channel path is the last path.

System action:  The system issues message IEE131D requesting operator approval before the channel path is taken offline.

SLIP TRAP ID=id modname IS NOT IN THE LPA. THE SYSTEM ASSUMES IT WILL BE ADDED LATER

Explanation:  In response to a SLIP SET command that uses the LPAMOD or LPAEP parameter, the system could not locate the specified module. Since it is possible that the module will be added to LPA later, the system continues to process, with the trap inactive.

In the message text:

id  The SLIP trap identifier.
modname  The name of the load module or entry point specified via the LPAMOD or LPAEP parameter.

System action:  If the module is subsequently added to LPA, the system will use the new address information about the specified load module, and will update and activate the trap.

Operator response:  If it is expected that the module might not yet be in the LPA, no action is required. Otherwise make sure that you specified the correct module name.

System programmer response:  None.

Source:  SLIP
Detecting Module:  IEECB905

UNIT dev NOT BROUGHT ONLINE [text]

Explanation:  The system could not bring the device online because of hardware or software conditions.

In the message text:

dev
The device number of the unit.

text  Consists of a header message, accompanying messages that explains why the device could not be brought online, and a trailer message.

System action:  The system does not bring the device online.

Operator response:  Correct the condition and then reissue the VARY command to bring the device online.

hh.mm.ss UNIT ALLOCATED [idr]

text
Where text is:

dev jobname asid ... [jobname asid]

[DISPLAY TRUNCATED - INSUFFICIENT STORAGE]
[Unit status number of units requested exceeds number available]
[INCOMPLETE UNIT ALLOCATION STATUS]
[ALLOC STATUS UNAVAILABLE - ALLOCAS INOPERATIVE]
The system issues this message in response to a DISPLAY U,,ALLOC command. The message displays the status of the devices attached to the system.

In the message text:

\[ hh:mm:ss \]

The time in hours (00-23), minutes (00-59), and in seconds (00-59). If 00.00.00 appears, the time of day (TOD) clock is not working.

\[ idr \]

An identifier used with the CONTROL C,D command to cancel status displays:

- Written on typewriter or printer consoles
- Displayed inline (that is, not in a display area) on a display console

This identifier does not appear when the display is presented in a display area on a display console.

The line beginning with \[ dev \] appears one or more times for each allocated unit specified on the command.

\[ UNIT \]

\[ dev \]

The device number of the allocated unit specified on the DISPLAY command.

\[ JOBNAME \]

\[ jobname \]

Each job to which the unit is allocated. The job name is one of the following:

- The name of a job
- The name of a system address space
- The name of a task created by the START or MOUNT command
- *MASTER* when the unit is allocated to the master address space
- *CONSOLE* when the unit is a console allocated to multiple console support (MCS)
- *SYSTEM* when the unit is allocated to the system control program
- *PAGE* when the unit is being used as a paging device
- *UNKNOWN* when the unit is allocated but the DISPLAY command processor cannot identify the owner.

\[ ASID \]

\[ asid \]

The hexadecimal address space identifier (ASID) for each address space to which the unit is allocated.

**DISPLAY TRUNCATED - INSUFFICIENT STORAGE**

The system cannot obtain enough storage for the display.

**UNIT STATUS NUMBER OF UNITS REQUESTED EXCEEDS NUMBER AVAILABLE**

The DISPLAY command specified more units than are allocated.

**INCOMPLETE UNIT ALLOCATION STATUS**

The system cannot display complete data on unit allocation because of an internal error.

**ALLOC STATUS UNAVAILABLE - ALLOCAS INOPERATIVE**

The system is not recording the units allocated.

**System action:** The system continues processing.

**Operator response:** If DISPLAY TRUNCATED - INSUFFICIENT STORAGE appears in the message text, specify fewer units on the DISPLAY U,,ALLOC command.

**System programmer response:** If INCOMPLETE UNIT ALLOCATION STATUS or ALLOC STATUS UNAVAILABLE - ALLOCAS INOPERATIVE appears in the message text, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**RM=nnn IM=iiiii CEM=cccc Em=eeee RU=mrrr IR=0000 [NO]AMRF**

**ID:R/K T TIME SYNAME JOB ID MESSAGE TEXT**

- [NO MESSAGES OUTSTANDING]
- [NO REQUESTS OUTSTANDING FOR SPECIFIED OPTIONS]
- [NO MESSAGES OUTSTANDING FOR SPECIFIED OPTIONS]
- [OUTSTANDING keynm MESSAGES NOT FOUND]
- [OUTSTANDING messages WITH MESSAGE KEYNAMES]
- [OUTSTANDING msgid MESSAGE NOT FOUND]
- [OUTSTANDING jobname MESSAGE NOT FOUND]
- [READY UNITS: dev{dev}...]
- [PENDING UNITS: dev{dev}...]
- [INTRV REQ'D: dev{dev}...]
- [DISPLAY TRUNCATED - INSUFFICIENT STORAGE]

The system issues this message in response to a DISPLAY R command.

The **PENDING REQUESTS** line always appears in the message text. The fields in this line are:

**hh.mm.ss**

The time in hours (00-23), minutes (00-59), and seconds (00-59). The value is 00.00.00 if the time of day (TOD) clock is not working when the system gathers the information for the display.

**idr** An identifier used with the CONTROL C,D command to cancel status displays:

- Written on typewriter or printer consoles
- Displayed inline (that is, not in a display area) on a display console

This identifier does not appear when the display is presented in a display area on a display console.

The next lines appear in response to the DISPLAY R,KEY command. Following the CNT KEY heading, four count-keyname pairs appear on each line until all pairs are displayed:

**CNT ccc**

The decimal number of occurrences for each keyname in the KEY column. If ccc is greater than 999, the display shows asterisks.

**KEY kkk**

The keyname for one or more outstanding action messages or WTORs.

The line beginning **RM=nnn...** appears in response to a DISPLAY R command with no positional operands; for example, ‘DISPLAY R’ or ‘D R,SYS=sysname’. The fields in this line are as follows:

**RM=nnn**

A decimal number representing the number of messages awaiting replies.

**IM=iiiii**

A decimal number representing the number of outstanding immediate action messages (those with descriptor codes 1 or 2). If the number is greater than 99999, asterisks appear in this field.

**CEM=cccc**

A decimal number representing the number of outstanding critical eventual action messages (those with descriptor code 11). If the number is greater than 99999, asterisks appear in this field.

**EM=eeee**

A decimal number representing the number of outstanding eventual action messages (with descriptor code 3). If the number is greater than 99999, asterisks appear in this field.

**RU=mrrr**

A decimal number representing the number of outstanding mount requests.
IR=0000
A decimal number representing the number of outstanding requests for operator intervention.

AMRF
The action message retention facility (AMRF) is active.

NOAMRF
The AMRF is not active.

The lines beginning RM=nnn... and ID:R/K... appear in response to the DISPLAY R command. I, CE, E, R, LIST, L, ALL, A or ., as the second positional operand. The line following the ID:R/K... heading lists all outstanding messages or WTORs:

ID:R/K
xxxxxxxxxxx
One of the following:
- The message identifier
- If the message is awaiting a reply, the identifier used in the REPLY command
- If the message is an action message, the identifier is the number to be used in the CONTROL C command (the action message sequence number)

T
The type of message being displayed, as follows:
- R The message is awaiting an operator reply
- I An immediate action message (descriptor code 1 or 2)
- C A critical eventual action message (descriptor code 11)
- E An eventual action message (descriptor code 3)

TIME
hh:mm:ss
The time stamp associated with the message in hours (h1), minutes (m1), and seconds (s1). This data appears when you specify the T operand in the DISPLAY R command.

SYSNAME
sysname
The name of the system from which the message was issued. This column appears when you specify the T or J operand in the DISPLAY R command.

JOB ID
yyyyyyyy
The job name (in a JES3 environment) or the job identification number (in a JES2 environment) of the task that issued the message. The JOB ID appears only when you specify the T or J operand in the DISPLAY R command.

MESSAGE TEXT
text
The text of the message. It continues on the following lines, if necessary. If the system could not retain all the lines of a multiple-line message, this field contains all of the message text.

The remaining lines that may appear in the message are:

NO MESSAGES OUTSTANDING
There are no messages awaiting replies, no messages waiting for operator action, no outstanding mount requests, and no outstanding requests for operator intervention.

NO REQUESTS OUTSTANDING FOR SPECIFIED OPTIONS
There are no outstanding requests in the category specified in the DISPLAY R command.

NO MESSAGES OUTSTANDING FOR SPECIFIED OPTIONS
There are no outstanding messages in the category specified in the DISPLAY R command.

OUTSTANDING keynm MESSAGES NOT FOUND
There are no outstanding messages that match the keyname in the KEY= keyword on the DISPLAY R command.

In the message text:
keynm
The keyword name.

NO OUTSTANDING MESSAGES WITH MESSAGE KEYNAMES
The operator entered the DISPLAY R,KEY command with the optional SYS=sysname and CN=(ALL) keywords and there are no outstanding messages with keynames.

OUTSTANDING msgid MESSAGE NOT FOUND
There are no outstanding requests for messages.

In the message text:
msgid
The message identifier.

OUTSTANDING jobname MESSAGE NOT FOUND
There are no outstanding messages that match the jobname in the JOB keyword on the DISPLAY R command.

READY UNITS: dev [dev]...
The system issued a mount request that has not yet been performed. This line appears in response to a DISPLAY R, DISPLAY R,U, or a DISPLAY R,L command if there are any outstanding ready unit requests.

dev
The device number.

INTRV REQ'D: dev [dev]...
Operator intervention was requested but has not yet been performed. This line appears in response to a DISPLAY R, DISPLAY R,U, or a DISPLAY R,L command...
command, if there are outstanding intervention-required requests.

In the message text:

\texttt{dev}

The device number.

\textbf{DISPLAY TRUNCATED - INSUFFICIENT STORAGE}

There is not enough storage for the system to finish listing this message. However, the second line of the message does contain the correct number of outstanding requests.

\textbf{Note:} If a DISPLAY R,LIST command specifies that the display is to appear in an out-of-line display area, the \texttt{ID:R/K...} heading line appears in the first frame and remains on the screen for each frame until the \texttt{READY UNITS} or \texttt{INTRV REQ’D} lines appear.

\textbf{Operator response:} Perform the action or enter the reply requested by the text of waiting messages. Re-enter the DISPLAY R command to see if the message(s) were deleted; if not deleted, you can delete I, C, and E messages saved by AMRF by using a CONTROL C command.

If the system displays I, C, and E messages, because they were not displayed on all necessary consoles, then issue a DISPLAY C command. You can determine the console responsible for the problem by looking in the display at the NBUF values, which give the number of buffers queued to each console. A high value identifies the console that is backed up. Take appropriate steps to free the backed-up console.

For each device listed, find the last mount request message for the device and mount the indicated volume on the device, or find the last intervention-required message and ready the indicated device. Enter a DISPLAY R,LIST command to locate these messages. If the system did not issue a mount request message for a device in the list, wait until the system issues that message.

For the syntax of the DISPLAY R command, see \texttt{Z/OS MVS System Commands}.

\textbf{IEE114I} \hspace{1em} \texttt{hh.mm.ss yyyy.ddd ACTIVITY [idr] text}

\textbf{Explanation:} Where \texttt{text} is:

\begin{itemize}
  \item \texttt{JOBS M/S} TS USERS SYASAS INITVS ACTIVE/MAX OAS VTAM
  \item \texttt{xxxx xxxx xxxx} x xxxxx x xxxxx x xxxxx x xxxxx [\texttt{[iji sss [ppp] www[zz]x [o] [iji sss\ldots ] ]} [\texttt{[iji sss [ppp] www[zz]x [o] strdrk - endadrk} [\texttt{userid www[zz] userid www[zz]\ldots ] [DISPLAY TRUNCATED - INSUFFICIENT STORAGE] [NO ENTRIES FOUND WITH USERID=\texttt{rquserid}]

The system issues this message when the operator enters a DISPLAY command with either:

- \texttt{JOBS}, or \texttt{TS}, or \texttt{A} as a single parameter
- The \texttt{JOBS,LIST} or the \texttt{TS,LIST} or the \texttt{A,LIST} parameters

The first three lines of the message text always appear.

If the command is one of the following, some combination of the fourth, fifth, and sixth lines appears:

\textbf{JOBS,LIST}

A list of all:

- Virtual=virtual (V=V) jobs, tasks, and attached transaction programs (ATX) created by the START or MOUNT command. One or two entries appear on each line.
- V=R jobs, virtual=real (V=R) tasks, and V=R attached transaction programs (ATX) created by the START command. One entry appears on each line.

\textbf{TS,LIST}

A list of all active TSO/E users. Up to five entries appear on each line.

\textbf{A,LIST}

The displays for both \texttt{JOBS,LIST} and \texttt{TS,LIST}.
In the message text:

\[ \text{hh.mm.ss} \]

The time, in hours (00 through 23), minutes (00 through 59), and seconds (00 through 59). If \[ \text{hh.mm.ss} \] is 00.00.00, the time of day (TOD) clock is not working.

\[ \text{yyyy.ddd} \]

The date, in years (using the 4-digit year number, such as 1996 or 2150), and days (000 through 366). If \[ \text{yyyy.ddd} \] is 0000.000, the system cannot determine the year and the day.

\[ \text{idr} \]

A 3-digit decimal identifier to be used in a CONTROL C,D command to cancel the status displays if it is:

- Written on typewriter or printer consoles
- Displayed inline (that is, not in a display area) on a display console

This identifier does not appear when the display is presented in a display area on a display console.

**JOBS**

\[ \text{xxxxx} \]

The number of address spaces running under initiators.

**M/S**

\[ \text{xxxxx} \]

The number of address spaces created by a MOUNT or START command, but not an initiator.

**TS USERS**

\[ \text{xxxxx} \]

The number of active Time Sharing Option Extensions (TSO/E) address spaces.

**SYSAS**

\[ \text{xxxxx} \]

The number of system address spaces.

**INITS**

\[ \text{xxxxx} \]

The number of started job entry subsystem (JES) and advanced program-to-program communications (APPC) initiators in the system.

**ACTIVE/MAX VTAM**

\[ \text{xxxxx}/\text{xxxxx} \]

The number of active TSO/E address spaces using the Virtual Telecommunications Access Method (VTAM) and the maximum number of TSO/E address spaces that could use VTAM.

**OAS**

\[ \text{xxxxx} \]

The total number of z/OS UNIX address spaces on this system.

**Note:** If the value for JOBS is less than the value for INITS, some initiators are inactive. The sum of the values for JOBS, M/S, TS USERS, and SYSAS is the total number of active address spaces.

\[ jji \]

One of the following:

- The name of a job or ATX attached by an initiator.
- The procedure name of a task created by a START or MOUNT command.
- **STARTING** if initiation of a started job, task, or ATX is incomplete.

\[ sss \]

One of the following:

- The step name for a job or ATX attached by an initiator.
- The identifier of a task created by the START command.
- The step name for a step that called a cataloged procedure.
- **STARTING** if initiation of a started job, task, or ATX is incomplete.
- Blank, if there is no stepname or procedure stepname.

\[ ppp \]

One of the following:

- For APPC-initiated transactions, the userid requesting the transaction.
- The step name within a procedure that was called by the step specified in field \[ sss \].
- Blank, if there is no procedure or procedure stepname.

\[ www \]

The status of the job, task, ATX, or TSO/E address space:

- **IN** Swapped in.
- **OUT** Swapped out, ready to run.
- **OWT** Swapped out, waiting, not ready to run.
- **OU** In the process of being swapped out.
- **IN** In the process of being swapped in.
- **NSW** Non-swappable.

\[ zz \]

One of the following:

- **LW** Address space is in long wait.

**Note:** **LW** appears only when the address space is swapped in or is non-swappable. **LW** indicates an abnormal condition.
Address space is not dispatchable because of a failure in the address space.

Address space has a program event recording (PER) SLIP trap active.

The type of user:
- A ATX
- J Job
- M Mount
- S Started task
- * System address space

A z/OS UNIX dubbed address space.

Starting and ending decimal addresses, in kilobytes, of the job or task’s V=R region. For example, 00040 K is decimal address 40960.

One of the following:
- The identifier of an active TSO/E user.
- *LOGON*, if initiation of the address space is incomplete.

The system cannot obtain enough storage for the display.

A userid is not active in the system.

This message appears when the operator enters the DISPLAY command with one of the following six operands:
- JOBS,name,[USERID=rquserid]
- JOBS,ALL
- TS,name
- TS,ALL
- A,name
- A,ALL

The first three lines of the message text appear for any of these six pairs.

The variables in the first line are:

- hh.mm.ss The time in hours (00 through 23), in minutes (00 through 59), and in seconds (00 through 59). If hh.mm.ss is 00.00.00, the time-of-day (TOD) clock is not working.
- yyyy.ddd The date in years (using the 4-digit year number, such as 1996 or 2150), and in days (000 through 366). If yyyy.ddd is 0000.000, the system cannot determine the year and the day.
- idr A 3-digit decimal identifier to be used in a CONTROL C,D command to cancel the status displays if it is:
  - Written on typewriter or printer consoles
  - Displayed inline (that is, not in a display area) on a display console
This identifier does not appear when the display is presented in a display area on a display console.

The variables in the second and third lines are:

**JOBS**

*xxxxx*

The number of address spaces running under initiators.

**M/S**

*xxxxx*

The number of address spaces created by a MOUNT or START command, but not an initiator.

**TS USERS**

*xxxxx*

The number of active Time Sharing Option Extensions (TSO/E) address spaces.

**SYSAS**

*xxxxx*

The number of system address spaces.

**INITS**

*xxxxx*

The number of started job entry subsystem (JES) and advanced program-to-program communication (APPC) initiators in the system.

**ACTIVE/MAX VTAM**

*xxxxx* *xxxxx*

The number of active TSO/E address spaces using the Virtual Telecommunications Access Method (VTAM) and the maximum number of TSO/E address spaces that could use VTAM.

**Note:** If the value for JOBS is less than the value for INITS, some initiators are inactive. The sum of the values for JOBS, M/S, TS USERS, and SYSAS is the total number of active address spaces.

**OAS**

*xxxxx*

The total number of z/OS UNIX System Services address spaces on this system.

Some combination of the remaining message text appears, depending on the operands entered with the DISPLAY command:

**JOBS, name (or J, name)**

The lines beginning with *jjj*, *PGN=*, and *CT=* appear when the name operand specifies a virtual=virtual (V=R) job or a V=R task created by the START command.

The lines beginning with *strarK*, *ADDR SPACE*, and *DSPNAME=* also appear when the JOBS, name or J, name operand is specified. The *ADDR SPACE* line is repeated for each data space associated with the address space. If there are no data spaces for the address space, or if the system could not return the data space information, the *ADDR SPACE* line will not appear in the message display.

**JOBS, ALL (or J, ALL)**

The *userid* and *PGN=* lines appear when the name operand specifies an active TSO/E user.

**TS, name**

The *PGN=* lines appear for each active TSO/E user.

**TS, ALL (or T, ALL)**

The *userid* line appears for each active TSO/E user.

**A, name**

The displays for both JOBS, name and TS, name appear.

**A, ALL (or A, ALL)**

The displays for both JOBS, ALL and TS, ALL appear.

The variables in all but the first three message text lines are:

**jjj**

One of the following:

- The name of a system address space.
- The name of a job or attached APPC transaction program attached by an initiator.
- The procedure name of a task created by the START or MOUNT command.
- STARTING, if initiation of a started job, task, or attached APPC transaction program is incomplete.
- *MASTER*, for the master address space.
- The name of an initiator address space.
- The name of an attached APPC transaction program.

**sss**

One of the following:
• The name of a system address space.
• The name of a step, for a job or attached APPC
  transaction program attached by an initiator.
• The identifier of a task created by the START
  command.
• The name of a step that called a cataloged
  procedure.
• STARTING, if initiation of a started job, system
  task, or attached APPC transaction program is
  incomplete.
• *MASTER*, for the master address space.
• The name of an initiator address space.

ppp
One of the following:
• For APPC-initiated transactions, the user ID
  requesting the transaction.
• The name of a step within a cataloged procedure
  that was called by the step specified in field sss.
• Blank, if there is no cataloged procedure.
• The identifier of the requesting transaction program.

www
The status of the job, task, attached APPC
transaction program, or TSO/E address space:
IN  Swapped in
OUT  Swapped out, ready to run
OWT  Swapped out, waiting, not ready to run
OU*  In process of being swapped out
IN*  In process of being swapped in
NSW  Non-swappable

zz
One of the following:

LW  Address space is in long wait
Note: LW appears only when the address space
is swapped in or is non-swappable; LW indicates an
abnormal condition.

NF  Address space is not dispatchable because of
a failure in the address space

PR  Address space has program event recording
(PER) trap active

x  The type of user:
  A  Attached APPC transaction program
  I  Initiator address space.
  J  Job

M  Mount
S  Started task
  •  System address space
o  UNIX address space indicator
O  A z/OS UNIX System Services dubbed address space.

asid
Address space identifier (ASID), in hexadecimal.

aaa
One of the following:

YES
A PER trap is active in the address space.

NO
No PER trap is active in the address space.

bbb
Number of outstanding step-must-complete
requests.

ccc
N/A, not applicable. PGN is irrelevant because the
system is operating in goal mode.

eee
N/A, not applicable. DMN is irrelevant because the
system is operating in goal mode.

ffff
The identifier of the processor, for up to any four
processors, if the job requires the services of
specific processors. ffff can also be one of the
following:

NONE
The job can run on any processor.

nnnnnnnn
For CT, the processor time used by the address
space, including the initiator. This time does not
include SRB time.

For ET, one of the following:
• For address spaces other than system address
  spaces, the elapsed time since job select time.
• For system address spaces created before
  master scheduler initialization, the elapsed time
  since master scheduler initialization.
• For system address spaces created after master
  scheduler initialization, the elapsed time since
  system address space creation.

nnnnnnnn has one of these formats, where ttt is
milliseconds, sss or ss is seconds, mm is minutes,
and hh or hhhh is hours:

sss.tttS  When time is less than 1000 seconds

hh.mm.ss  When time is at least 1000 seconds, but
less than 100 hours
When time is at least 100 hours
********
When time exceeds 100000 hours
NOTAVAIL
When the TOD clock is not working

WUID=workid
The work unit identifier.

USERID=requserid
The user ID associated with the unit of work, which is one of the following:
- The user ID specified for the USER keyword in the JCL.
- The user ID that requested the transaction.

kkkkkk
The name of the workload currently associated with the address space.

llllll
The name of the service class currently associated with the address space.

m
The service class period currently associated with the address space.

rrrrrr
The name of the resource group currently associated with the service class.
rrrrrr can also be N/A if there is no resource group association.

vvv
One of the following:
YES
The address space is a server.
NO
The address space is not a server.

qqq
One of the following:
YES
The address space has been quiesced.
NO
The address space is not quiesced.

stradr - endadr
Starting and ending decimal addresses, in kilobytes, of the job or task’s V=R region. Each KB is 1024 bytes; 00040K, for example, is decimal address 40960.

ggggggg
Central address of the address space number second table entry (ASTE)

hhhhhhhh
Data space name associated with the address space

iiiiii
Central address of the data space (hhhhhhhh) ASTE

userid
The user ID of an active TSO/E user.

DISPLAY INCOMPLETE
The system could not return the data space information for the address space. In this case, no data space information for the address space appears in the message display.

[name NOT FOUND] [WITH USERID=rquserid]
The DISPLAY command included the name operand, and the specified name is not active in the system.

NO ENTRIES FOUND WITH USERID=rquserid
A user ID is not active in the system.

In the message text:

rquserid
The user ID associated with the unit of work, which is one of the following:
- The user ID specified for the USER keyword in the JCL.
- The user ID that requested the transaction.
- ++++++++ if the user ID requesting the transaction is not defined to the security product.

DISPLAY TRUNCATED - INSUFFICIENT STORAGE
The system could not obtain enough storage for the display.

System action: The system continues processing
Operator response: Enter the command again. If the system issues this message again, contact hardware support to repair the device with the error.

Detecting Module: IEECB800
Routing Code: -
Descriptor Code: 5
IEE122I  START COMMAND JCL ERROR

Explanation: A START command invoked a cataloged procedure or job. The system detected one of the following error conditions:

- The member specified in the START command does not exist.
- The cataloged procedure contains incorrect JCL statements.
- The job contains incorrect JCL statements.

System action: The system rejects the command.

Operator response: Contact the system programmer. When the system programmer directs, enter the command again.

System programmer response: Do the following:

1. Look in the system output (SYSOUT) for messages associated with this command. These messages describe any errors found in the source JCL or in the overriding JCL statements generated from the START command. If the MSGCLASS for Started Tasks is a DUMMY class, then it may be necessary to change it temporarily to a "real" message class in order to get the SYSOUT for the failing START command. This can be accomplished in either of two ways:
   - Add the desired MSGCLASS to the START command. For example:
     - S procedurename,MSGCLASS=A
   - Change the MSGCLASS for all STCs via a $TJOBCLASS command and then change the MSGCLASS back to what it was. For example:
     - $TJOBCLASS(STC),MSGCLASS=A
     - Run the failing started task
     - $TJOBCLASS(STC),MSGCLASS=Z

   Once the failing JCL statements are identified, correct those JCL statements in the procedure or job. Ask the operator to enter the command again.

2. If the command was entered correctly, run the IEBPTPCH utility to print the cataloged procedure or job that was to be invoked by the START command. Check for, and correct, any incorrect JCL statements in the procedure or job. After making corrections, ask the operator to enter the command again.

3. If the command continues to fail, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: Master scheduler

IEE124I  MOUNT COMMAND JCL ERR

Explanation: A MOUNT command requested the allocation of a I/O device to all job steps. While processing the command, the system found incorrect JCL statements in the procedure invoked by the command.

System action: The system rejects the command.

Operator response: Contact the system programmer. When the system programmer directs, enter the command again.

System programmer response: Do the following:

1. Look in the system output (SYSOUT) for messages beginning with IEF associated with this command. These messages describe any errors found in the procedure. Correct the JCL statements in the procedure. Ask the operator to enter the command again.

2. If the command continues to fail, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: Master scheduler

IEE125A  REPLY U TO CONTINUE PROCESSING

Explanation: The system is processing the error described in the preceding messages. After performing any actions required by the messages, the operator must notify the system that the actions are complete.

System action: The system prompts the operator for a reply. When the reply is received, the system resumes normal processing.

Operator response: Enter U at the current cursor position.

Source: Communications task (COMMTASK)

IEE126I  COMPLETE TEXT OF MESSAGE msgid CANNOT BE DISPLAYED

Explanation: A message issued by the disabled console communications facility (DCCF) had more lines than the console could display. The system truncates the message.

In the message text:
msgid
   The message identifier.

System action: See the system action for message msgid.

Operator response: See the operator response for the message.

Source: Communications task (COMMTASK)

Detecting Module: IEEVDCMP

Routing Code: Note 12

Descriptor Code: -

IEE128A PERFORM THE CANCEL ACTION TO RESTORE THE NORMAL DISPLAY

Explanation: The disabled console communications facility has been using the console screen to display messages required by system conditions. You can now restore the original contents of the console screen and resume normal console operations.

System action: The system continues normal operation.

Operator response: To restore the original contents of the screen, perform the CANCEL action (press the PA2 key on most consoles). If you need more information about the CANCEL action, see z/OS MVS System Commands. The system might not respond immediately.

Note: Be sure to perform only the proper CANCEL action. Any other action will produce unpredictable results.

Source: Communications task (COMMTASK)

Detecting Module: IEEVDCCR

Routing Code: Note 9

Descriptor Code: -

IEE129I hh.mm.ss DISPLAY EMCS

parameter list

NUMBER OF CONSOLES MATCHING CRITERIA: nnnnn

console1 console2 ...

NO CONSOLES MEET SPECIFIED CRITERIA

Explanation: The system issues this message in response to DISPLAY EMCS, SUMMARY command.

In the message text:
In the message text:

hh:mm:ss
The time when the message was issued, in hours (00 through 23), minutes (00 through 59), and seconds (00 through 59).

**Parameter-list**
Parameters specified when the command was issued.

**Number of consoles matching criteria:**
nnnnn
Number of extended MCS consoles that matches the search criteria.

**CN=consname**
Name of each console that matches the criteria. (The name is specified on the MCSOPER ACTIVATE macro).

**STATUS=status**
Indicates that the console is active (A), inactive (N), or in the case of the system console only, in problem determination (PD) mode.

**CNID=consid**
The 4-byte console id of the console in hexadecimal.

**MIGID=migid**
The 1-byte migration id of the console or --- if the console does not have a migration id.

**KEY=key**
The class name of a collection of extended MCS consoles logically grouped by key.

**SYS=sys**
The name of the system where the console is active or -------- if the console is not active on any system.

**ASID=asid**
The asid in hexadecimal of the console task if the console is active on the current system or ---- if the console is not active, or is active on another system.

**JOBNAME=jobname**
The jobname of the console task if the console is active or -------- if the console is not active on any system or if the jobname is not available for the console task.

**JOBID=jobid**
The jobid of the console task if the console is active or -------- if the console is not active on any system or if the jobid is not available for the console task.

**HC=Y**
**HC=N**
Indicates whether this console is receiving messages with the HC attribute.

**AUTO=Y**
**AUTO=N**
Indicates whether this console is receiving messages eligible for automation.

**MONITOR=monitor**
The monitor status of a console, where monitor is one or more of the following:

**JOBNAMES**
The console is monitoring job names.

**SESS**
The console is monitoring sessions.

**STATUS**
The console is monitoring data sets.

--------
The console has no monitor status defined.

**DOM=dom**
Indicates the DOM (delete operator message) attribute for the console, where dom is one of the following:

**NORMAL**
DOM requests are queued according to normal message queueing criteria.

**ALL**
All DOM requests are queued.

**NONE**
No DOM requests are queued.

**CMDSYS=cmdsys**
The name of the system for which this console has command association.

**LEVEL=level**
Specifies the message level(s) to be received by the console, where level is one or more of the following:

**ALL**
The console receives all messages by the console.

**CE**
The console receives critical eventual action messages.

**E**
The console receives eventual action messages.

**I**
The console receives immediate action messages.

**IN**
The console receives information messages.

**NB**
The console does not receive broadcast messages.

**R**
The console receives messages requiring a reply (WTORs) are to be received by the console.

**AUTH=auth**
displays the command authority of the console:
ALL
Any INFO, SYS, IO, or CONS command.

INFO
Any command from the informational command.

MASTER
Any operator command.

CONS
INFO commands as well as console control (CONS) command.

IO
INFO commands as well as I/O control (IO) command.

SYS
INFO commands as well as system control (SYS) commands.

ALTGRP=altgrp
The alternate group defined for this console.

MSCOPE=mscope
The name of the system or systems from which this console is receiving unsolicited messages, where mscope is one of the following:

ssssss
The system name.

*ALL
All systems defined in the sysplex.

(ssssss,ssssss,...)
List of system names, enclosed in parentheses.

ROUTCDE=routcde
Displays information about routing codes, where routcde is one of the following:

nnnnnn
The routing codes assigned to the console or hardcopy log. For an output only console, the routing codes assigned to the output device.

ALL
All routing codes, 1 through 128.

NONE
No routing codes

CNSWITCH=swcons1, swcons2, ...
A list of consoles that have been switched to this console.

SWITCHTO=recvcons
The console to which this console has switched.

ALERTPCT=alert
The queue depth percentage at which message queueing to the console is suspended.

QUEUED=queued
Number of messages in the message queue for this console. QUEUED appears only for a DISPLAY EMCS,FULL command.

QLIMIT=qlimit
Maximum message queue depth percentage. This field is only displayed for a DISPLAY EMCS,FULL command.

SIZEUSED=used
Number of kilobytes (K) used in the EMCS message dataspace. This field is only displayed for a DISPLAY EMCS,FULL command.

MAXSIZE=max
Maximum number of kilobytes (K) used in the EMCS message dataspace. This value is a 'high-water' indicator; it shows the maximum size used, not necessarily the size currently in use. This field is only displayed for a DISPLAY EMCS,FULL command.

ERROR=text
text is the error status of the console. The ERROR field appears only when the DISPLAY command requests FULL information. If there is no error status, the field is omitted. text is one of:

MEMORY LIMIT REACHED
There are no more cells in the message dataspace for storing messages. Queueing is halted.

QUEUE DEPTH LIMIT REACHED
The console’s message queue has reached the maximum depth. Queueing is halted.

INTERNAL ERROR
An error has occurred while manipulating the message queues. Queueing is halted.

ALERT PERCENTAGE REACHED
The number of messages on the queue has reached a certain percentage of the maximum queue depth. Queueing continues.

NO CONSOLES MEET SPECIFIED CRITERIA
No extended MCS consoles match the specified filters.

NO DATASPACE INFORMATION AVAILABLE FOR THIS CONSOLE
A DISPLAY EMCS,FULL command was specified, or FULL information was forced by other filters on the command, but data space information is not available for this extended MCS console. Data space information is only available for a console that is active on the system where the D EMCS command is executed. If the console is active on a different system, you can use the ROUTE command to execute a D EMCS command on that system.

**IEE131D REPLY CANCEL OR CONTINUE**

**Explanation:** This message asks the operator to decide whether to cancel or to continue processing the CONFIG CHP(xx),OFFLINE,FORCE command.

Forcing the channel path offline may have serious effects on the system. Message IEE100E precedes this message and explains the effects of forcing the channel path offline.

**System action:** The system waits for the operator to reply.

**Operator response:** Check status of alternate paths. Vary online any paths that should be online. Defer reconfiguration, if possible. Otherwise, recover the failing tasks.

- Reply CANCEL to cancel the CONFIG command and keep the channel path online.
- Reply CONTINUE to force the channel path offline and keep the devices listed in message IEE100E allocated and forced offline. Any I/O request to any of these devices results in a permanent I/O error. To allow any job associated with an allocated device to continue, enter the CONFIG command to provide an alternate path to the device.

**Note:** Do not reply CONTINUE if a device that is critical to the operation of the system is involved, or you may have to reIPL the system.

**Source:** Reconfiguration

**IEE132I START COMMAND DEVICE ALLOCATION ERROR**

**Explanation:** A START command invoked a cataloged procedure. While allocating the device specified on the command, the system detected an error.

**System action:** The system rejects the command.

**Operator response:** Contact the system programmer. Enter the command again, as directed by the system programmer.

**System programmer response:** Do the following:

1. Look in the system output (SYSOUT) data set for messages associated with this START command. These messages describe errors found in the source JCL or in the overriding JCL statements generated from the START command.
   If the MSGCLASS for Started Tasks is a DUMMY class, you may need to change it to a real message class temporarily in order to get the JES Job Log for the failing START command. Do this in one of the following ways:
   - Add the desired MSGCLASS to the START command. For example, add:
     `S procedurename,MSGCLASS=A`
   - Change the MSGCLASS for all STCs using a $TJOBCLASS command, and then change the MSGCLASS back to what it was. For example:
     a. First change the MSGCLASS using the $TJOBCLASS command:
        `$TJOBCLASS(STC),MSGCLASS=A`
     b. Now run the failing started task.
     c. Finally, change the MSGCLASS back to what it was using a $TJOBCLASS command:
        `$TJOBCLASS(STC),MSGCLASS=Z`

2. If the command fails again, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Once the failing JCL statements are identified, correct those JCL statements in the procedure or job, or any catalog entries which caused the error messages to be issued. Ask the operator to enter the command again.

**Descriptor Code:** 3

---

**IEE133I nn DEVICES BUSY ON CHP(xx)**

**Explanation:** A reconfiguration request asked that the system configure one or more channel paths offline. While processing the request, the system detected that devices are currently doing I/O through one of the specified channel paths.

In the message text:

- `nn` The number of devices doing I/O through a channel path.
- `xx` The channel path on which the devices are doing I/O.

**System action:** The system waits a maximum of 2.5 minutes for all I/O through channel path `xx` to complete. After 15 seconds, if all I/O has not completed, the system issues this message to notify the operator of busy devices. If the 2.5-minute waiting time expires and all I/O through channel path `xx` is not complete, the system issues message IEE717D.

MOUNT COMMAND DEVICE ALLOCATION ERROR

Explanation: A MOUNT command requested the allocation of an I/O device to all job steps. While allocating the device specified on the command, the system detected an error.

System action: The system rejects the command.

Operator response: Contact the system programmer. Enter the command again, as directed by the system programmer.

System programmer response: Do the following:
1. Correct the errors indicated by other messages on the console or in the system output (SYSOUT) data set. Ask the operator to enter the command again.
2. If the command fails again, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

MASTER AND ALL ALTERNATES UNAVAILABLE - REASON=reason

Explanation: Where text is:

ISSUE VARY MSTCONS OR LOG ON TO A MASTER AUTHORITY SMCS CONSOLE

The operator could not switch from the master console to an alternate console because no alternate consoles were active.

In the message text:

reason

Explains the problem, as follows:

ATTRES  
The master console was varied offline after a failure.

K V  
The operator entered a CONTROL V, USE=FC command to relieve a no consoles condition.

LOGOFF  
The operator ended the SMCS console session.

LOGON  
The operator accessed the SMCS console session.
The operator varied a console online to relieve a no consoles condition.

The operator pressed the external interrupt key.

An I/O error occurred on the failing console.

A software error caused the console to fail.

An open failure forced the console switch.

The system cannot obtain the console queue element (CQE).

The hard-copy function was switched from SYSLOG.

The operator entered a VARY MSTCONS command.

The operator entered a CONFIG channel program command.

A system in the sysplex failed.

A system in the sysplex completed initialization, causing a change in the console configuration.

The system switches the hard-copy log to the console. The system switches the hard copy to the system log if the console is a hard-copy device.

If the device is not a hard-copy device, enter the VARY HARDCPY command from the console with master authority to switch the hard-copy log to an acceptable console.

Communications task (COMMTASK)

IEAVSWCB

Note 4

4
Explanation: In response to a CONTROL M or
CONTROL M,REF command, this message displays:

- The status of the action message retention facility
  (AMRF)
- The maximum number of write to operator (WTO)
  buffers
- The maximum number of write to operator response
  (WTOR) buffers
- The status of the general WTO installation exit
  IEAVMXIT
- The maximum number of messages that the system
  can hold in SYSLOG buffers
- The timeout value for the ROUTE *ALL or ROUTE
  systemgroupname command.
- The SMCS APPLID, if one, is in effect.
- The SMCS GENERIC, if one, is in effect.

In the message text:

**AMRF=Y**
**AMRF=N**
The status of the AMRF:
- Y for active.
- N for not active.

**MLIM=nnnn**
The current limit of WTO buffers. When the number
of WTO buffers reaches this number, the system
places any program that issues a WTO into a wait
state until the number of WTO buffers decreases to
a value less than the limit.

**RLIM=nnnn**
The current limit of outstanding WTOR messages
that the system or sysplex can hold in buffers.
When the number of WTOR buffers reaches this
value, the system places any program that issues a
WTOR into a wait state until the number of WTOR
buffers decreases to a value less than the limit.

**UEXIT=Y**
**UEXIT=N**
The status of the IEAVMXIT installation exit:
- Y - The exit is being used.
- N - The exit is not being used.

**LOGLIM=nnnnnn**
The current limit of messages that can be buffered
to the SYSLOG processor. When the number of
messages buffered up for the SYSLOG processor
reaches this value, subsequent messages to be
buffered to the SYSLOG processor will be lost until
the number of buffered messages decreases to a
value less than the limit.

**ROUTTIME=nnn**
The maximum duration in seconds that the ROUTE
*ALL or ROUTE systemgroupname command waits
for responses to a command from each system for
aggregating responses. After that time, the
command will be considered to have timed out for
aggregation with respect to any systems which
have not responded, and message IEE421I will
indicate that this has occurred. Responses received
after the specified timeout interval are individually
returned to the originator of the ROUTE command.
If ROUTTIME is 0, command responses will not be
aggregated.

**RMAX=nnnn**
The current maximum number of reply IDs.

**APPLID=aaaaaaaa**
The SMCS APPLID. If the system does not have an
APPLID in effect, the APPLID keyword will not be
displayed.

**GENERIC=aaaaaaaa**
The SMCS GENERIC. If no GENERIC is in use,
"NONE" will be displayed. The GENERIC keyword
will not be displayed if the system is in XCFLOCAL
or MONOPLEX mode.

System action: The system continues processing.

Descriptor Code: 5

#### IEE145I DELETION REJECTED [FOR MESSAGE xxx]-reason [COMMAND ISSUED IS command]

Explanation: reason is one of the following:

**ID DOES NOT EXIST**
**REPLY COMMAND REQUIRED**
**PRESENTATION INCOMPLETE**

A CONTROL C command tried to request deletion of
one or more action messages that the action message
retention facility (AMRF) retained. The command was
entered incorrectly.

In the message text:

**FOR MESSAGE xxx**

xxx is a message identifier specified in the
command. The message identifier is incorrect for
the reason that appears in the message. This
message text appears only on printer-keyboard
consoles.
ID DOES NOT EXIST
The command specified a message identifier that does not exist.

REPLY COMMAND REQUIRED
The specified message identifier is for a message that requires a reply. The system cannot delete the message until the operator enters a reply.

PRESENTATION INCOMPLETE
The specified message identifier is for a message that has not yet been displayed on all consoles. The message is queued to appear on a console or the hard-copy device; therefore, the system cannot delete the message.

COMMAND ISSUED IS command
command is the text of the command that was originally entered.

System action: If the CONTROL command specifies a series of message identifiers, the system deletes all messages before the identifier in error. If the operator entered the CONTROL command from a display console, the system displays the command again and positions the cursor under the message identifier in error. The system does not include the identifiers of any messages that are deleted.

Operator response: Depending on the message text, do the following:

ID DOES NOT EXIST
Enter DISPLAY R to determine the correct identifier for the message to be deleted. Enter the CONTROL command again with the correct identifier.

REPLY COMMAND REQUIRED
Reply to the message. Then the system will delete the message.

PRESENTATION INCOMPLETE
Wait for the system to complete presentation of the message before trying again to delete the message. If the system does not complete the presentation, enter a DISPLAY CONSOLES command to determine if a console has a large backlog of messages. If so, correct the problem with the console. Enter the CONTROL command again.

Descriptor Code: 4

IEE148I item NOT RECONFIGURED [-|PHYSICALLY {ONLINE|OFFLINE}, text]
Explanation: A reconfiguration request asked that the system reconfigure items online or offline. The system could not perform the requested reconfiguration, except as noted under the explanation for texts NOT...
RECONFIGURED PHYSICALLY ONLINE or FUNCTION NOT APPLICABLE.

In the message text:

`text` is one of the following:
- INVALID ID
- FUNCTION NOT APPLICABLE
- ITEM NOT AVAILABLE
- COMMAND NOT EXECUTABLE ON CURRENT CONFIGURATION
- CONTAINS REQUIRED FACILITIES IN ANOTHER PARTITION
- SERVICE PROCESSOR BUSY
- SERVICE PROCESSOR FAILURE
- SERVICE PROCESSOR CALL FAILED
- TARGET HARDWARE ERROR
- TARGET RECONFIGURATION ERROR
- INSUFFICIENT RESOURCES AVAILABLE
- NO MORE STORAGE AVAILABLE IN OFFLINE STORAGE ELEMENT
- AT LEAST ONE CHP IS ONLINE
- WOULD REMOVE A CPC-CRITICAL STP TIMING LINK

`item`

The item that was to be reconfigured:

[RREAL STORAGE LOCATIONS] xM to yM
The beginning and ending addresses, in megabytes, of a range of central storage. x and y are 1- or 2-digit decimal numbers.

CHP(xx)
Channel path xx.

EXTENDED STORAGE ELEMENT(n)
Expanded storage element n.

[REAL] STORAGE ELEMENT(n)
Central storage element n.

REAL STORAGE
Central storage range or amount.

ELEMENT(S)
ITEM(S)
An error occurred while trying to build the new CONFIG ONLINE or OFFLINE display.

NOT RECONFIGURED PHYSICALLY ONLINE
Indicates that one of the following occurred:
- A CONFIG OFFLINE command was entered. The item was taken logically offline but could not be taken physically offline.
- A CONFIG ONLINE command was entered. The item was brought physically online, but the attempt to bring it logically online failed, and the system issued the appropriate error message. The system then attempted to take the item physically offline to make its physical status consistent with its logical status. This attempt also failed; message IEE148I refers to this attempt. The item is logically offline but still physically online.

NOT RECONFIGURED PHYSICALLY ONLINE
Indicates that an item could not be brought physically online. For a CONFIG command, if MVS is running as a VM guest, the item is a channel path, and, if `text` is FUNCTION NOT APPLICABLE, then the CONFIG command processor was able to verify that the channel path is physically online to VM and configured the channel path logically online to MVS. Otherwise, the system did not bring the item logically online.

`text`
The reason why the item could not be reconfigured:

INVALID ID
The item specified in the CONFIG command does not exist in the configuration.

FUNCTION NOT APPLICABLE
One of the following occurred:
- The service processor received an incorrect or unsupported command.
- The CONFIG command processor determined that channel path physical reconfiguration is not supported and did not attempt to configure the channel path physically online. It did determine, however, that MVS is running as a VM guest and that the channel path is physically online to VM, so the channel was configured logically online to MVS.
- The CONFIG command processor determined that channel path physical reconfiguration is not supported and did not attempt to configure the channel path physically online. However, logical offline processing might have been performed.

ITEM NOT AVAILABLE
The specified item is part of another partition.

COMMAND NOT EXECUTABLE ON CURRENT CONFIGURATION
One of both of the following occurred:
- The operator command is not supported by the hardware on which MVS is running.
- The CONFIG command processor determined that channel path physical reconfiguration is not supported and did not attempt to configure the channel path physically online. The CONFIG command processor determined either that MVS is not running as a VM guest or that MVS is running as a VM guest but could not verify that the channel path was physically online to VM. The channel path was not configured logically online to MVS.

CONTAINS REQUIRED FACILITIES
The storage element specified in a CONFIG command could not be taken offline because it contains storage that must be kept online.
IN ANOTHER PARTITION
The item specified in a CONFIG command is in a different partition from the MVS system in which the CONFIG command was issued.

SERVICE PROCESSOR BUSY
The service processor could not process the CONFIG command because the service processor control block is in use or the hardware is processing another request.

SERVICE PROCESSOR FAILURE
The service processor could not process the CONFIG command because of an internal service processor error.

SERVICE PROCESSOR CALL FAILED
The system could not invoke the service processor. The item is not varied. The system writes a logrec data set error record and requests an SVC dump.

TARGET HARDWARE ERROR
One of the following occurred:
- An error occurred during a target equipment check that is associated with the resource being configured or deconfigured. The state of the resource is changed. The error is not associated with the service-call logical processor (SCLP).
- An error occurred during a target equipment check that is associated with the resource being configured or deconfigured. The state of the resource did not change. The error is not associated with SCLP.
- Enter the CONFIG command. If the problem persists, contact Hardware Support.

TARGET RECONFIGURATION ERROR
One of the following occurred:
- An error occurred during a target equipment check that is associated with the resource being configured or deconfigured. The state of the resource cannot be determined. The error is not associated with the SCLP.
- An error occurred during a target equipment reconfiguration check that is associated with the resource being configured or deconfigured. The state of the resource changed. The error is not associated with the SCLP.
- Enter the CONFIG command. If the problem persists, contact Hardware Support.

INSUFFICIENT RESOURCES AVAILABLE

NO MORE STORAGE AVAILABLE
Central storage could not be brought online because all of the central storage in the system is either currently in use or part of another partition.

IN OFFLINE STORAGE ELEMENT
The storage identified in the message could not be brought online because all or part of that storage was in a storage element that is offline.

AT LEAST ONE CHP IS ONLINE
At least one CHP remained online after a CONFIG CHP(xx) command.

WOULD REMOVE A CPC-CRITICAL STP TIMING LINK
The STP facility has determined that the command would deconfigure the last path between Server Time Protocol (STP) nodes and rejected the request. The respective channel path was not deconfigured.

System action: The system does not reconfigure the item displayed in the message text, except as noted in the explanation for the texts NOT RECONFIGURED PHYSICALLY ONLINE or FUNCTION NOT APPLICABLE. If the CONFIG command specified several items, the system reconfigures those items not named in the message text. The system writes messages.

Operator response: Depending on the message text, do the following:

COMMAND NOT EXECUTABLE ON CURRENT CONFIGURATION
If channel path physical reconfiguration was attempted, MVS is running as a VM guest, and the channel path was physically configured offline to VM, then physically configure the channel path online to VM and re-enter the CONFIG command to attempt to configure the channel path logically online to MVS.

INVALID ID
Enter the CONFIG command with the correct ID number for the item.

ITEM NOT AVAILABLE
Enter the CONFIG command after the specified item has been released from the other partition.

IN ANOTHER PARTITION
Enter the CONFIG command after the specified item has been released from the other partition.

SERVICE PROCESSOR BUSY
Enter the CONFIG command. If the problem persists, contact your system programmer.

SERVICE PROCESSOR FAILURE
Enter the CONFIG command. If the problem persists, contact hardware support. Provide the logrec data set error record.
SERVICE PROCESSOR CALL FAILED
Enter the CONFIG command. If the problem persists, contact the system programmer.

IN OFFLINE STORAGE ELEMENT
Enter a CONFIG command to bring online the storage element. If the entire range of storage identified in the message does not come online when you bring the storage element online, enter the CONFIG command for that range.

WOULD REMOVE A CPC-CRITICAL STP TIMING LINK
Contact System Programmer.

System programmer response: If SERVICE PROCESSOR CALL FAILED or SERVICE PROCESSOR BUSY appear in the message text, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the logrec data set error record.

If WOULD REMOVE A CPC-CRITICAL STP TIMING LINK appears in the message text, See the IBM Redbooks®, Server Time Protocol Planning Guide and Server Time Protocol Implementation Guide for more information on STP.

IEE151I DELETE MESSAGE INCONSISTENT-text
[COMMAND ISSUED IS command]

Explanation: text is one of the following:

NO DELETABLE MESSAGES
INVALID RANGE
SEG = 0

INVALID OPERAND

NO DISPLAY ON SCREEN
DISPLAY NOT ON SCREEN
NO DISPLAY IN AREA

A CONTROL command requested that the system delete messages from a display console screen. The command was in error.

In the message text:

NO DELETABLE MESSAGES
One of these commands was entered to delete a message:
• CONTROL E,F
• CONTROL E,SEG
• CONTROL E,nr[,nn]

No current messages could be deleted by this request.

INVALID RANGE
A CONTROL E,nr[,nn] command requested deletion of messages, but the command was specified incorrectly, in one of these ways:
• One or more of the specified message numbers were not displayed in the visible message area.
• The specified message numbers were incorrect.
• The specified message numbers included blank lines.

SEG = 0
A CONTROL S,SEG command was entered, but SEG was specified with a value of 0. A value of 0 is not meaningful for a CONTROL S,SEG command.

INVALID OPERAND
A CONTROL E,X command was entered, but a valid range was not specified on the command.

NO DISPLAY ON SCREEN
A CONTROL E,N command was entered, but the message line numbers were already removed.

DISPLAY NOT ON SCREEN
There are no status display areas on the console.

NO DISPLAY IN AREA
There is no status display in the area.

COMMAND ISSUED IS command
command is the text of the command that was originally entered.

System action: The system rejects the command.

Operator response: Correct the command and enter it again.

Enter DISPLAY C,K to obtain a display that explains the CONTROL command.
**IEE153I**  ERROR - ENTRY GREATER THAN 126 CHARACTERS

Explanation: The 127th position in the entry area contains a character other than a blank. The cursor appears under the 127th character to aid the operator in correcting the command.

System action: Until the 127th position contains a blank, the system ignores all commands.

Operator response: Correct the command that appears in the entry area and make sure that a blank is typed in the 127th position. Then perform an ENTER action.

If it is desired to clear the entry area before making the correction, perform the CANCEL action. Then enter the command correctly and perform an ENTER action.

Source: Console services

**IEE156I**  cm INVALID OPERAND[-]op

[COMMAND ISSUED IS command]

Explanation: A CONTROL command requested that a console be controlled in some way. The command was specified incorrectly.

In the message text:

*cm* The CONTROL command that was incorrectly specified.

*op* The first 6 characters of the incorrect parameter.

COMMAND ISSUED IS command

*command* is the text of the command that was originally entered.

The command was incorrectly specified in one of these ways:

- The command specified the S parameter incorrectly.
- The first character after CONTROL (or K) was not one of the following:
  
  A
  C
  D
  E
  M
  N

Q
S
V

- The parameter following CONTROL D (or K D) was not one of the following:
  
  F
  N
  N,HOLD
  PFK

- If the command issued was CONTROL M (or K M), the problem is one of the following:
  - If the cursor is under a keyword, the keyword is not valid for this command.
  - If the cursor is under a parameter value, the value is not valid for that keyword. Some examples are:
    - The value of MLIM, RLIM, RMAX, LOGLIM, or ROUTTIME is not a decimal number, or is outside the acceptable range for this value.
    - The value of UEXIT or AMRF is not Y or N.
    - The value of RLIM is more than the current value of RMAX.
    - The value of RMAX is changed when the system is not at a correct level for changing it:
      • The sysplex couple data set has been configured for eight or fewer systems.
      • The value of RMAX would be decreased by this command. This is not allowed.
  - RNUM or RTME specified a value of 0.
  - A CONTROL N,PFK command contains an error. The type of error is indicated by the location of the cursor:
    - If the cursor is under the first letter of a keyword (CMD, KEY, PFK, or CON), that keyword or its trailing equal sign is incorrect.
    - If the cursor is under the number of the key being defined, that key is not a numeric character, not a key that was defined when the system was installed, or is a key that is defined as a list of keys that is already contained within another list of keys.
    - If the cursor is under a key number after the KEY parameter, that key is not a numeric character, the number of the key that is being defined, a key which has been defined as a list of keys, or a key that was not defined when the system was installed.
    - If the cursor is under some other location, a syntax error exists at the position indicated by the cursor.
  - The multi-line WTO ID specified on the CONTROL C,D command is incorrect or is directed to the wrong console.
  - The parameters on the CONTROL V command are incorrect.

System action: The system rejects the command.

Operator response: Do one of the following:

- Correct the command by positioning the cursor under the characters to be changed and typing the correct information. Then enter the changed command.
**DELETION REQUESTED**

**Explanation:** The operator requested deletion in conversational mode. The deletion request appears in command form in the entry area. The messages selected for deletion are indicated by vertical lines displayed in position 3 of the message line.

**System action:** The system does not delete any messages until the operator responds to this message.

**Operator response:** Respond in one of the following ways:

- To delete the messages as requested, press the ENTER key on the console.
- To change the deletion request, position the cursor under the name of the message you want to delete and press the ENTER key on the console.
- To cancel a deletion request, enter the CANCEL command. This will restore the screen, remove the vertical lines from the entry area, and place the cursor at the left side of the entry area.

**Source:** Communications task (COMMTASK)

**Routing Code:** Note 6

**Descriptor Code:** -

---

**REQUEST INCONSISTENT**

**Explanation:** The CONTROL command was used to display or erase the PFK line on a device that does not support the PFK line.

**optional-text** is one of the following:

**STATUS ALREADY EXISTS**

The operator requested a CONTROL option that is already in effect. For example, CONTROL S,DEL=R is entered when the console is in roll mode.

**NO DISPLAY ON SCREEN**

The operator requested a CONTROL option for a display, such as framing or erasing, and there is no display on the screen.

**LAST FRAME DISPLAYED**

The operator requested a CONTROL option for a display area, such as framing or erasing, and there is no display in that area.

**FRAME NOT COMPLETE**

The operator entered a framing request CONTROL D,F, but the frame of the display currently on the screen is not complete yet. The request must be reentered when the current frame is complete.

**PFK IN USE**

The operator entered the CONTROL N, PFK command to change the definition of a program function key (PFK). However, the system is currently processing a PFK for that console.

**COMMAND ISSUED IS command**

The text of the command that was originally entered.

**STATUS ALREADY EXISTS**

Change the command and reenter it, or CANCEL the command because the condition already exists.

**NO DISPLAY ON SCREEN**

Change the command to specify the correct console ID, with L=name, and reenter the command, or CANCEL the command because the conditions required by the command do not exist.

**NO DISPLAY IN AREA**

Change the command to specify the correct area, then reenter or CANCEL the command.

**FRAME NOT COMPLETE**

Enter the request again after the entire frame has been displayed.

**PFK IN USE**

Allow the processing of the PFK to end before changing the PFK definition.

**Source:** Communications task (COMMTASK)

**Routing Code:** -

**Descriptor Code:** 5
**IEE159E  MESSAGE WAITING**

**Explanation:** A message is waiting to be displayed, but the message area is full. This message appears:

- If automatic message deletion is not in effect (DEL=N)
- If automatic message deletion was in effect (DEL=Y) but no messages were marked for deletion
- If the screen is full of intervention required (INT REQ) messages or write to operator with reply messages (WTOR)
- When the console is in hold mode, and has a message waiting

**System action:** Unless automatic message deletion is in effect, new messages to be displayed wait until the operator deletes messages from the message area. The system removes this message from the screen when there is enough room in the message area to display all new messages.

**Operator response:** Delete messages that are no longer pending from the message area by entering the CONTROL command or by using the light pen or the cursor. Press the ENTER key on the console to verify the deletion request. In conversational mode, press ENTER a second time to verify the deletion request.

**Source:** Communications task (COMMTASK)

**Detecting Module:** IEECVFT2, IEECVETU

**Routing Code:** Note 6

**Descriptor Code:** -

---

**IEE160I  UNVIEWABLE MESSAGE**

**Explanation:** A status display temporarily replaces one or more messages.

**System action:** If a system task or a problem program issued a DOM (delete operator message) macro and DEL=Y is in effect, the system deletes messages automatically to remove the status display and display new messages. Otherwise, the system does not display new messages until the operator either removes the status display or deletes some messages above the status display. Message IEE159E replaces this message if there are more messages waiting that the status display is currently displacing.

**Operator response:** Do one of the following:

- To remove the status display, enter the CONTROL E,D command or position the light pen on "E" in the title line to remove the display and free the bottom portion of the message area.
- To request message deletion so new messages can be displayed, mark messages for deletion with the CONTROL command, the cursor or the light pen, then press the ENTER key on the console.

**Source:** Communications task (COMMTASK)

---

**IEE161I  WARNING - CON=N,DEL=Y**

**Explanation:** One of the following occurred:

- Automatic message deletion was in effect (DEL=Y) when the operator entered a CONTROL S,CON=N command, requesting non-conversational message deletion mode.
- Conversational mode was not in effect (CON=N) when the operator entered a CONTROL S,DEL=Y command, requesting automatic message deletion.
- The operator entered a CONTROL S,CON=N,DEL=Y command, requesting non-conversational mode and automatic message deletion.

The system issues this message in response to an erase (E) request.

**System action:** Processing continues. Some messages other than the messages requested for deletion may be lost.

**Operator response:** If automatic message deletion is in effect, use conversational mode to verify message deletions before the system performs them. If you do not want conversational mode, delete the messages manually before the message area is filled.

**Source:** Communications task (COMMTASK)

---

**IEE162I  hh.mm.ss K COMMAND [idr]**

**Explanation:** A DISPLAY C,K command requested the display of CONTROL command functions. In response, the system issues this display message to summarize the operands in CONTROL commands. In the message text:

`hh.mm.ss` The time in hours (00-23), in minutes (00-59), and seconds (00-59).

`idr` An identifier used with the CONTROL C,D command to cancel status displays:

- Written on typewriter or printer consoles
- Displayed inline (that is, not in a display area) on a display console.

This identifier does not appear when the display is presented in a display area on a display console.

The rest of the message displays the operands in the CONTROL command.
The system continues processing.

Source: Communications Task (COMMTASK)

System action: The system continues processing.

Source: Communications Task (COMMTASK)

System action: The system ignores the action requested with the light pen. The system continues processing.

Operator response: Position the light pen or cursor on one of the following areas:

• Any position on a non-action message line.
• The asterisk on an action message line.
• A detectable CONTROL command option (such as \*F or \*E) in the control line of a status display.
• The instruction line.

IEE168D NOT ENOUGH RECONFIGURABLE STORAGE AVAILABLE. REPLY U TO USE PREFERRED STORAGE (ABOVE/BELLOW) OR REPLY C TO CANCEL.

Explanation: The operator entered a CONFIG STOR(E=x) command to configure a central storage element offline. In response, the system tried to swap storage containing fixed pages with storage containing swappable pages, but could not find enough storage containing swappable pages.

If you continue with the reconfiguration, the system will swap storage containing fixed pages with preferred storage, with preferred storage above 16 megabytes, and then, if necessary, with preferred storage below 16 megabytes. This swapping will decrease the amount of preferred storage available to the system and may cause performance degradation.

This message may appear if previous IAR005I messages have been issued.

System action: The system waits for the operator to reply.

Operator response: Do one of the following:
• Reply U to continue trying to vary the storage offline.
• Reply C to cancel the CONFIG STOR command.

VARY REJECTED, PATH(dev,xx) OFFLINE DUE TO sss

Explanation: A request was made to place online a path to a device through a channel path. However, the path is being kept offline by a system service.

In the message text:

dev,xx  The path representing the connection between the channel path xx and the device with device number dev.

sss  The service that is keeping the path offline. For example, sss might be System Automation. When sss is C.U.I.R., the operator’s request to vary the specified path online has been rejected because the path was varied offline by the Control Unit Initiated Reconfiguration (C.U.I.R.) service.

System action: The system does not process the VARY PATH command. The system continues processing.
Operator response:  Wait until the service specified by sss varies the path online. If sss is C.U.I.R., enter the VARY PATH ONLINE command with the FORCE operand to override the C.U.I.R. service.

Use the FORCE operand only when a path was never varied back online by the C.U.I.R. service after it completed a service action involving the path. This situation could occur if the customer engineer neglected to resume the path after finishing the service action or if the RESUME failed. If you do not use the FORCE operand to bring the path online in this situation, the path will remain offline for the life of the IPL.

IEE172I  ALL CHANNEL PATHS ON SIDE x ARE NOW (ONLINE/OFFLINE)

Explanation:  In response to a reconfiguration request, the system has successfully reconfigured all channel paths online or offline.

In the message text:

x  The side on which the system has successfully reconfigured channel paths.

ONLINE  The system has successfully reconfigured every channel path on side x online in response to a CONFIG CHP(ALL,x),ONLINE command.

OFFLINE  The system has successfully reconfigured every channel path on side x offline in response to a CONFIG CHP(ALL,x),OFFLINE command.

System action:  The system continues processing.

Source:  Reconfiguration

Detecting Module:  IEEVIOSR

Descriptor Code:  5

IEE173I  n CHANNEL PATH[S] ON SIDE x {IS|ARE} STILL (ONLINE/OFFLINE)

Explanation:  A reconfiguration request asked that the system reconfigure all channel paths on a side online or offline. The system could not successfully configure every channel path as requested.

In the message text:

n  The number of channel paths that the system could not configure.

x  The side on which the system could not reconfigure the channel paths.

ONLINE  The system could not configure every channel path on side x online.

OFFLINE  The system could not configure every channel path on side x offline.

System action:  The system continues processing.

Operator response:  Do the following:
1. Enter DISPLAY M=SIDE(x) to determine the status of the side.
2. Enter DISPLAY M=CHP(y) for each channel path y on side x that was not successfully reconfigured to determine the status of each channel path.

In the message text:

```plaintext
cpuid
```

The processor identifier.

- The state of the processor, Integrated Facility for Applications (IFA), or Integrated Cryptographic Feature (ICRF) attached to the processor, which is one of the following meanings:
  - The processor, Integrated Facility for Applications (IFA), or ICRF is online.
  - The processor, IFA or ICRF is offline.
  - There is no ICRF attached to this processor.
  - The processor is an IFA.
  - The processor is an IBM System z9® Integrated Information Processor or IBM System z10™ Integrated Information Processor (zIIP).
  - The processor ID is valid but the processor is neither online nor able to be configured online.
  - The processor is being managed by WLM and has not been configured offline by the operator.

- The 2-hex-digit user partition identifier, or 1-digit logical CPU address and 1-digit logical partition identifier, is followed by the last 4 digits of the CPU identification number, followed by the 4-digit machine type number.

- status is one of the following:
  - ONLINE
  - OFFLINE
  - NOT IN SYSTEM
  - SUBCHANNEL STATUS NOT AVAILABLE
  - SUBCHANNEL IN PERMANENT ERROR
  - DEVICE NOT AVAILABLE
  - DEVICE IS BOXED
  - ALIAS OF BASE bdev
  - UNBOUND ALIAS
  - HYPERPAV ALIAS
  - HYPERPAV ALIAS OF BASE bdev
  - ALIAS IS BOXED: RESIDUAL DATA FOLLOWS
  - UNSUSBLE HYPERPAV ALIAS
  - CHANNEL PATH NOT INSTALLED
  - SPECIAL

- nn A channel path (X’00’ through X’FF’) to the device.
  - The system might display from one to eight channel paths (nn). In a column under each nn, either Y or N indicates whether the condition in the corresponding row is true.

PATH ONLINE YIN
- The specified channel path is or is not configured online to the system.
  - Use the VARY PATH command to bring the channel path logically online.

CHP PHYSICALLY ONLINE YIN
- The specified channel path is or is not configured online to the hardware.
Use the CONFIG CHPID command to bring the channel path physically online.

**PATH OPERATIONAL Y/N**
The device did or did not respond to an attempted device selection on the channel path. The channel path might have been disconnected.

**PATH ATTRIBUTES pa**
The path attribute of the path is preferred (PF), non-preferred (NP), or not specified (NS). This line is only displayed if the device supports preferred pathing and at least one path has been through path validation. Since a path attribute is not known until the path is validated, an unspecified path attribute may appear for paths that are not yet validated.

**Note:** When the path attributes line is displayed, a symbol explanation line is also displayed.

**PATHS NOT VALIDATED**
For devices that are defined to come up offline, one of the following occurred during NIP processing:
- The system did not validate the paths
- A failure occurred while the system was validating the paths.

For devices that are 'genned' online, during NIP processing
- A failure occurred while the system was validating the paths.

Use the VARY device command to validate the paths.

**PAV BASE AND ALIASES pp**
For Active Parallel Access Volume (PAV) Base devices. This display shows the total number of exposures for the PAV. The total number of exposures is obtained by adding the base devices plus all aliases that are currently bound to the base device.

**Note:** This line is not displayed for non-PAV, HyperPAV and non-active base devices.

**HYPERPAV ALIASES CONFIGURED = nnn**

where

nnn
indicates the number of aliases configured in the same logical subsystem as the input device devn.

**HYPERPAV DEVICE OPERATING IN BASE ONLYMODE**
This message indicates that the input device is a HyperPAV device that is temporarily not allowed to use alias devices due to some condition.

**FUNCTIONS ENABLED = functions**
Displays what functions are enabled for the device. The following functions may be displayed:

- **MIDAW**
  Indicates that the Modified Indirect Addressing Word (MIDAW) facility is enabled for use. This implies that the control unit supports MIDAWs and that the operating system is enabled for MIDAWs.

- **ZHPF**
  Indicates that High Performance FICON for System z® (zHPF) facility is enabled for use. This implies that the control unit and channels support zHPF, and the operating system is enabled for zHPF.

- **HS**
  Indicates the device is being monitored by HyperSwap™.

**DEVICE HAS BEEN SWAPPED**
The device is part of a Special PPRC pair (3390B/3390D) that has been swapped.

**DEVICE STOPPED BY HYPERSWAP**
I/O activity to the device has been stopped because of the STOP option specification. See message IOSHM0303I for explanation of the STOP option.

**ALIAS OF BASE bdev**
For Active Parallel Access Volume (PAV) Alias devices. This display shows the base device number that the alias device is currently bound to.

bdev is the base device number for the PAV.

**UNBOUND ALIAS**
For Inactive Parallel Access Volume (PAV) Alias devices. This display is used when a PAV-alias is currently not bound to any base device.

**HYPERPAV ALIAS**
The alias is an unbound HyperPAV alias.

**HYPERPAV ALIAS OF BASE bdev**
The alias is a HyperPAV alias currently bound to device bdev

**ALIAS IS BOXED: RESIDUAL DATA FOLLOWS**
The input device was an alias device that is currently boxed

**UNUSABLE HYPERPAV ALIAS**
The input device was a HyperPAV alias that is currently unusable due to a no paths condition.

**CHANNEL PATH NOT INSTALLED**
Channel path specified in display of device with CHIPID is not installed for the device.

**Note:** For BOXED devices, the following residual data will be provided for debugging purposes: CHP, PATH ONLINE, and PATH OPERATIONAL.

**Detecting Module:** IEEMPDM

CHPID STATUS OUT OF SYNC,
PHYSICAL=status,
LOGICAL=status

Explanation:

CHPID STATUS OUT OF SYNC
A physical versus logical mismatch in the channel
path status has been detected. One of the reasons
this may occur is if the Hardware Management
Console (HMC) is used to configure this channel
path on or off. This causes the operating system’s
(S/W) view to be out of sync with the actual state
(H/W) and creates a physical versus logical
mismatch.

PHYSICAL
Channel path’s status as reported by hardware.

LOGICAL
Software’s representation of the channel path’s
physical status.

STATUS
Status of the channel path, which is one of the
following:
ONLINE
OFFLINE
If the use of HMC caused this mismatch, bring the channel path status back in sync by using one of the following MVS operator commands:

- If the physical status is online, `CONFIG CHP (chp), ONLINE`
- If the physical status is offline, `CONFIG CHP (chp), OFFLINE`

**Detecting Module:** IEEEDMCHP

**Routing Code:** -  
**Descriptor Code:** 4

**IEE174I (form 14 of 33)**  
`hh.mm.ss DISPLAY M [idr]`

**DISPLAY M RESOURCE ’xxxxxxx’ IS CURRENTLY IN USE**

**Explanation:** `xxxxxxx` is one of the following:

- CPU  
- PATH  
- STORAGE

A reconfiguration display request (a DISPLAY M command or an internal request) asked the system to display the status of one of the following:

- One or more channel paths by device  
- A central processor  
- A device  
- Expanded storage  
- Storage size  
- Hardware storage area (HSA)  
- A resource  
- A side  
- Central storage  
- Central storage element  
- Expanded storage element

This message displays the status of the requested storage.

In the message text:

- `hh.mm.ss`  
  - The time in hours (00 through 23), in minutes (00 through 59), and in seconds (00 through 59).
- `idr`  
  - The particular display option.
- `s`  
  - The number of physically online channel paths available to the indicated device. `s` can also be one of the following symbols:
    - Channel path `xx` does not exist.
    - Channel path `xx` is logically and physically offline to device number `dev`. The `CONFIG CHP(xx),ONLINE` command brings channel path `xx` logically and physically online to all devices connected to channel path `xx`.
    - Device is offline.
    - Channel path `xx` is logically offline but physically online to device number `dev`. The `VARY PATH(dev,xx,ONLINE)` command brings channel path `xx` logically online to device number `dev`.
- `#`  
  - Paths not validated: Online, physically online, and operational indicators are not equal.
    - The path is not operational.
    - The path is not validated: Online, physically online, and operational indicators are not equal.
    - The device is boxed.
    - The device is not available.
    - The subchannel `s` is not available.
    - The subchannel is in permanent error.
    - The UCB is an active (that is, Bound) alias UCB of a parallel access volume.
    - The UCB in an inactive (that is, UNBOUND) alias UCB of a parallel access volume.

**Source:** Reconfiguration

**Detecting Module:** IEEMPDM

Or:

NO DEVICES ARE ACCESSIBLE THROUGH THIS CHANNEL PATH.

Or:

COUPLING FACILITY type info. sequence
PARTITION: partition name
CPCID: opcrid
CONTROL UNIT ID: cunit
A reconfiguration display request (a DISPLAY M=CHP(chp) command) asked the system to display the status of a channel path and the devices connected to it.

In the message text:

- **CHPID nn**
  A channel path (X'00' through X'FF').

- **TYPE=tt**
  tt is the channel path type.

- **DESC=description**
  Full description of the channel path type tt. For a complete list of channel path types, please see the section on message IEE174I Channel Path Type Status.

- **dev**
  The first 3 digits of the 4 digit device number. The last digit is indicated by the row of hexadecimal digits above the corresponding status positions. In the above example, dev0 is ONLINE and dev7 is OFFLINE.

- **ssss**
  If the channel path is switch-attached, then this is the switch device number. Otherwise, it is ‘NONE’.

- **ss**
  If the processor is cascade-capable and the channel path is native FICON and switch-attached, then this is the logical switch number.

- **ttttt.mmm.nnn.ppp.sssssssssssss**
  If the processor is cascade-capable and the channel path is native FICON, then this is the node descriptor of the device to which the channel is attached. These descriptors are made up of the following:
  - tttt Type number of the device.
  - mmm The model number of the device.
  - nnn The manufacturer identification code.
  - pp The plant of manufacture number.
  - sssssssssss The sequence number, unique device number.

- **cccc**
  Physical channel identifier associated with the channel, if any.

- **facility1, facility2,**
  A list of facilities supported by the channel. The following facilities may be displayed:

  - **ZHPF**
    Indicates that High Performance FICON for System z (zHPF) facility is supported by the channel.

  - **type**
    Node type (See ndetype in IXLYNDE).

  - **mfg**
    Node manufacturer ID (See ndemfg in IXLYNDE).

  - **plant**
    Node manufacturer plant ID (See ndeplant in IXLYNDE).

  - **sequence**
    Node sequence number (See ndesequence in IXLYNDE).

  - **partition**
    Node LPAR partition number (See ndepartition in IXLYNDE).

  - **side**
    The node PP/SI mode indicator and configuration code from the IXLYNDE are used to determine the value for side. Value and meaning are:
    - **SIDE: 0** means the coupling facility is on SIDE 0 of a partitionable CPC.
    - **SIDE: 1** means the coupling facility is on SIDE 1 of a partitionable CPC.
    - blank means the coupling facility is in a non-partitionable CPC.

  - **cpcid**
    Node Central Processor Complex (CPC) ID (See ndecpcid in IXLYNDE).

  - **cuid**
    Control unit number of the coupling facility.

  - **cfname**
    Name of the coupling facility from the CFRM active policy.

  - **chpid / pchid**
    CHPID and/or PCHID for the coupling facility sender.

  - **phystatus**
    One of the following:
    - **ONLINE**
      The path, chpid to the coupling facility cfname is physically available for use. The chpid is configured online and is operating.
    - **OFFLINE**
      The path, chpid to the coupling facility cfname is configured offline.
    - **MISCABLED**
      The path, chpid to the coupling facility cfname is not connected to the correct facility.
    - **NOT OPERATIONAL**
IEE174I (form 18 of 33)

- When displayed under **SENDER PATH** header, it indicates that the path `chpid`, to the coupling facility `cfname`, is not operational.
- When displayed under **COUPLING FACILITY DEVICE** header, it indicates that the coupling facility subchannel `subchannel`, to the coupling facility `cfname`, is not operational.

**NOT CONNECTED**
The path, `chpid` to the coupling facility `cfname` is defined to a control unit that is accessible by this partition. However, the `chpid` is not accessible by the partition (not in the access list nor the candidate list for this partition). The partition cannot access this `chpid`.

**FACILITY PAUSED**
The path, `chpid` to the coupling facility `cfname` is not operational. The most recent path validation operation attempted for this path received a facility paused status condition.

**PATH NOT AVAIL**
The path, `chpid` to the coupling facility `cfname` is not operational. The most recent path validation operation attempted for this path received a path not available status condition.

**logstatus**
One of the following:

- **ONLINE**
The path `chpid` to the coupling facility `cfname` is logically online.
- **OFFLINE**
The path `sender chpid` to the coupling facility `cfname` is logically offline.

**channeltype**
One of the following:

- **CFS**
The channel path type description of path `chpid` is a Coupling Facility Sender.
- **CBS**
The channel path type description of path `chpid` is a Coupling Facility Integrated Cluster Bus Sender.
- **ICS**
The channel path type description of path `chpid` is an Internal Coupling Sender.
- **CBP**
The channel path type description of path `chpid` is a Coupling Facility Integrated Cluster Bus Peer Channel.
- **CFP**
The channel path type description of path `chpid` is a Coupling Facility Peer Channel.

**ICP**
The channel path type description of path `chpid` is an Internal Coupling Peer Channel.

**device**
Coupling facility device.

**subchannel**
Coupling facility subchannel.

**status**
The status of the channel path, which is one of the following:

- **OPERATIONAL/IN USE**
The coupling facility subchannel `subchannel` to the coupling facility `cfname` is operational and available for operations.
- **OPERATIONAL/NOT IN USE**
The coupling facility subchannel `subchannel` to the coupling facility `cfname` is operational but not currently in use.
- **ONLINE**
The channel path is online to the device.
- **OFFLINE**
The channel path is offline to the device.
- **DOES NOT EXIST**
The channel path to the device does not exist.
- **PHYSICALLY ONLINE**
The channel path is physically connected to the device.
- **PATH NOT OPERATIONAL**
The channel path is validated, but not operational.
- **PATHS NOT VALIDATED**
The I/O check of the paths to a device has failed (unable to validate those paths) indicating the display shown may not be accurate.

**hh.mm.ss DISPLAY M**

**SWITCH ssss, PORT pa,**
**DCM STATUS=**
**ATTACHED NODE =**
**ttttt.mmm.nnn.pp.sssssssssss**

Explanation: A reconfiguration display request (a DISPLAY M=SWITCH(dev,pa) command) asked the system to display the status of a particular port on the specified switch device.

In the message text:

**sss**
The requested switch device number.
IEE174I (form 21 of 33)

The specific port on the switch device.

The status of the port specified, which can be one of the following:

DCM ALLOWED
This port is configured to allow management by dynamic channel path management.

DCM NOT ALLOWED BY OPERATOR
This port is temporarily ineligible for management by dynamic channel path management because the operator is using either the VARY SWITCH or CF MEMBER(xx) command, or because programs are using the IOSVRYSW programming interface.

NOT DCM ELIGIBLE
This port is not connected to a managed subsystem that support dynamic channel path management.

DCM NOT ALLOWED DUE TO PORT STATE
This port is blocked or otherwise physically ineligible to be managed by dynamic channel path management.

CHANNEL ATTACHED
This port is connected to a channel.

UNABLE TO DETERMINE CURRENT ATTACHMENT
The currently attached element cannot be determined from the provided self description information (that is, the node descriptor).

NOT ATTACHED
No element is attached at this implemented port address.

DOES NOT EXIST
This port is not implemented or not installed.

The attached node descriptor for the subsystem or channel attached to the specified port, made up of the following:

Type number of the device.
Model number of the device.
Manufacturer identification code.
Plant of manufacture number.
Sequence number, unique device number.

NOT OPERATIONAL REASON TEXT
PAY BASE AND ALIASES = PP

A reconfiguration display request (a DISPLAY M=DEV(dev(chp)) command or an internal request) asked the system to display the status of a device for one channel path to the specified device.

In the message text:

nnnn
The device number.

status
The status of the device, which can be one of the following:

ONLINE
OFFLINE
NOT IN SYSTEM
SUBCHANNEL STATUS NOT AVAILABLE
DEVICE NOT AVAILABLE
ALIAS of BASE nnnn

DEVICE IS BOXED: RESIDUAL DATA follows

Note: For BOXED devices, the following residual data will be provided for debugging purposes: CHP, PATH ONLINE, and PATH OPERATIONAL.

PATHS NOT VALIDATED
The I/O check of the paths to a device has failed (unable to validate those paths) indicating the display shown may not be accurate.

SPECIAL
The device is of a 3390S or 3390D device type.

CHP nn
A channel path (X'00' through X'FF' to the device. Under each nn is Y or N indicating whether the corresponding condition is true or not.

ENTRY LINK ADDRESS la
A 1-byte or 2-byte physical link address of the channel path to the entry switch. If 1 byte, it is the link address. If 2 bytes, the first byte is the switch address (domain) and the second byte is the entry port address (area). This information will only be displayed when the cascade facility is available. Also, if there is no link number IEDMDEV module puts "..." in the first byte of the link address and blanks in the other.

DEST LINK ADDRESS la
A 1-byte or 2-byte address of a control unit that is used to access the I/O device associated with the specified channel path. If 1 byte, it is the link address. If 2 bytes, the first byte is the switch address (domain) and the second byte is the destination port address (area).

MANAGED Y|N
The channel path is or is not defined as managed. This line will be displayed only for a managed subsystem.

MAXIMUM MANAGED CHPID(S) ALLOWED =n
The maximum number of managed channels that may be assigned to this subsystem. A subsystem may have a value greater than 0 and still not have any managed channels attached. This line will be displayed only for a managed subsystem.

DESTINATION CU LOGICAL ADDRESS=da
The logical link address of a control unit that is used to access the I/O device associated with the specified channel paths.

CCCC
The control unit that was specified.

CU NUMBER
Control unit number of attached control unit

SCP CU ND
Node descriptor last obtained by the system control program (SCP).

ACTUAL CU ND
Node descriptor of the attached subsystem read from the device in response to this command.

SCP TOKEN NED
Node-element descriptor last obtained by the SCP.

ACTUAL TOKEN NED
Node-element descriptor read from the device in response to this command.

SCP Device NED
Node-element descriptor last obtained by the SCP.

ACTUAL Device NED
Node-element descriptor read from the device in response to this command.

RNID
Remote node identifier

NOT OPERATIONAL REASON TEXT
First line of text contains the general reason for the not operative path.
Second line of text, if it exists, contains the specific reason for the not operative path.

ttttt.mmm.nnn.pp.sssssssssss.uuuu
These descriptors are made up of the following:

- ttttt
  Type number of the device.

- mmm
  Model number of the device.

- nnn
  Manufacturer identification code.

- pp
  Plant of manufacture number.

- sssssssssssss
  Sequence number, unique device number.

- uuuu
  Two byte tag.

Routing Code: -
Descriptor Code: 4

A 1-byte or 2-byte physical link address of the channel path to the entry switch. If 1 byte, it is the link address. If 2 bytes, the first byte is the switch address (domain) and the second byte is the entry port address (area). This information will only be displayed when the cascade facility is available.

CHP PHYSICALLY ONLINE Y|N
The specified channel path is (Y) or is not (N) configured online to the hardware.

PATH VALIDATED Y|N
The I/O check of the paths to a device was successful (Y) or has failed (N).

MANAGED Y|N
The channel path is (Y) or is not (N) defined as managed. This line will be displayed only for a managed subsystem.

MAXIMUM MANAGED CHPID(S) ALLOWED=n
The maximum number of managed chips that can be used by the control unit.

DESTINATION CU LOGICAL ADDRESS=da
The logical link address of a control unit that is used to access the I/O device associated with the specified channel paths.

CCCC
The control unit that was specified.

CU ND
Node descriptor of the attached subsystem.

CU NED
Node-element descriptor that was most recently obtained from the control unit.

DEFINED DEVICES
dddd
A list of devices defined for the specified control unit are displayed.

DEFINED PAV ALIASES
aaaa
A list of PAV ALIASES defined for the specified control unit is displayed.

ttttt.mmm.nnn.pp.ssssssssssss.uuuu
These descriptors are made up of the following:

ttttt
Type number of the device.

mmm
Model number of the device.

nnn
Manufacturer identification code.

pp
Plant of manufacture number.

ssssssssss
Sequence number, unique device number.

uuuu
Two-byte tag.

Routing Code: -
Descriptor Code: 4
display the status of selected central processors. When you issue the DISPLAY M=CPU command from a PR/SM partition, the system displays the status for the logical processors, and ICRFs defined to the partition.

Note: If the crypto facility is not installed, the CR does not appear.

The system information presented on the CPC SI line reflects any dynamic upgrades that have been performed. The information presented on the CPC ND and CPC ID lines remain unchanged across any such upgrades.

In the message text:

**cpuid**
The processor identifier.

The state of the processor, Integrated Facility for Applications (IFA), or Integrated Cryptographic Feature (ICRF) attached to the processor, which is one of the following meanings:

- The processor, IFA, or ICRF is online.
- The processor, IFA, or ICRF is offline.
- There is no ICRF attached to this processor.

**A** The processor is an IFA.

**N** The processor ID is valid but the processor is neither online nor able to be configured online.

**W** The processor is being managed by WLM and has not been configured offline by the operator.

**ser_no**
Processor serial number.

**CPC ND = ttttt.nnn.mm.pp.sssssssssss**
The central processing complex node descriptor, in EBCDIC, where

- **tttttt** Designates the type number.
- **nnnn** Designates the model number of the processor at the last IML/POR.

Note: If the processor is concurrently upgraded to a new model, this number will not reflect the new model until the next processor IML/POR.

- **mmm** Designates the manufacturer.
- **ppp** Designates the plant of manufacture.
- **ssssssssss** Designates the sequence number.

**CPC SI = text02**
text02 is

The system information from the STSI instruction, in EBCDIC, where

- **tttt** Designates the type number.

- **nnnnnnnnnnnnnn** Designates the model-capacity identifier on 2084 and later processors and the model number on prior processors.

Note: On a 2084 or later processor, the model-capacity identifier is updated after a concurrent upgrade.

- **mmmmmmmmmmmmmmmmmm** Designates the manufacturer.
- **pppp** Designates the plant of manufacture.
- **ssssssssssssss** Designates the sequence number.
- **ooooooo0000000** Designates the model number.

Notes:

1. If the processor is concurrently upgraded to a new model, the model number in field oooooooo0000000 will reflect the new model without a processor IML/POR.
2. The line that begins "Model:" will only be displayed if model number oooooooo0000000 differs from model number/model-capacity identifier nnnnnnnnnnnnnnnn.

**CPC ID = ii**
The central processing complex node identifier, in binary.

**CPC NAME = cpc_name**
The central processing complex name, in EBCDIC.

**LP NAME = lp_na**
The logical partition name, in EBCDIC.

**LP ID = jj**
The logical partition identifier, in binary.

**CSS ID = cc**
The logical channel subsystem identifier, in binary. The CSS ID will not appear if you are running on an IBM @server zSeries® 990 processor.

**MIF ID = m**
The multiple image facility identifier, in binary. The MIF ID will only appear if you are running in LPAR mode.

{00 s . . . . . . . . s}
{01 s . . . . . . . . s}
... 
{FF s . . . . . . . . s}
[PATHS NOT VALIDATED]

A reconfiguration display request (a DISPLAY M=DEV command or an internal request) asked the system to display the status of all devices in the system. The first 2 digits of the device number appear as X'00' through X'FF' down the left; digit 3 is X'0' through X'F' across the top.

Routing Code: -
Descriptor Code: 4

EXTENDED STORAGE STATUS ONLINE - [NOT] RECONFIGURABLE aaaaM-bbbbM

[ccccK BAD EXTENDED STORAGE]
[PENDING OFFLINE {xxxxxxxxxINONE}dddM IN OFFLINE STORAGE ELEMENT(S)]
[dddM IN ANOTHER CONFIGURATION]
[ESTOR PARAMETER NOT SUPPORTED]

Explanation: A reconfiguration display request (a DISPLAY M=ESTOR command or an internal request) asked that the range of expanded (extended) storage that is either available or unavailable to the system be displayed.

In the message text:

aaaaM-bbbbM
The range of expanded storage that is either available or unavailable to the system.

ccccK
The number of kilobytes of bad expanded storage.

PENDING OFFLINE xxxxxxx
The expanded storage blocks for which the offline request has been issued but not yet completed. xxxxxxxx is the hexadecimal address.

PENDING OFFLINE NONE
The expanded storage blocks for which the offline request has been issued but not yet completed; there is no expanded storage available.

dddM IN OFFLINE STORAGE ELEMENT(S)
The total number of megabytes of storage in an offline expanded storage element or elements. This amount of storage comes online when the element is brought online. Enter a CONFIG ESTOR(E=id), ONLINE command to bring the expanded storage element online.

dddM IN ANOTHER CONFIGURATION
The number of megabytes of storage that is either:
• In another partition
• In a maintenance or service configuration

Note: All the storage in another configuration might not be reported as such when a machine is physically partitioned. If there is some storage that cannot be moved between partitions, this storage might not be reported in this message.

ESTOR PARAMETER NOT SUPPORTED
The service processor does not support expanded storage.

Routing Code: -
Descriptor Code: 4

STORAGE SIZE STATUS

HIGH REAL STORAGE ADDRESS IS xxxxxxM'zzzzzz'M HIGH EXTENDED STORAGE ADDRESS IS yyyyyyM'wwwwww'M

Explanation: A reconfiguration display request (a DISPLAY M=HIGH command or an internal request) asked that the highest possible central (real) storage address and the highest possible expanded storage address in the system be displayed.

In the message text:

xxxxxxM
The highest central storage address, in decimal megabytes.

X'zzzzzz'M
The highest central storage address, in hexadecimal megabytes.

yyyyyyM
The highest expanded storage address, in decimal megabytes.

X'wwwwww'M
The highest expanded storage address, in hexadecimal megabytes.

Routing Code: -
Descriptor Code: 4

HSA STATUS

{ADDRESS={xxxxxx I zzzzzzzz} LENGTH=yyyyyyKINO HSA IN MAIN STORE}

Explanation: A reconfiguration display request (a DISPLAY M=HSA command or an internal request) asked that the status of the hardware system area...
(HSA) be displayed. The second line appears once for each HSA in the system.

In the message text:

\[ \text{xxxxxx} \]

The central storage starting address of the HSA, in decimal kilobytes.

\[ \text{zzzzzzzz} \]

The central storage starting address of the HSA, in hexadecimal bytes.

\[ \text{yyyyyyy} \]

The length of the HSA, in decimal kilobytes.

**NO HSA IN MAIN STORE**

No HSA exists in central (main) storage.

**Routing Code:** -

**Descriptor Code:** 4

- **CHP:** list
- **STOR(x=+)** list
- [**ESTOR(x=+)** list]
- **TOTAL STOR:** ddddm
- [**TOTAL ESTOR:** ddddm]
- \* = OFFLINE

The total storage or expanded storage, in decimal megabytes.

**UNASSIGNED:** ddddm

The part of storage in online central storage elements, in decimal megabytes. This storage can be brought online with a CONFIG STOR(dddM),ONLINE command.

**Routing Code:** -

**Descriptor Code:** 4

---

### IEE174I (form 29 of 33) **SIDESTATUS**

**Explanation:** A reconfiguration display request (a DISPLAY M [=SIDE(id)] command or an internal request) asked the system to display the status of the selected sides in the system and the status of the resources that make up each side. An error occurred and the system could not display the status of the sides you requested.

**Routing Code:** -

**Descriptor Code:** 4

---

### IEE174I (form 30 of 33) **hh.mm.ss DISPLAY M [idr]**

**REAL STORAGE STATUS**

**Explanation:** A reconfiguration display request (a DISPLAY M command, DISPLAY M=STOR command, DISPLAY M=STOR(range) command, or an internal request) asked the system to display the status of blocks of central (real) storage frames.

**Routing Code:** -

**Descriptor Code:** 4
The status of a block or range of blocks, which is one of the following:

**OFFLINE**
The central storage blocks that are offline.

**ONLINE - NOT RECONFIGURABLE**
The central storage blocks that are online and are not reconfigurable or pending offline.

**PENDING OFFLINE**
The central storage blocks for which an offline request has been issued but not yet completed.

**ONLINE - RECONFIGURABLE**
The central storage blocks that are online and are not pending offline or preferred.

**dd d M IN OFFLINE STORAGE ELEMENT(S)**
The number of megabytes of central storage in an offline storage element or elements. Each element can be brought online using a CONFIG STOR(E=id),ONLINE command.

**dd d M UNASSIGNED STORAGE**
The number of megabytes of storage that is available to be brought online in online storage elements. The storage can be brought online with a CONFIG STOR (dddM),ONLINE command.

**dd d M IN ANOTHER CONFIGURATION**
The number of megabytes of storage in either:
- Another partition
- A maintenance or service configuration

**STORAGE INCREMENT SIZE IS xx M**
The number of megabytes of central storage in each storage increment.

Under each status line, the storage blocks are identified. *blocks* is one of the following:

**xxxxxxxx**
The address of the storage block, in hexadecimal.

**ccccM-ddddM**
The address range of the storage blocks, in decimal megabytes.

**xxxxxxxx-xxxxxxxx**
The address range of the storage blocks, in hexadecimal.

**FIRST aaK OF EVERY bbK FROM ccccM TO jjjM**
This status is for the first aaK of storage at multiples of bbK in the range of cccc to jjj decimal megabytes.

**SECOND aaK OF EVERY bbK FROM ccccM TO jjjM**
This status is for the second aaK of storage at multiples of bbK in the range of cccc to jjj decimal megabytes.

**NONE**
No frames have this status.

**addstat**
One of the following:

**BAD FRAMES address**
The central frame that begins at address has a storage error. This message text appears when *status* is either:

**ONLINE - NOT RECONFIGURABLE**

**ONLINE - RECONFIGURABLE**

**PENDING STATUS DUE TO:**

**RANGE ASID JOBNAME**
address-range asid jobname

address-range asid jobname

These lines identify central storage that cannot be released yet. The storage range is given as contiguous frames. For each range of contiguous frames, the address space identifier (ASID) and the job name are given whenever possible. If asid is ????? or jobname is ??????, the system could not obtain the ASID and job name for the frame. If the ASID is blank and the JOBNAME is "SHARED", the storage is shared through the use of the IARVSERV macro.

**Detecting Module:** IEEMPDM

**Routing Code:** -

**Descriptor Code:** 4

**Explanation:** A reconfiguration display request (a DISPLAY M=[STOR(E)|STOR(E=|id]) command, a DISPLAY M=[ESTOR(E)|ESTOR(E=|id]) command, or an internal request) asked the system to display the status of all storage elements by storage element identifier.

In the message text:

**id** The storage element identifier.

**xxM**
The amount of owned storage, in decimal megabytes.

**X’zz’M**
The amount of owned storage, in hexadecimal megabytes.
**UNASSIGNED STORAGE = yyM**: The number of megabytes of storage in the storage element with no addresses assigned. This storage can be brought online with a CONFIG STOR range or amount request. **stat** is the status of the storage element, which is one of the following:

- **ONLINE**: Storage element id is physically online.
- **OFFLINE**: Storage element id is physically offline.

**STOR(E) PARAMETER NOT SUPPORTED**
- The service processor does not support information about central (real) storage or expanded storage elements.

**ESTOR(E) PARAMETER NOT SUPPORTED**
- The service processor does not support information about expanded storage elements.

**STOR(E) STATUS NOT OBTAINED**: The system failed to obtain the status of the central or expanded storage element(s) from the service processor.

**ESTOR(E) STATUS NOT OBTAINED**: The system failed to obtain the status of the central or expanded storage element(s) from the service processor.

In the message text:

- **text**: The reason for the failure, which is one of the following:
  - **INVALID ID**: An incorrect storage element identifier was specified in either the DISPLAY M=STOR(E=id) or the DISPLAY M=ESTOR(E=id) command.
  - **SERVICE PROCESSOR CALL FAILED**: An error occurred in the service processor call interface.
  - **SERVICE PROCESSOR FAILURE**: An internal error occurred in the service processor.
  - **STOR(E=id) IS PART OF ANOTHER CONFIGURATION-NO STATUS OBTAINED**
  - **ESTOR(E=id) IS PART OF ANOTHER CONFIGURATION-NO STATUS OBTAINED**

**ROUTE174I (form 32 of 33)**
- **DISPLAY M RESOURCE 'xxxxxx' IS CURRENTLY IN USE**

**Explanation**: In response to a reconfiguration request, the system tried to vary one of the following offline:
- A Vector Facility

Descriptor Code: 7

IEE178I AUTOMATIC RECOVERY IS IN PROGRESS NO OPERATOR ACTION IS REQUIRED.

[PROCESSOR(y) DETECTED AN EXCESSIVE DISABLED SPIN LOOP WAITING FOR event FROM PROCESSOR(x).] | [A SIGP(event) OCCURRED WHEN PROCESSOR(y) TRIED TO SIGNAL PROCESSOR(x).] AUTOMATIC RECOVERY ACTION IS action

[optional-text]

Explanation: optional-text is one of the following:

ACR IS ALREADY IN PROGRESS, SPIN WILL CONTINUE
ABEND/TERM COULD NOT BE INITIATED, SPIN WILL CONTINUE
PROCESSOR IS IN A VALID SPIN, SPIN WILL CONTINUE

The system is in a spin loop on one central processor, waiting for an event on another central processor. This message reappears at regular intervals until either:

• The recovery action resolves the spin loop
• The system enters non-restartable wait state X'0A1'

In the message text:

y The processor that detected the spin loop.

x The processor on which an event is to occur.

event For SIGP failures, one of the following:

SIGP(NOT OPERATIONAL)
SIGP(EQUIPMENT CHECK)
SIGP(CHECK STOP)
SIGP(NOT READY)
SIGP(BUSY CONDITION)
SIGP(RECEIVER CHECK)

For non-SIGP failures, one of the following:

RISGNL RESPONSE
LOCK RELEASE
RESTART RESOURCE
ADDRESS SPACE TO QUIESCE
action
Automatic spin loop recovery processing chooses the appropriate recovery action. It is one of the following:

SPIN
The system continues spinning

ABEND
The system abnormally ends the unit of work on processor \( x \), allowing recovery routines to retry

TERM
The system abnormally ends the unit of work on processor \( x \), without allowing recovery routines to retry

ACR
ACR places processor \( x \) offline. ACR abnormally ends the current unit of work on processor \( x \).

ACR IS ALREADY IN PROGRESS, SPIN WILL CONTINUE
Because the system was processing another alternate CPU recovery (ACR) request, the system continues the spin loop.

ABEND/TERM COULD NOT BE INITIATED, SPIN WILL CONTINUE
Because the system could not begin restart processing for an ABEND or TERM recovery action, the system continues the spin loop.

PROCESSOR IS IN A VALID SPIN, SPIN WILL CONTINUE
Due to the duration of their processing time, some system routines cause other processors to spin for a longer time than the spin loop timeout interval. One of these routines was running, so the system performed the SPIN recovery action.

System action: The system tries to resolve the spin loop by taking the recovery action appearing in the message text. If the first recovery action does not resolve the spin loop, recovery continues until one of the following occurs:
- The system-initiated recovery actions resolve the spin loop
- The system enters wait state X’0A1’. This occurs when all pre-defined recovery actions are exhausted.

System programmer response: If the system enters wait state X’0A1’, see the system programmer response for this wait state.

**IEE186I**

command COMMAND NOT PROCESSED. reason

**Explanation:** The command that was issued could not be processed by the system.

In the message text:

**command**
The command that was not processed.

**reason**
One of the following:

- **SECURITY INTERFACE DORMANT.**
  - command cannot be processed until the security product becomes active.

- **LOGON REQUIRED.**
  - command cannot be processed until an operator logs on to the console.

- **CONSOLE NOT LOGGED ON.**
  - command cannot be processed because the console is not logged on.

- **NOT AUTHORIZED FOR CONSOLE.**
  - The user that attempted to log on is not authorized to log on to that console.

- **FAILED BY INSTALLATION EXIT.**
  - A SAF exit has rejected command.

- **USERID userid NOT DEFINED.**
  - userid is not defined to the security product.
    - userid
      The userid that is not defined.

- **USERID userid REVOKED.**
  - userid is not allowed to access the system.
    - userid
      The userid that is not allowed to access the system.

- **NOT AUTHORIZED FOR SMCS APPLID smcsappl.**
  - The SMCS console is not authorized for smcsappl.
    - smcsappl
      The smcs applid.

**System action:** The command is not processed.

**Operator response:** If the message text contains SECURITY INTERFACE DORMANT, contact your system programmer.

- If the message text contains LOGON REQUIRED, logon to the console with a userid that is authorized to issue command and reissue the command.

- If the message text contains CONSOLE NOT LOGGED ON, command must be issued from a logged on console.

- If the message text contains USERID userid NOT...
DEFINED, logon to the console with a userid defined to the security product. If userid should be defined to the security product, contact your system programmer.

If the message text contains USERID userid REVOKED, contact your system programmer.

If the message text contains NOT AUTHORIZED FOR CONSOLE, contact the system programmer.

If the message text contains NOT AUTHORIZED FOR SMCS APPLID smcsappl, contact your system programmer.

If the message text contains FAILED BY INSTALLATION EXIT, contact the system programmer.

System programmer response: If the message text contains SECURITY INTERFACE DORMANT, determine why the security product is inactive and take appropriate steps to activate it.

If the message text contains USERID userid NOT DEFINED, determine why userid is not defined to the security product. Then define userid to the security product as appropriate.

If the message text contains USERID userid REVOKED, determine why userid has been revoked and reinstate userid as appropriate.

If the message text contains NOT AUTHORIZED FOR CONSOLE, grant authorization so the user can log on to that console as appropriate.

If the message text contains NOT AUTHORIZED FOR SMCS APPLID smcsappl, grant the SMCS console access to smcsappl as appropriate.

If the message text contains FAILED BY INSTALLATION EXIT, determine which exit rejected command and change the exit to allow command as appropriate.

Descriptor Code: 5

IEE187I ENTER LOGON PARAMETERS [text]

Explanation: text is one of the following:

USERID NOT DEFINED
USERID NOT SPECIFIED
PASSWORD INCORRECT
PASSWORD EXPIRED
PASSWORD NOT SPECIFIED
NEW PASSWORD NOT ACCEPTED
GROUP NOT DEFINED

GROUP ACCESS REVOKED

SECLABEL NOT DEFINED

If the message text does not give a problem, the multiple console support (MCS) console is ready for the operator to logon. If the message does give a problem, the system denied the operator access.

In the message text:

USERID NOT DEFINED
The operator attempted to log on specifying a userid that was not defined to the security product.

USERID NOT SPECIFIED
The operator attempted to logon without specifying a userid.

PASSWORD INCORRECT
The operator attempted to logon specifying an incorrect password.

PASSWORD EXPIRED
The operator attempted to logon specifying a password that has expired. The installation determines the length of time that a password remains valid.

PASSWORD NOT SPECIFIED
The operator attempted to logon without specifying a password.

NEW PASSWORD NOT ACCEPTED
The operator attempted to logon and change the password, but the system did not accept the password for one of the following reasons:
• The two new passwords did not match
• The new password did not conform to the password syntax rules set by the installation.

GROUP NOT DEFINED
The operator attempted to logon, specifying a group that was not defined to the security product.

GROUP ACCESS REVOKED
The operator attempted to logon specifying a group to which access has been revoked for that operator.

SECLABEL NOT DEFINED
The operator attempted to logon specifying a security label that was not defined to the security product.

The system displays message IEE187I in the instruction line of the MCS console. It is accompanied by the MCS logon prompt, which is displayed in the command entry area of the console. The logon prompt provides the operator with fields to enter a userid, password, optional group identifier, and optional SECLABEL parameter.

System action: The system continues processing while the operator tries to logon again.
Operator response: Depending on the message text, do the following:

USERID NOT DEFINED
Specify a different userid and try to logon again, or contact the security administrator to have the userid defined to the system.

USERID NOT SPECIFIED
Specify a valid userid and try to logon again.

PASSWORD INCORRECT
Enter the correct password when try to logon again.

PASSWORD EXPIRED
Change the existing password by specifying the old and new passwords together in this format: old-password/new-password/new-password. When automatic logon is in effect, operators can log on to the system but are not required to do so. If an attempt to logon fails, then the system displays this message inline (that is, not in a display area) instead of on the instruction line, where this message usually appears. This message also appears without the MCS LOGON prompt. You must reenter the LOGON command to enter the userid, password, new password, group id, and security label.

PASSWORD NOT SPECIFIED
Specify a valid password and try to log on again.

NEW PASSWORD NOT ACCEPTED
Enter a valid password when you try to logon again.

GROUP NOT DEFINED
Specify a valid group or leave the field blank when you try to logon again.

GROUP ACCESS REVOKED
Either specify a valid group to which access has not been revoked or leave the field blank when you try to logon again.

SECLABEL NOT DEFINED
Either specify a valid security label or leave the field blank when you try to logon again.

IEE188I hh.mm.ss MPF DISPLAY idr

text

Explanation: Where text is:

[status]
MESSAGE-ID SUP RETAIN USER EXIT MPF=xx
msgid {Y|N} {Y|N} {ERR-|NFD-}userid

GENERAL WTO USER EXIT (IEAVMXIT) -
{ACTIVE|INACTIVE|ABENDED, NOT ACTIVE}

FIELD COLOR HLIGHT INTEN MPF={xx|DFL}
msgtype ccc hhh iii

{COMMAND USER EXITS NOT FOUND}
{COMMAND-USEREXIT} {MPF=xx}
{NFD-|ERR-} {e-id}

In response to the DISPLAY MPF command, this message displays the message facility.

If the operator requested MPF processing, the message contains the third line once and the fourth line as often as needed to display each message in the MPF table.

In the message text:

hh.mm.ss
The hour, minute, and second that the command was entered. If the time-of-day clock (TOD) is not working, the value in this field is 00.00.00.

idr An identifier used with the CONTROL C,D command to cancel status displays:

- Written on typewriter or printer consoles
- Displayed inline (that is, not in a display area) on a display console

This identifier does not appear when the display is presented in a display area on a display console.

status
One of the following:
MESSAGE SUPPRESSION AND USER EXITS
INACTIVE - NOT INITIALIZED
The operator has not requested MPF processing. This line appears if the MPF is not active.

MESSAGE SUPPRESSION INACTIVE - HARDCOPY LOG NOT ESTABLISHED
The operator has requested MPF processing, but no hard-copy log has been established. WTO user exit routines receive control, but messages are not suppressed. This line appears if the MPF is not active.

MESSAGE SUPPRESSION INACTIVE - HARDCOPY SUSPENDED
The operator has requested MPF processing, and a hard-copy log has been established, but no device is available to print the hard-copy log. WTO user exit routines receive control, but messages are not suppressed. This line appears if the MPF is not active.

MESSAGE-ID
msgid
The message identifier.

SUP
One of the following:
Y Indicates that the message is to be suppressed if it is eligible.
N Indicates that the message is not to be suppressed.

RETAIN
One of the following:
Y The action message retention facility will retain the message if it is eligible.
N The action message retention facility will not retain the message.

USER EXIT
The corresponding user-specified WTO exit routine or blank, if no routine was specified, and one of the following:
ERR A failure occurred in the exit routine. The exit routine is no longer active.
NFD The exit routine could not be loaded.

MPF=xx
One of the following:
xx The two-digit number the operator entered on the SET MPF=xx command to change the color, intensity, and highlighting attributes; this xx is the last two digits of an MPFLSTxx member in SYS1.PARMLIB.

DFL MPF processing is using the default attributes.

GENERAL WTO USER EXIT (IEAVMXXIT)
Indicates whether the exit routine is ACTIVE, INACTIVE, or NOT ACTIVE because the exit routine was abnormally ended.

FIELD
msgtype
The message type, which is one of the following:
URGATTN Messages requiring urgent attention
IMEDACTN Messages requiring immediate action
EVETACTN Messages requiring eventual action
GENMSG General system messages
PPMSG Messages issued by problem programs and requiring no action

SELPPEN Fields that can detect a selector (light) pen

INSTRERR Error messages that appear in the instruction line

ENTRYARA Entry area

WARNLGEN General messages in the left half of the warning line

WARNRGEN General messages in the right half of the warning line

WARNRURG Messages requiring urgent attention and appearing in the right half of the warning line

OOLCNTL Control lines in an out-of-line status display

OOLLABEL Label lines in an out-of-line status display

OOLDATA Data lines in an out-of-line status display

COLOR
ccc
The color attribute of the field, which is one of the following:
BLUE
TURQU (turquoise)
GREEN
WHITE
PINK
YELLOW
RED

HIGHLIGHT
The highlighting with which the message or field is displayed. The values are:

- **NONE**
  - No highlighting. No colored characters on a black background.

- **BLINK**
  - The message or field background blinks.

- **RE-VID**
  - Reverse video. Black characters on a colored background.

- **UNDSCR**
  - The message or field is underscored with a line.

The intensity at which the message or field is displayed. The values are:

- **NORM**
  - Normal intensity

- **HIGH**
  - High intensity

The suffix of the MPFLST parmlib member being used to control message processing.

**COMMAND USER EXITS NOT FOUND**
No command installation exits were specified by the installation.

**COMMAND-USEREXIT**
The installation specified command installation exits or blanks, if the end of the list of the installation exit names. This heading appears as many times as necessary to display the active installation exits or blanks.

**ERR**
If ERR appears before the name of an exit routine, a failure occurred in the exit routine and the routine is no longer active. ERR appears next to each failing exit routine name.

**NFD**
If NFD appears before the name of an exit routine, the system could not find the exit routine. NFD appears for each exit routine that the system cannot find.

The command installation exit routine name.

**System action:** If MESSAGE SUPPRESSION INACTIVE - HARDCOPY LOG NOT ESTABLISHED or MESSAGE SUPPRESSION INACTIVE - HARDCOPY SUSPENDED appears, this message lists the messages in the MPF table, but the system does not suppress messages until a hard-copy log is established and a device is available to print the hard-copy log. The WTO user exits and RETAIN are in effect. Otherwise, the system continues processing.

**Operator response:** If you want message suppression, but MESSAGE SUPPRESSION INACTIVE or MESSAGE SUPPRESSION AND USER EXITS INACTIVE appears, do one of the following:

- If NOT INITIALIZED appears, use the SET MPF command to request MPF processing.
- If HARDCOPY LOG NOT ESTABLISHED appears, establish a hard-copy log and make a device available to print it.
- If HARDCOPY SUSPENDED appears, make a device or SYSLOG available to print the hard-copy log.

**timestamp DISPLAY ASM**

**text**

**Explanation:** If the DISPLAY ASM,SWAP command is issued, text is SWAP DATA SETS NO LONGER SUPPORTED.

If the DISPLAY ASM,DUPLEX command is issued, text is DUPLEX PAGE DATA SET NO LONGER SUPPORTED.

Otherwise, text is:

```
<table>
<thead>
<tr>
<th>TYPE</th>
<th>FULL</th>
<th>STAT</th>
<th>DEV</th>
<th>DATASET NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaaaa</td>
<td>bbb</td>
<td>cccc</td>
<td>dev</td>
<td>eeee</td>
</tr>
<tr>
<td>VOLSER</td>
<td>DEVTP</td>
<td>SIZE</td>
<td>USED</td>
<td>AVAIL</td>
</tr>
<tr>
<td>ffffff</td>
<td>gggggg</td>
<td>hhhhhh</td>
<td>iiiiii</td>
<td>jjjjjjj</td>
</tr>
</tbody>
</table>
```

`additional-text` is one of the following:

SYNTAX ERROR, COMMAND TERMINATED
UNABLE TO PROCESS, DATASET NAME LIST NOT BUILT
DATASET dsname IS NOT IN USE AS A PAGE DATASET
PAGE DATASET IS NOT IN USE
PAGEDEL COMMAND IS NOT ACTIVE
PAGEDEL COMMAND IS IN PROGRESS

In response to a DISPLAY ASM command, this message displays information about one or more system page data sets and the status of the PAGEDEL command.

In the message text:

**TYPE**

aaaaaaa
The type of page data set:

PLPA
The PLPA page data set

COMMON
The COMMON page data set

LOCAL
A local page data set that accepts VIO

LOCAL NV
A NONVIO local page data set

**FULL**

bbb
The percentage of the data set’s allocated space that is currently in use; the percentage ranges from 0 to 100%, with leading zeroes suppressed.

**STAT**

cccc
The data set status:

OK
The data set is in normal use

BAD
ASM has marked the data set as incorrect, and will not process write requests for the data set

**FULL**

The data set presently has no available space

**DEL**

A PAGEDEL is in progress

**DRN**

The data set is draining because of a PAGEDEL DRAIN command

**DEV**

dev
The device number of the device on which the data set resides.

**DATASET NAME**

eeeeee
The page data set name, as specified to ASM at IPL or PAGEADD. eeeee uniquely identifies the data set.

**VOLSER**

ffffff
The volume serial of the volume on which the data set resides.

**DEV**

gggggg
The type of device on which the data set resides. gggggg may be any device type supported by ASM.

**SIZE**

hhhhhh
The allocated size of the data set. For a page data set, the value of hhhhhh is the number of 4-kilobytes slots. Leading zeroes are suppressed if the value of hhhhhh is less than six digits.

**USED**

iiiiii
The number of allocated slots that presently contain valid data. Leading zeroes are suppressed if the value of iiiiii is less than 6 digits.

**AVAIL**

jjjjjj
The number of allocated slots that are presently available to satisfy write requests. Leading zeroes are suppressed if the value of jjjjjj is less than six digits.

**ERRORS**

kkkkkk
The number of permanent I/O errors that have occurred on the data set. ASM will mark a data set as bad (thus making the data set unavailable for write requests) if kkkkkk exceeds the present threshold value of 174. Note that since ASM may attempt to read from a bad data set, the number of errors may exceed 174. Leading zeroes are suppressed if the value of kkkkkk is less than six digits.

**PAGEDEL COMMAND IS NOT ACTIVE**

No PAGEDEL command is currently in progress.

**PAGEDEL COMMAND IS IN PROGRESS**

The PAGEDEL command is currently processing one or more page data set. The data set will have DEL status in the DISPLAY ASM command output. No additional PAGEDEL commands will be accepted while this command is in progress.

**System action:** The system continues processing normally.

**Source:** Auxiliary storage manager (ASM)

**Descriptor Code:** 5
IEE201I PAGDEL COMMAND - DATA SET NAME dsname reason

Explanation: In processing a PAGDEL command, the system determined that PAGDEL could not be performed on data set dsname because of the reason given in the message.

reason is one of the following:

SPECIFIED MORE THAN ONCE IN PAGDEL COMMAND

Explanation: The data set is not valid because it duplicates a previously specified data set name in the same PAGDEL command.

System Action: The system performs no further validity checks on this name, because such checks were performed on the first occurrence of the name in the command. Validity checking continues with the next data set name specified in the command, if any.

Operator Response: Eliminate the duplicate data set name. Reenter the corrected PAGDEL command.

IS NOT IN USE AS A LOCAL PAGE DATA SET

Explanation: The data set is not valid because the system is not currently using it as a local page data set (if processing the page data set type).

System Action: The system performs other validity checks on this name to look for additional errors. Validity checking then continues with the next data set name specified in the command, if any.

Operator Response: Correct the data set name. Reenter the corrected PAGDEL command.

/TRUNCATED/ HAS AN INVALID LENGTH

Explanation: The data set name is longer than the maximum allowed for a page or swap data set name. The system truncates the data set to this length.

System Action: The system performs no further validity checks on this name. Validity checking then continues with the next data set name specified in the command, if any.

Operator Response: Correct the data set name. Reenter the corrected PAGDEL command.

IS SPECIFIED AS REPLACEMENT BUT IS ALREADY IN USE

Explanation: The data set name is specified as the name for a replacement data set, but the name is already in use as a page data set (if processing the page data set type).

System Action: The system performs other validity checks on this name to look for additional errors. Validity checking then continues with the next data set name specified in the command, if any.

Operator Response: Correct the data set name. Reenter the corrected PAGDEL command.

Source: Auxiliary storage manager (ASM)
Detecting Module: ILRPGEDEL
Routing Code: *
Descriptor Code: 5

IEE202I PAGDEL COMMAND - UNABLE TO PROCESS COMMAND text

Explanation: The system could not process a PAGDEL command. text is one of the following.

DUE TO A SYNTAX ERROR: SWAP DATA SETS NO LONGER SUPPORTED

Explanation: SWAP data sets are no longer supported.

System Action: The system will continue without processing the SWAP data sets.

Operator Response: Notify the system programmer.

System Programmer Response: Re-examine what you were trying to do and find a supported way to do it.

DUE TO INSUFFICIENT VIRTUAL STORAGE

Explanation: The system could not process the PAGDEL command because the system could not obtain the required virtual storage.

System Action: The system ends PAGDEL processing.

Operator Response: Notify the system programmer.

System Programmer Response: Wait until more virtual storage is available or actively go about freeing up virtual storage.

DUE TO INSUFFICIENT AUXILIARY STORAGE

Explanation: The system could not process the command because processing would have resulted in a shortage of usable auxiliary storage.

System Action: The system ends PAGDEL processing.

Operator Response: Do one of the following:
• Postpone the PAGDEL until auxiliary storage utilization is lower.
• Enter a PAGEADD command for one or more page data sets to provide additional auxiliary storage. Then reenter the PAGDEL command.

BECAUSE DATA SET NAME LIST IS NOT AVAILABLE

Explanation: The system could not process the command because the auxiliary storage manager (ASM) could not build the ASM data set name list at IPL.

System Action: The system ends PAGDEL processing. The PAGEADD, PAGDEL, and DISPLAY ASM commands will not be usable for this IPL.
IEE202I

**Operator Response:** Notify the system programmer.

**System Programmer Response:** On a subsequent IPL, you may want to specify an increased common storage area (CSA) allocation, so ASM can build the data set name list.

**BECAUSE INVALID DATA SET NAMES(S) WERE SPECIFIED**

**Explanation:** The system could not process the command because one or more of the specified data set names were incorrect.

**System Action:** Message IEE201I will precede IEE202I to indicate why the data set names are incorrect. The system ends PAGEDEL processing.

**Operator Response:** Correct the data set names indicated by message IEE201I. Then reenter the PAGEDEL command.

**BECAUSE RECOVERY ENVIRONMENT COULD NOT BE ESTABLISHED**

**Explanation:** The system could not establish recovery.

**System Action:** The system ends PAGEDEL processing.

**Operator Response:** Notify the system programmer.

**DUE TO A SYNTAX ERROR: NULL DATA SET NAME**

**Explanation:** One delimiter immediately followed another when the system expected a data set name.

**System Action:** The system performs no further syntax checking and ends PAGEDEL processing.

**Operator Response:** Correct the PAGEDEL command syntax. Reenter the command.

**DUE TO A SYNTAX ERROR: INVALID DELIMITER, COMMA OR BLANK EXPECTED**

**Explanation:** The system found a delimiter other than a comma or blank where it expected only a comma or blank.

**System Action:** The system performs no further syntax checking and ends PAGEDEL processing.

**Operator Response:** Correct the PAGEDEL command syntax. Reenter the command.

**DUE TO A SYNTAX ERROR: INVALID DELIMITER, LEFT PARENTHESIS EXPECTED**

**Explanation:** The system found a delimiter other than a left parenthesis where it expected only a left parenthesis.

**System Action:** The system performs no further syntax checking and ends PAGEDEL processing.

**Operator Response:** Correct the PAGEDEL command syntax. Reenter the command.

**DUE TO A SYNTAX ERROR: INVALID DELIMITER, COMMA EXPECTED**

**Explanation:** The system found a delimiter other than a comma where it expected only a comma.

**System Action:** The system performs no further syntax checking and ends PAGEDEL processing.

**Operator Response:** Correct the PAGEDEL command syntax. Reenter the command.

**DUE TO A SYNTAX ERROR: INVALID DELIMITER, RIGHT PARENTHESIS EXPECTED**

**Explanation:** The system found a delimiter other than a right parenthesis where it expected only a right parenthesis.

**System Action:** The system performs no further syntax checking and ends PAGEDEL processing.

**Operator Response:** Correct the PAGEDEL command syntax. Reenter the command.
**Operator Response:** Correct the PAGEDEL command syntax. Reenter the command.

**Explanation:** The system found a left parenthesis that was not syntactically correct.

**System Action:** The system performs no further syntax checking and ends PAGEDEL processing.

**Operator Response:** Correct the PAGEDEL command syntax. Reenter the command.

**Explanation:** The system found a right parenthesis that was not syntactically correct.

**System Action:** The system performs no further syntax checking and ends PAGEDEL processing.

**Source:** Auxiliary storage manager (ASM)

**Detecting Module:** ILRPGDEL

**Descriptor Code:** 5

**IEE203I** PAGEDEL COMMAND - ERROR IN PROCESSING TPARTBLE - FUTURE QUICK OR WARM STARTS WILL HAVE UNPREDICTABLE RESULTS

**Explanation:** While processing the PAGEDEL command, the system failed to read or write the temporary page activity reference table (TPARTBLE). Therefore, the TPARTBLE may contain incorrect information about the page data set configuration. The TPARTBLE may also contain incorrect information about which types of IPL are permissible, so future quick or warm start IPLs may have unpredictable results.

**System Action:** PAGEDEL command processing continues. The system continues processing this IPL.

**Operator response:** Ensure that the next IPL is a cold or quick start (with CLPA or CVIO option). An attempt to warm start will either fail, if the temporary page activity reference table (TPARTBLE) is still usable, or have unpredictable results.

IEE206I  PAGEDEL COMMAND ACCEPTED - PAGEDEL [IN PROGRESS | ALREADY ACTIVE]

Explanation: The operator entered a PAGEDEL command to process one or more page or swap data sets. The system issues one of the following messages:

PAGEDEL COMMAND ACCEPTED - PAGEDEL IN PROGRESS
The system accepts the PAGEDEL command. This message remains on the screen until PAGEDEL processing completes.

PAGEDEL COMMAND NOT ACCEPTED - PAGEDEL ALREADY ACTIVE
The system does not accept the PAGEDEL command because it is already processing another PAGEDEL command. The system accepts no additional PAGEDEL commands while this command is in progress.

System action: The system rejects the PAGEDEL command if another PAGEDEL command is in progress. Otherwise, the system starts PAGEDEL processing.

Operator response: If the PAGEDEL command is rejected because another PAGEDEL command is active, wait until the active command completes. Reenter the command.

IEE220I  PFKTABxx: SKIPPING TO PFKTAB STATEMENT. ONE OR MORE PFK DEFINITIONS PRECEDE THE FIRST PFKTAB STATEMENT.

Explanation: Processing for a SET PFK command found an error in the PFKTABxx parmlib member. The PFK definitions appeared before the first PFKTAB statement.

In the message text:

PFKTABxx
The parmlib member, with a suffix of xx.

System action: The system continues processing specifications in PFKTABxx, skipping all data until it locates the first valid PFKTABxx statement.

Operator response: Notify the system programmer.

System programmer response: Before the next system initialization correct the PFKTABxx member.

Source: Device independent display operator console support (MCS)
Detecting Module: IEECB816
Routing Code: *
Descriptor Code: 5

IEE221I  PFKTABxx LINE nnn: SKIPPING TO PFKTAB STATEMENT. text

Explanation: The SET PFK command found an error in the PFKTABxx parmlib member.

In the message text:

PFKTABxx
The parmlib member, with a suffix of xx.

nnn  The line number where the error occurred.

UNRECOGNIZED STATEMENT TYPE
The system did not find a PFKTABxx statement as the first non-comment data. The system skips data until it finds a valid PFKTAB statement.

UNRECOGNIZED KEYWORD keyword
The system found a keyword as the first non-comment data in the parmlib member. The valid statement type PFKTAB must be the first non-comment data item in the parmlib member. The system skips data until it finds a valid PFKTAB statement.

In the message text:

keyword
The misplaced keyword.

MISPLACED PFKTAB STATEMENT
The system found a PFKTAB statement identifier that was not the first non-comment data. The system skips data until it finds a valid PFKTAB statement.
TABLE KEYWORD FOUND WHICH DOES NOT IMMEDIATELY FOLLOW PFKTAB

The system found a TABLE keyword, but a PFKTAB statement did not immediately precede the TABLE keyword. The system skips data until it finds a valid PFKTAB statement.

PFKTAB FOUND BUT TABLE KEYWORD DOES NOT IMMEDIATELY FOLLOW

The system found a PFKTAB statement, but the TABLE keyword did not immediately follow the statement. The system skips data until it finds a valid PFKTAB statement.

TABLE NAME NOT VALID. MUST BE 1 TO 8 ALPHANUMERIC CHARACTERS.

The name of the PFK table specified in the TABLE keyword on the PFKTAB statement is not 1 to 8 alphanumeric characters in length. The system skips data until it finds a valid PFKTAB statement.

TABLE(ttttttt) SPECIFIED ON A PRECEDING PFKTAB STATEMENT

The system is currently processing a PFKTAB statement with the specified table name. The system skips data until it finds a valid PFKTAB statement.

In the message text:

```
ttttttt  The table name.
```

System action: The system continues processing the valid specifications in PFKTABxx.

Operator response: Notify the system programmer.

System programmer response: Before the next system initialization, correct the PFKTABxx member.

Source: Device independent display operator console support (MCS)

Detecting Module: IEECB816

---

IEE22I PFKTABxx TABLE (tttttttt): PFK(nn) DEFINITION IGNORED. PFK(nn) SPECIFIED ON A PRECEDING PFK DEFINITION

Explanation: The SET PFK command found an error in the PFKTABxx parmlib member. In the message text:

```
PFKTABxx
```

The parmlib member, with a suffix of xx.

```
ttttttt  The table name.
```

System action: The system continues processing the valid specifications in PFKTABxx.

Operator response: Notify the system programmer.

System programmer response: Before the next system initialization, correct the PFKTABxx member.

Source: Device independent display operator console support (MCS)

Detecting Module: IEECB816

Routing Code: -

Descriptor Code: 5
In the message text:

**PFKTABxx**

The parmlib member, with a suffix of *xx*.

**tttttt** The name of the PFK table that contains the error.

**nn** The erroneous PFK number.

**System action:** The system continues processing the valid specifications in PFKTABxx. The system ignores the duplicate PFK definition and skips all data until it finds another PFK definition or PFKTAB statement.

**Operator response:** Notify the system programmer.

**System programmer response:** Before the next system initialization, correct the PFKTABxx member.

**Source:** Device independent display operator console support (MCS)

**Detecting Module:** IEECB816

**Routing Code:** -

**Descriptor Code:** 5

---

**IEE225I**

PFKTABxx TABLE(**tttttt**) PFK(**nn**):

**reason**

**Explanation:** Processing for a SET PFK command found an error in the PFKTABxx parmlib member.

In the message text:

PFKTABxx

The parmlib member, with a suffix of *xx*.

**tttttt** The name of the PFK table that contains the error.

**nn** The erroneous PFK number.

**reason** One of the following:

**UNRECOGNIZED KEYWORD** **keyword** **IGNORED**

The system found an unrecognizable keyword on the PFK definition. CMD, KEY, and CON are the only keywords allowed on the PFK definition.

In the message text:

**keyword**

The unrecognized keyword.

The SET PFK command ignores the keyword and skips all data up to:

- The next right parenthesis, if a left parenthesis follows the keyword
- A blank
- The next PFK definition
- A PFKTAB statement

**DUPLICATE** **keyword** **KEYWORD IGNORED**

The system ignores the duplicate keyword.

In the message text:

**keyword**

The unrecognized keyword.

**MISSING RIGHT PARENTHESES FOR** **keyword** **KEYWORD VALUE ASSUMED**

The system assumed that a right parenthesis on a keyword was present. The next data item in the PFKTABxx member is another PFK definition, PFKTAB statement, or end-of-file.

In the message text:

**keyword**

The unrecognized keyword.

**keyword2 MUTUALLY EXCLUSIVE WITH** **keyword1. ** **keyword2** **IGNORED.**

The two keywords cannot be specified on the same PFK definition. The valid values are CMD / KEY or KEY / CMD. The system processes **keyword1** and ignores **keyword2**.

In the message text:

**keyword1**

The first keyword found by the system.

**keyword2**

The second keyword found by the system.

**CON VALUE NOT VALID. CON** ***nn*** **APPLIED.**

The value for the CON keyword was not valid. **Y** and **N** are the only valid values. The system uses the default value of **n** for the CON keyword.

In the message text:

**nn** SPECIFIED FOR BOTH KEY AND PFK KEYWORDS. KEY IGNORED.

The PFK being defined is also in the key list for itself. The same value is specified for both the PFK and KEY keywords. Since a PFK cannot be defined as itself, the SET PFK command ignores the KEY keyword.

In the message text:

**nn**

The duplicate PFK value.

**nn ALREADY PART OF A KEY LIST. KEY IGNORED**

The definition of a PFK value already appears in the key list for a different PFK that was previously defined. The previously defined key appears in the
PFK table. The system command ignores the KEY keyword.

In the message text:

nn The duplicate PFK value.

duplicate PFK value

**keyword VALUE NOT VALID. keywd IGNORED**

The value for a keyword is not valid; KEY and CMD are the only valid values.

In the message text:

keyword

**The unrecognized keyword.**

- For KEY, the keyword value must be a list of keys with values between 1 and 24 separated by blanks or commas.
- For CMD, the keyword value must be 1 to 126 characters surrounded by single or double quotation marks.

The SET PFK command ignores the keyword, and skips all data up to the next right parenthesis, the next PFK definition, or the next PFKTAB statement.

In the message text:

keyword

**The keyword with an incorrect value.**

KEY VALUE NOT VALID. nn DEFINED AS A LIST OF KEYS. KEY IGNORED.

A PFK value in the key list was previously defined as a list of keys in the PFK table. The system ignores KEY.

In the message text:

nn The PFK value.

MORE THAN 62 KEYS SPECIFIED IN THE KEY VALUE. KEY IGNORED.

More than 62 keys were specified in the key list. The SET PFK command ignores the KEY keyword.

**System action:** The system continues processing the valid specifications in PFKTABxx.

**Operator response:** Notify the system programmer.

**System programmer response:** Before the next system initialization, correct the PFKTABxx member.

**Source:** Device independent display operator console support (MCS)

**Detecting Module:** IEECB816

---

IEE226I PFKTABxx: PREMATURE END OF FILE DETECTED

**Explanation:** Processing for a SET PFK command found an error in the PFKTABxx parmib member. text is one of the following:

PFKTBxx

The parmib member, with a suffix of xx.

**INCOMPLETE PFKTAB STATEMENT IGNORED**

The system was expecting more input for the last PFKTAB statement or PFK definition.

**INCOMPLETE KEYWORD keyword IGNORED**

The system did not recognize a keyword on the last PFKTAB statement or PFK definition.

**System action:** The system continues processing. PFK tables specified correctly in PFKTABxx remain available.

**System programmer response:** Check the syntax of the last statement in PFKTABxx to see if it is a complete PFKTAB statement or PFK definition.

**Source:** Device independent display console support (MCS)

**Detecting Module:** IEECB816

**Routing Code:** -

**Descriptor Code:** 5

Routing Code: -
Descriptor Code: 5

IEE228I  PFKTABxx: NO VALID STATEMENTS FOUND.

Explanation: Processing for a SET PFK command found that the PFKTABxx parmlib member did not contain any valid PFKTAB statements.

In the message text:

PFKTABxx
The parmlib member, with a suffix of xx.

System action: The system continues processing.

Source: Communications task (COMMTASK)
Detecting Module: IEECB816
Routing Code: -
Descriptor Code: 5

IEE229I  PFKTABxx: PROCESSING TERMINATED. INSUFFICIENT STORAGE

Explanation: During processing for a SET PFK command, the system could not obtain enough storage.

In the message text:

PFKTABxx
The parmlib member, with a suffix of xx.

System action: The system stops processing the PFKTABxx member. The system continues other processing. If the error occurred during system initialization, the system uses the IBM default PFK definitions for all consoles.

Operator response: To replace the IBM default PFK definitions, enter the SET PFK command for the appropriate PFKTABxx parmlib member. Then issue a CONTROL N,PFK command for each console while specifying the PFK table for that console.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: Communications task (COMMTASK)
Detecting Module: IEECB816
Routing Code: -
Descriptor Code: 5

IEE230I  IBM DEFAULT PFKS USED FOR CONSOLE name. text.

Explanation: While the system was performing program function key (PFK) processing to initialize a console, an error occurred.

name The name of the console that was being initialized when the failure was detected.

text One of the following:

NO PFK TABLES REQUESTED
The CONSOLxx parmlib member did not specify the name of a PFK table to be used for console.

TABLE ttttttt NOT FOUND
The CONSOLxx parmlib member specified ttttttt as the name of the PFK table that should be used for the console, but ttttttt was not one of the PFK tables that was available for use.

PFK TABLE INITIALIZATION NOT COMPLETE
The CONSOLxx parmlib member requested a PFKTABxx member to be used to define PFK tables for consoles. Initialization of the PFK
tables was not complete when the specified console was being initialized.

System action: The system uses the IBM default PFK definitions for the console.

Operator response: If desired, do the following:
1. Enter the SET PFK command to define the available PFK tables, if the IBM default PFK definitions are not appropriate.
2. Enter the SET PFK command to define the available PFK tables,
3. Enter the CONTROL N,PFK command to specify the PFK table to be used for the console.

System programmer response: Depending on the message text, do the following:

NO PFK TABLE REQUESTED
Update the CONSOLxx parmlib member for the console to include a PFK table name to be used.

TABLE ttttttt NOT FOUND
Check the PFK table name specified for the console in the CONSOLxx parmlib member. If the table name is incorrect, change it to a valid PFK table name. If the table name is correct, ensure that the PFK table is defined in the PFKTABxx parmlib member.

PFK TABLE INITIALIZATION NOT COMPLETE
No response necessary. Ask the operator to enter CONTROL N,PFK when the system has completed initialization.

Source: The following:
- Communications task (COMMTASK)
- Device independent display operator console support (MCS)
- Master scheduler

IEE233I • IEE234I

IEE233I PF KEYS CANNOT BE USED ON CONSOLE consname reason.

Explanation: While the system was initializing a console, a failure occurred during PFK processing.

consname The console name.
reason One of the following:

IBM DEFAULT PFKS NOT FOUND
The system could not locate the IBM default PFK definitions.

INSUFFICIENT STORAGE TO CONTAIN THE PFK DEFINITIONS
The system could not obtain the storage needed to process the PFK definitions.

System action: The system does not use the PFK definitions for the console.

Operator response: Depending on the message text, one of the following:

IBM DEFAULT PFKS NOT FOUND
Enter the SET PFK command for the appropriate PFKTABxx parmlib member. Then enter the CONTROL N,PFK command to specify a PFK table for the console.

INSUFFICIENT STORAGE TO CONTAIN THE PFK DEFINITIONS
If the console requires PFKs, vary the console offline, then vary the device online as a console. If the problem persists, notify the system programmer.

System programmer response: Depending on the message text, one of the following:

IBM DEFAULT PFKS NOT FOUND
Ensure that SYS1.LINKLIB contains all needed system modules.

INSUFFICIENT STORAGE TO CONTAIN THE PFK DEFINITIONS
Wait until there is enough storage to process the request.

Source: Device independent display console support (MCS)

IEE239I CPU(x) NOT RECONFIGURED {ONLINE|PHYSICALLY OFFLINE} -- text

Explanation: A CONFIG command requested that the system reconfigure a central processor online or offline. The system was unable to perform physical reconfiguration because the service processor detected an error condition.

In the message text:

SERVICE PROCESSOR BUSY
The service processor could not process the CONFIG command because it is processing another request.

REQUIRED SYSTEM RESOURCE NOT AVAILABLE
The system could not process the CONFIG command because a software resource needed by the service processor was in use.

SERVICE PROCESSOR FAILURE
The service processor could not process the CONFIG command because of an internal service processor error.

SERVICE PROCESSOR ERROR
The service processor indicated that the central processor reconfiguration hardware is not installed; however, the hardware indicators show that the central processor reconfiguration hardware is installed.

TARGET HARDWARE ERROR
One of the following occurred:
- An error occurred during a target equipment check that is associated with the resource being configured or deconfigured. The state of the resource changed. The error is not associated with the service-call logical processor (SCLP).
- An error occurred during a target equipment check that is associated with the resource being configured or reconfigured. The state of the resource did not change. The error is not associated with the SCLP.

CPU ID NOT RECOGNIZED BY SERVICE PROCESSOR
The service processor did not recognize the central processor identifier; however, the hardware indicators show that this identifier is valid.

CPU NOT AVAILABLE
The specified central processor is not a part of this configuration.

CPU IS POWERED OFF
The specified central processor is powered off.

WOULD REMOVE LAST CPU
During CONFIG command processing, alternate CPU recovery (ACR) took another central processor offline, leaving the specified central processor the last one in the system.

System action: Depending on the value of text, the system does the following:

SERVICE PROCESSOR BUSY
REQUIRED SYSTEM RESOURCE NOT AVAILABLE
SERVICE PROCESSOR FAILURE
SERVICE PROCESSOR ERROR
CPU ID NOT RECOGNIZED BY SERVICE PROCESSOR

The system does not reconfigure the central processor online or physically offline. If the request was OFFLINE, the system takes the central processor logically offline.

CPU NOT AVAILABLE
The system does not reconfigure the central processor online or physically offline. If the request was OFFLINE, the central processor is already offline in another configuration.

CPU IS POWERED OFF
The system does not reconfigure the central processor online.

WOULD REMOVE LAST CPU
The system does not reconfigure the central processor offline.

CPU(x) NOT ONLINE
The system does not reconfigure the central processor online.

Operator response: Do the following:
1. Enter DISPLAY M=CPU to display the status of the central processors in the system.
2. Depending on the value of text, do the following:

SERVICE PROCESSOR BUSY
REQUIRED SYSTEM RESOURCE NOT AVAILABLE
SERVICE PROCESSOR FAILURE
Enter the CONFIG command again. If the problem recurs, contact hardware support.

SERVICE PROCESSOR ERROR
CPU ID NOT RECOGNIZED BY SERVICE PROCESSOR
Contact hardware support.

CPU NOT AVAILABLE
Make the specified central processor a part of this configuration. Enter the CONFIG command again.

CPU IS POWERED OFF
Make sure the central processor is powered on. Enter the CONFIG command again.

WOULD REMOVE LAST CPU
Check the status of the central processor.
CPU(x) NOT ONLINE
Make sure the specified central processor is online. Enter the CONFIG command again.

IEE240I  CPU(x) NOT RECONFIGURED
         {OFFLINE|ONLINE} -- text

Explanation: A reconfiguration request asked that the system reconfigure a central processor online or offline. The system was unable to perform the requested reconfiguration; the message text gives the reason.

In the message text:
DUE TO RPSGNL SWITCH FAILURE ON TARGET CPU        RPSGNL SWITCH failed to initiate the processor ending routine.
DUE TO SYSTEM RECOVERY     Alternate CPU recovery (ACR) processing removed a processor during CONFIG command processing.
WOULD REMOVE LAST CPU AVAILABLE FOR JOB SCHEDULING  The target central processor cannot be removed because it is the only one in the system that can be used for scheduling jobs.

WOULD RESULT IN A NO CLOCK CONDITION
The target central processor could not be taken offline because it is the only processor in the complex with a functioning time-of-day (TOD) clock.

ERROR WHILE PERFORMING SIGP RESTART
An error occurred on the target central processor during SIGP RESTART processing.

ERROR WHILE PERFORMING SIGP INITIAL CPU RESET
An error occurred on the target central processor during SIGP INITIAL processor RESET processing.

ERROR WHILE PERFORMING SIGP SET PREFIX
An error occurred on the target central processor during SIGP SET PREFIX processing.

CPU INITIALIZATION PROCESSING DID NOT BEGIN
Processor initialization did not start on the target central processor.

CPU INITIALIZATION PROCESSING DID NOT COMPLETE
Processor initialization did not complete on the target central processor.

CLOCKS CANNOT BE SYNCHRONIZED
The central processor reconfiguration process failed because TOD clocks could not be synchronized.

ERROR CREATING SYSTEM TRACE AREAS
The target central processor could not be brought online because the system trace areas could not be created for it.

ERROR CREATING MACHINE CHECK HANDLER AREAS
The target central processor could not be brought online because the machine check handler areas could not be created for it.

ERROR CREATING CPU-RELATED LINKAGE STACKS
The target central processor could not be brought online because the central processor-related linkage stacks could not be created.

ERROR OBTAINING STORAGE
The target central processor could not be brought online because storage could not be obtained for processor-related system data areas.

ERROR LOCATING FRR INITIALIZATION ROUTINE
The target central processor could not be brought online because a routine could not be located in the system nucleus.
ESTAE COULD NOT BE ESTABLISHED
The recovery environment for processor reconfiguration could not be established.

ID NOT RECOGNIZED
The reconfiguration operation was canceled because the specified central processor identifier is incorrect.

CPU NOT AVAILABLE
The reconfiguration operation was canceled because the requested central processor does not belong to this configuration.

WOULD REMOVE LAST CPU
The target central processor cannot be removed because it is the only one in the system.

UNABLE TO OBTAIN CPU STATUS, SERVICE PROCESSOR COMMUNICATION FAILURE
The reconfiguration operation was cancelled because of a service processor interface error.

UNABLE TO CONFIGURE CRYPTO OFFLINE
The operator tried to configure offline a processor with an associated Integrated Cryptographic Feature (ICRF) but the system could not configure the ICRF offline.

UNABLE TO OBTAIN STORAGE FOR ENF SIGNAL
The operator tried to configure offline a processor with an associated Integrated Cryptographic Feature (ICRF) but the system could not obtain storage to issue an ENF signal.

CPU INITIALIZATION PROCESSING DID NOT COMPLETE
Enter the CONFIG command again; if the problem persists, notify the system programmer.

ID NOT RECOGNIZED
Enter the CONFIG command again specifying a valid central processor identifier.

CPU NOT ONLINE
Make sure the specified central processor is online. Enter the CONFIG command again.

CPU NOT AVAILABLE
Make sure that the central processor is in this configuration. Enter the CONFIG command again.

For any other message text, enter the CONFIG command again.

System programmer response: If the problem cannot be resolved, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

DUE TO SYSTEM RECOVERY
Check the central processor status.

WOULD RESULT IN A NO CLOCK CONDITION
Enter the CONFIG command again when there are other central processors in the complex with functioning TOD clocks.

EXPLANATION:
Central processor ending did not complete within the expected time period.

System action: The system takes the target central processor offline.

CONFIG COMMAND CANCELLED BY THE OPERATOR

EXPLANATION:
The operator replied 'C' to the following message:

IEE325D to cancel a request to configure offline the processor associated with the last Integrated Cryptographic Feature in the system.

System action: The system cancels the CONFIG command.
IEE244D • IEE248I

Source:  Reconfiguration
Detecting Module:  IEEVVFLL
Routing Code:  -
Descriptor Code:  5

IEE244D  REPLY ‘S’ TO SUSPEND AFFINITY JOB SCHEDULING, OTHERWISE REPLY ‘N’

Explanation:  A reconfiguration request asked that the system reconfigure a central processor offline, but the system is unable to perform the requested reconfiguration because one or more jobs have affinity to that processor.

System action:  The system issues message IEE718I prior to issuing this message. Message IEE718I lists the names of the jobs. The system cancels the CONFIG command, regardless of the reply.

Operator response:  Do the following:
1. Reply N to continue scheduling jobs with affinity to the central processor.
2. Reply S to stop scheduling jobs with affinity to the central processor.
3. Enter CONFIG CPU(x), OFFLINE to request reconfiguration of the central processor offline when no more jobs with affinity to the central processor exist.
4. Enter CONFIG CPU(x),ONLINE to make the central processor available for affinity job scheduling, even if the central processor is already online.

IEE248I  hh.mm.ss yy.ddd ACTIVITY [idr]

Explanation:  Where text is:

<table>
<thead>
<tr>
<th>text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOBS</td>
<td>The number of address spaces running under initiators.</td>
</tr>
<tr>
<td>xxxxx</td>
<td>M/S</td>
</tr>
<tr>
<td>xxxx</td>
<td>TS USERS</td>
</tr>
<tr>
<td>xxxx</td>
<td>SYSAS</td>
</tr>
<tr>
<td>xxxx</td>
<td>INITS</td>
</tr>
<tr>
<td>ACTIVE/MAX</td>
<td>VTAM</td>
</tr>
</tbody>
</table>

If the command is one of the following, some combination of the fourth, fifth, and sixth lines appears:

**JOBS**

- A list of all:
  - Virtual=virtual (V=V) jobs, tasks, and attached transaction programs (ATX) created by the START or MOUNT command. One or two entries appear on each line.
  - V=V jobs, virtual=real (V=R) tasks, and V=R attached transaction programs (ATX) created by the START command. One entry appears on each line.

**TS**

- A list of all active TSO/E users. Up to five entries appear on each line.

**A**

- The displays for both JOBS,LIST and TS,LIST.

In the message text:

- hh.mm.ss:
  - The time, in hours (00 through 23), minutes (00 through 59), and seconds (00 through 59). If hh.mm.ss is 00.00.00, the time of day (TOD) clock is not working.

- yy.ddd:
  - The date, in years (00 through 99) and days (000 through 366). If yy.ddd is 00.000, the system cannot determine the year and the day.

- idr:
  - A 3-digit decimal identifier to be used in a CONTROL C,D command to cancel the status displays, if it is:
    - Written on typewriter or printer consoles
    - Displayed inline (that is, not in a display area) on a display console

This identifier does not appear when the display is presented in a display area on a display console.
The number of started job entry subsystem (JES) and advanced program-to-program communications (APPC) initiators in the system.

**ACTIVE/MAX VTAM**

The number of active TSO/E address spaces using the Virtual Telecommunications Access Method (VTAM) and the maximum number of TSO/E address spaces that could use VTAM.

**Note:** If the value for JOBS is less than the value for INITS, some initiators are inactive. The sum of the values for JOBS, M/S, TS USERS, and SYSAS is the total number of active address spaces.

**jjj** One of the following:
- The name of a job or ATX attached by an initiator.
- The procedure name of a task created by a START or MOUNT command.
- **STARTING** if initiation of a started job, task or ATX is incomplete.

**sss** One of the following:
- The step name for a job or ATX attached by an initiator.
- The identifier of a task created by the START command.
- The step name for a step that called a cataloged procedure.
- **STARTING** if initiation of a started job, system task, or ATX is incomplete.

**ppp** One of the following:
- The step name within a cataloged procedure that was called by the step specified in field sss.
- Blank, if there is no cataloged procedure.
- For APPC initiated transactions, the userid requesting the transaction.

**www** The status of the job, task, ATX or TSO/E address space:
- **IN** Swapped in.
- **OUT** Swapped out, ready to run.
- **OWT** Swapped out, waiting, not ready to run.
- **OU** In the process of being swapped out.
- **IN** In the process of being swapped in.
- **NSW** Non-swappable.

**zz** One of the following:
- **LW** Address space is in long wait.

**Note:** **LW** appears only when the address space is swapped in or is non-swappable. **LW** indicates an abnormal condition.

**NF** Address space is not dispatchable because of a failure in the address space.

**PR** Address space has a program event recording (PER) SLIP trap active.

**x** The type of user:
- **A** ATX
- **J** Job.
- **S** Started task.
- **M** Mount.
- * System address space.

**stradrK** - **endadrK**

Starting and ending decimal addresses, in kilobytes, of the job or task's V=R region. For example, 00040 K is decimal address 40960.

**userid** One of the following:
- The identifier of an active TSO/E user.
- **LOGON***, if initiation of the address space is incomplete.

**DISPLAY TRUNCATED - INSUFFICIENT STORAGE**

The system cannot obtain enough storage for the display.

**NO ENTRIES FOUND WITH USERID = rquserid**

The specified userid is not active in the system.

In the message text:

**rquserid** The identifier of the user that requested the transaction.

**System action:** The system continues processing.

**Operator response:** If DISPLAY TRUNCATED appears in the message, avoid using the LIST parameter on the DISPLAY command until there is less system activity.

The fields **jjj** and **sss** are the procedure name and the identifier to be used in a STOP or MODIFY command, if one is to be entered.

Enter DISPLAY ACTIVE,ALL to obtain a display that includes the system address spaces.

IEE251I PARMLIB DISPLAY | PARMLIB, ERROR[

Explanation: Where text is:

PARMLIB DATA SETS SPECIFIED [error]
[AT IPL | AT hr.mm.sc ON mm/dd/yyyy]
[LOADxx DATA SET = dsname | PARMLIB CONCATENATION VOLUME=vol | CATALOG]

ENTRYフラグVOLUMEDATASET
nnfparmvlparmdsn
...
...
...

X D defvolSYS1.PARMLIB

[NO ERRORS IN PARMLIB CONCATENATION]
[MASTER PROCESSING USING THE FOLLOWING PARMLIBS]

ENTRYフラグVOLUMEDATASET
nnfparmvlparmdn1
...
...
...

This message displays PARMLIB information when a DISPLAY PARMLIB command is issued.

In the message text:

hh.mm.ss The current time. The time format is in hours (00-23), minutes (00-59) and seconds (00-59).

error If the DISPLAY PARMLIB,E or DISPLAY PARMLIB,ERRORS command is specified, the following will be included in the message for error: BUT NOT FOUND

hr.mm.sc The time of the last SETLOAD command.

mm/dd/yyyy The date of the last SETLOAD command.

dsname The data set where the LOADxx was found. If this field shows PARMLIB CONCATENATION, the member was found using the existing parmlib concatenation.

vol The volume where the dsname resides. CATALOG indicates that the volume was found using the catalog entry for the data set.

nn The order in which the parmlibs were specified

f Describes how the parmlibs were specified:

S the LOADxx PARMLIB statement

D the default (SYS1.PARMLIB)

parmvl The volume serial for the parmlib data set. defvol is the volume SYS1.PARMLIB resides on.

parmdsname The parmlib data set specified in the PARMLIB statement in LOADxx. The data set name can be up to 44 characters long. SYS1.PARMLIB will always be concatenated as the last parmlib, unless it was specified in a PARMLIB statement in LOADxx. If there was no PARMLIB statement in LOADxx, then SYS1.PARMLIB is the default.

parmdn1 The parmlib data set specified in the IEFPARM DD statement in Master JCL. If PARMLIB statements were specified in LOADxx, this section of the message is not displayed.

System action: The system continues processing.

**hh.mm.ss IPLINFO DISPLAY**

| text | |

**Explanation:** Where text is:

- **SYSTEM** IPLED AT hh.mm.ss ON mm/dd/yyyy
- **RELEASE** fmid LICENSE = system
- **USED** LOADxx IN loadxxdsname ON devx
- **ARCHVL = n MTLSHARE = Y|N**
- **IEASYM LIST = s1|NONE**
- **IEASYS LIST = s2( OP )**
- **IODF DEVICE : ORIGINAL( iodfdev1 ) CURRENT( iodfdev2 )**
- **IPL DEVICE : ORIGINAL( ipldev1 ) CURRENT( ipldev2 ) VOLUME( iplvol )**

Displays IPL information when a DISPLAY IPLINFO command is issued.

In the message text:

- **hh.mm.ss** The current time. The time format is in hours (00-23), minutes (00-59) and seconds (00-59).
- **mm/dd/yyyy** The master scheduler initialization completed; the IPL completed. That date format is in month (01-12), day (01-31) and year (0000-9999).

| rrrrrr | The release level of the system being IPLed. |
| xx | The LOADxx member used to IPL the system. |
| loadxxdsname | The data set where the LOADxx originated. The data set name will be either: SYSn.IPLPARM (where n can be 0-9) or SYS1.PARMLIB. |
| devx | The device address where the LOADxx member originated. |
| MTLSHARE = Y|N | MTL tape devices are treated as regular standalone drives (Y), as compared to MTL resident drives (N). |
| n | Either 1 indicating ESA/390 or 2 indicating z/Architecture. The value displayed is the value specified (or defaulted) by the ARCHVL statement of the LOADxx parmlib member. |
| s1 | The IEASYMxx member or members used by the IPLed system. s1 can be either a single member name, a list of members (specified in parenthesis) or by NONE. The default value is NONE. |
| s2 | The IEASYSxx member or members used by the IPLed system. s2 can be either a single member name, a list of members (specified in parentheses). |
| OP | The IEASYSxx values were specified in LOADxx SYSPARM statements or from the reply to the IEA101A system parameters prompt. |
| iodfdev1 | The device number of the volume where the I/O configuration resided when the system was originally IPLed. |
| iodfdev2 | The device number of the volume where the I/O configuration now resides. iodfdev1 and iodfdev2 can be the same. |
| ipldev1 | The SYRES device number from which the system was originally IPLed. |
| ipldev2 | The current SYRES device number. ipldev1 and ipldev2 can be the same. |
| iplvol | The IPL volume serial. |
| system | The IPLed system, z/OS or zNALC (a z/OS system that requested zNALC pricing). |

**System action:** The system continues processing.

IEE260I  SCHEDxx LINE  line:  text

Explanation:  During system initialization, the system detected an error in the MT specification in the SCHEDxx parmlib member.

In the message text:

**SCHEDxx**
The parmlib member in which the system detected an error, with a suffix of xx.

**line**
The number of the line containing the erroneous MT statement.

**MT SIZE 24K APPLIED. SIZE VALUE NOT VALID.**
The MT value was in error because the value is either:
- Not decimal
- Not specified in kilobytes
- Not within the range 16 kilobytes to 999 kilobytes

The system uses the default value of 24 kilobytes.

**USING MT SIZE(****). DUPLICATE SIZE IGNORED.**
The SIZE keyword appears more than once on an MT statement. The system ignores the duplicate specification. **** is one of the following:
- nnnK  The size of the MT table in kilobytes.
- NONE

MT data IGNORED. UNRECOGNIZED KEYWORD.
The system encountered data, which is not a keyword defined for the MT statement.

DUPLICATE MT STMT IGNORED.
The system has already processed an MT statement, and ignores the duplicate statement.

MISSING RIGHT PARENTHESIS ASSUMED.
The system encountered an end of statement while searching for a closing right parenthesis.

System action:  The system continues processing the data within the SCHEDxx parmlib member. If the following message text appears, the system does the following:

**USING MT SIZE(****). DUPLICATE SIZE IGNORED.**
The system ignores the duplicate specification.

DUPLICATE MT STMT IGNORED.
The system ignores the duplicate statement.

Operator response:  Contact the system programmer.

System programmer response:  Do the following:
1.  Run the IEBPTPCH utility to print the parmlib member.
2.  Find the incorrect specification and correct the error that the message described.

IEE271I  NO PFK TABLES EXIST [COMMAND ISSUED IS command]

Explanation:  A CONTROL N,PFK command requested alteration of a program function key (PFK) command definition. The command referenced a PFK table that does not exist in the system. Either:
1.  The PFK tables were not specified in the CONSOLxx parmlib member.
2.  An error occurred during processing of a previously entered SET PFK=xx command.

In the message text:

**COMMAND ISSUED IS command**
command is the text of the command that was originally entered.

System action:  The system ignores the command.

Operator response:  Do one of the following:
- In case 1, enter SET PFK=xx to activate the PFKTABxx parmlib member, if the PFK tables were not specified in the CONSOLxx parmlib member and a PFKTABxx parmlib member exists.
  Enter CONTROL N,PFK to define the PFK table for the system to use.
- In case 2, contact the system programmer.

System programmer response:  Do one of the following:
- If a PFKTABxx parmlib member does not already exist, create a member to define the PFK tables that the system can use.
- If an error occurred during processing of a SET PFK command, then correct the error in PFKTABxx.

Source:  Master scheduler
Detecting Module:  IEECVFTB, IEE8C03D
Routing Code:  *
Descriptor Code:  5
IEE272I  PFK TABLE NOT FOUND IN PFKTABxx
[COMMAND ISSUED IS command]

Explanation: A CONTROL N,PFK command requested alteration of a program function key (PFK) command definition. The referenced PFK table is not defined in PFKTABxx, which is the active PFK table parmlib member.

In the message text:

PFKTABxx
The active PFK table parmlib member, with a suffix of xx.

COMMAND ISSUED IS command
command is the text of the command that was originally entered.

System action: The system ignores the CONTROL N command.

Operator response: Do the following:
1. Enter SET PFK=xx for the PFKTABxx parmlib member that contains the requested PFK table definition.
2. Enter CONTROL N,PFK to define the PFK table for the system to use.

If the CONTROL command fails, contact the system programmer.

System programmer response: Do the following:
1. Run the IEBPTPCH utility to print the PFKTABxx parmlib member.
2. Make sure that the PFKTABxx member contains the definition of the PFK table specified on the CONTROL N,PFK command.

IEE274I  verb CONSOLE name NOT VALID

Explanation: A command specified a console name that does not represent a valid console.

In the message text:

verb The command verb.
name The name or identifier of a console specified on the command.

System action: The system rejects the command.

Operator response: Contact the system programmer.

System programmer response: Do one of the following:
• If the command specified a console identifier, ensure that the identifier is a decimal value between 01 and 99.
• If the command specified a console name, ensure that it is a valid MCS console name and is not a SMCS console name.
• If the identifier of a subsystem console was specified with the VARY command, ensure that the only option specified is AUTH.
• Check to see if the command originated from a ROUTE command (for example RO *ALL or RO *OTHER or RO sysgrpname). Some commands will be rejected if issued from a ROUTE command because it would have modified an IBM internally owned console’s attribute.

IEE275I  cmd ROUTING CODE KEYWORD
VALUE OF value NOT ALLOWED

Explanation: A VARY CONSOLE or VARY HARDCPY command requested that the system add or delete specified routing codes to the routing codes already
defined for a console or the hard-copy log. The value specified for the AROUT or the DROUT keyword was either NONE or ALL. These are not acceptable values for these keywords.

In the message text:

\begin{verbatim}
  cmd  The command.
  value  The value specified for the AROUT or the DROUT keyword.
\end{verbatim}

**System action:** The system rejects the command.

**Operator response:** If you want to vary the console offline, first give the function of the console with master authority to another console. Then, vary the console offline.

**Source:** Master scheduler

**Detecting Module:** IEECB850

**Routing Code:**  

**Descriptor Code:** 5

---

**Explanation:** A VARY OFFLINE command requested that the system place offline the console with master authority. The command did not specify the FORCE parameter when varying the console offline.

In the message text:

\begin{verbatim}
  dev  The device number.
  cccccccc  The console name.
\end{verbatim}

**System action:** The system rejects the command.

**Operator response:** Enter the command again, specifying the FORCE parameter.

**Source:** Master scheduler

**Detecting Module:** IEECB848

**Routing Code:** 2

**Descriptor Code:** 5,12

---

**Explanation:** The system expected a reply to a synchronous write to operator with reply (WTOR) message. The operator entered a reply command with a non-decimal identifier.

In the message text:

\begin{verbatim}
  id  The erroneous identifier on the REPLY command.
  nn  The correct identifier on the REPLY command.
\end{verbatim}

**System action:** The system ignores the reply and waits for a correct reply.

**Operator response:** Enter a correct reply identifier.

**Source:** Communications task (COMMTASK)
Detecting Module:  IEAVG724
Routing Code:  -
Descriptor Code:  4

**IEE280A**  REPLY id TOO LONG FOR REQUESTOR. RESPECIFY REPLY nn.

**Explanation:**  In response to a synchronous write to operator with reply (WTOR) message, the operator entered a reply command that was too long for the user’s buffer.

In the message text:

id  The identifier on the REPLY command.

nn  The correct identifier on the REPLY command.

**System action:**  The system waits for a correct reply.

**Operator response:**  Reenter the reply correctly.

**Source:**  Communications task (COMMTASK)

**Detecting Module:**  IEAVG724
**Routing Code:**  -
**Descriptor Code:**  4

**IEE281A**  REPLY id IGNORED; IMPROPER USE OF DELIMITERS. RESPECIFY.

**Explanation:**  The operator entered an incorrect REPLY command when the system expected a different reply to a synchronous write to operator with reply (WTOR) message. The error was one of the following:

- A closing apostrophe did not follow the text when the text was preceded by an apostrophe.
- A character other than a comma, space, or null followed the identifier.

In the message text:

id  The identifier on the REPLY command.

nn  The correct identifier on the REPLY command.

**System action:**  The system ignores the reply and asks for a correct reply.

**Operator response:**  Reenter the reply correctly.

**Source:**  Communications task (COMMTASK)

**Detecting Module:**  IEAVG724
**Routing Code:**  -
**Descriptor Code:**  4

**IEE282A**  REPLY id EXPECTED; NO OTHER COMMANDS ACCEPTED. SPECIFY REPLY id.

**Explanation:**  The operator entered a command other than a REPLY command when the system expected a reply to a synchronous write to operator with reply (WTOR) message.

In the message text:

id  The identifier on the REPLY command.

nn  The correct identifier on the REPLY command.

**System action:**  The system ignores the command and asks for a correct reply. The system does not accept any other commands at this time.

**Operator response:**  Enter the reply correctly.

**Source:**  Communications task (COMMTASK)

**Detecting Module:**  IEAVG724
**Routing Code:**  -
**Descriptor Code:**  4

**IEE286I**  CONSOLE DELAYED MESSAGE BUFFER FULL. MESSAGES LOST

**Explanation:**  The buffer for the following messages is filled and cannot be expanded:

- Branch-entry write to operator (WTO)
- Branch-entry write to operator with reply (WTOR)
- Delete operator messages (DOM)

**System action:**  Until space is regained, the system:

- Does not send branch-entry messages to the console or the hard-copy log
- Sends synchronous messages to the console, but not to the hard-copy log
- Sends all messages to the console, but not to the hard-copy log if the nucleus initialization program (NIP) is active

4-93
The system may delete some messages. Callers of branch-entry WTO, WTOR and delete operator message (DOM) receive a return code. When space is regained, the system issues message IEE287I.

**Operator response:** Enter the DISPLAY R command to display information about all outstanding immediate action and eventual action messages. Delete messages by:

- Responding to messages requesting an action
- Entering the CONTROL C command

**Source:** Communications task (COMMTASK)

**Detecting Module:** IEAVBWTO

**Routing Code:** -

**Descriptor Code:** 4

In the message text:
\textit{cm} The command in which the system detected the error.

\textbf{System action:}\ The system rejects the command.

\textbf{Operator response:}\ Enter the command again, correctly. If the command was originally entered through the input stream, the command may be entered again through the console in response to this message.

\textbf{Source:}\ Master scheduler
IEE299I  {SYSLOGIOPERLOG} REQ'D FOR HARDCPY - USE UNCOND TO TURN OFF HARDCOPY

Explanation: A VARY [SYSLOGIOPERLOG],HARDCPY,OFF command requested to stop the hardcopy medium. However, processing the command would cause both the system log and operations log to be inactive when the hardcopy function is required.

If it is absolutely necessary to turn off the hardcopy function, issue VARY [SYSLOGIOPERLOG],HARDCPY,OFF,UNCOND. This should be done temporarily, as a last resort in order to repair hardcopy functions.

In the message text:

nnnnnnnn A console name.

System action: The system rejects the command.

Operator response: Either change the hardcopy to a different medium, or use the UNCOND parameter if it is necessary to turn off hardcopy.

Source: Master scheduler

IEE300I  nnnnnnn/mmmmmmmm INVALID ALTCON

Explanation: A VARY device,CONSOLE command was entered from a console requesting that the console itself be named as an alternate console.

In the message text:

nnnnnnnn Name of the console for which an alternate console is being specified.

mmmmmmm The alternate console name specified on the VARY command.

Note: nnnnnnnn and mmmmmmmm are the same device.

System action: The system rejects the command.

Operator response: Choose another alternate console. Enter the command again.

Source: Master scheduler

IEE301I  jobname {CANCEL|FORCE|FORCE ARM} COMMAND ACCEPTED

Explanation: A command requested that the system stop processing a job.

In the message text:

jobname One of the following:

- The name of the job removed in response to the command.
- The job name of a task created by the START or MOUNT command. (If an identifier was specified on the START or MOUNT command that created the task, the message includes the identifier.)
- The name of an advanced program-to-program communications (APPC) transaction program.
- STARTING, if initiation of a started job, task, or ATX is complete.

CANCEL A CANCEL command requested removal of the job.

FORCE A FORCE command requested removal of the job. A CANCEL or FORCE ARM command was entered previously for the job.

FORCE ARM A FORCE ARM command requested the end of the job.

System action: The system accepts the command for processing and will try to remove the job from the system and to delete all references to it. Note, however, that message IEE301I indicates only that the console command was accepted by the system and that the CANCEL or FORCE processing has been scheduled. Message IEE301I does not guarantee that the CANCEL or FORCE processing will complete properly, and it is therefore possible for message IEE301I to be issued, but for the job not to be removed from the system. Depending on the message text, the system does the following:

CANCEL The system issues messages explaining the reason for the cancellation. If the system is in the process of normally terminating the job when the CANCEL command is issued, the system ignores the command and completes the normal termination.
FORCE
A CANCEL or FORCE ARM command was previously entered for the job. The system ends the job’s address space.

FORCE ARM
The system issues messages explaining the reason for the cancellation.

IEE302I IEE1302I

unit ONLINE [BY sss] [NOT VERIFIED]

Explanation: unit is one of the following:
PATH(dev,xx)
  dev
  nnnnnnnnn

One of the following occurred:
• A reconfiguration request asked that the system place a device or console online.
• A reconfiguration request asked that the system place a path to a device online.

For active teleprocessing (TP) devices, or OSA or CTC devices in use by VTAM with a long running I/O active, the system bypasses a validity check of the physical path to the device. The system marks the path online.

In the message text:
PATH(dev,xx)
  A VARY PATH,ONLINE command was entered, requesting that path xx to device number dev be placed online.
  dev
  nnnnnnnnn

One of the following occurred:
• A VARY devspec,OFFLINE command requested that a device or console be placed offline.
• A VARY PATH,OFFLINE command requested that a path to a device be placed offline.

In the message text:
PATH(dev,xx)
  A VARY PATH,OFFLINE command was entered, requesting that path xx to device number dev be placed offline.
  dev
  nnnnnnnnn

BY sss
If BY sss appears in the message, the request to place device dev offline was made by system service sss. For example, sss might be System Automation.

System action: The system successfully processes the command. The system continues processing.

Source: Master scheduler
Detecting Module: IEEVPITH, IEECB844, IEECB847
Routing Code: -/Note 13
Descriptor Code: 5
EXPLANATION: In response to a RESET command, the system changed the performance group of the job.

In the message text:

jobname

The name of the job.

SYSTEM ACTION: The system continues processing.

SOURCE: System resources manager (SRM)

DETECTING MODULE: IEEMB810

ROUTING CODE: 2

DESCRIPTOR CODE: 5

EXPLANATION: A command is incorrect for one of the following reasons:

- The command is misspelled or punctuated incorrectly.
- A command valid only at initial program load (IPL) was used after IPL.
- A command was issued without a prerequisite command.
- The command had an incorrect operand, as in HOLD or RELEASE commands without a TP operand.

In the message text:

MODE Indicates that ECC was requested in record mode while HIR was in quiet mode.

CSCB USE Indicates that the maximum number of Telecommunications Access Method (TCAM) commands had been enqueued when another TCAM command was submitted.

cm The command that is incorrect.

blanks The operand of the central command was too long, or a framing quote was not found within 62 bytes.

SYSTEM ACTION: The system rejects the command.

OPERATOR RESPONSE: If blanks or cm appears, enter the command again correctly. For MODE, if desired, enter the command to place HIR into record mode before resubmitting the command to place ECC into record mode.

When CSCB USE appears, resubmit the command at a later time. If the condition persists, increase the number of command input buffers (CIB) specified on the INTRO macro in the TCAM main control program (MCP).

Routing Code: *
Descriptor Code: 5

IEE313I  {HARDCOPY|sdddd} UNIT REF. INVALID

Explanation: While processing a command, the system detected one of the following errors:

1. The unit, console identifier, or console name specified on the command indicates a device type that cannot be used for the purpose intended by the command. Among the reasons for this are:
   - The device has not been defined or has not been properly defined in the CONSOLxx member.
   - The device has been properly defined in the CONSOLxx member, but the system is unable to accept the device definition. This can be caused by defining devices that exceed the limit of 99 console definitions per sysplex.
2. The command issuer is not authorized.
3. The command requested that the system vary the hard-copy log offline, but the system has no current recording log.

If the unit is an output only device, it will be referenced as O-dev (for example, VARY O-dev,ONLINE).

In the message text:

HARDCOPY

A VARY HARDCPY,OFFLINE command was entered.

s   The subchannel set id.

dddd   The number for the device specified on the command.

System action: The system rejects the command.

If VARY CN(xx),AUTH=value or VARY CN(nnnnnnnn),AUTH=value was entered, and the console identifier or name is incorrect or the issuer is not authorized, the system does not change the authority value for the specified console.

If a VARY CONSOLE command was entered for a console name that is a SMCS console or a subsystem console, the system issues this message to show the status.

If a VARY CONSOLE command was entered for device number dev or console name nnnnnn and the device is not active and not ready, the system issues this message to show the status.

If the unit is offline when an UNLOAD command is entered, then the system does not process the UNLOAD command. For example, if the UNLOAD 13D command is entered, when 13D is offline, the system issues message IEE313I as follows:

IEE313I 13D UNIT REF. INVALID

If a VARY device command (for example, VARY dev1-dev2,OFFLINE) is entered and each of the specified units is individually incorrect, the system displays dev1-dev2 in the message text.

Operator response: Do the following:

- For case 1, enter the command again, specifying the correct unit name.
- For case 2, enter the command from a console with master authority.
- For case 3, none.

Also, check the SYSLOG of the system where the console should have been defined for the presence of message IEA195I; this indicates that one or more console definitions were not accepted. Issue the “D CL” command and see whether the console mentioned in message IEE313I is listed as a validly-defined console.

IEE316I  OPERATIONS LOG HAS FAILED ON SYSTEM sysname {UNABLE TO CONNECT TO LOG STREAM - conreason} {UNABLE TO WRITE TO LOG STREAM - conreason} {EXCESSIVE WAIT DURING operation - RETURN CODE}

Explanation:  The operations log has failed on a system in the sysplex. Messages created on that system are no longer being written to the operations log.

In the message text:

sysname  The name of the system on which the log has failed.

UNABLE TO CONNECT TO LOG STREAM - conreason
The failure occurred after the IXGCONN macro was issued in an attempt to connect to the operations log stream.

conreason identifies the reason for the connection failure, which can be one of the following:

LOG STREAM NOT DEFINED
The operations log stream, named SYSPLEX.OPERLOG, has not been defined to system logger. This error corresponds to IXGCONN macro return code 0008, reason code 080B.

RETURN CODE=xxxx-yyyy
The IXGCONN macro returned an error other than a log stream or structure not being defined. The return code is xxxx and the reason code is yyyy.

EXCESSIVE WAIT DURING operation - RETURN CODE
The failure occurred after the IXGWRITE or IXGCONN macro was issued in an attempt to write or connect to the operations log stream. OPERLOG received a return and reason code requesting that it wait for an ENF signal before proceeding with further requests. However more than 5000 messages have been queued and no ENF signal has been received yet.

operation identifies the the operation requested at the time of failure.

RETURN CODE=xxxx-yyyy
The IXGWRITE or IXGCONN macro returned an a return code of xxxx and reason code of yyyy: See z/OS MVS Programming: Assembler Services Reference IAR-XCT for explanation of the macro return and reason codes.

System action:  The operations log will be discontinued on the named system. If the hardcopy medium is not active, the system attempts to activate it. The system continues processing.

Operator response:  Notify the system programmer. When the problem with the operations log is resolved, enter the VARY OPERLOG,HARDCPY command to activate the operations log.
System programmer response: Depending on the message text, do one of the following:

LOG STREAM NOT DEFINED
Define the operations log stream using the administrative data utility. Then activate the operations log.

STRUCTURE NOT DEFINED
Define the structure using the administrative data utility. Then activate the operations log.

Otherwise, see z/OS MVS Programming: Assembler Services Reference IAR-XCT for a description of the return and reason codes.

IEE325D    REPLY U TO CONTINUE CONFIG COMMAND. REPLY C TO CANCEL

Explanation: The operator attempted to configure offline the processor associated with the last Integrated Cryptographic Feature (ICRF) in the system and the system is asking that the operator verify this request. Message IEE109I was issued prior to this message giving the cpuid of the affected processor.

System action: The system waits for the operator to reply.

Operator response: If you want the system to configure the specified processor offline, reply U. If you want to cancel the configuration request, reply C.

Note: If you configure the processor offline and jobs are submitted to the system that require the ICRF, the jobs will abend.

Source: Reconfiguration

Detecting Module: IEEVCRLF
Routing Code: -
Descriptor Code: 7

IEE328I    cccccc COMMAND ABORTED
- [reason]

Explanation: The system could not run a command for one of the following reasons:
• There is not enough storage available to schedule the command.
• The system tried to obtain more address spaces than the maximum number supported.
• The operator tried to issue a vary command to activate or deactivate a console or to set a device online or offline, but the command failed because of an abend.
• If the command is LOGON, MOUNT, or START, there is a shortage of available slots in the auxiliary storage paging space. The system also issues message IRA200E.

• If the command is DISPLAY GRS or VARY GRS, an error occurred during global resource serialization processing.
• If the command is DISPLAY APPC or DISPLAY ASCH, the storage area for the display is too small because extremely high APPC or APPC/MVS transaction scheduler activity occurred.
• If the command is UNLOAD, the command failed for one of the following reasons:
  – An attempt was made to obtain an enqueue.
  – An internal error occurred during allocation UNLOAD processing and the UNLOAD command could not continue.

In the message text:
ccc  The command, or a portion of the command, entered.
ssssssss  The target system.
reason  One of the following:

TARGET SYSTEM sssssss APPEARS STOPPED
The system could not deliver a command to another system in the sysplex for one of the following reasons:
• The target system is quiesced.
• The channel-to-channel (CTC) link between the source and target systems is not working.

TARGET SYSTEM sssssss NOT READY FOR COMMANDS
The system on which the command was targeted for processing is still initializing and is not yet ready to process commands.

System action: The system rejects the command. The system may issue additional messages about a failed CTC or failed processor partitioning.

Operator response: Do one of the following:
• Enter the command again at a later time.
• Redirect the command to a different processor.
• Restart the stopped system.
• If the command is LOGON, MOUNT, or START, see message IRA200E for actions to relieve the auxiliary storage shortage.
• If the command is DISPLAY GRS or VARY GRS, enter the command again. If the problem persists, stop entering GRS commands on this system. Re-IPL the system.
• If the command is DISPLAY APPC or DISPLAY ASCH, enter the command again. If the problem persists, enter the command again, using the CLASS
keyword parameter on DISPLAY ASCH or any of the keyword parameters on DISPLAY APPC.

System programmer response: If the command is VARY and the failure is caused by an internal error, collect documentation and contact L2.

Explanation: The system is in a spin loop on one processor, waiting for an event on another processor. The spin loop exceeded the time normally needed for the event to occur.

In the message text:

y The waiting processor.

x The processor on which an event is to occur.

event The event that should occur on processor x, is one of the following:

CPU IN STOPPED STATE
OPERATOR INTERVENING STATE
RISGNL RESPONSE
LOCK RELEASE
RESTART RESOURCE
ADDRESS SPACE TO QUIESCE
INTERSECT RELEASE
SUCCESSFUL BIND BREAK RELEASE

System action: Processor y waits for the operator to respond. The other processors continue with their processing. If the operator does not respond within 125 seconds, processor y may load restartable wait state X'099'.

Operator response: Reply one of the following:

U or SPIN The system continues spinning.

ABEND The system abnormally ends the unit of work on processor x, allowing recovery routines to retry.

TERM The system abnormally ends the unit of work on processor x, without allowing recovery routines to retry.

ACR Alternate CPU recovery (ACR) places processor x offline. ACR abnormally ends the current unit of work on processor x.

System programmer response: Identify the module that was running on processor x, using the methods described in z/OS Problem Management and z/OS MVS System Codes, under the description of system completion code 071. Also see z/OS MVS Setting Up a Sysplex and the EXSPATxx section of z/OS MVS Initialization and Tuning Reference.
IEE334I  HALT EOD SUCCESSFUL

Explanation: The operator entered a HALT EOD command. The system processed the command successfully.

System action: The system writes a logrec data set error record containing job and system statistics and data records.

Operator response: Stop the operating system.

Descriptor Code: 5

IEE339I  \{devnnnnnnnn\} CHANGING STATUS

Explanation: A VARY command requested that a device or a console be varied online or offline. However, the specified device or console is currently in the process of changing status.

In the message text:
dev A VARY command was entered for device number dev.
nnnnnnn A VARY command was entered for a console named nnnnnnnn.

System action: The system rejects the command.

Operator response: Do one of the following:
1. Enter DISPLAY CONSOLE to determine the status of the console.
2. Enter VARY to place the device or console online or offline, after it has completed its status change.
3. If the VARY command does not work, you can, if necessary force the console displayed in this message into an offline state using the RESET CN command. Before issuing the RESET CN command, see [z/OS MVS System Commands]

IEE340E  DUMP DATA SET UNUSABLE: nn

Explanation: While writing an SVC dump, the system detected that the specified dump data set cannot be used to write the SVC dump for one of the following reasons:
• The specified dump data set had been added with the DUMPDS command.
• The specified dump data set was on a direct access storage device (DASD). Dynamic allocation failed to allocate the data set to the dump address space, and the data set is unusable.

In the message text:

nn The 2-digit suffix of the DASD SYS1.DUMP data set name. For example, if the name is SYS1.DUMP17, xx is 17.

System action: The dump data set can no longer receive SVC dumps.
**Operator response:** Enter a DUMPDS ADD command to try to reconnect any lost dump data sets.

**Routing Code:** `*`

**Descriptor Code:** 5

---

**IEE341I**

**Explanation:** The operator entered a command that applies to a time sharing system, a job, or a multiple console support (MCS) console. However, the task, job, or console is not currently active.

In the message text:

- `ttt` is the command applied to the Time Sharing Option Extensions (TSO/E) system `ttt`
- `jobname` is one of the following:
  - The name of the job removed in response to the command.
  - The job name of a task created by the START or MOUNT command. (If an `identifier` was specified on the START or MOUNT command that created the task, the message includes the identifier.)
  - The name of an advanced program-to-program communications (APPC) transaction program (TP).
  - The name of an initiator.
  - `STARTING`, if initiation of a started job, task, or ATX is complete.
- `CN=nnnnnnnn` is the name of a multiple console support (MCS) console.

**IN SPECIFIED ADDRESS SPACE**

The CANCEL, FORCE, STOP, or RESET command had a parameter `A=ijj`.

For example, if CANCEL JOBX is entered with no JOBX running, the message text `JOBX NOT ACTIVE` appears. If DISPLAY R,A,`CN=95` is entered when only consoles 1 through 60 are active, the message text `CN=95 NOT ACTIVE` appears.

**System action:** The system rejects the command.

**Operator response:** Do one of the following:

- If `ttt` is TRACE, no response is needed. If `ttt` is anything else, then do the following:
  - Enter a DISPLAY A,LIST command to verify that task `ttt` was started.

---

**IEE342I**

**Explanation:** While processing a command, the system detected that either:

- The task associated with the command had not finished processing a previous command.
- The command was entered for a job or task that is in a step-must-complete mode.

For example, while JOBX was running, a STOP JOBX command was entered. If a MODIFY X,`parameters` command was entered, the system will issue message IEE342I.

In the message text:

- `cm` is the command, or a portion of the command, entered.

**System action:** The system rejects the command.

**Operator response:** Enter the command again after the previous commands have completed processing.

**Source:** Master scheduler

**Routing Code:** `*`

**Descriptor Code:** 5

---

**IEE343I**

**Explanation:** Additional lines that display are:

- AUTOSWITCHABLE DEVICES ON LINE TO SYSTEM `tysname`
- UNIT TYPE STATUS SYSTEM `jobname` `asid` `volser` `volstate` `ssysname` `jobname` `asid` `volser` `vvvvvvvvv` `sysname(sunt,styp)`
- AUTOSWITCHABLE DEVICES NOT ON LINE TO SYSTEM `tysname`
- UNIT TYPE STATUS SYSTEM `jobname` `asid` `volser` `volstate` `ssysname` `jobname` `asid` `volser` `vvvvvvvvv` `sysname(sunt,styp)`

**[AUTOSWITCH STATUS UNAVAILABLE - textl]**

**[DISPLAY TRUNCATED - INSUFFICIENT STORAGE]**

This message appears in response to a DISPLAY U,,AUTOSWITCH command and displays the status of all automatically switchable devices or describes why it
was unable to provide the status. See in z/OS MVS System Commands for more information.

In the message text:

UNIT The device number of an automatically switchable device.

TYPE The type of magnetic tape unit, as defined through HCD (for example, 3480). Devices appear as specified through HCD.

The following device types appear in the TYPE field:

- type Device type, such as ‘3480’
- xxxS where xxx represents the first three digits of device type (for example, ‘348’ for a 3480 or ‘349’ for a 3490) and ‘S’ means the device has a cartridge stack loader.
- xxxL where xxx represents the first three digits of a device type (for example, ‘348’ for a 3480 or ‘349’ for a 3490) and ‘L’ means the device is a library device.
- UND where the device is not known.

Note: If a device is both a library device and has a cartridge stack loader, the L designation takes precedence over the S designation.

STATUS The status of the device:

- A Allocated
- CA Cartridge stack loader is active
- OFFLINE Offline
- RAL Restricted to allocation
- SYS Allocated to system

SYSTEM The system to which the device is assigned. The system name is one of the following:

- The name of the system, as specified on the SYSNAME parameter of the IEASYSxx parmlib member.
- *UNKNOWN when the device is allocated but the DISPLAY command processor cannot identify the system. In this case, the automatically switchable device is assigned to a system that is not connected to the same IEFASWITCH structure, or is connected to the same structure but is using the device as a dedicated device.

If a range of devices was specified on the DISPLAY AUTOSWITCH command and some of those devices are not automatically switchable, they are not displayed. The additional information in the form of sysname (sunt, styp) shows devices defined to other systems than this one, and provides similar information to OEM tape sharing software.

If none of the devices specified on the DISPLAY AUTOSWITCH command are automatically switchable, message IEE317I appears to indicate this condition.

idr An identifier used with the CONTROL C,D command to cancel status displays:

- Written on printer consoles
- Displayed inline (that is, not in a display area) on a display console

This identifier does not appear when the display appears in a display area on a display console.
IEE345I • IEE351I

In the message text:

`text1`

is one of the following:

**[SYSTEM ERROR]**

A system error occurred.

**[DISPLAY TRUNCATED - INSUFFICIENT STORAGE]**

The system was unable to obtain sufficient storage for a display line to complete the command.

System action: The system continues processing.

IEE345I  
`command [REJECTED] AUTHORITY INVALID [text] [- `keyword`] [COMMAND ISSUED IS command]`

Explanation: The operator entered a command from a console that did not have the correct command authority.

In the message text:

`command`

The rejected command. If message IEE345I is a result of issuing the CMDAUTH macro with the CBLKTYPE=SSCM, or CBLKTYPE=CMDX, this field will appear as COMMAND.

`text`

text is one of the following:

**FAILED BY MVS**

The MVS console command authority was insufficient for this command. Either:

- no security product was active for this function, or
- a security product was active for this function, but it could not determine whether the command should be allowed or failed.

**FAILED BY SECURITY PRODUCT**

The MVS console command authority was insufficient for this command. Your installation is using RACF or another security product to control command authority for consoles.

**FOR DEVICE (dev)**

Displays the device number for a device associated with the command.

`dev` shows the device number.

---

IEE351I  
`cm COMMAND FAILED. CROSS MEMORY ROUTINE ERROR DETECTED.`

Explanation: A SET MMS or a DISPLAY MMS command was entered, but the system could not issue a response to the command.

In the message text:

`cm`

The command, or a portion of the command, entered.

System action: The system rejects the command.

Operator response: Enter the command again. If the command fails again, contact the system programmer.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IEE351I  
`SMF SYS1.MAN RECORDING NOT BEING USED`

Explanation: One of the following occurs during system management facilities (SMF) initialization processing or during SET SMF command processing:

- Allocation failed for the SYS1.MANn data set.
- The SYS1.MANn data set could not be opened.
- The current SMFPRMxx parmlib member specifies that SMF recording is not to be used.
The message is also issued when DISPLAY SMF command processing determines that SMF recording is not currently being used.

**System action:** For a problem with the SYS1.MANn data set, the system issues an error message about the problem before this message. For a problem during SMF initialization processing, the system writes no records in the SYS1.MANn data set. In all cases, processing continues.

**Operator response:** Do one of the following:

* For a problem with the SYS1.MANn data set, notify the system programmer.
* For a production system that requires SMF recording, reIPL the system after the SMFPRMxx parmlib member is redefined. In all other cases, no response is required.

**System programmer response:** Properly define the SMFPRMxx parmlib member as indicated in the preceding message.

---

**IEE360I** SMF NOW RECORDING ON SYS1.MANn ON ser TIME=hh.mm.ss

**Explanation:** System management facilities (SMF) will write records on the SMF data set SYS1.MANn.

SMF issues this message:

- During SMF initialization processing to indicate which data set was chosen by the SMF writer as the current recording data set.
- When a switch in active data sets takes place during system processing.

In the message text:

**SYS1.MANn** The data set, with a suffix of n.

**ser** The volume serial number.

**hh.mm.ss** The time given as the hour (00-23), the minute (00-59), and the second (00-59).

**System action:** SMF initially places records in a buffer. When the buffer is full, SMF writes the data in the buffer to the indicated data set. If the system fails before the buffer is full, the records are lost.

**Source:** System Management Facilities (SMF)

**Detecting Module:** IEEMB829

**Routing Code:** Route code for switch SMF processing. *,2

**Descriptor Code:** 4

---

**IEE362A** SMF ENTER DUMP FOR SYS1.MANn ON ser

**Explanation:** The SMF SYS1.MANn data set is ready to be dumped; this message is issued in response to either a HALT EOD or a SWITCH SMF command being entered, or if an alternate data set was not empty at SMF Initialization Time.

In the message text:

**SYS1.MANn** The data set, with a suffix of n.

**ser** The serial number of the volume that the data set resides on.

**System action:** System processing continues. If another SMF data set is available, SMF continues recording and issues message IEE360I. If none is available, SMF will store the records in the buffer area until either data set becomes available or there is no
more buffer space available. If SMF runs out of buffer space to use then message IEE979W is issued and SMF will lose data.

**Operator response:** Request the SMF dump program for the data set.

If you do not dump the data set within a reasonable time, SMF data might be lost, which is indicated by message IEE366I. How much time can elapse before SMF data is lost depends on the size of the recording data sets and the type of records being recorded.

**Source:** System Management Facilities (SMF)

**Detecting Module:** IEEMB829

**Routing Code:** Route code for switch SMF processing. *,1

**Descriptor Code:** 2

---

**IEE362I** SMF ENTER DUMP FOR SYS1.MAN\_n ON \_ser

**Explanation:** The SYS1.MAN\_n data set is full, or a HALT EOD or a SWITCH SMF command was entered.

In the message text:

SYS1.MAN\_n
The data set, with a suffix of \_n.

\_ser
The volume serial number.

**System action:** System processing continues. If another SMF data set is available, SMF continues recording and issues message IEE360I. If none is available, SMF does no further recording.

**Operator response:** Request the SMF dump program for the data set.

If you do not dump the data set within a reasonable time, SMF data might be lost, which is indicated by message IEE366I. How much time can elapse before SMF data is lost depends on the size of the recording data sets and the type of records being recorded.

---

**IEE364I** SMF (LOGICAL|PHYSICAL) I/O ERROR ON SYS1.MAN\_n (FEEDBACK CODE=fc) \_error

**Explanation:** The system found an error while writing to the system management facilities (SMF) SYS1.MAN\_n data set.

In the message text:

SYS1.MAN\_n
The data set, with a suffix of \_n.

fc The VSAM feedback code for a logical error.

\_error The VSAM error message text for a physical error.

**System action:** SMF continues processing, but does not write to the erroneous data set. If another SMF data set is available, SMF writes to it and issues message IEE360I. Otherwise, SMF does no further recording.

**Operator response:** For a logical error, check the VSAM code and fix the error. The error might be the result of an improperly defined data set.

**System programmer response:** For a logical error, check the VSAM code and fix the error. The error might be the result of an improperly defined data set.

**Source:** System Management Facilities (SMF)

**Detecting Module:** IEEMB829

**Routing Code:** 2,10

**Descriptor Code:** 4

---

**IEE366I** NO SMF DATA SETS AVAILABLE -- DATA BEING BUFFERED TIME = hh.mm.ss

**Explanation:** The current SMF data set is full. The system could not find an available SMF data set. As a result, SMF will put the SMF data in a buffer until a data set is available. This condition developed because the SYS1.MAN\_n data sets were not dumped in response to message IEE362A. This message is also issued in response to a DISPLAY SMF command when no SMF data sets are available.
In the message text:

\textit{hh.mm.ss}

The time given as the hour (00-23), the minute (00-59), and the second (00-59).

**System action:** System processing continues, but SMF buffers all SMF records. SMF counts the number of records it buffered and logs the starting and ending times when it was unable to write any records. When a data set does become available, SMF writes an SMF data lost record (type 7) to the available data set and then writes the buffered SMF records to the data set.

**Operator response:** Run the SMF dump program. If a dump program is currently running, make sure that it completes as soon as possible.

VARY REJECTED, UCB FOR DEVICE dev NOT CONNECTED

Explanation: A reconfiguration request asked that the system reconfigure a device, but the device is not connected to any subchannel.

In the message text:

- dev The hexadecimal device number.

System action: The system does not perform the requested reconfiguration for the path to the device. The system continues processing.

Operator response: Make sure that the device is the desired device:
- If it is not the desired device, enter the VARY PATH command again, specifying the correct device number.
- If it is the desired device, contact the system programmer.

System programmer response: Define the device to a subchannel by performing another I/O reconfiguration.

RELATED MESSAGES

Explanation: When the system tried to access a device, an error occurred.

In the message text:

- dev
  The device number.

- chp
  The channel path that could not be brought online.

- header_msg
  An allocation, data facility product (DFP), dynamic device reconfiguration (DDR), or reconfiguration message that describes the error.

- IEE763I NAME=mod_name CODE=msg_code
  This message appears at the beginning of each group of IOS messages that describe a problem.

  In the message text:

- mod_name
  The name of the module that generated the IOS messages which follow message IEE763I.

- msg_code
  A diagnostic aid for the allocation, input/output supervisor (IOS), and/or reconfiguration components.

- iosmsgid1 ios_msg1
- iosmsgid2 ios_msg2
  Messages issued by IOS which further describe the problem. One or more of the following messages may appear:
  IOS445
  IOS550- IOS570

IEE764I END OF msg_id RELATED MESSAGES

The system issues this message after issuing all messages that are part of message IEE386I.

In the message text:

- msg_id
  The identifier for the header message that the system issues as part of message IEE386I.

System action: The system does not perform the requested action on the device.

Operator response: See the operator response for the header messages and/or IOS messages that describe the problem.

System programmer response: See the operator response for the header messages and/or IOS messages that describe the problem.

IEE388I SMF NOW RECORDING ON VOLSER ser, DSN=dsname TIME=hh.mm.ss

Explanation: System management facilities (SMF) will write records on the SMF data set, dsname.

SMF issues this message:

- During SMF initialization to indicate which data set was chosen by the SMF writer as the current recording data set.

- When a switch in active data sets takes place during system processing.

Note: This message is issued instead of IEE360I only when an installation defines a data set name that does not use the SYS1.MANn naming convention.

In the message text:

- ser
  The volume serial number of the volume containing the SMF data set.

- dsname
  The name of the SMF recording data set.

- hh.mm.ss
  The time, given as the hour (00-23), the minute (00-59), and the second (00-59).

System action: SMF initially places records in a buffer. When the buffer is full, SMF writes the data in the buffer to the indicated data set. If the system fails before the buffer is full, the records are lost.
### IEE389I MVS COMMAND PROCESSING AVAILABLE

**Explanation:** The system issues this message during IPL processing when commands can be expected to work successfully.

**System action:** The system continues processing.

**Source:** Master scheduler

### IEE390I ERROR OCCURRED WHILE PROCESSING SPECIFIED LOGLIM - DEFAULT VALUE APPLIED

**Explanation:** The system was unable to process the specified LOGLIM value because of insufficient storage. LOGLIM has been set to the default value of 1 (1000 buffers).

**System action:** The system resets LOGLIM to the default value of 1 (1000 buffers).

**System programmer response:** Verify the amount of CSA storage available for system log buffers. Set LOGLIM based on that amount.

**Source:** Master Scheduler

### IEE391A SMF ENTER DUMP FOR DATA SET ON VOLSER ser, DSN=dsname

**Explanation:** The dsname data set is full, or a HALT EOD or a SWITCH SMF command was entered.

**Note:** This message is issued instead of IEE362I only when an installation defines a data set name that does not use the SYS1.MANn naming convention.

**System action:** System processing continues. If another SMF data set is available, SMF continues recording and issues message IEE388I. If none is available, SMF will begin to buffer SMF data into storage until a data set becomes available. If a data set does not become available, SMF data will be lost.

**Operator response:** Request the SMF dump program for the data set.

If you do not dump the data set within a reasonable time, SMF data might be lost, which is indicated by message IEE366I. How much time can elapse before SMF data is lost depends on the number of records being recorded.

**Source:** System Management Facilities (SMF)

### IEE392I SMF ENTER DUMP FOR DATA SET ON VOLSER ser, DSN=dsname

**-- or --**

**SMF ENTER DUMP FOR DATA SET ON VOLSER ser, DSN= dsname**

**Explanation:** The dsname data set is full, or a HALT EOD or a SWITCH SMF command was entered.

**Note:** This message is issued instead of IEE362I only when an installation defines a data set name that does not use the SYS1.MANn naming convention.

In the message text:

**ser** The volume serial number of the volume containing the SMF data set.

**dsname** The name of the SMF recording data set.

**System action:** System processing continues. If another SMF data set is available, SMF continues recording and issues message IEE388I. If none is available, SMF will begin to buffer SMF data into storage until a data set becomes available. If a data set does not become available, SMF data will be lost.

**Operator response:** Request the SMF dump program for the data set.

If you do not dump the data set within a reasonable time, SMF data might be lost, which is indicated by message IEE366I. How much time can elapse before SMF data is lost depends on the number of records being recorded.

Source: System Management Facilities (SMF)
Detecting Module: IEEMB829
Routing Code: 2
Descriptor Code: 4

IEE393I text
Explanation: Where text is:
SMF {LOGICAL|PHYSICAL} I/O ERROR ON dsname
{FEEDBACK CODE=fc|errortext}

The system found an error while writing to the System Management Facilities (SMF) dsname data set.

Note: This message is issued instead of IEE364I only when an installation defines a data set name that does not use the SYS1.MAN naming convention.

In the message text:

dcname
The name of the SMF recording data set.

fc
The VSAM feedback code for a logical error.

errortext
The VSAM error message text for a physical error.

System action: SMF continues processing but does not write to the erroneous data set. If another SMF data set is available, SMF writes to it and issues message IEE388I. Otherwise, SMF will begin to buffer SMF data into storage until another data set becomes available.

Operator response: Notify the System Programmer.

System programmer response: For a logical error, check the VSAM code and fix the error. The error might be the result of an improperly defined data set. Some physical errors are caused when an image has crashed and the SMF MANx dataset has not been closed properly. Other physical errors are the result of actual hardware failures. For logical errors that cannot be attributed to actual hardware device failures, do the following:

1. If there is data from a previous IPL to be preserved and the installation wished to preserve the SMF data, attempt to offload the dataset via the installation’s SMF offload job using program IFASMFDP. If there is no real physical hardware issue, the offload will succeed.
2. Delete and reallocate the SMF MANx dataset. Ensure no I/O errors occurred during the reallocate of the dataset.
3. Add the dataset back via the SET SMF or SETSMF command.
4. If an I/O still occurs, then notify hardware support. Supply the EREP data for the device in error.

IEE394I text
Explanation: System management facilities (SMF) processing was unable to allocate, open, or close SMF recording data set dsname.

Note: This message is issued instead of IEE950I only when an installation defines a data set name that does not use the SYS1.MAN naming convention.

In the message text:
text
The requested operation. ALLOCATED, OPENED, or CLOSED.

ALLOCATED
If allocation failed, the message includes the return code, error code, and information code from dynamic allocation.

OPENED
If open processing failed, the message includes the return code and error code from VSAM open processing. Message IEC161I precedes this message.

CLOSED
If close processing failed, the message includes the return code and error code from VSAM close processing. Message IEC251I precedes this message.

dcname
The name of the SMF recording data set.

return-code
The dynamic allocation VSAM return code.

error-code
The dynamic allocation VSAM error code.

ic
The dynamic allocation VSAM information code.

System action: SMF processing continues but ignores the dsname data set. If other SMF recording data sets are available, SMF continues recording and issues message IEE388I. Otherwise, SMF will begin to buffer SMF data into storage until another data set becomes available. If a data set does not become available, SMF data will be lost.

Operator response: Notify the system programmer.
System programmer response: See the codes from dynamic allocation or VSAM. See the accompanying messages.

IEE397I  

**form 1 or form 2**

**Explanation:** form 1 is:

SMF DATA SET IS TOO SMALL AND WILL NOT BE USED, DSN=dsname

form 2 is:

SMF DATA SET IS TOO SMALL AND WILL NOT BE USED, DSN=dsname

The dsname recording data set is too small to hold the largest possible SMF record (32 kilobytes) and the control information that is required to segment the record.

**Note:** This message is issued instead of IEE960I only when an installation defines a data set name that does not use the SYS1.MANn naming convention.

In the message text:
dsname
The name of the SMF recording data set.

**System action:** SMF initialization or SET SMF command processing continues but ignores the dsname data set. If at least one valid SMF recording data set is available, SMF continues recording and issues message IEE398I. Otherwise, SMF will begin to buffer SMF data into storage until another data set becomes available.

**Operator response:** Notify the system programmer.

**System programmer response:** Recreate the dsname data set using the access method services DEFINE utility and specifying a larger size. Use the access method services LISTCAT utility to check the size of all SMF recording data sets. A data set is large enough if the LISTCAT output shows a HI-ALLOC-RBA value of at least 36863 for the data set. Recreate any data set that is too small.

**Note:** This message can be issued when the system tries to use an SMF data set that was created with extents. SMF data sets cannot have extents.

IEE405I SLIP TRAP ID=xxxx keyword TRIPLET number NOT PERFORMED. text

Explanation: A SLIP trap requested a storage refresh, but the system has not completed the refresh.

xxxx
The SLIP trap identifier specified on the SLIP command.

keyword
The specified timing of the data refresh: REFBEFOR for before or REFAFTER for after.

number
The number of the triplet that failed.

text
The reason that the triplet failed. One of the following.

(FIRST | SECOND) OPERAND ADDRESS SPACE WAS NOT ACTIVE.
The address space specified by the first or second operand was not active.
{FIRST | SECOND} OPERAND COULD NOT BE ACCESSED.
The address space specified by the first or second operand could not be accessed.

FIRST OPERAND WAS WRITE PROTECTED.
The address space specified by the first operand was write protected.

System action: The system does not perform the failing triplet and subsequent triplets in the SLIP command. If an operand crosses a page boundary, the system might have performed part of the triplet.

Operator response: Contact the system programmer.

System programmer response: Correct the SLIP command and issue the command again.

Source: SLIP
Detecting Module: IEAVTSL3
Routing Code: 10
Descriptor Code: 4

IEE406I SLIP TRAP ID=xxxx NOT ACTIVATED.

Explanation: The system did not activate a SLIP trap. In the message text:

xxxx
The SLIP trap identifier specified on the SLIP command.

text
The reason that the trap was not activated. One of the following:

FIRST RANGE ADDRESS SPACE WAS NOT ACTIVE.
The address space qualifier for the first address of a range specified an address space that is not active.

SECOND RANGE ADDRESS SPACE WAS NOT ACTIVE.
The address space qualifier for the second address of a range specified an address space that is not active.

FIRST RANGE ADDRESS COULD NOT BE DETERMINED.
The system could not evaluate the first indirect address specified in the SLIP command for one of the following reasons:
• The address space was swapped out.
• The page where the address resides was paged out.
• The page where the address resides was not valid.

SECOND RANGE ADDRESS COULD NOT BE DETERMINED.
The system could not evaluate the second indirect address specified in the SLIP command for one of the following reasons:
• The address space was swapped out.
• The page where the address resides was paged out.
• The page where the address resides was not valid.

RANGE OF A TARGET TRAP USES THE SA QUALIFIER BUT SOURCE TRAP IS NOT SA.
The SA qualifier was used in the RANGE parameter of a target trap, but the source trap was not SA.

DYNAMIC PER ACTIVATION CHAIN IS NOT COMPLETE.
An attempt was made to enable the first trap in a dynamic PER chain. However, not all the traps in the chain were present.

RESPONSE WAS CANCEL.
The command entered was SLIP MOD,ID=XXXX,ENABLE, but the range was too large. The operator chose to cancel activation of the trap.

COULD NOT RESOLVE PVTMODE RANGE.
SLIP could not obtain the local lock of the primary address space where the PER interrupt occurred. The local lock is required to search the job pack queue.

COULD NOT SET PER RANGE.
The problem is caused by the timing of the command or the environment.

System action: The system does not activate the SLIP trap. The system continues other processing.

Operator response: If the text was COULD NOT SET PER RANGE, enter the SLIP command again. For any other text, contact the system programmer.

System programmer response: Correct the problem indicated by the text. Ask the operator to enter the SLIP command again.

IEE407D SLIP ID=xxxx text RESPECIFY TARGETID KEYWORD OR ‘CANCEL’

Explanation: The system did not activate the first SLIP trap in a dynamic PER activation chain because the TARGETID parameter of one trap was incorrect. In the message text:
The SLIP trap identifier specified on the SLIP command with the incorrect TARGETID parameter.

text

The reason the TARGETID was not correct is one of the following:

**TARGETID CAUSES A CIRCULAR DYNAMIC PER ACTIVATION CHAIN.**

The TARGETID of one trap in the chain references another trap that, in turn, refers back to the first trap, directly or indirectly.

**TARGETID CORRESPONDS TO A nnnn TRAP.**

Where nnnn is one of the following:

- **SUBTRAP**
- **IGNORE**
- **NON-PER**

These traps do not participate in dynamic PER activation chains.

**System action:** The system does not active the SLIP traps in the dynamic PER activation chain. The system continues with other processing.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the problem indicated by the text. Ask the operator to enter the SLIP commands again.

sysnn  RESPONSES  -------------------
response0n

In the message text:

text

As many characters of the routed command as will fit on the line. For ROUTE *ALL, this is 16 characters. For ROUTE systemgroupname, this is from 12 to 19 characters.

sys01, sys02,...sysnn

The names of each of the systems in the sysplex.

response01, response02,...,response0n

The responses from each of the systems in the sysplex.

Each response can be one or more lines.

**Note:** The responses are sometimes too long to fit on one line. When a response is more than 71 characters long, it is split into two lines.

sysxx, sysyy, syszz,...

The names of the systems in the sysplex that have not returned responses within the timeout value in effect for the ROUTE command.

**Note:** The IBM-defined default timeout value is 30 seconds.

**System action:** The system continues processing.

command COMMAND OUTPUT 
COMMAND RESPONSE FOR 
WORKITEMS AFFECTED BY 
jobname.id* jobname.identifier text 
jobname.identifier text . . .

**Explanation:** This message is issued when a STOP, MODIFY, or CANCEL command is issued with a wildcard character in the identifier.

**command**

is the issued command verb.

**jobname.id**

is the jobname and wildcard identifier specified on the command.

**jobname.identifier**

is the affected jobname/identifier pair.

text

is one of the following:

- AUTHORITY INVALID, FAILED BY MVS
- AUTHORITY INVALID, FAILED BY SECURITY PRODUCT
- COMMAND ACCEPTED
- NON-CANCELABLE
- NON-CANCELABLE-ISSUE FORCE ARM
- REJECTED-TASK BUSY
- INSUFFICIENT STORAGE FOR COMMAND
- text of message returned by the security product

**System action:** If the text is COMMAND ACCEPTED then the work item is affected by the **command**. Otherwise the **command** may not have been executed against the specified work item. The system continues processing.

**Operator response:** Correct any error and reissue if necessary, or issue FORCE if directed to do so.

VARY CN OFFLINE KEYWORD 
IGNORED FOR EXTENDED MCS 
CONSOLE consname

**Explanation:** The VARY CN command was issued with OFFLINE specified, and more than one console was specified. At least one of the specified consoles was an extended MCS console.

**System action:** The system ignores the OFFLINE keyword on the VARY CN command for the extended MCS console.

**Source:** Communications task (COMMTASK)

**Detecting Module:** IEECB856
Routing Code: *  
Descriptor Code: 5

IEE424I  devconsnameconsid OFFLINE DUE TO CONFIGURATION MANAGER, CANNOT BE VARIED ONLINE

Explanation: A VARY command was issued to vary the device online or activate the console. However, the device or console is being kept offline by a configuration manager (such as ESCON Manager), and cannot be varied online or activated.

In the message text:

dev  The device number specified in the VARY command.
consname  The console name specified in the VARY command.
consid  The console identifier specified in the VARY CN command.

System action: The system rejects the command.

Operator response: To vary the device online, either vary the device online using the configuration manager (for example, using ESCON Manager) or add the FORCE option to the VARY ONLINE or VARY CN,ONLINE command.

**IEE457I** hh.mm.ss UNIT STATUS [idr]

**Explanation:** Where text is:

<table>
<thead>
<tr>
<th>UNIT</th>
<th>TYPE</th>
<th>STATUS</th>
<th>VOLSER</th>
<th>VOLSTATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>uuuu</td>
<td>type</td>
<td>status</td>
<td>volser</td>
<td>vvvvvvvv</td>
</tr>
</tbody>
</table>

This message appears in response to a DISPLAY U command. It can appear in either of two formats, depending on whether the command is DISPLAY U or D U,,ONLINE, or DISPLAY U,,OFFLINE.

The message that displays in response to DISPLAY U or D U,,ONLINE has the following format:

<table>
<thead>
<tr>
<th>UNIT</th>
<th>TYPE</th>
<th>STATUS</th>
<th>VOLSER</th>
<th>VOLSTATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>uuuu</td>
<td>type</td>
<td>status</td>
<td>volser</td>
<td>vvvvvvvv</td>
</tr>
</tbody>
</table>

The message that displays in response to DISPLAY U,,OFFLINE has up to seven instances of UNIT and TYPE, followed by device information.

In the message text:

**UNIT**
The unit for which you are accessing information

**TYPE**
Refers to the following devices:
- CTC adapters
- DASD
- Graphic devices
- Magnetic tape device
- Communication equipment
- Unit record devices

Devices appear as specified through HCD (for TP devices, only the control unit is shown.)

The following device types might appear in the TYPE field:

- **type** Device type, such as ‘3380’
- **3330-1** 3330V

**Note:** Certain Device Types in the same Device Class may display as all the same Device Type. This behavior is discussed in APAR OY58396.

**xxxS** where xxx represents the first three digits of device type (for example, ‘348’ for a 3480 or ‘349’ for a 3490) and ‘S’ means the device has a cartridge stack loader.

**xxxL | xxxM** where xxx represents the first three digits of a device type (for example, ‘348’ for a 3480 or ‘349’ for a 3490). ‘L’ means the device is ATL resident, and ‘M’ means the device is MTL resident.

**Note:** If a device is both a library device and has a cartridge stack loader, the L or M designation takes precedence over the S designation.

**UND** where the device is not known.

**STATUS**
The status of the device, which can be a combination of the following. For example, if A-BSY appears in the message, the device is both allocated and busy.

- **A** Allocated
- **AS** Automatically switchable
- **BOX** Hardware error
- **BSY** Busy
- **C** Console
- **F** Offline. This is used when a combination of offline and some other status value needs to be displayed; for example, F-NRD.
L  The release on a device is pending and reserve may or may not have occurred.

M  A device managed by a device manager, such as JES3 or a non-IBM tape management subsystem

MTP  Mount pending

NRD  Not ready

O  Online

OFFLINE
This is used when the only status value that needs to be displayed is OFFLINE.

P  Reserve pending

PND  Offline pending

PO  Offline pending, and also not ready. This status value is displayed only if NRD is also displayed on the status line.

PUL  Unload pending

R  Reserved, shared DASD or exclusively-assigned device

RAL  Restricted to allocation

S  SYSRES

SPD  Channel program is temporarily suspended while the system is using it.

SYS  Allocated to system

UNAVL  The device has been marked unavailable for allocation by the VARY xxxx,UNAVAIL operator command.

Note: A MOUNT pending designation for a given device (shown as ‘MTP’ in the message text) does not indicate that a volume should be mounted on the device in the following cases:

- No MOUNT message has yet been issued for the device (in this case the device is also designated allocated - shown as 'A' in the message text).
- One or more MOUNT messages were issued for the device but the job(s) for which the messages were issued has been cancelled.

In the first case no action is necessary because a MOUNT message may or may not be issued. In the second case no action is necessary, but issuing an UNLOAD command to the device clears the mount-pending condition.

VOLSER  The volume serial number of the device.

VOLSTATE  How the device is to be used, either for public (PUB) or private (PRIV) or storage (STRG) use and whether the device is reserved (RSERV) or removable (REMOV) or permanently resident (RSDNT).

idr  An identifier used with the CONTROL C,D command to cancel status displays:
- Written on printer consoles
- Displayed inline (that is, not in a display area) on a display console

This identifier does not appear when the display is presented in a display area on a display console.

System action: The system continues processing.

Detecting Module: IEE23110

Routing Code: Note 18

Descriptor Code: 5,8,9

IEE458I  LOGROUTE  text

Explanation: The system issues this message in response to a START, STOP, or MODIFY LOGROUTE command, or after the LOGROUTE task has detected an excessive number of records being routed.

In the message text:

CURRENTLY ACTIVE
The log routing was already successfully started when the START LOGROUTE command was entered.

System Action: The system will not start the second LOGROUTE job. Change the current log routing

Operator Response Use the MODIFY LOGROUTE command to display or change the current log routing.

SET TO NODE.USERID TIME=tt CLASS x
Log routing was successfully started or modified.

System Action: Log routing is started or modified to the new NODE.USERID, TIME and CLASS value.

SET TO DEFNODE*.DEFUSER* TIME=tt CLASS x
The MROUTE option has been selected to allow routing to destinations specified by the OUTPUT JCL statements. The NODEID.USERID parameter, if specified, is ignored.

System Action: Log routing is started to the NODE.USERID specified on the output JCL statement.

INACTIVE
Log routing was successfully stopped in response to the STOP LOGROUTE command.
CANCELLED
The system encountered a programming error in a log routing module.

System Action: All log routing activity stops and the LOGROUTE procedure is cancelled. The system issues an SVC dump and writes a record in the logrec data set error record.

Operator Response: Log routing was stopped to prevent the error from recurring. At the direction of the system programmer, issue the START LOGROUTE command to start log routing.

LOGROUTE SHOULD NOT BE CANCELLED, USE STOP COMMAND
The operator entered a CANCEL command to stop log routing, but the STOP LOGROUTE command must be used instead.

Operator Response: Enter the STOP LOGROUTE command.

NODEID=VALUE nnnnnnnnnn INVALID
The operator entered a START or MODIFY command specifying an incorrect value in the NODEID keyword.

Operator Response: Check the value of the NODEID keyword and re-enter the command. The NODEID keyword must be 1-8 characters long, delimited by a period, and must represent a valid node and userid.

TIME=VALUE nnnnnnnnn INVALID
The operator issued a START or MODIFY command specifying an incorrect value for the TIME keyword.

Operator Response: Check the value of the TIME keyword and re-enter the command. The TIME keyword must a value between 1 and 1440. The value represents minutes.

CLASS=VALUE nnnnnnnnnn INVALID
The operator issued a START or MODIFY command specifying an incorrect value for the CLASS keyword.

Operator Response: Check the value of the CLASS keyword and re-enter the command.

parameter PARAMETER INVALID
The operator entered a START or MODIFY command with an unrecognized parameter.

Operator Response: Check the parameter and re-enter the command. Valid parameters are NODEID and TIME for a START command, and NODEID, TIME, or DISPLAY for a MODIFY command.

UNRECOGNIZED COMMAND
The operator issued a command other than START, STOP, or MODIFY LOGROUTE.

Operator Response: Check the command entered and enter the START, STOP, or MODIFY LOGROUTE command.

NODEID=KEYWORD MISSING, TIME=KEYWORD MISSING, DISPLAY=KEYWORD MISSING
The operator entered a START or MODIFY command without the required NODEID, TIME, or DISPLAY keyword.

Operator Response: Enter the START command with the indicated keyword.

TOO MANY PARAMETERS SPECIFIED
The operator entered a START or MODIFY command with more than one parameter.

Operator Response: Check the command entered, and re-enter the command with only one parameter.

MUST USE JES2 OR 3 TO START LOGROUTE
The operator entered the START command when SUB is something either than JES2 or JES3.

Operator Response: Check the SUB field and re-enter the START command.

RECORD ROUTING SUSPENDED, RECORD ACTIVITY LIMIT EXCEEDED. CHECK FOR LOOP OR HOT I/O
The LOGROUTE task monitors the number of records routed per minute. If the rate exceeds 200 per minute, routing to JES spool is temporarily suspended and records are queued in the LOGROUTE task private storage. This is to prevent possible exhaustion of JES spool. Monitoring continues and a message will be issued after 10 minutes if activity is still high, and at 10 minute intervals if activity stays high.

Operator Response: Examine the LOGROUTE data sent to the Service Director™ for an abnormally high number of records from one or more sources. If one source is found, examine that device, switch or channel to see if it may be defective.

MONITOR REPORT. RECORD ACTIVITY STILL ABOVE LIMIT. STOP LOGROUTE TO PREVENT INTERVAL MESSAGE
The LOGROUTE task has suspended routing records to JES spool and has been monitoring activity for at least 10 minutes. This message is to alert the operator so they may find and correct the cause of high activity. This message will repeat at 10 minute intervals until the activity is normal again or the LOGROUTE task is stopped.

Operator Response: Continue to look for the source of the high number of records routed to the service director. The operator may wish to stop LOGROUTE task to prevent attempts to route records and to prevent issuance of this message every 10 minutes.
RECORD ROUTING RESUMED, RECORD ACTIVITY NOW BELOW LIMIT
Records are no longer being queued to the LOGROUTE task at an excessive rate. Records that were queued to private storage in the LOGROUTE task will be routed to JES spool and normal routing of records has been resumed. LOGROUTE task continues to monitor for high activity.

Operator Response: Be alert for repeat of suspended messages in case the problem reoccurs.

NOT STARTED, OUTPUT STATEMENT MISSING
The MROUTE option has been selected for the LOGROUTE task but no "OUTPUT" statements were added to the LOGROUTE PROC. MROUTE is a new option that when used allows for routing of LOGROUTE records to multiple destinations. If selected, an OUTPUT JCL statement must be added to the LOGROUTE procedure JCL for each destination. Correct the JCL and restart LOGROUTE.

Operator Response: Examine the LOGROUTE PROC JCL and make corrections to either remove the MROUTE parameter or include at least one correctly coded OUTPUT JCL statement.

Explanation: After the above message, a heading appears:
UNIT TYPE M CNT VOLSER CHPID=PATH STATUS
Then one or more of the following lines appear:
sdddd uuuuxm ccc vvvvvv chpid=s [...] sdddd uuuuxm ccc vvvvvv device status message
Another heading might also appear:
SSID CFW TC DFW PIN DC-STATE CCA DDC CYL CU-TYPE
Followed by one or more of:
ssss i cc. ff. p wwwwwww xx yy zzzzzzzz tttt-tt
Then a processing message might appear:
processing message
Followed by symbol definitions:
symbol1symbol2
symbol n-1symbol n
A cache heading might also appear:
RTYPE SSID CFW TC DFW PIN DC-STATE CCA DDC CYL CU-TYPE
Followed by one or more of:
rrrm ssst i cc. ff. p wwwwwww xx yy zzzzzzzz tttt-tt

For fenced information:
FENCED YYYYYYYYY XHHHHHH XHHHHHH
XHHHHHH XHHHHHH
Followed by:
zzzzzz zzzzzzzz
In response to a DEVSERV PATHS command, this message displays the following requested information:

hh.mm.ss
The time in hours, minutes, and seconds.

UNIT TYPE M CNT VOLSER CHPID=PATH STATUS
These are the column headings for the information displayed in the message.
sdddd
The device number the system is displaying. 's' indicates the requested subchannel set with 's' defaulting to 0. 'dddd' is a 3 or 4 digit device number. If the a subchannel set number is not 0 and the device number is 3 digits, the 3 digits device number must be preceded by 0, for example, 10800.

uuuux
uuu is the device type indicated by the UCBTYP field. x is a modifier for a specific feature or model. This field may contain one of the following:
3480S Indicates 3480 with automatic cartridge loader.
3480X Indicates 3480 with the compaction feature.
If the DEVSERV command does not support this device then one of the following generic types applies:
CHRDR Character reader.
CTC Channel-to-channel adapter.
GRAPH Display device.
TP Communication device.
UR Unit record device.
?dcut This is an unknown device, where dcut is the hexadecimal device class and unit type from the UCB.
m This is the logical mode of the device, and may be one of the following:
A The device is allocated. See the use count.
F The device is logically offline to MVS.
M The device has mount pending.
The device is logically online to MVS.

The device is pending offline to MVS.

The device is not allocatable; a system component has control.

The number of data sets allocated on the volume from the UCBDMCT field.

The volume serial label from the UCBVOL1 field.

The channel path id.

This indicates the status of the path, which may be one of the following:

+ The path is logically and physically available and I/O on the path was successful.

* The path is physically, but not logically available. The subchannel's logical path indicator is off but I/O to the path is successful. You can use the command VARY PATH(ddd,nn),ONLINE to make channel path nn logically available to device ddd.

- The path is neither logically nor physically available. The subchannel's logical and physical indicators are both off for this channel path. You can use the command CONFIG CHP(nn),ONLINE to make the channel path logically available to all devices connected to the channel.

& The device is reserved to another path. This indicator applies to devices with the dynamic pathing selection feature.

< The path is installed but not physically available. The start subchannel request received a condition code of 3.

> The device microcode has detected an error and will not allow I/O to complete on the path.

B The path is unable to communicate. The device indicates that a busy or reserve condition exists on the path.

C A controller error occurred while accessing the device.

D A device error occurred while accessing the device.

I Intervention is required; the device is not ready.

R The path is available and the device is reserved to this path/group. This only applies to devices with the dynamic pathing feature.

A time out has occurred; there is no response from the device. The cause of the time out is undetermined and this condition is transient.

A storage control unit or storage director error occurred while accessing the device.

Unable to determine the failing unit.

This heading appears in the display only if a device attached to a caching 3990 subsystem (for example, 3990 Model 3 or 6) is included in the DEVSERV command. The information appearing in each column is:

The real (true) device type of the device specified in the DEVSERV command when DTYPE represents the emulated device type. Note that when the control unit is emulating a 3990-2, the system displays only CCA and DDC values.

The subsystem identifier for this storage subsystem in hexadecimal.

The status of cache fast write, which is one of the following:

Y Cache fast write is active.

N Cache fast write is inactive.

S Cache fast write is suspended because of pinned data.

The first character is one of four possible values:

Y Volume is eligible for track caching.

N Volume is ineligible for track caching.

P Track caching is pending inactive, de-stage is in progress for this volume.

F Track caching is pending inactive, de-stage has failed for this volume.

The second character is one of seven possible values:

Y Track caching is active for the subsystem.

N Track caching is inactive for the subsystem.

A Track caching is pending active for the subsystem.

T Track caching is ended because of an error.
Track caching is disabled for maintenance.

Track caching is pending inactive, de-stage is in progress.

Track caching is pending inactive, de-stage has failed.

Subsystem is running in single cluster mode with active cache.

The third character is a period. Caching does not occur unless both the first and second characters are Y.

The first character is one of five possible values:

Y Volume is eligible for DASD fast-write.

N Volume is ineligible for DASD fast-write.

I DASD fast-write is inhibited, de-stage is in progress for this volume.

U Volume has data in failed non-volatile storage.

S DASD fast-write suspended for pinned data for this volume.

The second character is one of seven possible values:

Y Subsystem non-volatile storage is active.

N Subsystem non-volatile storage is inactive.

P Subsystem non-volatile storage is pending inactive for the subsystem, de-stage is in progress.

F Subsystem non-volatile storage is pending inactive for the subsystem, de-stage has failed.

U Subsystem non-volatile storage has failed.

I Subsystem non-volatile storage battery is defective.

M Subsystem non-volatile storage is disabled for maintenance.

The third character is a period. DASD fast-write does not occur unless both the first and second characters are Y.

This field will contain one of three possible values:

N Volume does not have pinned data in cache or non-volatile storage.

Y Volume has pinned data in cache or non-volatile storage, DASD fast-write and cache fast-write are permitted.

S Volume has pinned data in cache or non-volatile storage, DASD fast-write and cache fast-write are suspended.

This reflects dual copy status, SPARE status or PPRC of volume; the status can be one of the following:

- SIMPLEX: the volume has no dual copy association
- PRI-PNDG: establishment of a duplex pair is in progress; this will be the primary of the pair
- SEC-PNDG: establishment of a duplex pair is in progress; this will be the secondary of the pair
- PRI-SDPL: primary of a suspended duplex pair; the control unit will make the operational device the primary, and the non-operational device, the secondary
- SEC-SDPL: secondary of a suspended duplex pair; the control unit will make the operational device the primary, and the non-operational device, the secondary
- PRI-SSEC: duplex pair is in a suspended state, device was originally the secondary and is now the primary. The operational volume of a suspended duplex pair will always be the primary, while the non-operational device will always be the secondary.
- SEC-SPRI: duplex pair is in a suspended state, device was originally the primary and is now the secondary. The operational volume of a suspended duplex pair will always be the primary, while the non-operational device will always be the secondary.
- SPARE: the device is a SPARE volume.
- SPAR-PNDG: the device is in SPARE PENDING status.
- SPAR-BRKN: the device is in SPARE BROKEN status.
- PPRIMARY: the device is a PPRC PRIMARY volume.
- PPRIM-PNDG: establishment of PPRC pair is in progress; this will be the PPRC primary volume.
- PPRI-FAIL: the device is in PPRC PRIMARY FAIL status.
- PPRI-SUSP: primary of a suspended PPRC pair.
- PSECOND: the device is a PPRC SECONDARY volume.
- PSEC-PNDG: establishment of PPRC pair is in progress; this will be the PPRC secondary volume.
- PSEC-FAIL: the device is in PPRC SECONDARY FAIL status.
- PSEC-SUSP: secondary of suspended PPRC pair.

xx Two hexadecimal digits that are the channel connection address.

yy Two hexadecimal digits that are the director-to-device connection address.

zzzzzzzz When this column is prefixed with "ALT", the number after "ALT" reflects the device number of the other device of an established or pending dual copy pair. For primary entry, this identifies the secondary device. For secondary entry, this identifies the primary device. For simplex volumes and control units that don’t support Dual Copy, this column shows number of cylinders in this device.

tttt-tt This provides the control unit type to which the device is attached.

device-status-message The device status message may be one of the following:

DEVICE CLASS/TYPENOT SUPPORTED BY DEVSERV COMMAND
The device must be a tape drive or DASD.

DEVICE UNAVAILABLE, SCP ROUTINE IN CONTROL
The control program is using the device. The system may be attempting recovery.

SUBCHANNEL ERROR, PATH STATUS UNAVAILABLE
Information from the SCHIB is not available. There may be a problem with the processor.

UCB NOT CONNECTED, PATH STATUS UNAVAILABLE
The unit control block does not contain a subchannel number. The path may need to be varied offline.

DEVICE BOXED, PATH STATUS UNAVAILABLE
IOS has forced the device offline.

** FENCED (STORAGE PATH/CHANNEL/DEVICE) xxxxxxxx xxxxxxxxxxxxx
xxxxxxxxxxxx
The storage control subsystem has ‘fenced’ one or more of the four storage paths (0, 1, 2, and 3). ‘Fenced’ means that the indicated path to the device will not be used; alternate path(s) to the device will be used. The degree of fencing is indicated by:

STORAGE PATH
A storage path is unavailable to all devices.

** CHANNEL
A storage path is unavailable to all devices from one or more channel interfaces; some channel interfaces will continue to use the storage path.

** DEVICE
A storage path is unavailable to the indicated device.

xxxxxxxxxx represents the four hexadecimal bytes of storage path status for each path. The total 16 bytes of path status are described in IBM 3990/9390 Storage Control Reference under the description of read subsystem data (storage path status).

** processing message**
The following processing information may be contained in the message:

** NO DEVICES MEET SELECTION CRITERIA **
No devices at or higher than the address you specified met your online/offline requirements.

** NO OTHER DEVICES MEET SELECTION CRITERIA **
An insufficient number of devices at or higher than the address you specified met your online/offline requirements.

symbol1 ... symboln The meaning of the symbols used in a given display.

YYYYYYYYY The first 16 bytes of storage path status.

ZZZZZZZZ The last 8 bytes returned from read subsystem status.

Notes:
1. The DISPLAY MATRIX command output may not always agree with DEVSERV’s display. DEVSERV’s path status is based on the results of real I/O.
2. Due to transient conditions in the system, repetitive issuing of the DEVSERV command may yield different results.
3. With JES3, a device can be online to JES3, but offline to the MVS system on which the DEVSERV command was issued.

Operator response: If the device status indicates that the storage control subsystem has fenced one or more storage paths, contact your service representative to fix the condition that caused the fencing. If the device has been fenced, refer to the z/OS DFSMSdfp Storage Administration for an explanation of the CONTROL command needed to unfence the device.

Otherwise, follow your installation’s procedures for the status which is indicated in the message display. Recovery actions are contingent upon the following:
hardware and software configurations, system load and job mix. However, the following are some examples of possible actions:

**Path Status Action**
- `<` Check all path switches for correct settings.
- `&` Check if shared device is in use by another system.
- `T` Re-enter DEVSERV, and if the condition still exists, end the program which is tying up the device.

### IEE459I hh.mm.ss DEVSERV QDASD (id)

After the above message, the system displays requested DEVSERV DASD information.

**UNIT VOLSER SCUTYPE CYL SSID SCU-serial DEV-serial EFC**
Then, one or more of the following lines appear:

```
sdddd vvvvvv cccomm dddmmn* nnnnnnnn ssid mpp-ssss mpp-ssss fff aaaaao bbbbbbb **** ggg DEVICE(S) MET THE SELECTION CRITERIA **** iii DEVICE(S) FAILED EXTENDED FUNCTION CHECKING
```

DASD device attributes are displayed for each device if "ATTRIBUTE" keyword is specified.

**UNIT VOLSER SCUTYPE CYL SSID SCU-serial DEV-serial EFC**
Then, one or more of the following lines appear:

```
sdddd vvvvvv cccomm dddmmn* nnnnnnnn ssid mpp-ssss mpp-ssss fff ttttttttttttttttttq tttttttttttttttttttttttttt q aaaaao bbbbbbb **** ggg DEVICE(S) MET THE SELECTION CRITERIA **** iii DEVICE(S) FAILED EXTENDED FUNCTION CHECKING
```

Note: `aaaaaa` and `bbbbbbb` are optional display as requested in the DS QDASD command. A brief explanation of the command syntax is displayed by typing DS QD,?. For a complete explanation of the command syntax, see [z/OS MVS System Commands](#).

`sdddd` The device number the system is displaying. 's' indicates the requested subchannel set with 's' defaulting to 0. `ddd` is a 3 or 4 digit device number. If the a subchannel set number is not 0 and the device number is 3 digits, the 3 digits device number must be preceded by a 0, for example, 10800.

`vvvvv` volume serial number

`ccccomm` control unit type and model

`ddddmmn` device type and model, where a `.` after `ddddmmn` indicates the defined device type is incompatible with the real device type

`nnnnnnnn` number of cylinders, where an `*` after `nnnnnnnn` indicates a VM mini-disk

`ssid` subsystem identifier

`mpp-ssss` control unit or device serial number

`fff` result of a status validation, where a `?` after `fff` indicates the device failed the extended function consistency checking. `fff` represents:

* `OK` host view is consistent with subsystem view of control unit and device function status
* `BYP` the EF consistency check was bypassed, no MVS storage resident status was found. Device is offline, or it is a VM mini-disk, or it does not support extended functions.
* `CUC` subsystem cache status is inconsistent
* `NVS` NVS status is inconsistent
* `SSI` device has inconsistent SSID
* `UCB` UCB to device relationship inconsistent
* `CCA` Channel Connection Address is incorrect
* `DDC` Director to Device Connection address is incorrect
* `DVC` Device Caching status is inconsistent
* `DFW` DASD Fast Write Status is inconsistent
* `DC` Dual Copy status is invalid
* `PIN` Pinned Data status in invalid
* `DCA` Dual Copy Alternate Channel Connection address is invalid
* `ASC` Asynchronous Commit status is inconsistent

The following text might appear with the detailed unit information when a unit address is encountered for which no information is available:

**** UNLISTED DEVICE(S) AND REASON CODES: 

where:

\[ uuuu \]

unit number

\[ rc \]

reason code why no information is presented, where:

01 device not configured, UCB not found
02 UCB not connected to a physical drive
03 device unavailable - system routine in control
04 subchannel error detected
05 device boxed
06 UCB does not define as tape device
07 I/O error accessing the device
08 UCB not connected to a tape device
09 QTAPE does not support the tape device since it is not capable of SENSEID

The following text might appear indicating the results of the DS QT command execution:

**** TYPE=tttt IS AN INVALID UCB TYPE

TYPE= and DEFINED were both specified, and no DASD units of the type tttt were found

**** hhh DEVICE(S) WITH INCONSISTENT UCB TYPE DEFINED

hhh is the number of unit addresses encountered for which the defined device type is inconsistent with the connected physical device

**** hhh DEVICE(S) WITH DEVICE EMULATION ACTIVE

hhh is the number of devices in emulation mode

Operator response: If the device status indicates that the storage control subsystem has fenced one or more storage paths, contact your service representative to fix the condition that caused the fencing. If the device has been fenced, refer to the z/OS DFSMSdfp Storage Administration for an explanation of the CONTROL command needed to unfence the device.

Otherwise, follow your installation’s procedures for the status which is indicated in the message display. Recovery actions are contingent upon the following: hardware and software configurations, system load and job mix. However, the following are some examples of possible actions:

Path Status

Action

< Check all path switches for correct settings.
& Check if shared device is in use by another system.
T Re-enter DEVSERV, and if the condition still exists, end the program which is tying up the device.

IEE459I hh.mm.ss DEVSERV QTAPE (id)

There are two formats for DEVSERV TAPE information. When DEVSERV QTAPE MED is issued the following DEVSERV TAPE information is displayed after the above message:

First, a header appears:

UNIT RDTYPE EDTYPE EXVLSR INVLSR RMEDIA EMEDIA WWID

Where:

UNIT tape device address
RDTYPE real device type

Note: For the TS7720 disk-only Virtualization Engine, this field contains all zeroes.

EDTYPE emulated device type
EXVLSR external volume serial of cartridge
INVLSR internal volume serial of cartridge
RMEDIA real media type of the volume mounted on the drive
EMEDIA emulated media type of the volume mounted on the drive
WWID worldwide unique cartridge identifier

Then one or more lines of data appear:

unit rdtype edtype exvlsr invlsr rmmedia emedia wwid

Where:

unit The tape device address is displayed in each line.
rdtype The real device type is displayed if information is available, otherwise it is blank.
**IEE459I (form 2 of 3)**

**edtype**
The emulated device type is displayed if available, otherwise it is blank.

**exvlsr**
The external volume serial of the cartridge is displayed if available, otherwise it is blank.

**invlsr**
The internal volume serial of the cartridge is displayed if available, otherwise it is blank.

**rmedia**
The real media type of the volume mounted on the drive. The value will be one of the following:
1. CST
2. EC-CST
3. 3590 STD length tape
4. 3590 EXT length tape
5. 3592 Enterprise Tape Cartridge
6–W

**IEE459I (form 2 of 3)  hh.mm.ss DEVSEVR QPAVS [id]**

**Explanation:** Display software and hardware configuration information and to identify any configuration discrepancies.

Two objectives are to be met with the DEVSEVR display of the PAV configuration:
1. Depict a logical subsystem configuration as defined to the host software
2. Highlight any inconsistencies between the host configuration definition, and the Subsystem configuration.

QPAVS will optionally display unbound alias device types (UCB parameter), or unbox the alias device if it is boxed when UNBOX is specified.

QPAVS will show the BASE UA information followed by the associated bound PAV-ALIAS devices UA information when the new VOLUME parameter is specified.

In addition to device number, devices can be selected according to specified SSID value (SSID=ssss).

DEVSEVR QPAVS command will be in one of the following forms,
- DEVSEVR QPAVS,sdddd,nnn
- DEVSEVR QPAVS,sdddd,tttt
- DEVSEVR QPAVS,SSID=ssss

where
- **QPAVS** is a required (positional) keyword(s)
- **sdddd** is a 3 or 5 hex digits specifying a subchannel set number and a device number.
- **nnn** is a decimal number from 1-256 with the default as 1.
- **tttt** can be UNBOX, VOLUME, UCB or DCE.
- **ssss** is the requested SSID value.

---

--- DS QP Display Content has two formats: ---

IEE459l (form 3 of 3) hh.mm.ss DEVSERV QLIB [id]

Explanation: After the above message, DEV SERV displays the requested tape library information. There are several types of displays, depending on the request. For requests to display library configuration information the first message display is:

The following are defined in the cccccccc configuration:

Where cccccccc is either ACTIVE or INACTIVE, depending on whether the ACTIVE or INACTIVE parameter was specified (ACTIVE is the default if neither is specified).

- ACTIVE indicates that the library configuration being displayed is the one currently in use by the system.
- INACTIVE indicates that the library configuration being displayed is the one that will become ACTIVE following an IODF activate.

There are two display formats, depending on whether the request was for a list of library serial numbers or a list of library devices.

When a list of library serial numbers is requested, the display lists up to 10 library serial numbers per line as follows:

The following are defined in the ACTIVE configuration:
+1111 22222 +33333 +44444 55555 66666 77777 88888 99999 00000

Note: An asterisk preceding a library serial number indicates that the library has connectivity to the system (at least one device in the library is connected)

When a list of library devices is requested, the display lists up to 8 library devices per line as follows:

The following are defined in the ACTIVE configuration:

When specifying a composite library sequence number, for example “11111”, the following output is displayed:

LIBID PORTID DEVICES
1111 4 0040 0441 0442 0443 0444 0445 0446 0447

Notes:
1. LIBID is the five hexadecimal digit library serial number.
2. PORTID is the hexadecimal identifier of a 'string' of library devices.
3. An asterisk following a distributed library sequence number, for example “AAAAA”, the following output is displayed:

   The following are defined in the ACTIVE configuration:
   +1111 22222 +33333 +44444 55555 66666 77777 88888 99999 00000

   Note: An asterisk preceding a distributed library serial number indicates that the library has connectivity to the system (at least one device in the library is connected)

4. If the specified library is a composite library, its distributed library names are also displayed.
5. An asterisk following a distributed library serial number indicates that the distributed library has connectivity to the host system (at least one device in the distributed library is connected).

When specifying a distributed library sequence number, for example “AAAAA”, the following output is displayed if all of the distributed libraries that the host has connectivity to are at TS7700 release 1.5 microcode level or above:

LIBID PORTID DEVICES
AAAA 4 0040 0441 0442 0443 0444 0445 0446 0447

DISTRIBUTED LIBID(S)
AAA A BBB B CCCC

Note: Only the devices that are associated with the specified distributed library are displayed.

When specifying a distributed library sequence number that has no connectivity to the host or none of its
devices has been defined to the host (even though all of the distributed libraries in the grid-configuration are at TS7700 release 1.5 or above), the following output is displayed:

```
DEVSERV QLIB,CCCCC
```

IEE459I 14.15.28 DEVSERV QLIB
No devices connected or configured to host
Composite LIBID 11111

When specifying a distributed library sequence number in a grid-configuration that has one or more of the distributed libraries at pre-release 1.5 microcode level of the TS7700, the following output is displayed:

```
DEVSERV QLIB,22222
```

IEE459I 14.15.28 DEVSERV QLIB
Library 1Libid=22222 not found

For a request to list the queued library orders, the following is displayed:

```
QLIB,ID,LIBID,DEVICE,VOLSER,CATEGORY,REQUEST,TIME ON QUEUE,QUEUE
0001,0002,0003,0004,0005,0006,0007,0008,0009,000A,000B,000C,000D,000E,000F,0000
```

For a request to display the library partitioning category codes, below is an example showing the system default category code:

```
QLIB,CATS
```

IEE459I 09.56.02 DEVSERV QLIB 600
0001 0002 0003 0004 0005 0006 0007 0008 0009 000A 000B 000C 000D 000E 000F

For a request to change the library partitioning category codes, the first 3 digits of the category can be modified with the last digit being fixed and representing the media type:

```
QLIB,CATS(111*)
```

IEE459I 09.57.02 DEVSERV QLIB 603
1111 1112 1113 1114 1115 1116 1117 1118 1119 111A 111B 111C 111D 111E 111F

Note: The queue display lists asynchronous orders that have been accepted by the library, but have not yet completed. When asynchronous orders complete the library uses attention I/O to signal the host. At that time the order will be removed from the queue.

For a request to display the library partitioning category codes, below is an example showing the system default category code:

```
QLIB,CATS
```

IEE459I 09.56.02 DEVSERV QLIB 600
0001 0002 0003 0004 0005 0006 0007 0008 0009 000A 000B 000C 000D 000E 000F

For a request to change the library partitioning category codes, the first 3 digits of the category can be modified with the last digit being fixed and representing the media type:

```
QLIB,CATS(111*)
```

IEE459I 09.57.02 DEVSERV QLIB 603
1111 1112 1113 1114 1115 1116 1117 1118 1119 111A 111B 111C 111D 111E 111F

Note: If the library partitioning category codes are modified using the DS QL,CATS command, the corresponding changes must also be reflected in the DEVSUPxx PARMLIB member. If not, an IPL reverts the category codes to what is specified in DEVSUPxx.

After the category codes have been updated, issue the DS QL,CATS command to reflect the updated categories:

```
QLIB,CATS
```

IEE459I 09.57.11 DEVSERV QLIB 606
1111 1112 1113 1114 1115 1116 1117 1118 1119 111A 111B 111C 111D 111E 111F

Note: APAR OA24965 of Device Service is needed before you use the DEVSERV QLIB,CATS command. This APAR is needed to additionally recognize and support media types MEDIA9 and MEDIA10.

LIBID
Displays the 5 hexadecimal digit library serial number.

DEVICE
Displays the UCB device number associated with the queued request.

REQUEST
Asynchronous requests are:
MOUNT,DEumont,EJECT and AUDIT.

VOLSER
Displays the volume serial number associated with the request. For a scratch mount the volser will be blank.

CATEGORY
Displays the hexadecimal category code of the volume.

TIME ON QUEUE
Displays the approximate time that the request has been on the queue.

One of the following messages may be received:

NO cccccccc configuration is defined to the system

Where cccccccc is either ACTIVE or INACTIVE. This message indicates that no library control blocks are defined for the configuration that was specified (either ACTIVE or INACTIVE).

state save issued to dddd

Where dddd identifies the device that was used to perform a state save. dddd may not be the same device specified by the DS QL,ddd,SS command. Because state save is used to diagnose device errors DEVSERV QLIB attempts to issue the state save using another device in the same control unit.

state save failed

An attempt to issue state save to the library identified by DS QL,ddd,SS was not successful.

library not found for device dddd

ddd was specified in the command DS QL,ddd,SS and there is no library defined to the system that contains device dddd.

Reply ‘YES’ to delete the INACTIVE configuration for library lllll, any other reply to quit.

This message is issued following the command DS QL,lllll,DELETE. Reply ‘YES’ and devserv will delete the
control blocks that define the INACTIVE library.
Deleting INACTIVE library definitions should only be done in order to recover from an incorrect control block definition. After the deletion, when an IODF is activated that properly defines the configuration, both the INACTIVE and ACTIVE control blocks will be rebuilt.

Source: DFSMSdip
Detecting Module: IGUDSL01

IEE460I  UNIT dev MUST BE OFFLINE BEFORE ITS AUTOSWITCH ATTRIBUTE CAN BE MODIFIED.

Explanation: The device must be in a varied-offline state for the AUTOSWITCH attribute to be changed.

In the message text:

dev  The device number

System action: The system continues processing.
Operator response: Vary the device offline and reissue the VARY AUTOSWITCH command.

Source: Master scheduler
Detecting Module: IEECB857
Routing Code: Note 18
Descriptor Code: 5

IEE461I  UNIT dev CANNOT BE DEFINED AS AUTOSWITCH BECAUSE IT IS A JES3-MANAGED TAPE.

Explanation: JES3-managed tapes cannot be automatically switchable.

In the message text:

dev  The device number

System action: The system continues processing.
Operator response: Choose a device that is not managed by JES3

Source: Master scheduler
Detecting Module: IEECB857
Routing Code: Note 18
Descriptor Code: 5

IEE462I  UNIT dev IS NOT A VALID DEVICE TYPE FOR THE AUTOSWITCH ATTRIBUTE.

Explanation: An automatically switchable device must be assign-capable.

In the message text:

dev  The device number

System action: The system continues processing.
Operator response: Choose an assign-capable tape device, such as a 3480 or later IBM drive.

Source: Master scheduler
Detecting Module: IEECB857
Routing Code: Note 18
Descriptor Code: 5

IEE463I  UNIT dev IS NOW DEFINED AS AUTOSWITCH CAPABLE [BY sss]

Explanation: The system issues this message in response to a VARY dev,AUTOSWITCH,ON command. This is an indication that the AUTOSWITCH attribute has been changed as requested. If “BY sss” appears in the message, the request to change the AUTOSWITCH attribute for the device was made by a system service sss. For example, sss might be System Automation.

In the message text:

dev  The device number

System action: The system continues processing.
Source: Master scheduler
Detecting Module: IEECB857
Routing Code: Note 18
Descriptor Code: 5

IEE464I  UNIT dev IS NOW DEFINED AS A DEDICATED DEVICE [BY sss]

Explanation: The system issues this message in response to a VARY dev,AUTOSWITCH,OFF command. This is an indication that the AUTOSWITCH attribute has been changed as requested. If “BY sss” appears in the message, the request to change the AUTOSWITCH attribute for the device was made by a system service sss. For example, sss might be System Automation.

In the message text:

dev  The device number

System action: The system continues processing.
Source: Master scheduler
Detecting Module: IEECB857
Routing Code: Note 18
Descriptor Code: 5
**Explanation:** The system brings the device online in response to a VARY device command, and warns of limitations in device usability.

In the message text:

- **dev**
  The device number.
- **text**
  Warns of limitations in device usability. The text consists of a header message, accompanying messages that warn of limitations in device usability, and a trailer message.

**System action:** Processing continues.

**Operator response:** Use the device consistently with the restrictions indicated.

**Source:** Master scheduler

**Detecting Module:** IEECB840

**Routing Code:** /Note 13

**Descriptor Code:** 5

---

**Explanation:** During master scheduler initialization, the master scheduler or command processing for the communications task (COMMTASK) failed.

In the message text:

- **MASTER SCHEDULER**
  The master scheduler or a system function that depends on the master scheduler has failed.

- **COMMAND SCHEDULER**
  A task for the communications task (COMMTASK) has failed.

- **FAILED**
  The failure occurred during master scheduler or communications task initialization.

- **ABEND cde**
  The system abended the master scheduler or communications task with system completion code cde.

- **DUMPED**
  The system wrote a complete dump. If DUMPED does not appear in the message text, there is no usable dump.

- **CODE xx**
  Identifies the failing portion of master scheduler initialization. xx identifies where the error occurred:
  - **2** This code is associated with abend X'0C4'. The system issues a dump. The master scheduler or communications task initialization has abended and cannot recover.
  - **10** Base initialization.
  - **12** Initialization for linkage to Time Sharing Option Extensions (TSO/E) input/output (I/O) service routines.
  - **13** Subsystem interface initialization.
  - **14** Allocation address space creation routine.
  - **15** Attach for initiator.
  - **16** Event notification facility (ENF).
  - **17** Scheduler work area (SWA) manager initialization.
  - **18** Scheduler work area (SWA) manager initialization.
  - **19** A service processor initialization routine.
  - **1E** Scheduler services address space creation routine.
  - **1Z** Initiator returned control to base initialization.
  - **20** Region initialization.
  - **21** Recovery ending manager initialization.
  - **22** Mass storage system (MSS) initialization.
  - **23** Subsystem initialization.
  - **24** Display allocation scavenge routine.
  - **25** Input/output supervisor (IOS) dynamic pathing initialization.
  - **27** External Security Manager (either Resource Access Control Facility (RACF) or an OEM) initialization.
  - **28** Time Sharing Options/Extensions (TSO/E) initialization.
  - **29** ATTACH of Master scheduler wait processor.
  - **2A** System log (SYSLOG) task.
  - **2B** APPC resource initialization.
  - **2C** Reconfiguration master scheduler initialization routine.
  - **2E** Region initialization could not establish an ESTAE-like recovery environment.
  - **30** Wait initialization.

**System action:** The system puts the failing task into an enabled wait state. The system does not complete initialization.

**Operator response:** Do the following:

1. After all messages have been printed, restart the system with the MSTRJCL=(,L) system parameter. The L form of MSTRJCL causes the list of
messages associated with the Master JCL to be routed to the console. Give the output to the system programmer.

2. If DUMPED does not appear in the message and the system programmer requests a stand-alone dump, obtain one.

An ABEND cde of 0A0 with CODE xx of 1Z generally indicates that a data set in the Master JCL (MSTRJCL) is not properly cataloged in the Master Catalog. Ensure that all data sets in the MSTRJCL are either cataloged in the Master Catalog or are directly pointed to by their MSTRJCL DD statement via the specification of both a UNIT and a VOL=SER parameter.

- If a data set is in the Master Catalog, ensure that its device type in that catalog is correct.
- If a DD statement in the MSTRJCL has a UNIT parameter specified (regardless of whether or not it also has a VOL=SER parameter specified), ensure that the UNIT parameter is correct.

System programmer response: Ensure that the MSTRJCL parameter of the IEASYSxx parmlib member is specified with the L option. This option allows JCL messages associated with processing the MSTJCLxx data set to be sent to the console rather than only to SYSLOG. These messages might be needed for debugging. If the message contains an abend code, see the system programmer response for the abend code.

If the problem persists, obtain the dump for the message. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the dump, if available. If no dump was produced with the message, ask the operator to obtain a stand-alone dump.

Descriptor Code: 1

IEE480I jjj [ABEND cde-rrrrrr,[DUMPED,] TERMINATED]

Explanation: A task abnormally ended or processing for a command failed.

In the message text:

- One of the following:
  - name
  - cm COMMAND
  - SVC 34

IEE481I ([(MASTERCOMMAND) SCHEDULER])
ABEND cde-rrrrrr, [DUMPED,] [REIPL - CODE yy] I RESTARTING

Explanation: The master scheduler or command processing for the communications task (COMMTASK). The system is trying to restart the function except if REIPL was specified.

In the message text:

- cde-rrrrrr
- cm is the failed command.
- SVC 34

DUMPED

The system has written a complete dump. If DUMPED does not appear in the message text, there is no usable dump.

CODE yy

Identifies the failing portion of master scheduler initialization. yy identifies where the error occurred.
IEE482E • IEE494W

30  Wait initialization.

DUMPED
The system has written a complete dump. If DUMPED does not appear in the message text, there is no usable dump.

RESTARTING
The system automatically restarts the failing function.

System action: The system automatically restarts the failing function. IEE482E is issued only when the restart of the master scheduler fails. IEA365E is issued when the restart of the command scheduler fails. The system will need to be reipled in the REIPL case.

System programmer response: See the system programmer response for abend code code. If DUMPED appears in the message text, obtain the dump.

**IEE496I**  
{CPU(xx)IFA(xx)SUP(xx)} RECONFIGURED (ONLINE | OFFLINE) TO MATCH THE INITIAL NUMBER OF {CPUS|IFAS|SUPS} SET FOR THE LOGICAL PARTITION

**Explanation:** The specified CPU, IFA (zAAP), or SUP (zIIP) was reconfigured either online or offline to match the initial number of configured logical CPUs, zAAPs and zIIPs set for the logical partition. The initial numbers of configured logical CPUs, zAAPs, and zIIPs are set on the Processor Page of the Customize Activation Profiles task on the Hardware Master Console or Support Element for your machine.

The initial numbers are checked during z/OS initialization.

- If the initial number is not zero, the system uses it to determine how many logical CPUs, zAAPs, or zIIPs should be online.
- If the initial number is larger than the number of logical CPUs, zAAPs, or zIIPs that are currently configured, the system will reconfigure online enough logical CPUs, zAAPs, or zIIPs to make up the difference. The system does the reconfiguration by processing logical CPUs, zAAPs, or zIIPs that are currently in standby state, from low address to high address.
- If the initial number is smaller than the number of logical CPUs, zAAPs, or zIIPs that are currently configured, the system will reconfigure offline enough logical CPUs, zAAPs, or zIIPs to make up the difference. The system does the reconfiguration from high address to low, taking into consideration feature requirements of the logical CPUs, zAAPs, or zIIPs and skipping required ones.

In the message text:

xx  The processor identifier.

**System action:** The system continues processing.

**Operator response:** If the CPU, zAAP, or zIIP was reconfigured offline and if it is needed online, issue the CONFIG CPU(xx),ONLINE command to bring it online. If the CPU, zAAP, or zIIP was reconfigured online and you want it to be offline, issue the CONFIG CPU(xx),OFFLINE command to take it offline.

IEE507D SHOULD ACTIVE DEVICES HAVE I/O TERMINATED? REPLY NO OR YES

Explanation: The operator replied CONTINUE in response to messages IEE100E and IEE131D. That reply told the system that a CONFIG CHP(xx),OFFLINE command with the FORCE option should continue, even though the channel being removed is the last path to one or more devices.

This message asks the operator whether or not those devices should be boxed, which means:

- I/O on the device is ended.
- Any new I/O requests result in permanent I/O errors.
- No new allocations are done for the device.
- If the device was online, it is marked pending offline. A pending offline device goes offline when these conditions occur, in this order:
  1. The device is no longer allocated to any job.
  2. Allocation can get the necessary resources to process the request.

If the device was offline, it remains offline.

System action: The system waits for the operator to reply.

Operator response: Do one of the following:

- Reply NO to allow the current I/O to complete and to keep allocated devices, teleprocessing devices, and devices the system is using online. Generally, reply NO if you want to discontinue the request to configure a channel path offline.
- Reply YES to mark the devices pending offline and purge all I/O. Generally, reply YES if you must prevent I/O from being enqueued to the devices, or you must prevent the device from being allocated.

Reply YES only when you must get a channel offline regardless of what happens to ongoing I/O over the channel. This reply can cause data to be damaged or lost.

IEE510I \{text\} dM TO dM OFFLINE

Explanation: text is one of the following:

- STORAGE LOCATIONS
- REAL STORAGE LOCATIONS
- EXTENDED STORAGE LOCATIONS
- \(n\) OF EVERY \(m\) FRAMES IN STORAGE LOCATIONS
- \(n\) OF EVERY \(m\) FRAMES IN REAL STORAGE LOCATIONS

A reconfiguration request asked that the system reconfigure storage. The system displays this message in response to that request.

In the message text:

STORAGE LOCATIONS

REAL STORAGE LOCATIONS

EXTENDED STORAGE LOCATIONS

\(n\) OF EVERY \(m\) FRAMES IN STORAGE LOCATIONS

\(n\) OF EVERY \(m\) FRAMES IN REAL STORAGE LOCATIONS

Note: If all storage in a range affected by the CONFIG command has been varied offline, the first format of this message appears for that range.

EXTENDED STORAGE LOCATIONS

A CONFIG ESTOR(E=\(id\),OFFLINE command requested that expanded storage be varied offline.

\(n\) OF EVERY \(m\) FRAMES IN STORAGE LOCATIONS

\(n\) OF EVERY \(m\) FRAMES IN REAL STORAGE LOCATIONS

A CONFIG STOR OFFLINE requested that a range of central storage be varied offline.

In the message text:
The number of frames that have been taken offline within each unit of \( n \) frames.

\( m \) The number of units.

For example, if \( n \) is 1 and \( m \) is 2, one of every two frames within the specified range has been taken offline.

\( dd \)M TO \( dd \)M OFFLINE

The beginning and ending addresses of the storage that the system has varied offline, in decimal megabytes. If \( text \) is \( n \) OF EVERY \( m \) FRAMES IN [REAL] STORAGE LOCATIONS, the ending address is the first byte of the frame that follows the last frame taken offline.

System action: The system continues processing.

- SYSZVARY,PATH
- SYSZVARY,STORAGE

IEE521I

\( hh.mm.ss \) CONFIG DISPLAY \([idr]\)

REQUEST TYPE: \( reqtyp \)

[RESOURCE: \{resource\} IS CURRENTLY IN USE - STATUS MAY BE CHANGING]

STATUS NOT OBTAINED:

\{SERVICE PROCESSOR CALL FAILED\}

SERVICE PROCESSOR FAILURE}
resource is one of the following:
SYSZVARY,CPU
SYSZVARY,PATH
SYSZVARY,STORAGE

A reconfiguration request asked that the system perform storage reconfiguration.

In the message text:

hh.mm.ss
The time, in hours (00-23), minutes (00-59), and seconds (00-59).

idr A decimal identifier used with the CONTROL C,D command to cancel status displays that are either:
• Written on typewriter or display consoles
• Displayed in-line (not in display area) on operator consoles

This identifier does not appear when the display is presented in a display area on a display console.

REQUEST TYPE: reqtyp
The type of request specified on the command. reqtyp is either ONLINE or OFFLINE.

RESOURCE: {resource} IS CURRENTLY IN USE - STATUS MAY BE CHANGING
The system completed normal processing of a CONFIG ONLINE or CONFIG OFFLINE command. This message displays two sets of elements or items:
• One set for the existing configuration.
• One set for the elements and items that are currently offline, that is, not in use by the operating system, but that can be brought online. Offline elements and items are identified by an asterisk after the identifier (id).

In the message text:

resource
The resource in use.

status
The status of the side, which is one of the following:
ONLINE
OFFLINE
UNAVAILABLE

If the central processor is physically partitioned and all resources are being used by one side, then they will be marked as UNAVAILABLE to the other side.

cpuids The central processor identifier. The message lists the central processors (1) that are in the current configuration and (2) that are offline but can be brought into the configuration.

cfids The Integrated Cryptographic Feature (ICRF) identifiers. The message lists the processors that have ICRFs associated with them and indicates the online/offline status of each feature.

chpids The channel path identifier. The message lists the CHPs that are (1) online or (2) offline but can be brought online. They are given as a single CHP, a range of CHPs (chpid-chpid), or a combination of the two.

list A list of hexadecimal identifiers and/or ranges.

TOTAL STORAGE: xxxxM
The amount of central storage available for each side. The total central storage online equals xxxxM- yyyyM.

UNASSIGNED: yyyyM
The amount of central storage online or unassigned.

STORAGE: xxxxM
The part of the storage that is in online central storage elements. This storage can be brought online with a CONFIG STOR( xxxxM),ONLINE command.

STATUS NOT OBTAINED: SERVICE PROCESSOR CALL FAILED
STATUS NOT OBTAINED: SERVICE PROCESSOR FAILURE
The system cannot display the reconfigurable resources installed in the system in response to a CONFIG ONLINE or OFFLINE command due to an error.

System action: Depending on the message text, the system does the following:

STATUS NOT OBTAINED:
If this phrase appears in the message, the system:
• Does not perform the requested reconfiguration
• Issues abend code X'0B7'
• Writes a logrec data set error record
• Writes a dump

If the phrase does not appear in the message text, the system prompts the operator for a reply to the question at the end of the message text. The system issues message IEE522D to request a reply to the question.

Operator response: Depending on the message text, do the following:

WHICH ITEMS DO YOU WANT BROUGHT ONLINE?
Reply to message IEE522D to respond to this question.

WHICH ITEMS DO YOU WANT TAKEN OFFLINE?
Reply to message IEE522D to respond to this question.
STATUS NOT OBTAINED: SERVICE PROCESSOR CALL FAILED
Enter the CONFIG command again. If you receive the same version of message IEE521I, contact the system programmer.

STATUS NOT OBTAINED: SERVICE PROCESSOR FAILURE
Contact hardware support. Provide the logrec data set error record.

System programmer response: See the system programmer response for abend X'0B7'.

IEE525I CHP(xx) FORCE STATUS UNKNOWN, ERROR OCCURRED DURING FORCE

Explanation: The system tried to force a channel path offline, but an error occurred.

In the message text:

xx The channel path identifier.

System action: The specified channel path is in an unknown state. The system writes a logrec data set error record. The system continues processing.

Operator response: Enter DISPLAY M To determine if the system took the channel path offline.
IEE526I  \{EXTENDED|REAL\} STORAGE ELEMENT \(x\) \{ONLINE, \(y\)M UNASSIGNED\}|OFFLINE\}

Explanation: A reconfiguration request asked that the system reconfigure a central (real) or expanded storage element online or offline. The system issues this message to display the state of the storage element.

In the message text:

**EXTENDED**
A CONFIG ESTOR(E=\(id\)) command requested the reconfiguration of an expanded storage element online or offline.

**REAL**
A CONFIG STOR(E=\(x\)) command requested reconfiguration of a central (real) storage element online or offline.

\(x\) The storage element identifier.

\(y\)M UNASSIGNED
A CONFIG ONLINE command requested that the system place the storage element online, but \(y\) megabytes of storage in that element are not assigned to any configuration.

System action: The system continues processing.

IEE541I CHP(xx) NOT RECONFIGURED, WOULD REMOVE LAST PATH TO DEVICE(S): dev, dev ...

Explanation: A reconfiguration request asked that the system reconfigure a channel path offline, but this channel path represents the last channel path to one or more devices. If a CONFIG command specified the UNCOND parameter, any devices listed in the message text are allocated or assigned to JES3.

In the message text:

xx The channel path for which the request was entered.

dev The device number or numbers associated with the specified channel path.

System action: Depending on the command entered, one of the following:

- If a CONFIG CHP(xx),OFFLINE command was entered, the system ends reconfiguration processing for channel path xx.
- If a CONFIG CHP OFFLINE command specified a range of channel paths, the system continues reconfiguration processing for the next requested channel path.

Operator response: Do one of the following:

- If the CONFIG command did not specify the UNCOND parameter, enter the CONFIG command again, specifying UNCOND, to reconfigure the channel path or processor offline.
- If the CONFIG command specified the UNCOND parameter, do one of the following:
  - Provide an alternate path to the devices listed in the message, or wait until the devices are unallocated or unassigned. Then enter the command for the desired channel path again.
  - Enter the command for the desired channel path again using the FORCE option to force the channel path offline.

Note: Do not use the FORCE option for a device displayed in this message if the device is critical to the operation of the system: You might have to reIPL the system.

IEE559I syselem NOT RECONFIGURED [PHYSICALLY OFFLINE], [COMMAND PROCESSOR ERROR] CONFIG REAL STORAGE COMMAND PROCESSOR ERROR

Explanation: In response to a reconfiguration request, the system tried to reconfigure a system element. The system encountered an internal error and tried to recover. The recovery was not complete; the system element identified in the message could not be varied.

In the message text:

syselem

The system element for which the CONFIG or VARY command requested reconfiguration. syselem is one of the following:

- CHP(xx)
- CPU(z)
- EXTENDED STORAGE ELEMENT (x)
SIDE(x) REAL STORAGE [ELEMENT (x)]

COMMAND PROCESSOR ERROR
A problem in the CONFIG command processor.

CONFIG REAL STORAGE COMMAND PROCESSOR ERROR
A problem in the CONFIG command for central (real) storage.

System action: In most cases, the system abnormally ends the current task with abend code X'0B7'. Depending on the message text, the system does the following:

CHP(xx)
The system did not reconfigure channel path xx. If the CONFIG command requested reconfiguration of a range of channel paths, the system continues reconfiguration for the next requested channel path. The system writes a logrec data set error record and an SVC dump.

CPU(z)
REAL STORAGE
REAL STORAGE ELEMENT
EXTENDED STORAGE ELEMENT
The system ends reconfiguration processing. The system writes a logrec data set error record and an SVC dump.

Operator response: Enter the DISPLAY M command to determine the status of system elements in the system. Enter a CONFIG command naming only the element specified in the message text. If the CONFIG command succeeds and your original CONFIG command included additional elements, enter the original command again. If the original command fails again, contact hardware support.

IEE576I NO (REAL) STORAGE CONFIGURED-NO MORE AVAILABLE

--or--

NO MORE (REAL) STORAGE CONFIGURED-NO MORE AVAILABLE

Explanation: One of the following reconfiguration requests was entered to reconfigure storage:

- CONFIG STOR(xM)
- CONFIG STOR(xM-yM)
- An internal request

The system did not reconfigure any of the storage as requested.

In the message text:

{REAL|EXTENDED} STORAGE LOCATIONS ddM TO dcM NOT RECONFIGURED-text

{REAL|EXTENDED} STORAGE NOT RECONFIGURED-text

NO (REAL) STORAGE CONFIGURED-NO MORE AVAILABLE

The system did not perform the requested reconfiguration.

In the message text:

ddM

A 1- to 2-digit decimal number identifying a storage address, in megabytes.

OPERATOR CANCELLED

The operator replied CANCEL to message IEE575A to cancel a CONFIG STOR command.

PERMANENTLY RESIDENT DATA

The system cannot reconfigure the storage because the storage contains a hardware system area (HSA) or permanently resident data. The nucleus code is an example of permanently resident data.

V=R CANDIDATE STORAGE

The storage contains some or all of the V=R (virtual equals real) storage area. When the system issued message IEE577D, the operator replied NONE, indicating that none of the V=R area was to be reconfigured offline.

COMMAND PROCESSOR ERROR

One of the following occurred:

- The ESTAE macro failed, so that a recovery environment could not be established for configuring the storage.
- A system ABEND occurred while the storage was being configured offline.

SOME STORAGE IN OFFLINE STORAGE ELEMENT

A CONFIG STOR(xM-yM), OFFLINE command was entered. The range of storage identified in the message is partially or entirely within an offline storage element.

OFFLINE PRIOR TO REQUEST

The range of storage identified in the message was offline when a CONFIG STOR command was entered.
STATE UNCERTAIN
A CONFIG STOR(xM),ONLINE command or
CONFIG STOR(xM+yM),ONLINE command
was entered. The range of storage identified in
the message is physically online, but the
command processor failed while bringing the
storage logically online. Some or all of the
range identified might be online. Use the
DISPLAY M=STOR command to find out how
much, if any, storage is online.

UNABLE TO SWAP DATA
A CONFIG STOR(E=x),OFFLINE command
was entered. The system tried to swap storage
containing fixed data with storage containing
non-fixed data, but the command processor
either could not find or could not configure
offline enough storage containing non-fixed
data.

INVALID RANGE
The CONFIG STOR(xM-yM) command entered
contained this error:
• One of the addresses was not a multiple of
the smallest amount of storage that can be
physically reconfigured in the system.

RANGE END TOO HIGH
A CONFIG STOR(xM-yM) command was
entered. The ending address, yM, was higher
than the highest central (real) storage address
in the system.

INVALID AMOUNT
A CONFIG STOR(xM) command was entered.
The amount of storage specified, xM, was
either 0 or was not a multiple of the smallest
amount of storage that can be reconfigured
in the system.

AMOUNT TOO HIGH
A CONFIG STOR(xM) command was entered.
The amount of storage specified, xM, was
greater than the total amount of storage in the
system.

NO MORE AVAILABLE
A CONFIG STOR ONLINE command was
entered. Either all of the storage in the system
was already online, or there was no more
storage physically available to be reconfigured
online.

OPTION NOT INSTALLED
A CONFIG command was entered, but the
option specified is not installed in the system.

NO MORE (REAL) STORAGE CONFIGURED-NO
MORE AVAILABLE
The system reconfigured part of the storage
specified in the command but could not reconfigure
all of it.

System action: If a reconfiguration error caused an
abnormal ending, the system writes an SVC dump and
a logrec data set error record.

In all other cases, the system continues processing.

Operator response: Do one of the following:
• If it is not necessary to configure the storage, no
response is required.
• Enter the CONFIG STOR command again, if you
want to configure the storage and the message text
is one of the following:
  OPERATOR CANCELED
  COMMAND PROCESSOR ERROR
  STATE UNCERTAIN

If the command fails again, contact the system
programmer.

System programmer response: Examine the dump
to verify that the RSU parameter is correct for your
installation. If the problem persists, search problem
reporting data bases for a fix for the problem. If no fix
exists, contact the IBM Support Center. Provide the
SVC dump and the logrec data set error record.

IEE577D MAY V=R STORAGE BE CONFIGURED
OFFLINE? REPLY Y OR N

Explanation: A reconfiguration request asked that the
system reconfigure storage offline. However, to process
the request, the system must vary offline some of the
V=R (virtual equals real) storage. This message asks
the operator if V=R storage can be varied offline.

System action: The system takes offline the storage
that is not V=R storage and waits for the operator to
reply. The system continues other system processing.

Operator response: Do one of the following:
• Reply YES to have the system take the V=R storage
offline.
• Reply NO to leave the V=R storage online.

IEE578I xK OF BAD {REAL|EXTENDED}
STORAGE LEFT OFFLINE

Explanation: A reconfiguration request asked that the
system reconfigure storage online. In response, the
system varied one or more ranges of storage online.
However, the system left offline some frames that
contained storage errors.
In the message text:

xK The total amount of storage, in kilobytes, that is left offline.

**System action:** The system continues processing.

**Operator response:** Do one of the following:
- Enter DISPLAY M=STOR to find the defective central frames. Contact hardware support.
- Enter DISPLAYM=ESTOR (dddmM-dddmM) to determine where the expanded storage frames are located. Contact hardware support.

**Source:** Reconfiguration

IEE601E PROCESSOR (y) IS IN AN EXCESSIVE DISABLED SPIN LOOP WAITING FOR event HELD BY PROCESSOR (x). ACR IS ALREADY ACTIVE. SPIN WILL CONTINUE.

**Explanation:** event is one of the following:

- CPU IN STOPPED STATE
- OPERATOR INTERVENING STATE
- RISGNL RESPONSE
- LOCK RELEASE
- RESTART RESOURCE
- ADDRESS SPACE TO QUIESCE
- INTERSECT RELEASE
- SUCCESSFUL BIND BREAK RELEASE

The system is in a spin-loop on one central processor, waiting for an event on another central processor. The spin loop exceeded the time normally needed for the event to occur.

The system on the waiting processor tried to initiate alternate CPU recovery (ACR) for the other processor. However, ACR was already in progress for another malfunctioning processor.

**In the message text:**

y The waiting processor.
x The processor on which an event is to occur.
event The event that should occur on processor x.

System action: The spin-loop continues. The ACR processing should complete shortly.

Operator response: If the system issues message IEE331A again, specify a different spin loop recovery action in your reply to message IEE331A.

IEE603I hh.mm.ss OPDATA DISPLAY idr

Explanation: Additional lines that display are:

PREFIX OWNER SYSTEM SCOPE REMOVE FAILDISP
[prefix name sysname scope YES|NO faildisp]

[NO COMMAND PREFIXES ARE DEFINED]

In response to the DISPLAY OPDATA,PREFIX command, this message displays the command prefix table.

In the message text:

hh.mm.ss The hour (00-23), minute (00-59), and second (00-59) that the system issued the message.

idr An identifier used with the CONTROL C,D command to cancel status displays:
- Written on typewriter or printer consoles
- Displayed inline (that is, not in a display area) on a display console

This identifier does not appear when the display is presented in a display area on a display console.

The line beginning with uuu appears one or more times for each allocated unit specified on the command.

PREFIX prefix A 1-8 character prefix used to route commands to a system or subsystem.

OWNER name The name of the user that issued the Command Prefix request.

SYSTEM sysname The name of the system to which this prefix is defined.

SCOPE scope One of the following:

SYSTEM The prefix has a system scope, meaning that the prefix applies to commands issued on the system defined as the prefix destination system.

SYSPLEX The prefix has a sysplex scope, meaning that the prefix applies to commands issued from anywhere within the sysplex.

REMOVE One of the following:
Y When the command is entered on the receiving system, the prefix should be removed.
N When the command is entered on the receiving system, the prefix should not be removed.

FAILDISP One of the following:

PURGE Communications task (COMMTASK) will automatically delete the prefix when the receiving system or subsystem fails.

RETAIN The prefix will remain intact despite system or subsystem failures.

SYSPURGE Communications task will automatically delete the prefix when the sysplex fails.

NO COMMAND PREFIXES ARE DEFINED No command prefixes are defined for this system.

System action: The system continues processing.

Source: Communications task (COMMTASK)
IEE604D  SLIP ID=xxxx WILL MATCH ON ADDRESS AND DATA SPACES. SPECIFY ASIDSA KEYWORD, DSSA KEYWORD, 'OK', OR 'CANCEL'

Explanation: A SLIP SET SA command was issued, but the ASIDSA and DSSA parameters were omitted. The omission of these parameters will cause the trap to potentially match in both address and data spaces. IEE604D provides an opportunity to correct the trap.

In the message text:

xxxx
   The ID of the trap being set.

System action: SLIP command processor waits for a response.

Operator response: Specify the ASIDSA or DSSA keywords; reply 'OK' to set the trap as is or reply 'CANCEL' to avoid setting the trap.

IEE633I SWITCH xxxx, PORT yy,

DCM STATUS=newstatus
ATTACHED NODE = node.descriptor
THE FOLLOWING DEVICE PATHS ARE oldstatus
THROUGH THIS PORT:
(ddddeeee,cc),
(ddd,cc),...

Explanation: A VARY SWITCH command requested that a port be varied online or offline.

In the message text:

xxxx refers to the requested SWITCH DEVICE NUMBER.

yy refers to the requested PORT ADDRESS.

newstatus is the current dynamic channel path management status of the port as a result of the command entered.

node descriptor is the node descriptor of the element attached to the port yy.

oldstatus is the current status of the non-managed device paths that are not varied as a result of this command request.

cc is a channel path connected to the device(s) listed below.

dddd is the device number of a device connected to the channel path or the lower limit of a device number range connected to the channel path.

eeee is the upper limit of device number range.

System action: The SWITCH DEVICE PORT status availability has been updated. The result of an ONLINE request is that if managed channel resources are needed and available, dynamic channel path management may attach additional channel paths to the devices.

The result of an OFFLINE request is that the port becomes unavailable for attaching additional channel paths from dynamic channel path management. Existing managed channel paths were removed.

Operator response: This message is the result of a VARY ONLINE or OFFLINE port request to dynamic channel path management. Managed paths to one or more devices are varied ONLINE or OFFLINE. The operator must take action to VARY ONLINE or OFFLINE any non-managed paths.

IEE634I SWITCH xxxx, PORT yy, IS A CHPID PORT

, IS NOT IMPLEMENTED
, IS NOT INSTALLED
, IS NOT ATTACHED
, IS PORT STATE OFFLINE
, IS SYSTEM STATE INELIGIBLE
, IS INELIGIBLE FOR DCM
, FAILS VERIFICATION

Explanation: A VARY SWITCH command requested that a port or ports be varied ONLINE or OFFLINE to dynamic channel path management. The request could not be carried out because of the reason given.

Rejection explanations:

IS A CHPID PORT
This port is connected to a channel path. Only ports connected to subsystems may be varied ONLINE or OFFLINE to dynamic channel path management.

IS NOT IMPLEMENTED
This port is outside the range of switch ports for this model.

IS NOT INSTALLED
The port is within the range of implemented ports for the model but it is not physically present at your installation.
IS NOT ATTACHED
This port is installed but is not presently connected to any element.

IS PORT STATE OFFLINE
This port is offline to dynamic channel path management due to its state (for example, it is blocked dedicated, or offline)

IS SYSTEM STATE INELIGIBLE
This port is offline because the system has determined that it is unavailable for dynamic channel path management.

IS INELIGIBLE FOR DCM
This port cannot be varied because it is not attached to a DASD subsystem.

FAILS VERIFICATION
This port cannot be varied because the specified switch device number is not a switch or cannot be determined.

System action: If a range of ports was specified, action may have been taken only on the valid ports.

Operator response: If this message is unexpected for a particular port, then correct the original condition. Once the failing condition is corrected, dynamic channel path management will begin managing the port as requested.

Source: Input/Output Supervisor (IOS)

IEE638I VARY SWITCH CONFIGURATION FAILURE ON ssss pa chp cu

Explanation: A channel path through a requested switch port could not be configured off the control unit.

In the message text:

sss refers to the switch device number specified on the command.

pa refers to the switch port address specified on the command.
**IEE639I • IEE677I**

chp  
refers to the channel path ID connected to the requested switch.

cu  
refers to the control unit number of the device connected to the switch port.

**System action:**  The configuration remains unchanged, and the channel path remains offline.

**Operator response:**  Verify the current configuration with the D M=SWITCH(ssss,chrp) or with D M=CHP(chp) command. Reenter the original command.

**Source:**  Input/Output Supervisor (IOS)

**Detecting Module:**  IOSVVSWR

### IEE639I  VARY SWITCH FAILED

- SYSTEM ERROR
- ENTERING CONFIGURATION MODE

**Explanation:**

**SYSTEM ERROR**  
Dynamic I/O returned an unexpected error condition.

**ENTERING CONFIGURATION MODE**  
Another dynamic I/O is in process.

**System action:**  The configuration remains unchanged, and the channel path remains offline.

**Operator response:**  Reenter the command.

**Source:**  Input/Output Supervisor (IOS)

**Detecting Module:**  IOSVVSWR

### IEE677I  text [field-text] [command-text]

**Explanation:**  text is one of the following:

- MESSAGE SUPPRESSION AND USER EXITS INACTIVE - NOT INITIALIZED
- MESSAGE SUPPRESSION INACTIVE - HARDCOPY LOG NOT ESTABLISHED
- MESSAGE SUPPRESSION INACTIVE - HARDCOPY SUSPENDED

**command-text** is one of the following:

- Or -  
  COMMAND USER EXITS NOT FOUND

The operator entered a DISPLAY MPF command. The message output can be divided into three sections, as follows:

- Message table information
  The first section of this message shows message automation, suppression, and user exit information. If the message processing facility (MPF) is not active, only one line appears. The text of the line can be one of the following:

- MESSAGE SUPPRESSION AND USER EXITS INACTIVE - NOT INITIALIZED
  The operator has not requested MPF processing.

- MESSAGE SUPPRESSION INACTIVE - HARDCOPY LOG NOT ESTABLISHED
  The operator requested MPF processing but no hardcopy log has been established. Write-to-operator (WTO) user exit routines receive control, but messages are not suppressed.

- MESSAGE SUPPRESSION INACTIVE - HARDCOPY SUSPENDED
  The operator requested MPF processing, and a hardcopy log has been established, but no device is available to print the hardcopy log.

**IEE677I  memname MEMBER IGNORED**

**Explanation:**  The system did not process a parmlib member because the parmlib member name is also a reserved keyword on the SET memname command.

**System action:**  The system does not process the parmlib member. Other processing continues.

For example, if the operator entered a SET CNGRP=(AA,NO,BB) command, the system processes the CNGRPA and CNGRPBB parmlib members, but does not process the CNGRPNO parmlib member because NO is a reserved keyword on the SET CNGRP command.

**Operator response:**  After the system programmer renames the parmlib member, enter the command again, specifying the new parmlib member name.

**System programmer response:**  Rename the parmlib member, using a character string that is not a reserved keyword.

**Source:**  Communications task (COMMTASK)

**Detecting Module:**  IEEMB856

4-170  z/OS V1R11.0 MVS System Messages, Vol 7 (IEB-IEE)
WTO user exit routines receive control, but messages are not suppressed.

If the operator requested MPF processing, the message displays the label line once and the data lines as often as needed to identify each message in the MPF table. The fields in the data line are as follows:

**MESSAGE-ID column**
msg-id indicates the message identifier for this row.

**MPF column**
sfx indicates the MPFLSTxx member from which this message identifier definition was derived.

**SUPPRESS column**
YES indicates that the message is to be suppressed if it is eligible. NO indicates that the message is not to be suppressed.

**RETAIN column**
YES indicates that the message is to be retained by the action message retention facility if it is eligible. NO indicates that the message is not to be retained.

**AUTO column**
YES indicates that the message is to be automated. NO indicates that the message is not to be automated.

**TOKEN column**
token indicates the token to be associated with the message, only if the message is to be automated.

**EXIT column**
exit indicates the user-specified WTO exit routine for this message. The field is blank if no routine is specified. The nfd value preceding the exit routine name can be one of the following:

- **ERR** Indicates a failure in the exit routine.
- **NFD** Indicates that the exit routine could not be loaded.

**Message color/highlighting information**
The second section of the message text describes the way different messages are colored and highlighted. A label line is displayed once and the data lines as often as needed to identify the color attribute for each message type. The fields in the data line are as follows:

**FIELD column**
Describes the message type or area being defined. msg-area can be one of the following values:

- **msg-area** Explanation

- **URGATTN** Messages requiring urgent attention.

- **IMEDECTN** Messages requiring immediate action.

- **EVETACTN** Messages requiring eventual action.

- **GENMSG** General system messages.

- **PPMSG** Message issued by problem programs and requiring no action.

- **SELPEN** Fields that can detect a selector (light) pen.

- **INSTRERR** Error messages that appear in the instruction line.

- **ENTRYARA** Entry area.

- **WARNLGEN** General messages in the left half of the warning line.

- **WARNRGEN** General messages in the right half of the warning line.

- **WARNHRURG** Messages requiring urgent attention and appearing in the right half of the warning line.

- **OOLCNTL** Control lines in an out-of-line status display.

- **OOLLABEL** Label lines in an out-of-line status display.

- **OOLDATA** Data lines in an out-of-line status display.

**MPF column**
The sfx can be one of two types of values:

- The sfx can indicate the MPFLSTxx member from which this message type or area definition was derived.

- The sfx value may be DFL, indicating that system defaults are being applied for this message type or area.

**COLOR column**
The color definition for this message type or area, as follows:

- **BLUE**
- **TURQU** (turquoise)
- **GREEN**
- **WHITE**
- **PINK**
- **YELLOW**
- **RED**

**HLIGHT column**
hlight indicates the highlighting attribute for this message type or area, as follows:

- **NONE** No highlighting occurs.

- **BLINK** The message or field background blinks.
RE-VID Reverse video; that is, black characters on a colored background.

UNDSCR The message or field is underscored.

INTEN column
int indicates the intensity at which the message is displayed, as follows:
NORM Normal intensity.
HIGH High intensity.

• Command user exit information
The last section of the message shows the command user exits activated through MPF. If no command user exits were activated, the following message appears:

COMMAND USER EXITS NOT FOUND

No command installation exits were specified by the installation.

If no command user exits were activated, then a label line is displayed once and the data lines as often as needed to identify each command user exit. The fields in the data lines are as follows:

COMMAND USEREXIT column
userexit indicates the name of the user exit. The nfd value preceding the exit routine name can be one of the following:
ERR Indicates a failure in the exit routine.
NFD Indicates that the exit routine could not be loaded.

MPF column
sfx indicates the MPFLSTxx member from which this command user exit definition was derived.

System action: If either MESSAGE SUPPRESSION INACTIVE - HARDCOPY LOG NOT ESTABLISHED or MESSAGE SUPPRESSION INACTIVE - HARDCOPY SUSPENDED appears, the display lists the messages in the MPF table, but the system does not suppress messages until a hardcopy log is established. However, the WTO user exits and RETAIN are in effect.

Operator response: If message suppression is desired, but MESSAGE SUPPRESSION INACTIVE or MESSAGE SUPPRESSION AND USER EXITS INACTIVE appears, do one of the following:
• If NOT INITIALIZED appears, enter the SET MPF command to request MPF processing.
• If HARDCOPY LOG NOT ESTABLISHED appears, establish a hardcopy log.
• If HARDCOPY SUSPENDED appears, make the SYSLOG or OPERLOG or both available to print the hardcopy log.

IEE678I {CNGRPxx LINE aaaaa: I DISPLAY CNGRP:) INCORRECT keyvalue VALUE, keyword IGNORED.

Explanation: The system found an incorrect keyword value while processing one of the following:
• A CNGRPxx parmlib member
• A DISPLAY CNGRP command

In the message text:
aaaaa The line number where the error occurred, if the system was processing the CNGRPxx member.

CNGRPxx The error occurred in the parmlib member, with suffix xx.

DISPLAY CNGRP:
The error occurred in a DISPLAY CNGRP command.

keyvalue The incorrect keyword value.

keyword The keyword that contains the incorrect value.

System action: The system does not process the incorrect keyword. The system continues processing.

Operator response: Do one of the following:
• Enter a DISPLAY CNGRP command again, specifying a correct keyword value.
• Enter the SET CNGRP command to specify a different CNGRPxx parmlib member.

System programmer response: If the error occurred in the CNGRPxx parmlib member, enter a correct keyword value in CNGRPxx.

IEE679I hh.mm.ss CNGRP DISPLAY [NO CONSOLE GROUPS DEFINED] [CONSOLE GROUP grpname NOT FOUND]

Explanation:
[Console Groups Activated from System sysname
-----GROUP----- -----MEMBERS------------------------
grpname xx memname memname memname memname
grpname xx memname memname]

Source: Communications Task (COMMTASK)
Detecting Module: IEECB807
This message appears when the operator enters a DISPLAY CNGRP command to display the console group.

In the message text:

hh.mm.ss
The hour, minute, and second. 00.00.00 appears in this field if the time-of-day (TOD) clock is not working.

NO CONSOLE GROUPS DEFINED
No console groups are defined in the CNGRPxx parmlib member(s).

CONSOLE GROUP grpname NOT FOUND
The system could not find the console group name specified in the DISPLAY CNGRP command.

sysname
The name of the system on which the specified console groups are active.

grpname
The console group name.

xx
The parmlib suffix that identifies the CNGRP member.

memname
The name of a console that is a member of the specified console group.

System action: The system continues processing.

IEE680I {CNGRPxx LINE aaaaa: I DISPLAY CNGRP:) DUPLICATE keyword1 VALUE, keyword2 IGNORED.

Explanation: The system found a duplicate keyword while processing one of the following:
• A CNGRPxx parmlib member
• A DISPLAY CNGRP command

In the message text:

CNGRPxx
The error occurred in the parmlib member, with suffix xx.

aaaaa The line number where the error occurred, if the system was processing the CNGRPxx member.

DISPLAY CNGRP:
The error occurred in a DISPLAY CNGRP command.

keyword1
The first occurrence of the duplicate keyword.

keyword2
The duplicate keyword.

System action: The system does not process the duplicate keyword. The system continues processing.

Operator response: Do one of the following:
• Enter a DISPLAY CNGRP command again, removing the duplicate keyword.
• Enter the SET CNGRP command to specify a different CNGRPxx parmlib member.

System programmer response: If the error occurred in the CNGRPxx parmlib member, remove the duplicate keyword in CNGRPxx.

IEE681I {parmmem LINE aaaaa: I cmd:} keyword1 EXPECTED BEFORE keyword2

Explanation: The system found that an expected keyword did not precede another keyword.

In the message text:

parmmem LINE aaaaa
The line number where the error occurred, if the system was processing the parmmem parmlib member.

cmd
The error occurred in a cmd command.

keyword1
The keyword that was expected before keyword2.

keyword2
The keyword that must follow keyword1, if the system was processing the parmmem parmlib member.

System action: The system does not process keyword2. The system continues other processing.

Operator response: Do one of the following:
• Enter the cmd command again, specifying keyword1 before keyword2.
• Select a different parmmem parmlib member.

System programmer response: If the error occurred in the parmmem parmlib member, ensure that keyword1 precedes keyword2 in the parmmem parmlib member.
IEE682I       {parmam LINE aaaaa: | cmd:} UNEXPECTED keyword IGNORED.

Explanation: The system found an incorrect keyword.
In the message text:
parmam LINE aaaaa:
   The system was processing Parmlib member parmam and detected the error in line aaaaa.

System action: The system does not process the incorrect keyword. The system continues processing the Parmlib member or command.

Operator response: Do one of the following:
   • Reenter the command again, specifying a correct keyword.
   • Select a different parmam Parmlib member.

System programmer response: If the error occurred in the Parmlib member, enter a correct keyword in the Parmlib member.

Descriptor Code: 5

IEE703I  (REPLY id MESSAGE [yyyy]) NOT REQUESTED FROM THIS CONSOLE COMMAND ISSUED IS command

Explanation: In a multisystem environment, one of the following occurred:

- The console receiving this message is not physically attached to the system that issued the message.
- A command was entered from a secondary console in response to a message that the console did not receive.

In the message text:

REPLY id  The command was a REPLY command; xx is the reply identifier of a write-to-operator with reply (WTOR) message.

MESSAGE [yyyy]  The command was a CONTROL C,I, CONTROL C,E, or CONTROL C,A command, where yyyy is the identifier of the message to be deleted. The identifier appears only on printer-keyboard consoles. On a display console, the cursor is positioned under the identifier in error.

cmd  The text of the originally issued command.

System action: One of the following:

- If a REPLY command was entered, the system ignores the command. The system continues processing.
- If a CONTROL command was entered, the system deletes any messages preceding the message in error.
- If the command was entered from a display console, the system displays the command again and positions the cursor under the message identifier in error. The identifiers of any messages that were deleted are not included in the display.

Operator response: Enter the command again from a console with master authority or from a console that received the message.

Source: Communications task (COMMTASK)

Detecting Module: IEECB811
Routing Code: *
Descriptor Code: 5

IEE704I  REPLY id NOT OUTSTANDING[,] [ON THIS SYSTEM]

Explanation: The operator entered a REPLY command. There is no outstanding reply request with the identifier in the reply. Either the message request has already been answered or the message reply identifier is incorrect.
If the reply identifier was correct and **ON THIS SYSTEM** appears in the message, the request originated on another system in the sysplex.

In the message text:

*id* The reply identifier for the command.

**System action:** The system ignores the REPLY command. The system continues processing.

**Operator response:** Reenter the command.

If you are on a system with a JES3 release prior to JES3 5.2.1 and **ON THIS SYSTEM** appears in the message display, enter the *SEND command to direct the REPLY command to the appropriate system.

**System programmer response:** To change the console so it can reply to messages issued from consoles that are defined to other systems in the sysplex, do one of the following:

- Include the other system’s name on the MSCOPES parameter of the CONSOLE statement in the CONSOXXX parmlib member for this system
- Change the console’s authority to master, so that it can reply to messages issued on any console from any system in the sysplex.

---

**IEE706I** (SWITCH|HALT) NOT SUCCESSFUL

**Explanation:** One of the following occurred:

- The operator entered the SWITCH SMF command in a system not supporting system management facilities (SMF).
- The operator entered the SWITCH SMF or the HALT EOD command while the SMF recording data sets were being switched or while no SMF data set was present.

**System action:** The system did not run the command.

**Operator response:** In a system supporting SMF, reenter the command as soon as the data set switch has completed.

In a system not supporting SMF, do not enter SMF commands.

**Source:** System Management Facilities (SMF)

**Detecting Module:** IEE70110

**Routing Code:** *

**Descriptor Code:** 5

---

**IEE707I** *cm* *yyy* NOT EXECUTED

**Explanation:** Before processing command *cm* *yyy*, MVS presented the command to all subsystems that monitor commands. Based on the response returned, MVS did not process the command for one of the following reasons:

1. One or more subsystems intentionally failed the command with a return code of 8.
2. One or more subsystems issued a return code that was not valid.
3. The command installation exit issued a return code of 8.

In the message text:

*cm* The command entered.

*yyy* The parameter field of the command.

**System action:** The system rejects the command.

**Operator response:** Contact the system programmer.

**System programmer response:** Determine why the subsystem or the installation exit routine rejected the command. The return code could be a valid, non-error return code.

**Source:** Master scheduler

**Descriptor Code:** 5
IEE708I  KEYWORD, VALUE INVALID

Explanation: The value of a keyword specified on a command or in response to a message is incorrect. For example, the performance group number specified on the PERFORM keyword is not defined to the system.

In the message text:

keyword
The keyword for which a value was specified.

If keyword is ASID, and it was entered in response to message IEE094D, the specified address space identifier (ASID) is greater than the limit specified for the MAXUSER keyword in response to message IEA101A.

If keyword is SYMDEF, and it was entered on a DUMP command, verify that the length of the symbol is at least as long as the length of the value that is being assigned to it. For example, &abc can only accommodate values 4 characters or less in length.

System action: The system continues processing, but does not perform the action specified by the keyword.

Operator response: Enter the command again with the correct keyword value.

IEE709I  xxx REQUIRED - NO HARDCOPY DEVICE AVAILABLE

Explanation: This message warns that the system is in hardcopy is mandatory mode, but there is no system log (SYSLOG) or OPERLOG. The operator has added a new console to the system configuration, but it does not resolve the original problem.

System action: The system continues processing.

Operator response: Take one of the following actions:
1. Make a system log available.
2. Enter VARY SYSLOG,HARDCPY to send the hardcopy log to the SYSLOG device.
3. Enter VARY OPERLOG,HARDCPY to send the hardcopy log to the OPERLOG.

Note: There is no need to use the VARY HARDCPY command unless you want to change the hardcopy authority and routing codes.

Source: Master scheduler
Detecting Module: IEECB852
Routing Code: *

IEE710I  SYSLOG NOW RECEIVING HARDCOPY

Explanation: In response to a VARY SYSLOG,HARDCPY command, the system has made the system log to receive the hardcopy log.

System action: The system continues processing.

Operator response: None.

Source: Master scheduler
Detecting Module: IEECB852
Routing Code: *
Descriptor Code: 5

IEE711I  [SYSTEM UNABLE TO DUMP|SYSTEM DUMP NOT TAKEN. reason]

Explanation: SVC dump processing could not write an SVC dump requested through the MVS operator DUMP command. If the message text is SYSTEM UNABLE TO DUMP, SVC dump processing may have been processing another dump when the dump was requested.

In the message text:

reason The reason for the failure may be any one of the reasons documented for return code 8 from the SDUMPX macro. (See z/OS MVS Programming: Authorized Assembler Services Reference LLA-SDU.) The following reasons are more oriented to operator interaction:
- ANOTHER DUMP WAS IN PROGRESS
- DUMP=NO WAS SET AT IPL OR INDICATED BY CHNGDUMP
- NO SYS1.DUMP DATA SET WAS AVAILABLE
- AN I/O ERROR OCCURRED
- MAXSPACE LIMIT REACHED
- A CRITICAL AUXILIARY STORAGE SHORTAGE EXISTS
- DUMP SPECIFICATION NOT VALID
- DUMPSRV PROCESSING IS UNAVAILABLE

System action: The system does not write the requested dump. The system continues processing.

Operator response: For conditions that do not have an immediate corrective action or that are not listed here, reissue the DUMP command after a couple of minutes has elapsed. If the command continues to fail, call the System Programmer.

SYSTEM UNABLE TO DUMP
If a dump is in progress, reenter the DUMP command when the previous dump finishes; otherwise, notify the system programmer.
ANOTHER DUMP WAS IN PROGRESS
Reenter the DUMP command when the previous
dump finishes; otherwise, notify the system
programmer.

DUMP=NO WAS SET AT IPL OR INDICATED BY
CHNGDUMP
Enter a CHNGDUMP command with DUMP=YES.
Then enter the DUMP command again.

NO SYS1.DUMP DATA SET WAS AVAILABLE
Add or clear a SYS1.DUMPnn data set, or enable
automatic dump data set allocation (as discussed in
z/OS MVS Diagnosis: Tools and Service Aids). Then
enter the DUMP command again.

AN I/O ERROR OCCURRED
Contact hardware support.

MAXSPACE LIMIT REACHED
SVC dump will not allow other dumps to be
captured until the amount of available space is
greater than the threshold value. The threshold
value is the lower of two values: 35 megabytes or
ten percent of the MAXSPACE value. To view the
amount of available space, use the DISPLAY
DUMP command.

A CRITICAL AUXILIARY STORAGE SHORTAGE
EXISTS
SVC dump will not allow another dump to be
captured until the shortage of auxiliary storage is
relieved.

DUMP SPECIFICATION NOT VALID
There was a syntax or semantic error within the
dump specification. Identify and correct the error.
See z/OS MVS System Commands for more
information on the MVS DUMP
command. See z/OS MVS Initialization and Tuning
Reference for more information on the MVS DUMP
parmlib member.

DUMPSRV PROCESSING IS UNAVAILABLE
DUMPSRV might have processed a CANCEL
request and will restart shortly. Otherwise,
DUMPSRV has either terminated or the primary
task is unavailable. Notify the system programmer.
SDUMP issuing applications will receive RC=08
RSN=0C.

System programmer response: If the reason field
shows MAXSPACE LIMIT REACHED, take one of the
following actions and then issue the DUMP command
again:
• Add more dump data sets. Use the DUMPDS
command or another utility to make more dump data
sets available. The system writes captured dumps to
available dump data sets, freeing storage for the next
dump.
• Delete existing captured dumps. If any dump is
captured but they are not required by the installation,
reply D to message IEA793A to delete the dumps.
• Increase the MAXSPACE value. Enter the
CHNGDUMP command to increase the value of
MAXSPACE, after ensuring that the available
auxiliary storage (paging slots) is at least three times
the MAXSPACE space.

If the reason field shows A CRITICAL AUXILIARY STORAGE
SHORTAGE EXISTS, first you need to ensure that enough
DASD resource is available for captured dumps to be
written out. Then, consider adding additional auxiliary
storage (paging) resources, because SVC dumps will
not be allowed again until the auxiliary storage
utilization drops below 35%. See the system
programmer response for message IRA201E for
additional information about auxiliary storage utilization
concerns.

You can use the AUXMGMT and MAXSPACE
parameters of the CHNGDUMP SET command to
manage the use of virtual and auxiliary storage by SVC
dump processing. See z/OS MVS System Commands
for more details about the CHNGDUMP command.

For other error conditions, search problem reporting
databases for a fix for the problem. If no fix exists or
DUMPSRV is unavailable, contact the SVC Dump
(SCDMP) component group at the IBM Support Center.

IEE712I cm PROCESSING COMPLETE
Explanation: The system completed processing a
command.
In the message text:

cm The command that the system processed, as
follows:

CONFIG
The system either:
• Successfully ran the command
• Rejected the command because of an error

CHNGDUMP
One of the following occurred:
• The dump options for an ABEND or SVC
dump are changed.
• The dump options specified by a previous
CHNGDUMP command have been
eliminated.

SET MPF
Issued for each parmlib member activated by
the SET MPF command.
The system accepted the command for processing.

*any-other-command*
If the command is other than CONFIG, CHNGDUMP, or SET MPF, the system successfully processed the command.

**System action:** The system continues processing.

```
command COMMAND PROCESSOR FAILED [-ISSUE K E,D,L=name-a TO DELETE]
```

**Explanation:** `command` is one of the following ones:

- CONFIG CPU
- VARY PATH
- `cm`

While processing a command, the system encountered an unrecoverable internal error.

In the message text:

**CONFIG CPU**
A CONFIG command requested reconfiguration of a central processor online or offline.

**VARY PATH**
A VARY PATH command requested that online or offline status of a channel path be changed.

`cm` The command that the system was processing when the error occurred.

**System action:** The system does not process the command. The system tries to write a logrec data set error record and to write a dump. The system continues processing.

**Operator response:** Enter the command again.

**Source:** Reconfiguration

**Detecting Module:** IEEVPTHR, IEEVPTH

**Routing Code:** *

**Descriptor Code:** 5

---

**IEE714I**

```
PATH(dev,xx) NOT OPERATIONAL
 [NAME=name CODE=code text]
```

**Explanation:** A VARY PATH command requested that an I/O path be reconfigured online or offline. The system issues this message for one of the following reasons:

- For an online request, one of the following occurred:
  - The path specified on the VARY command is not functioning or the device associated with the path has a permanent error.
  - The volume serial of the device does not match the volume serial for the device specified in the VARY PATH command. The system checks the volume serial to ensure that the path being brought online is properly configured.

- For an offline request, one of the following occurred:
  - The VARY command timed out and the system issued message IEE717D. The operator replied CANCEL to message IEE717D. However, the system could not bring the specified device back online.
  - The path specified on a VARY command is associated with a device that has a permanent error. The system does not take the specified path offline.

In the message text:

`dev` The device number associated with the path.

`xx` The path that was specified on the VARY command.

`name` The message identifier of the message returned from path verification explaining a “no paths” condition.

`code` A code returned from path verification.

`text` The message text of the message returned from path verification explaining a “no paths” condition.

**System action:** The system ends processing for path(`dev,xx`). The status of the path remains unchanged.

The system continues processing.

**Operator response:** Ensure that:
- Path(`dev,xx`) is operational
- Power is up on the device
- All switches are enabled

Enter the command again. If the command fails again, do one of the following:
- Contact service personnel to determine if the path was configured incorrectly, or if the path or device is in error.
- Notify the system programmer.
If the system programmer requests, obtain a stand-alone dump.

**System programmer response:** Do the following:
1. Use OLT to diagnose the problem in the device.
   For a device error, contact hardware support.
2. If the device does not have an error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**IEE1717D**

**cmd NOT PROCESSED, dev STILL BUSY. REPLY EXTEND OR CANCEL**

**Explanation:** A reconfiguration request asked that the system reconfigure a path to a device offline. The system waited 2.5 minutes for completion of I/O through the path. The I/O has not completed.

In the message text:

**cmd** CONFIG or VARY.

**dev** The device number of the device for which the CONFIG or VARY command requested reconfiguration, but on which I/O is still running.

**System action:** The system waits for the operator to reply. Meanwhile, the system continues processing.

**Operator response:** Do one of the following:
- Enter EXTEND: To ask the system to wait an additional 2.5 minutes for I/O to complete. If I/O is not complete at the end of 2.5 minutes, the system issues this message again.
- Enter CANCEL: To cancel the CONFIG or VARY for the path. The system continues to process other paths specified on the command, if any.

**IEE718I**

**IEE1718I**

**CPU(x) NOT RECONFIGURED, nnn JOBS SCHEDULED WITH AFFINITY. JOBNAMES ARE: cccccccc, ccccccc, ...**

**Explanation:** A reconfiguration request asked that the system reconfigure a processor offline. The system could not vary the processor offline because one or more jobs with affinity to the processor were scheduled.

In the message text:

**CPU(x)**

The central processor that could not be reconfigured offline. x is the central processor identifier.

**nnn**

The total number of jobs scheduled with affinity.

**cccccccc**

The name of each job with affinity to processor x. The message lists only the names of the first ten jobs found. If cccccccc is "UNKNOWN", the system did not find a valid job name.

**System action:** The system does not process the CONFIG CPU OFFLINE command, so the specified central processor is not taken offline. The system continues other processing. The system issues message IEE244D.

**Source:** Reconfiguration

---

**IEE719I**

**IEE1719I**

**CHP(x) NOT CONFIGURED, OUTSTANDING RESERVE TO DEVICE dev**

**Explanation:** A reconfiguration request asked that the system reconfigure a channel path offline, but there is currently an outstanding reserve on the channel path to a shared direct access device. If the channel path is removed, a release would never be issued. The system waited 10 seconds to see if the outstanding reserve
would be removed, but it was not.

In the message text:

**CHP(x)**

The channel path specified on the request.

**dev**

The device number of the shared direct access device associated with the channel path.

**System action:** One of the following:

- If a CONFIG CHP(xx),OFFLINE command was entered, the system ends processing for the channel path.
- If a CONFIG CHP(xx),OFFLINE command specified a range of channels, the system continues processing for the next requested channel path.

**Operator response:** Enter the CONFIG OFFLINE command again after the device is released.

**Source:** Reconfiguration

---

**IEE720I**

**Explanation:** A CONTROL command with a PFK parameter requested the display, deletion, or change of the program function keys (PFK). The console does not support PFKs, due to an error during console initialization.

In the message text:

**COMMAND ISSUED IS command**

*command* is the text of the command that was originally entered.

**System action:** The system rejects the command. The system issues either message IEE233I or IEE234I.

**System programmer response:** See the explanation of message IEE233I or IEE234I for information about why PFK support was unavailable.

**Source:** Master scheduler

---

**IEE721I**

**Explanation:** The operator pressed a PFK key or positioned the light pen a program function key (PFK). One of the following occurred:

- The selected key had no commands defined for it
- A zero length command was contained within the key definition

In the message text:

**PFK nnn NOT SUPPORTED**

*nnn* The PFK identifier.

**System action:** Processing continues.

**Operator response:** Enter the CONTROL N,PFK command to define commands for the undefined key. If the key is already defined, check the command syntax.

**Source:** Communications task (COMMTASK)

---

**IEE722I**

**Explanation:** The operator pressed a nonconversational program function key (PFK) or selected a nonconversational PFK number with the light pen. Then the operator pressed a second PFK or selected a second PFK number before the system completed processing the first request.

**System action:** The system ignores the second request. The system displays this message in the instruction line until processing of the first request is complete; then the system removes this message.

**Operator response:** Wait until the system removes the message from the instruction line, then reenter the second request.

**Source:** Communications task (COMMTASK)

---

**IEE723I**

**Explanation:** The operator pressed a program function key (PFK) that is not supported. The operator either:

- Pressed the PFK
- Selected the number from the PFK display line with the light pen

In the message text:

**PFK IN PROCESS. LAST INTERRUPT IGNORED**

**System action:** The system ignores the second request. The system displays this message in the instruction line until processing of the first request is complete; then the system removes this message.

**Operator response:** Wait until the system removes the message from the instruction line, then reenter the second request.

**Source:** Communications task (COMMTASK)
A SLIP SET command was entered without an END parameter. This message lists the parameters that are either specified or supplied by default.

In the message text:

prm The parameters specified in the command or supplied by default.

System action: The system issues message IEE726D to prompt the operator for a reply.

Operator response: See the operator response for message IEE726D.

Source: Recovery termination manager (RTM)

IEE726D ENTER ADDITIONAL SLIP PARAMETERS, [‘END’] OR ‘CANCEL’

Explanation: A SLIP SET command was specified without an END parameter. Message IEE725I, which lists the SLIP parameters, preceded this message.

Reply to this message to do one of the following:
- Add new SLIP parameters
- Change existing SLIP parameters
- Accept the parameters already specified
- Cancel the SLIP command

In the message text:

‘END’
A SLIP command, other than SLIP MOD or SLIP DEL, was entered.

System action: The system waits for the operator to reply.

Operator response: Do one of the following:
- Reply REPLY id,prm,prm,...,[END] to add parameters or to change the parameters indicated in message IEE725I.

To complete the SLIP SET command, specify END as the last parameter. If END is not specified, the system will issue message IEE725I again to display the updated list of parameters.

The reply can add or change any parameter in any order, except the following positional parameters. These parameters must be added immediately after the SET parameter:
- IF
- SA
- SB

New parameters replace original parameters in their entirety.

If an incomplete SLIP parameter was specified (for example, if the closing parenthesis was omitted on the last parameter), continue the parameter and complete it in the beginning of the reply.

- Reply REPLY id,CANCEL to cancel the original SLIP command.
- Reply REPLY id,END to accept the parameters in message IEE725I.

id is the identifier preceding the message number.

---

IEE727I SLIP TRAP ID=xxxx [ALREADY] {type} [text]

Explanation: A SLIP command requested that the system set, enable, disable, or delete a SLIP trap.

In the message text:

ID=xxxx
The SLIP trap identifier specified on the SLIP command.

ALREADY
The SLIP command was to enable or disable a SLIP trap, but the SLIP trap was already disabled or enabled. If ALREADY does not appear, a SLIP command successfully set, disabled, enabled, or deleted the SLIP trap.

type is one of the following:

- SET
  A SLIP SET command to define a new trap was entered.

- ENABLED
  A SLIP MOD command to enable a trap was entered.

- DISABLED
  A SLIP MOD command to disable a trap was entered.

- DELETED
  A SLIP DEL command to delete an existing trap was entered.

text is one of the following:
BUT GTF IS NOT ACTIVE
The SLIP command specified a SLIP trap to collect generalized trace facility (GTF) records, but GTF is not active.

BY TSO-userid
The SLIP trap was set, enabled, disabled, or deleted by a Time Sharing Option Extensions (TSO/E) user other than the user who originally set the trap.

This text appears the second time the system issues message IEE727I. The second message IEE727I contains the new status of the trap and the TSO/E userid responsible for the change.

BY CONS consname
The SLIP trap was set, enabled, disabled, or deleted from a console other than the console from which the original trap was set.

This text appears the second time the system issues message IEE727I. The second message IEE727I contains the new status of the trap and the name, consname, of the console from which the SLIP command was entered.

System action: One of the following:
• If ALREADY does not appear in the message, the system has successfully changed the status of the SLIP trap.
• If ALREADY appears in the message, the system ignores the SLIP command.
• If BUT GTF IS NOT ACTIVE appears in the message, the requested trace records might not be produced.

Operator response: If BUT GTF IS NOT ACTIVE appears in the message text, enter a START GTF command, specifying the SLIP option.

IEE730I DUPLICATE xxxx SUBSYSTEM NOT INITIALIZED
Explanation: Subsystem name xxxx, identified in an IEFSSNxx member of SYS1.PARMLIB, is a duplicate of an existing subsystem name.

System action: The system does not build a subsystem communication vector table (SSVCT) for the duplicate subsystem name.

If the system found the duplicate name in SYS1.PARMLIB, the system ignores the initialization routine specified with the duplicate subsystem name.

Operator response: Report this message to the system programmer.

System programmer response: Determine why subsystem xxxx was named more than once.

If subsystem xxxx is not properly initialized, and is essential for system processing, correct the error and reIPL.

Obtain the JCL for the job.

If you use SMP/E to make all changes to the system, obtain a full list of the current maintenance from the SMP/E control data set (CDS).

If the problem recurs and if the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IEE734I  dev NOW UNLOADED [ - DEVICE IS BOXED]

**Explanation:** In response to an UNLOAD command, the system unloaded a volume from a device.

In the message text:

**dev**

The device number of the device.

**DEVICE IS BOXED**

The device was boxed because of:

- A hardware I/O error
- VARY dev,OFFLINE,FORCE command processing
- VARY CH(x),OFFLINE,FORCE command processing

When a device is boxed, these events occur:

- I/O on the device ends.
- Any new I/O requests result in permanent I/O errors.
- The system does no new allocations for the device.
- If the device was online, it is marked pending offline.
  - A pending offline device goes offline when these conditions occur, in this order:
    1. The system no longer allocates the device to any job.
    2. Allocation can get the necessary resources to process the request.

If the device was offline, it remains offline.

**System action:** Processing continues.
**Source:** Master scheduler

IEE735I  hh.mm.ss. SLIP DISPLAY idr

**Explanation:** Where **text** is:

**SLIP DISPLAY idr**

**ACTION=opt, SET BY id-orig**

**[...LEVEL=opt]**

**[COMP=opt]**

**[JOBNAME=opt]**
A DISPLAY SLIP command requested the display of SLIP trap information. The system issues this message in response to that command.

In the first line of the message text:

```
hh.mm.ss
```

The time, in hours (00 through 23), in minutes (00 through 59), and in seconds (00 through 59). If `hh.mm.ss` is 00.00.00, then the TOD clock was not working when SLIP displayed the information.

```
idr
```

A 3-digit decimal identifier used with the CONTROL C,D command to cancel status displays either:

- Written on typewriter or printer consoles
- Displayed in-line (not in a display area) on display (CRT) consoles

This identifier does not appear when the display is presented in a display area on a display console.

The second and third lines of the message appear when a DISPLAY SLIP command is entered without a SLIP trap identifier.

In the second and third lines of the message text:

```
ID xxxx
```

The SLIP trap identifier specified on the SLIP command.

```
STATE state
```

The state of the SLIP trap: ENABLED, ENABLED(ACTIVE), ENABLED(INACTIVE) or DISABLED.

The remaining lines appear when a DISPLAY SLIP=xxxx command is entered. The type of SLIP trap and the options chosen when the trap was defined determine which fields appear, as follows:

```
ID=xxxx
```

The SLIP trap identifier entered in the DISPLAY command.

```
type
```

The type of SLIP trap:

- NONPER
  - Not a program event recording (PER) trap.
- PER-IF
  - PER instruction fetch trap.
- PER-SA
  - PER storage alteration trap.
- PER-SB
  - PER successful branch trap.
- PER-SB1
  - PER 1 successful branch trap.
- PER-SBT
  - PER 1 successful branch into (SBT) trap.
- PER-SAS
  - PER storage alteration by STORA (SAS) trap.

```
state
```

The state of the SLIP trap:

- ENABLED(ACTIVE)
  - The system found the private module specified in the PVTMOD or PVTEP parameter, as by a LOAD, and has activated the enabled trap.
- ENABLED(INACTIVE)
  - One of the following:
    - The system did not find the private module specified in the PVTMOD or PVTEP parameter.
    - The system deactivated the enabled trap, as by a DELETE.
- ENABLED
  - The system enabled the trap.
- DISABLED
  - The system disabled the trap.

```
ACTION=opt
```

The option specified in the ACTION parameter.

```
SET BY id-orig
```

`id-orig` identifies the originator of this SLIP trap, which is one of the following:

- TSO userid
  - The Time Sharing Option Extensions (TSO/E) user, if the SLIP trap was defined through a TSO/E terminal.
- CONS consname
  - The console name, if the SLIP trap was defined through a console.

```
PRCNTLIM=opt,p
```

`p` is the actual percentage of system processing time used to process PER interruptions, beginning with the first PER interruption processed for this SLIP trap.
If the percentage cannot be calculated, \( p \) is one of the following:

- **NA**: The calculation is not applicable. Either the trap is disabled or PRCNTLIM=99 was specified for the trap definition.
- **LT**: Less than 33 seconds has elapsed since SLIP processed the first PER interruption for this trap.
- **CK**: The time-of-day clock is in error.
- **BC**: The system contains an incorrect value for the number of in-line processors.

**MATCHLIM=opt,m**

\( m \) is the number of times that the conditions for this SLIP trap were met since the last time the trap was enabled.

**DATA=u,opt**

\( u \) is the number of times that the SLIP processor could not access the data in a target location because the data was unavailable. This failure can occur if either the data itself or an indirect pointer to the data was paged out when SLIP processing attempted to access the data.

**System action:** The system continues processing.

**IEE738D**

**SPECIFY text FOR SLIP**

\{xxxxxxx(COMMAND) OR ‘CANCEL’ (ID = xxxxCOMMAND)\}

**Explanation:** A SLIP command was entered with an incorrect or missing parameter.

In the message text:

**text**

An indication of the incorrect or missing parameter:

**ADDRESS RANGE**

The command incorrectly specified, or did not specify, the address range. An address range is required for the type of trap being defined. Address ranges are defined on the following parameters:

- **RANGE**
- **LPAMOD**
- **LPAEP**
- **PVTMOD**
- **PVTMOD**
- **NUCMOD**
- **NUCEP**

**RANGE KEYWORD**

The command incorrectly specified, or did not specify, the RANGE parameter. This parameter is required for the type of trap being processed.

**TARGETID**

The command contained ACTION=TARGETID, but did not specify a target identifier.
The type of SLIP command that was specified. If COMMAND appears, the system could not
determine the type of SLIP command.

ID=xxxx
The SLIP trap identifier specified on the SLIP command.

COMMAND
No SLIP trap identifier was specified on the SLIP command. The word COMMAND is substituted.

System action: The system waits for the operator to reply.

Operator response: Do one of the following:
• Reply REPLY id,prm to specify the missing or incorrect parameter, where prm is the required parameter. If the message contains TARGETID, the parameter is the target identifier of the target trap.
• Reply REPLY id,CANCEL to cancel the original SLIP command.

id is the identifier preceding the message number.

**IEE765E** PERMANENT SYSTEM LOG TASK FAILURE - REIPL TO ACTIVATE SYSTEM LOG OR ISSUE V OPERLOG,HARDCPY COMMAND

Explaination: The system log task (SYSLOG) has failed and cannot be restarted.

System action: When SYSLOG failed, the system either switched hardcopy to an alternate hardcopy device or suspended hardcopy. The system continues to run without a SYSLOG.

Operator response: Contact the system programmer.

System programmer response: If hardcopy was suspended, vary a printer device online and make it the hardcopy device. To re-activate SYSLOG processing, re-IPL the system.

Source: Master Scheduler

Detecting Module: IEEMB860  
Routing Code: 2,10  
Descriptor Code: 2

**IEE766E** BUFFER SHORTAGE FOR SYSTEM LOG - 60% FULL

Explaination: The system found that the system log task (SYSLOG) may be active and that 60% of its buffers are full.

System action: Write-to-log (WTL) processing continues to allocate WTL queue elements when needed.

Operator response: Increase the number of WTL buffers available to the system by entering the CONTROL M,LOGLIM=xxxxxx command.

System programmer response: Before the next system initialization, increase the value of LOGLIM in the CONSOLxx member of parmlib. This will allow for a higher number of outstanding WTL buffers.

If your system is a JES3 system, you will need a higher default for the LOGLIM parameter. See the `z/OS MVS Initialization and Tuning Reference` for more information.

Source: Master Scheduler

Detecting Module: IEEMB804  
Routing Code: 2,10  
Descriptor Code: 11

**IEE767A** SEVERE BUFFER SHORTAGE FOR SYSTEM LOG - 100% FULL

Explaination: The system found that the system log task (SYSLOG) may be active and that 100% of its buffers are full.

System action: Write-to-log (WTL) processing ceases.
to allocate WTL queue elements. Subsequent WTL requests result in a return code of 4 to the user.

**Operator response:** Increase the number of WTL buffers available to the system by entering the CONTROL M,LOGLIM=xxxxxx command.

**System programmer response:** Before the next system initialization, increase the value of LOGLIM in the CONSOLxx member of parmlib. This will allow for a higher number of outstanding WTL buffers.

If your system is a JES3 system, you will need a higher default for the LOGLIM parameter. See the [z/OS MVS Initialization and Tuning Reference](https://publib.boulder.ibm.com/infocenter/zosinfocenter/v1r11/topic/com.ibm.zos.v1r11.doc/rsrcmst/a0279820rn01.htm) for more information.

---

**IEE769I CPU(x) UNAVAILABLE FOR AFFINITY SCHEDULING**

**Explanation:** In response to a reconfiguration request, the system tried to reconfigure a processor offline and found programs with affinity to the target central processor. The operator requested that the target central processor be marked unavailable for starting any new steps with affinity to the target central processor.

In the message text:

**CPU(x)**  
The central processor identifier.

**System action:** The system completes any programs currently running with or without affinity to the central processor. The system does not initiate jobs whose first job step requests affinity to the central processor until the central processor is marked available. The system fails any job whose job step, other than the first job step, requests affinity to the central processor.

**Operator response:** Do one of the following:

- Enter CONFIG CPU(x),OFFLINE to reconfigure the central processor offline.
- Enter CONFIG CPU(x),ONLINE to make the central processor available for affinity scheduling.

---

**IEE775E STORAGE UNAVAILABLE FOR SYSTEM LOG BUFFER - LOG CLOSE IN PROCESS**

**Explanation:** The system attempted to obtain storage in the common storage area (CSA) for the system log (SYSLOG) buffer. The attempt failed, possibly because of a loop in a program issuing the WTL macro.

**System action:** The system closes the system log to free log buffers. The system continues processing. The system issues messages IEE043I and IEE037D.

**Operator response:** Do the following:

- Enter VARY HARDCPY,OFFLINE, if the SYSLOG was the hardcopy device, to stop the hardcopy output directed to the console with master authority.
- Enter WRITELOG START to activate the SYSLOG after the system issues message IEE037D.
- Enter VARY HARDCPY to assign hardcopy to the SYSLOG.
- Cancel the job, if the system repeatedly issues message IEE147I with the same text and a problem program is issuing the WTL. Contact the application programmer for the problem program.

**IEE776I**  

cmd HAS EXCEEDED THE REQUEST LIMIT OF limit

Explanation: A command was issued that has exceeded the allowable limit.

In the message text:

```plaintext
cmd
The command issued
limit
The maximum value which the command supports
```

The cmd/limit pairs supported by this message are:

<table>
<thead>
<tr>
<th>cmd</th>
<th>limit</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>D M=DEV</td>
<td>4096</td>
<td>A D M=DEV command was issued that specified more than 4096 devices.</td>
</tr>
<tr>
<td>VARY PATH</td>
<td>4096</td>
<td>A VARY PATH command was issued that specified more than 4096 devices.</td>
</tr>
</tbody>
</table>

System action: The system rejects the command

Operator response: Reissue the command specifying a range that will not exceed the allowable maximum limit value.

Source: Reconfiguration, Input/Output Supervisor

IEEVSCAN

IEEVPPTH

**IEE779I**  

ccm xxx-yyy RANGE INVALID

Explanation: A command specified a range of device numbers or routing codes incorrectly.

In the message text:

```plaintext
ccm
The command, or a portion of the command, entered.
xxx
The first number in the range.
yyy
The second number in the range.
```

System action: The system rejects the command.

Operator response: Enter the command again with a valid range.

IEE781I  PAGEADD COMMAND-UNABLE TO PROCESS DUE TO ERROR AT IPL

Explanation: During system initialization, the system could not build lists of active page and swap data sets. Without the lists, the system cannot determine for a PAGEADD command if the data set names in the command stream are unique.

System action: The system issues message ILR004I or ILR021I. The system ends PAGEADD command processing for the remainder of the current IPL.

Operator response: Do not issue the PAGEADD command during this IPL.

Source: Auxiliary storage manager (ASM)

Detecting Module: ILRPGEXP

Routing Code: *  
Descriptor Code: 5

IEE782I  PAGEADD COMMAND- dsname (PAGE|SWAP) DATA SET text

Explanation: text is one of the following:
- ALREADY IN USE BY SYSTEM
- NOT CATALOGED
- INSUFFICIENT STORAGE TO PROCESS THIS DATA SET
- VOLUME NOT MOUNTED-DATA SET WILL NOT BE PROCESSED
- HAS AN INVALID DEVICE TYPE
- I/O ERROR DETECTED - DATA SET UNUSEABLE
- NOT ALLOCATED - ERROR CODE xxxx
- INFORMATION CODE yyyy
- ALREADY IN USE BY PAGEDEL REPLACE COMMAND
- SWAP DATA SETS NO LONGER SUPPORTED
- COULD NOT BE SERIALIZED

The system is unable to process the PAGEADD command as requested.

In the message text:

dsname  
The name of the data set.

Source: Auxiliary storage manager (ASM)

Detecting Module: ILRPGEXP

Explanation: The PAGEADD command requested that the data set be added to the system page/swap data sets. However, the system is already using the data set as a page/swap data set.

System action: The system continues processing the PAGEADD command.

Operator response: If the data set name was entered incorrectly, Reenter the command specifying the correct data set name.

NOT CATALOGED

Explanation: Processing for the PAGEADD command could not add the data set to the system because
- The data set was not cataloged in the master catalog.
- The cataloged data set does not have the expected and necessary attributes of a page or swap data set.

System action: The system continues processing the PAGEADD command.

Operator response: To add the data set as a page or swap data set, do one of the following:
- For an uncataloged data set, run the AMS DEFINE utility to create a page/swap data set. Catalog that new data set in the master catalog. Then reenter the PAGEADD command.
- For a data set with incorrect attributes, use the AMS utility to delete the data set, and then to recreate it with the correct attributes for a page or swap data set. Catalog the new data set in the master catalog. Then reenter the PAGEADD command.

INSUFFICIENT STORAGE TO PROCESS THIS DATA SET

Explanation: While attempting to add the page/swap data set, the PAGEADD command could not obtain enough system queue area (SQA) to build the control blocks needed for the data set.

System action: The system continues processing the PAGEADD command.

Operator response: Reenter the PAGEADD command. If the problem persists, increase the size of the SQA at the next IPL.

VOLUME NOT MOUNTED - DATA SET WILL NOT BE PROCESSED

Explanation: Processing for the PAGEADD command could not open the page/swap data set because the volume containing the data set was not mounted.

System action: The system continues processing the PAGEADD command.

Operator response: Mount the requested volume. Reenter the command.

HAS AN INVALID DEVICE TYPE

Explanation: During PAGEADD processing, the system determined that the data set resides on a device type not supported for page/swap data sets.

System action: The system continues processing the PAGEADD command.

Operator response: Inform the system programmer
that a problem occurred in the ASM control blocks or code.

**System programmer response:** This situation indicates a problem in ASM control blocks or code. Verify that the VSAM catalog entries for the page and swap data sets have not been altered erroneously. If they have not been altered erroneously, try to recatalog them.

**I/O ERROR DETECTED - DATA SET UNUSEABLE**

**Explanation:** Processing for the PAGEADD command could not add the data set to the system because of an I/O error on the cached auxiliary storage subsystem.

**System action:** The system continues processing the PAGEADD command.

**Operator response:** Inform the system programmer that a problem occurred when you tried to use the cached auxiliary storage subsystem. Also, ensure that the following are true for the control unit involved:

- The control unit was assigned a unique subsystem storage director identification; and
- The control unit does not have the same identification as any other subsystem storage director that is used for paging or swapping.

**NOT ALLOCATED - ERROR CODE xxxx INFORMATION CODE yyyy**

**Explanation:** Processing for the PAGEADD command could not add the data set to the system due to an allocation error.

- xxxx The error code.
- yyyy The information code

**System action:** The system continues processing the PAGEADD command.

**Operator response:** Inform the system programmer that a problem occurred during data set allocation, and pass along the error and information codes.

**System programmer response:** Look up the SVC 99 error and information codes in [z/OS MVS Programming: Authorized Assembler Services Guide](#).

**ALREADY IN USE BY PAGEDEL REPLACE COMMAND**

**Explanation:** The PAGEADD command requested that the data set be added; however it is already in use as the replacement data set in a PAGEDEL REPLACE command.

**System action:** The system continues processing the PAGEADD command.

**Operator response:** If the data set name was entered incorrectly, reenter the command specifying the correct data set name.

**SWAP DATA SETS NO LONGER SUPPORTED**

**Explanation:** The PAGEADD command requested that a swap data set be added; however, swap data sets are no longer supported.

**System action:** The data set is not processed.

**Operator response:** None.

**COULD NOT BE SERIALIZED**

**Explanation:** The system was unable to obtain an ENQ of SYSZILRD dsname.volser for page data sets during a PAGEADD command. The page data set may be in use by another system.

**System action:** The data set is not processed.

---

**IEE783I PAGEADD COMMAND- dsname {PAGE|SWAP} DATA SET NOW AVAILABLE FOR SYSTEM USE**

**Explanation:** The PAGEADD command processing for the page/swap data set completed.

In the message text:

- dsname The name of the data set.

**System action:** System processing continues.

**Source:** Auxiliary storage manager (ASM)

**Detecting Module:** ILRPGEXP

**Routing Code:** *

**Descriptor Code:** 5

---

**IEE784I PAGEADD COMMAND- dsname {PAGE|SWAP} DATA SET LENGTH OF DATA SET NAME GREATER THAN 44 OR NULL**

**Explanation:** In the PAGEADD command, the length of the page/swap data set name is zero or greater than 44 characters.

In the message text:

- dsname The name of the data set.

**System action:** The system continues processing the PAGEADD command.

**Source:** Auxiliary storage manager (ASM)

**Detecting Module:** ILRPGEXP

**Routing Code:** *

**Descriptor Code:** 5
Explanation: In the PAGEADD command, the maximum number of page/swap data sets that can be added during one IPL have been added. The number is determined by the PAGTOTL system parameter, which was specified at IPL.

If this message occurred for page data sets, it may still be possible to add swap data sets. If this message occurred for swap data sets, it may still be possible to add page data sets.

System action: The system ends processing of the PAGEADD command.

System programmer response: If more page/swap space is needed, it may be acquired at the next IPL by either of the following:

- Specify more page/swap data sets on the PAGE and SWAP system parameters.
- Increase the number of page/swap data sets that can be used by the system on the PAGTOTL system parameter.

Source: Auxiliary storage manager (ASM)

Detecting Module: ILRPGEXP

Routing Code: *

Descriptor Code: 5

Explanation: The PAGEADD command encountered an error while attempting to read, write, or obtain storage for quick/warm start data. The status of the quick/warm start data is unknown at this time, but it may still be possible to quick/warm start.

In the message text:

READ
GETMAIN
It may be possible to reenter the command with no errors.

WRITE
The quick/warm start data is probably unusable. If a quick/warm start is attempted in spite of a WRITE error, do not attempt to use the PAGEADD command again for a page data set, because the system will make no further attempts to update the quick/warm start data.

System action: The system issues message IEE787A.

Operator response: See the operator response for message IEE787A.

Source: Auxiliary storage manager (ASM)

Detecting Module: ILRPGEXP

Routing Code: *

Descriptor Code: 5

Explanation: This message follows message IEE786I.

System action: The PAGEADD continues after REPLY id,U, and ends after REPLY id,END.

Operator response: Enter REPLY id,U to continue, or REPLY id,END to end the PAGEADD command.

- To keep quick/warm start capability:
  1. For READ or GETMAIN in message IEE786I, enter REPLY id,END, and enter the command again. If the command still fails, do not enter REPLY xx,U.
  2. For WRITE in IEE786I, enter REPLY id,END. Do not enter the PAGEADD command again.

- To continue PAGEADD processing, enter REPLY id,U. This reply will destroy all quick/warm start capability.

Source: Auxiliary storage manager (ASM)

Detecting Module: ILRPGEXP

Routing Code: *

Descriptor Code: 2,5

Explanation: The reply entered in response to message IEE787A was incorrect. The only acceptable replies are U and END.

System action: The PAGEADD continues after REPLY id,U, and fails after REPLY id,END.

Operator response: Enter REPLY id,U to continue, or REPLY id,END to fail the PAGEADD command.

Source: Auxiliary storage manager (ASM)

Detecting Module: ILRPGEXP

Routing Code: *

Descriptor Code: 2,5
IEE789I PAGEADD COMMAND- (READ|WRITE) ERROR FOR QUICK/WARM START DATA QUICK/WARM STARTS FROM THIS IPL WILL HAVE UNPREDICTABLE RESULTS

Explanation: An error occurred while the auxiliary storage manager (ASM) was accessing page data set information needed for a quick/warm start.

In the message text:

READ
The error may have been temporary. It may still be possible to quick/warm start, and the PAGEADD command may be reentered without further destroying quick/warm start capability.

WRITE
The status of the data set is unknown. It may still be possible to quick/warm start. However, further use of the PAGEADD command for page data sets will definitely destroy quick/warm start capability.

System action: The PAGEADD command abnormally ends.

Operator response: Notify the system programmer before issuing any more PAGEADD commands.

System programmer response: Determine the cause of the abnormal condition, whether the PAGEADD command should be allowed this IPL, and whether a quick or warm start should be attempted next IPL.

Source: Auxiliary storage manager (ASM)

Detecting Module: ILRPGEXP

Descriptor Code: 5

IEE791I dev VARY REJECTED - reason

Explanation: reason is one of the following:

- ASSIGNED TO ANOTHER SYSTEM
- ASSIGN CONFLICTS WITH CURRENT DEVICE STATUS
- ASSIGN FAILED, RC =rc
- DYNAMIC PATHING NOT OPERATIONAL ON DEVICE

A VARY ONLINE command requested dynamic pathing for a device. The command failed.

In the message text:

dev
The device number for which the VARY command requested dynamic pathing.

ASSIGNED TO ANOTHER SYSTEM
VARY ONLINE was entered, but the device is assigned to another system. This system cannot have exclusive access to the device. If the device is shared by another system, it is possible for this system to get shared access.

ASSIGN CONFLICTS WITH CURRENT DEVICE STATUS
Either:

1. A VARY ONLINE command specified a device that is already assigned to this system. The requested assign status conflicts with the current device status. A single-system assign request cannot be honored if the device is already assigned with shared status.
2. A VARY ONLINE,SHR command specified a device that is autoswitched. The command is rejected because SHR is incompatible with automatic tape switching.

ASSIGN FAILED, RC =rc
A VARY ONLINE command failed. rc is one of the following:

- 16 A time out occurred while the system was performing I/O to assign the device.
- 20 A permanent I/O error occurred while the system was performing I/O to assign the device, or the device is currently forced offline (boxed).
- 28 A SENSE operation failed while the system was performing I/O to assign the device.

DYNAMIC PATHING NOT OPERATIONAL ON DEVICE
A VARY ONLINE command attempted to establish dynamic pathing for a device. The path group was not established.

System action: The system ends VARY ONLINE processing for the specified device. The system does not change the device status.

Operator response: Depending on the message text, do the following:

ASSIGNED TO ANOTHER SYSTEM
If a single-system request was made, choose another device to vary online. If the device is required, vary the device offline to the other system, then vary it online to this system.

If a shared request was made, but some other system has the device exclusively, choose another device to vary online with the SHR option. If the device is required, vary the device offline, or online shared, to the other system, then vary it online with SHR to this system.

Note: The VARY command must be entered from a console attached to the system it is meant to affect.

ASSIGN CONFLICTS WITH CURRENT DEVICE STATUS
Either:
1. A VARY ONLINE command specified a device that is already assigned to this system. The requested assign status conflicts with the current device status. A single-system assign request cannot be honored if the device is already assigned with shared status. VARY the device offline, then back online.

2. A VARY ONLINE, SHR command specified a device that is autoswitched. The command is rejected because SHR is incompatible with automatic tape switching. VARY the device to be not autoswitchable, then issue the VARY ONLINE, SHR command.

ASSIGN FAILED, RC=rc
Enter the VARY command for the device again. If the command fails again, the device or control unit could be malfunctioning, which would prevent the device-end or control unit end from being received. Contact hardware support.

System programmer response: Do the following:
1. If dynamic pathing is not operational on the device and if the logrec data set contains hardware error records for the device, contact hardware support.
2. If the logrec data set OBR-DPA record contains incorrect path group ID information, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Detecting Module: CNZK1MIG, IEECB833
Routing Code: *
Descriptor Code: 5

IEE793I devnnnnnnn[PENDING] OFFLINE AND BOXED

Explanation: One of the following occurred:

1. The operator entered the VARY dev, OFFLINE, FORCE command.
   If the device with device number dev was online, it is now marked pending offline. It will go offline when two conditions are met, in this order:
   a. The device is no longer allocated to any job.
   b. Allocation can get the necessary resources to process the request.

   If device dev was offline, it remains offline.

2. The operator forced the device offline and boxed the device. The operator then tried to vary the device back online. The VARY command is rejected for that device.

In either case, the device has been boxed, which means:

- I/O for the device has been ended.
- Any new I/O request for the device will result in a permanent I/O error.
- No new allocations are done for the device.

In the message text:

- dev
  A VARY dev, OFFLINE, FORCE was entered to force offline the device with device number dev.
- nnnnnnnn
  A VARY nnnnnnnnn, OFFLINE, FORCE command was entered to force offline a console named nnnnnnnnn.

PENDING

Device number dev or a console named nnnnnnnnn was online. The system marked the device or console pending offline. The device or console will go offline when two conditions are met, in this order:

1. The device is no longer allocated to any job.
2. Allocation can get the necessary resources to process the request.

System action: Processing continues.

Operator response: Do one of the following:

- For case number 1: No action is required. However, if the device is pending offline and not allocated, use the D GRS,C=(SYSIEFSD, VARYDEV*) command to ensure no contention exists for SYSIEFSD.VARYDEV* resources. If all of the above conditions are met and no contention exists, notify the system programmer.
- For case number 2: To bring the device back online, enter a VARY dev, ONLINE, UNCOND command.
System programmer response: Use the DGRS,RES=(SYSIEFSD,VARYDEV*) command to determine if the SYSIEFSD.VARYDEV resource is being used elsewhere. If it is, monitor the resource to ensure processes using it are releasing it as expected. If the resource is held by a process that is hanging, attempt to cancel the job. If cancel is not possible, contact IBM.

IEE795I SYSTEM LOG - DATA LOSS, TEMPORARILY INACTIVE, IN RECOVERY

Explanation: While writing to the system log, the system detected an internal error in the log buffer.

System action: The system continues processing. The system cannot log commands temporarily. Message responses to the system log commands will be conflicting. The system writes a dump, but the dump may be incomplete.

If the system successfully recovers from the error, the system issues message IEE041I.

If the system does not recover from the error, the system issues message IEE037D.

Operator response: Enter system log commands after the system issues message IEE041I or IEE037D.

- If the system issues message IEE041I, the log is active and no response is needed.
- If the system issues message IEE037D, the log function is not active. Reactivate the log with the WRITELOG START command. If the log was a hardcopy log, enter a VARY command to make the log hardcopy.

IEE799D VARY CONSOLE DELAYED - REPLY RETRY OR CANCEL

Explanation: A VARY CONSOLE command requested that a console be placed online or offline. The system could not process the command due to other processing in the system such as:

- Another VARY CONSOLE command
- Device allocation in progress

System action: The system suspends processing of the VARY CONSOLE command until the operator enters a reply to this message.

After the system receives a reply, the system does the following, depending on the reply:

- For **REPLY id,RETRY**, the system tries to process the VARY command 5 more times at 5 second intervals. If the system cannot process the command after these 5 tries, the system issues message IEE799D again.
- For **REPLY id,CANCEL**, the system rejects the VARY CONSOLE command. The system issues message IEE756I.

Operator response: Do one of the following:

- Enter REPLY id,RETRY to have the system try the VARY command 5 more times at 5 second intervals.
- Enter REPLY id,CANCEL to cancel the VARY command.

If the command continues to fail, contact the system programmer.
System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IEE800D CONFIRM VARY FORCE FOR 
{nnnnnnnndev[,(dev,...)]} - REPLY NO OR YES

Explanation: A VARY OFFLINE,FORCE command requested that a device or console be forced offline. The system issues this message in response. This message asks the operator to confirm the FORCE request.

In the message text:

nnnnnnnn
A VARY nnnnnnn,OFFLINE,FORCE command requested that a console be forced offline.
nnnnnnnn is the console name.

dev
A VARY dev,OFFLINE,FORCE command requested that a device be forced offline. dev is the device number.

System action: The system waits for the operator to reply.

Operator response: Do one of the following:
• Reply REPLY id,NO to cancel the VARY OFFLINE,FORCE command.
• Reply REPLY id,YES to allow VARY OFFLINE,FORCE command processing to continue.

If you reply something other than NO or YES, the system issues messages:
• IEE792I to identify the incorrect reply
• IEE800D

COMMANDS EXCEED LIMIT IN COMMAND CLASS cc

Explanation: The number of commands of class cc, has exceeded the system limit of 50 commands executing at one time.

The excess commands are held in “waiting for execution” status and will be executed as current commands are finished.

In the message text:

cc is the class where:
- Class M1 commands run in the *MASTER* address space and may be essential to clearing the backlog of other commands.
- Class M2 commands are ordinary attached commands which run in the *MASTER* address space.
- Class M3 is only for SEND commands executed in the *MASTER* address space.
- Class C1 commands run in the CONSOLE address space and may be essential to clearing a backlog of other commands.
- Class C2 commands are ordinary attached commands which run in the CONSOLE address space.
- Class C3 is only for ROUTE commands executed in the CONSOLE address space.

System action: The warning message IEE822E has already been issued, and the system deletes it now. Processing continues. Additional commands are held in “waiting for execution” status, and will be executed as current commands finish.

The system will delete this message when the number of executing commands goes below 60% of the limit.

Operator response: Enter the CMDS DISPLAY command, and attempt to diagnose the reason for the excessive number of commands.

Use the CMDS SHOW and CMDS REMOVE commands to delete unwanted commands before execution.

If necessary, cancel the job which is issuing the excessive number of commands.

Notify the system programmer.

System programmer response: Diagnose the reasons for the excessive number of commands. Possibilities include:
- A job or automation program got into a loop issuing commands.
- The commands which are executing have become hung, due to a resource deadlock or a required action.
- The commands are legitimate; for example, a program has issued VARY commands for a large number of devices.

**IEE821E**  SMCS APPLID VALUE HAS BEEN CHANGED - SMCS MUST BE RECycled ON SOME SYSTEMS

Explanation: An operator has changed the SMCS APPLID on a system in the sysplex using the **K M,APPLID=** command. For the new APPLID to take effect, SMCS must be recycled on that system (using the **VARY NET,INACT,ID=smcsapplid** then **VARY NET,ACT,ID=smcsapplid** commands.) There are systems in the sysplex that have not been recycled yet, and are still using the previous SMCS APPLID.

System action: SMCS continues to use the previous APPLID on the system that is indicated in the message.

Operator response: SMCS should be recycled on the system indicated in the message.

Source: Communications Task

Detecting Module: IEAVC702
Routing Code: *,2,10
Descriptor Code: 3
IEE822E  COMMANDS ARE AT 80% OF LIMIT IN COMMAND CLASS cc

Explanation: The number of commands of class cc has reached 80% (40) of the system limit of 50 commands executing in an address space at one time.

Message IEE806A will be issued if the number reaches 100%.

In the message text:

cc is the class, where:

- Class M1 commands run in the "MASTER" address space and may be essential to clearing the backlog of other commands.
- Class M2 commands are ordinary attached commands which run in the "MASTER" address space.
- Class M3 is only for SEND commands executed in the "MASTER" address space.
- Class C1 commands run in the CONSOLE address space and may be essential to clearing a backlog of other commands.
- Class C2 commands are ordinary attached commands which run in the CONSOLE address space.
- Class C3 is only for ROUTE commands executed in the CONSOLE address space.

For detailed information on these commands, see the section on command flooding in [z/OS MVS System Commands].

System action: The system issues a CMDS DISPLAY command automatically. Processing continues.

The system will delete this message and issue IEE061I when the number of executing commands goes below 60% of the limit.

The system will delete this message and issue IEE806A when the number of executing commands goes to 100% of the limit.

Operator response: Attempt to diagnose the reason for the excessive number of commands.

Use the CMDS SHOW and CMDS REMOVE commands to delete unwanted commands before execution.

If necessary, CANCEL the job which is issuing the excessive commands.

Notify the system programmer.

System programmer response: Diagnose the reasons for the excessive number of commands. Possibilities include:

- A job or automation program got into a loop issuing commands.
- The commands which are executing have become hung, due to a resource deadlock or a required action.
- The commands are legitimate; for example, a program has issued VARY commands for a large number of devices.

IEE824I {STARTED TASK/TASKNAME ttt\{command\} FAILED, TERMINATED[, DUMPED] [STARTED TASK]}

Explanation: A START, MOUNT, or LOGON command requested that the system create or initialize an address space. In response, the system created a started task. A started task is one which must be started and does not run automatically. The started task failed because of an abend.

In the message text:

- ttt The name of the started task, if available. ttt is blank if the system cannot get the name of the task. If STARTED TASK appears, the system cannot get the name of the task.
- command The name of the command that failed.
- DUMPED The system wrote a dump. If DUMPED does not appear in the message text, the system tried to write a dump but could not.

System action: The system
- Ends the started task.
- Writes a logrec data set error record.
- Tries to write a dump.

Operator response: Enter the START or MOUNT command again, if one of these commands were attempted and failed. If the command fails again, contact the system programmer.

Application Programmer Response: Enter LOGON again, if you entered that command before the system issued this message. If LOGON fails again, contact the system programmer.

System programmer response: Do the following:
1. Look at the messages in the job log.
2. Examine the cataloged procedure in SYS1.PROCLIB.
3. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide either:
   - The command entered
   - The JCL for the started task

Descriptor Code: 3

IEE829E  SMCS APPLID xxxxxxxx IS NOT A VALID APPLID service FAILURE. RC: aaaaaaaaa RSN: bbbbbbbbb SMCS WILL WAIT FOR APPLID TO BE ACTIVATED BY VTAM

Explanation: SMCS tried to define itself to VTAM but could not because the APPLID (specified in the CONSOLxx member of Parmlib) was not a valid APPLID. The system will issue this message when the service, OPEN, fails.

If the RC (aaaaaaa) is X'08' and the RSN (bbbbbbbb) is X'56', this means the system found a match for the SMCS application program's symbolic name, but it is for a VTAM resource that is not an APPL.

System action: SMCS waits for VTAM to transition the APPLID to a usable state, or for the operator to change the APPLID for the SMCS to a different APPLID. When VTAM activates the APPLID, SMCS will continue initialization.

Operator response: If the RC = X'08' and the RSN = X'56', verify that VTAM knows the APPLID name used by SMCS as an application and not some other type of VTAM Resource. Use command, D NET,ID=xxxxxxxx, SCOPE=ALL to display the resource. If the name is displayed as an APPLID and VTAM does not activate the APPLID, attempt to activate the APPLID through the VARY NET,ACT,ID=xxxxxxxx command. If the APPLID is still not activated, issue command KM,APPLID=yyyyyyyy to use a different APPLID if possible. If the APPLID is still not activated, notify your system programmer.

IEE836D SLIP \{ID=\xxxx\|COMMAND\} ERROR - keywd - err, COL nnn. ENTER 1 KEYWORD, NULL LINE, OR 'CANCEL'.

Explanation: One of the following commands was entered with an incorrect parameter:

• SLIP
• REPLY in response to message IEE726D

In the message text:
ID=xxxx
   The SLIP trap identifier specified on the SLIP command.

COMMAND
   No SLIP trap identifier was specified on the SLIP command. The word COMMAND is substituted.

keywd
   The SLIP parameter that was incorrectly specified.

err
   A description of the error.

COL nnn
   The column number of the error, with origin being the first parameter on the input line.

System action: The system waits for the operator to reply.

Operator response: One of the following:
   • Reply REPLY id,keywd to specify the correct SLIP parameter. Your response should include all options for the parameter.
   • Reply REPLY id,EOB to tell the system to ignore the parameter that is not valid.
   • Reply REPLY id,CANCEL to cancel the original SLIP command.

id is the identifier preceding the message number.

IEE838I jobname CANCELABLE - ISSUE CANCEL BEFORE FORCE
   The job can be canceled.

IEE839I jobname NON-CANCELABLE - ISSUE FORCE ARM
   The job or procedure cannot be canceled.

Explanation: A FORCE command requested that a job be removed from the system. The system issues this message for one of these reasons:
   • The job can be canceled. Use the CANCEL command.
   • The job or procedure cannot be canceled. Use the FORCE nnn,ARM command.

In the message text:
jobname
   One of the following:
   • The name of the job removed in response to the command.
   • The job name of a task created by the START or MOUNT command (includes the identifier, if it was specified on the START or MOUNT command that created the task).
   • The name of an advanced program-to-program communications (APPC) transaction program (TP).
   • STARTING, if initiation of a started job, task, or ATX is complete.

CANCELABLE - ISSUE CANCEL BEFORE FORCE
   The job can be canceled.

NON-CANCELABLE - ISSUE FORCE ARM
   The job or procedure cannot be canceled.

System action: The system rejects the command.

Operator response: Reply according to the message text by entering a CANCEL or FORCE ARM command for the job.

If the system does not end the job after a reasonable time, enter the CANCEL or FORCE ARM command again; multiple CANCEL or FORCE ARM commands may be required to remove the job.

If the job is not removed, enter the FORCE command without the ARM parameter.

   AS=(ON|OFF) BR=(ON|OFF)
   MODE=(ON|OFF) EX=(ON|OFF)
   MT=(ON,pppK)|OFF\}
   ISSUE DISPLAY
   TRACE CMD FOR SYSTEM AND COMPONENT TRACE STATUS

Explanation: A TRACE or TRACE STATUS command requested that system or master tracing be started or that the status of tracing be displayed. The system issues this message in response to that command.

In the message text:
ST=ON,(nnnnM,{mmmmM|mmmmG})
ST=ON,(nG,mmmG)
ST=OFF
   The status of system trace.

nnnnM|nG
   The number of megabytes or gigabytes of storage allocated for the system trace table on each active processor.

mmmmM|mmmMG
   The number of megabytes or gigabytes of storage allocated for the system trace table buffers.
Note: When the trace storage exceeds $nnnnM$ or $mmmmmM$, it is rounded to the nearest gigabyte and displayed.

AS=ON
AS=OFF
The status of address space tracing.

BR=ON
BR=OFF
The status of branch tracing.

MODE=ON
MODE=OFF
The status of mode tracing.

EX=ON
EX=OFF
The status of explicit software tracing.

MT=ON, $pppK$
MT=OFF
The status of master tracing.

$pppK$
The size of the master trace table.

System action: The system continues processing.

IEE840I $xx$ TRACE TABLE INITIALIZATION FAILURE

Explanation: During master scheduler initialization, or during TRACE command processing, an error occurred in initialization of the master trace table.

For an error in TRACE command processing, one of the following occurred:

- The size of the master trace table specified in the MT=$nnnK$ parameter of the TRACE command exceeded the amount of storage available. In this case, the system issues message IEE839I.
- Master tracing failed.

System action: The system ends master trace table initialization.

Depending on when the error occurred, the system does the following:

- If the error occurred during TRACE command processing, the system issues message IEE839I following this message.
- If the error occurred during master scheduler initialization, the system issues message IEE480I or IEE481I before this message, and the system may issue message IEE839I following this message.

Master trace might not be active.

---

IEE841I $jobname$ (NON-CANCELABLEINON-FORCIBLE)

Explanation: A CANCEL or FORCE command requested that a job be removed from the system. The job specified on the command either cannot be canceled or cannot be forced.

In the message text:

$jobname$

One of the following:

- The name of the job specified on the CANCEL or FORCE command.
- The job name of a task created by the START or MOUNT command (includes the identifier, if it was specified on the START or MOUNT command that created the task).
- The name of an advanced program-to-program communications (APPC) transaction program (TP).
- STARTING, if initiation of a started job, task, or ATX is complete.

NON-CANCELABLE
A CANCEL command specified a job that is running but that is defined as non-cancelable.

NON-FORCIBLE
A FORCE command specified a job that is running, but the system cannot end the address space associated with the job.

System action: The system rejects the command.

Operator response: Verify that the job name was specified correctly in the FORCE or CANCEL command. If so, the job cannot be removed by a CANCEL or FORCE command.

A SLIP command requested that the system set a SLIP trap with an action of wait. The system found a match for this trap. The match is:

- A program event recording (PER) event in which the unit of work is not an enabled, unlocked task. Because the unit of work cannot be stopped safely, the system performs the WAIT action immediately, but not the remote actions specified.
- An error event.

In the message text:

**xxxx**

The SLIP trap identifier specified on the SLIP command.

**ACTION=** wait

Indicates that when a match is found for the trap, the system is to stop and display trap data in message IEE844W.

**TYPE=** yy

The system mode.

**REMOTE ACTION(S) NOT PERFORMED**

The SLIP command also specified the COND option of the REMOTE keyword.

aaaaa bbbbbbbb

Additional information based on the system mode indicated in TYPE=yy.

**System Mode (yy)**

aaaaa: bbbbbbbb

RTM1 SDWA ADDR:

The address of the system diagnostic work area (SDWA) associated with the error.

RTM2 RTM2WA ADDR:

The address of the recovery termination manager (RTM) 2 work area (RTM2WA) associated with the error.

**PSW:** cccccccc cccccccc

The program status word (PSW) of the event. If the SDWA indicates that the register and PSW information is not valid, the message reads: PSW: **NOT AVAILABLE**.

**CR 3-4:** ddddddddd eeeeee

The content of control registers 3 and 4. These registers contain cross memory information. If the SDWA indicates that the register and PSW information is not valid, the message reads: CR 3-4: **NOT AVAILABLE**.

**GR n-n:** ffffffff...fffffff

The content of the general registers. If the SDWA indicates that the register and PSW information is not valid, the message reads: **GR 0-F: NOT AVAILABLE**.

**AR n-n:** ffffffff...fffffff

The content of the access registers at the time of the PER interrupt or the error. The content of these registers is provided only if the processor was in AR mode and the system is MVS/ESA SP V5.2 or later.

**System action:** The system issues this message to
display trap data and enters a restartable wait state, as requested in the trap.

Operator response: Perform the actions requested by the system programmer for this trap. Restart the system.

If the system programmer requests, obtain a stand-alone dump. RelIPL the system.

System programmer response: Examine the message for information about the event. To capture diagnostic data, the SLIP trap can request an SVC dump, or, if necessary, ask the operator to obtain a stand-alone dump. The system cannot be restarted if a stand-alone dump is written; ask the operator to relIPL the system.

IEE852I  hh.mm.ss SYS1.DUMP STATUS [idr]

Explanation: Where text is:
SYS1.DUMP DATA SETS AVAILABLE=nnn
AND FULL=mmm
CAPTURED DUMPS=cccc,
SPACE USED=uuuuuuuuM,
SPACE FREE=ffffffffM
SYS1.DUMP AVAILABLE DASD DATA
SETS : xx,xx, xx-xx,xx,xx,xx-xx,...
SYS1.DUMP FULL DASD DATA
SETS : xx,xx, xx-xx,xx,xx,xx-xx,...
AUTOMATIC ALLOCATION IS: {ACTIVE|INACTIVE}

SMS=Des text
DASD=text
NAME=name-pattern
EXAMPLE=example

A DISPLAY DUMP command requested that the system display SYS1.DUMP data set information. The system issues this message in response to that command.

In the message text:

hh.mm.ss  The time when the message was issued, in hours (00 through 23), in minutes (00 through 59), and in seconds (00 through 59).
idr  A 3-digit decimal identifier. This identifier is used with the CONTROL C,D command to cancel status displays:
   • That are written on typewriter or display consoles
   • That are displayed in-line (not in display area) on display (CRT) consoles
   This identifier does not appear when the display is presented in a display area on a display console.

AVAILABLE=nnn  The number, in decimal, of available dump data sets.

FULL=mmm  The number, in decimal, of full dump data sets.

CAPTURED DUMPS=cccc  The number of dumps captured by SVC Dump. The dumps either are waiting for a dump data set to become available so they can be written to DASD, or are in the process of being written to DASD.

SPACE USED=uuuuuuuuM
The number of megabytes of virtual storage used by SVC dump to hold the data obtained for captured dumps. If you are using this value to estimate the amount of DASD space that a dump can occupy, note that this value does not include storage for common data areas that are not subject to change and that will be written with the dump data to DASD.

The maximum virtual storage that can be used by SVC dump is controlled by the AUXMGMT and MAXSPACE parameters of the CHNGDUMP SET command.

SPACE FREE=ffffffffM
The number of megabytes available for use by SVC dump to capture dump data. When this value is small, then either make dump data sets available so that captured dumps can be written to DASD or increase the MAXSPACE value using the CHNGDUMP command. Otherwise, the system can take only a partial dump and will lose any subsequent dumps.

AUTOMATIC ALLOCATION IS: {ACTIVE|INACTIVE}
The status of automatic allocation independent of the availability of automatic allocation resources.

SMS=text
Describes SMS-managed resources available for automatic dump data set allocation. One of the following:

NO SMS CLASSES DEFINED
No SMS classes are currently defined as available for dump data set allocation.

AVAILABLE SMS CLASSES: list
The SMS classes itemized in list are defined as available for dump data set allocation.

DASD=text
Describes non-SMS-managed resources available for automatic dump data set allocation. One of the following:

NO DASD VOLUMES DEFINED
No non-SMS-managed DASD volumes are currently defined as available for automatic allocation of dump data sets.

AVAILABLE DASD VOLUMES: list
The non-SMS-managed DASD volumes itemized in list are currently defined as available for automatic allocation of dump data sets.

NAME=name-pattern
The name-pattern currently in effect for automatic allocation of dump data sets. If the system default name-pattern is in effect, the following is displayed:
A DISPLAY DUMP,TITLE command requested that the system display the dump title, the dump identifier, and the time of dump for each requested SYS1.DUMPnn data set on a direct access storage device (DASD). When DUMPID is specified, the system displays the dump title, the dump identifier, and the time of the dump for each dump requested. DSN=ALL or AUTODSN=nnn is specified, the system displays the dump title, data set name, and the time of the dump for the most recently automatically allocated dump data set(s).

In the message text:

**hh.mm.ss**

The time when the system issued the message, in hours (00 through 23), in minutes (00 through 59), and in seconds (00 through 59).

**idr**

A 3-digit decimal identifier used with the CONTROL C,D command to cancel status displays:

- That are written on typewriter or display consoles
- That are displayed in-line (not in display area) on display (CRT) consoles

This identifier does not appear when the display is presented in a display area on a display console.

**error-text**

A DISPLAY DUMP,TITLE command requested that the system display the dump title, the dump identifier, and the time of dump for each requested SYS1.DUMPnn data set on a direct access storage device (DASD). When DUMPID is specified, the system displays the dump title, the dump identifier, and the time of the dump for each dump requested. DSN=ALL or AUTODSN=nnn is specified, the system displays the dump title, data set name, and the time of the dump for the most recently automatically allocated dump data set(s).

In the message text:

**hh.mm.ss**

The time when the system issued the message, in hours (00 through 23), in minutes (00 through 59), and in seconds (00 through 59).

**idr**

A 3-digit decimal identifier used with the CONTROL C,D command to cancel status displays:

- That are written on typewriter or display consoles
- That are displayed in-line (not in display area) on display (CRT) consoles

This identifier does not appear when the display is presented in a display area on a display console.
NO DUMP DATA AVAILABLE FOR THE FOLLOWING SYS1.DUMP DATA SETS WHICH ARE UNDEFINED TO SDUMP: xx-xx,...,

TITLE was requested for a data set that is not defined to the system as a SYS1.DUMP data set. To make the data set a SYS1.DUMP data set, it must be available at IPL or the operator must add it with the DUMPDS command.

In the message text:

nn The suffix of the SYS1.DUMPnn data set.

xx-xx A range of SYS1.DUMPnn data sets.

NO DUMP DATA AVAILABLE FOR THE FOLLOWING DUMPIDS: dumpid,...,dumpid

Lists the dump identifiers that have no dump data available. Issued in response to the DUMPID parameter.

NO DUMP DATA AVAILABLE FOR aaa AUTOMATICALLY ALLOCATED DUMP DATA SETS

TITLE was requested for more automatically allocated dump data sets than are available on the system. TITLE information for aaa dump data sets will not be displayed. For example, if the system has automatically allocated 12 dumps and you specified D D,T,AUTODSN=100 data would not be displayed for 88 dumps.

**-**-**-ERROR. OPEN ERROR ON {SYS1.DUMPnnldsnename}

The system tried to open the dump data set to read the header record. An error occurred.

**-**-**-ERROR. READ ERROR ON {SYS1.DUMPnnldsnename}

The system tried to read the dump data set header record. An error occurred.

**-**-**-ERROR. INVALID HEADER RECORD ON {SYS1.DUMPnnldsnename}

The system ends the request for the dump data set.

**-**-**-ERROR. ALLOCATION ERROR ON {SYS1.DUMPnnldsnename}-RC rc ERROR RSN CODE=errc INFO RSN CODE=info

The system tried to allocate the dump data set to read the header record. An allocation error occurred. rc is the allocation return code. errc is the error reason code, and info is the information reason code. See [z/OS MVS Programming: Authorized Assembler Services Guide](https://www.ibm.com/support/knowledgecenter/en/SSLTBW_2.4.0/com.ibm.zos.v2r4.jg20_05/).
A DISPLAY DUMP,ERRDATA command requested that
the system display error data from all requested dump
data sets. When DUMPID is specified, the system
displays the error data for each dump that has been
captured. When DSN=ALL or AUTODSN=nnn is
specified, the system displays the error data for the
most recent automatically allocated dump data set(s).

In the message text:

*hh.mm.ss*  
The time when the message was issued, in hours
(00 through 23), in minutes (00 through 59), and in
seconds (00 through 59).

*idr*  
A 3-digit decimal identifier. This identifier is used
with the CONTROL C,D command to cancel status
displays:
- That are written on typewriter or display consoles
- That are displayed in-line (not in display area) on
display (CRT) consoles

This identifier does not appear when the display is
presented in a display area on a display console.

**AVAILABLE** \(n\)  
The number, in decimal, of available dump data
sets.

**FULL** \(m\)  
The number, in decimal, of full dump data sets.

**AVAILABLE** \(nnn\)  
The number, in decimal, of available dump data
sets.

**FULL** \(mmm\)  
The number, in decimal, of full dump data sets.

**CAPTURED DUMPS** \(dmps\)  
The number of dumps captured.

**SPACE USED** \(uuuuuuuuuuuM\)  
The number of megabytes of virtual storage used
by SVC dump to hold the data obtained for
captured dumps. If you are using this value to
estimate the amount of DASD space which a dump
can occupy, note that this value does not include
storage for common data areas that are not subject
to change and that will be written with the dump
data to DASD.

The maximum amount of space that can be used
by SVC dump is limited by the MAXSPACE value,
which can be changed using the CHNGDUMP
command.

**SPACE FREE** \(fffffffffM\)  
The number of megabytes available for use by SVC
dump to capture dump data. When this value is
small, then either make dump data sets available
so that captured dumps can be written to DASD or
increase the MAXSPACE value using the
CHNGDUMP command. Otherwise, the system can
take only a partial dump and will lose any
subsequent dumps.

**DUMP** \(nn\)  
The suffix of the SYS1.DUMPnn name for a data
set on a direct access storage device (DASD).

**DUMPID** \(dumpid\)  
The dump identifier displayed by system message
IEA793A.

**dsname**  
The name of an automatically allocated dump data
set.

**TITLE** \(dump-title\)  
The title from the dump header or a message that
indicates why the system could not be read the
title.

**DUMP TAKEN TIME** \(hd.md.sd\)  
The time the dump was written, in hours (00
through 23), in minutes (00 through 59), and in
seconds (00 through 59).

**DATE** \(mm/dd/yyyy\)  
The date when the dump was written, in months
(00 through 12), in days (00 through 31) and in
years (using the 4-digit year number, such as 1996
or 2150).

**SEQ** \(yyyyy\)  
The unique sequence number assigned to the
error.

**CPU** \(zzzz\)  
The processor identifier of the processor on which
the error occurred.

**ASID** \(aaaa\)  
The address space identifier (ASID) of the address
space where the error occurred.

**TIME** \(hd.md.sd\)  
The time associated with the ERRORID, in hours
(00 through 23), in minutes (00 through 59), and in
seconds (00 through 59).

**DATE** \(mm/dd/yyyy\)  
The date associated with the ERRORID, in months
**IEE854I**

(00 through 12), in days (00 through 31) and in years (using the 4-digit year number, such as 1996 or 2150).

**SYSTEM ABEND CODE=cde**
System completion code in the system diagnostic work area (SDWA).

**USER ABEND CODE=ucde**
User system completion code in the SDWA.

**REASON CODE=reason-code**
The reason code in the SDWA.

**MODULE=mmmmmmmmm**
The name of the failing load module in the SDWA.

**CSECT=cccccccc**
The failing control section (CSECT) name supplied by the recovery routine. This name is in the SDWA.

**PSW AT TIME OF ERROR = pppppppp pppppppp**
The program status word (PSW) at the time of error, and saved in the SDWA.

**ILC=ilc**
The interrupt length code saved in the SDWA.

**INT=ccc**
The interrupt code saved in the SDWA.

**TRANSLATION EXCEPTION ADDR=tea**
The translation exception address in the SDWA.

**ABENDING PROGRAM ADDR=ssssssss**
The address of the abending program taken from the SDWA.

**RECOVERY ROUTINE=dddddddd**
The recovery routine name from the SDWA.

**GPR n-n rrrrrrr**
The content of the general registers at the time of the error and saved in the SDWA.

**error-text**
One of the following:

**NO DUMP DATA AVAILABLE FOR THE FOLLOWING EMPTY SYS1.DUMP DATA SETS:**
* xx,...,xx-xx,*
ERRDATA was requested for an empty dump data set. The message lists all empty dump data sets.

In the message text:

- **nn** The suffix of the SYS1.DUMPnn data set.
- **xx-xx** A range of SYS1.DUMPnn data sets.

**NO DUMP DATA AVAILABLE FOR THE FOLLOWING SYS1.DUMP DATA SETS WHICH ARE UNDEFINED TO SDUMP:**
* xx,...,xx-xx,*
ERRDATA was requested for a data set that is not defined to the system as a SYS1.DUMPnn data set. To make the data set a SYS1.DUMPnn data set, it must be available at IPL or the operator must add it with the DUMPDS command.

In the message text:

- **nn** The suffix of the SYS1.DUMPnn data set.
- **xx-xx** A range of SYS1.DUMPnn data sets.

**NO DUMP DATA AVAILABLE FOR THE FOLLOWING DUMPIDS:**
dumpid,...,dumpid
Lists the dump identifiers that have no dump data available. This is issued in response to the DUMPID parameter.

**NO DUMP DATA AVAILABLE FOR aaa AUTOMATICALLY ALLOCATED DUMP DATA SETS**
ERRDATA was requested for more automatically allocated dump data sets than are available on the system. ERRDATA information for **aaa** will not be displayed. For example, if 12 dumps have been automatically allocated and

D D,E,AUTODSN=100 was specified,
data would not be displayed for 88 dumps.

**-ERROR. OPEN ERROR ON**
{SYS1.DUMPnn|dsname}
The system tried to open the dump data set to read the header record. An error occurred.

**-ERROR. READ ERROR ON**
{SYS1.DUMPnn|dsname}
The system tried to read the dump data set header record. An error occurred.

**-ERROR. INVALID HEADER RECORD ON**
{SYS1.DUMPnn|dsname}
The system ends the request for the dump data set.

**-ERROR. ALLOCATION ERROR ON**
{SYS1.DUMPnn|dsname}-RC rc ERROR RSN CODE=errc INFO RSN CODE=info
The system tried to allocate the dump data set to read the header record. An allocation error occurred. rc is the allocation return code. errc is the error reason code, and info is the information reason code. See z/OS MVS [Programming: Authorized Assembler Services Guide](https://www.ibm.com/support/docview.wss?uid=swg21385597) for information about the SVC 99 return codes and the error reason code and information reason code.

**-ERROR. LOCATE FAILED ON**
dsname
dsname not found in catalog.

**DATA UNAVAILABLE FOR MIGRATED DATA SET**
ERRDATA was requested for automatically allocated dump data sets and this one was migrated. ERRDATA information for this dump
data set will not be displayed since SDUMP will not recall it to read the data.

**NO DUMP DATA AVAILABLE for aaa MIGRATED AUTOMATIC DUMP DATA SETS**

ERRDATA was requested for automatically allocated dump data set, and <aaa> of them have been migrated. ERRDATA information for these dump data sets will not be displayed, since SDUMP will not recall them to read the data.

**System action:** The system continues processing.

**Operator response:** If dumpid appears in the message, use this information to respond to system message IEA793A.

**Source:** SVC dump

**Descriptor Code:** 5,8,9

---

**IEE855I**

**DUMPDS COMMAND RESPONSE**

**DUMPDS COMMAND SYS1.DUMP DATA SET STATUS**

{NAME PATTERN [NOT] ACCEPTED: pattern}

reason-text1

{AUTOMATIC ALLOCATION IS: state}

reason-text2

{SYS1.DUMP DASD DATA SETS [NOT]}

{ADDED:|DELETED:| CLEARED:} xx,xx,xx-xx,...

{resource-type [NOT]}

{ADDED:|DELETED:}resources

reason-text3

{ (DASD VOLUMES | SMS CLASSES) NOT ADDED: AUTOMATIC ALLOCATION FAILED USING: resource, resource, ... }

**Explanation:** A DUMPDS command requested that the system display the status of SYS1.DUMP\text{n} data sets or automatic allocation resources.

- The first part of the message displays the dump data sets that were successfully processed.
- The second part of the message describes the dump data sets that could not be processed and gives the reasons for each failure.

In the message text:

**NAME PATTERN [NOT] ACCEPTED:**

The system accepted or did not accept the name pattern you specified on the NAME= command.

**pattern**

If the name pattern you specify on the NAME= command is accepted, it is displayed.

**reason-text1**

If the name pattern you specify on the NAME= command is not accepted, the system displays one of the following reasons:

**MISSING SYMBOLS: pattern**

You must specify the \&SEQ. symbol as part of pattern.

**DSNAME TOO LONG: dsname**

dsname is a sample resolution of the data set name pattern that you specified on the NAME= command. Resolution of the name pattern resulted in a data set name longer than 44 characters.

**INVALID DSNAME: dsname**

One or more of the qualifiers in dsname is not specified correctly. Possible errors are:

- Leading numeric character
- More than 8 characters
- Incorrect characters.

**state**

In response to the ALLOC= command, the system displays one of the following:

**ACTIVE**

The system will allocate dump data sets automatically.

**INACTIVE**

The system will not allocate dump data sets automatically.

**NOT ACTIVE**

If the system name begins with a numeric character, the ALLOC= command will not allow automatic allocation if the \&SYSNAME. symbol is used incorrectly in the name pattern.

**reason-text2**

If you use \&SYSNAME. incorrectly in the name pattern, the system does not allow automatic allocation and displays the reason:

**SYSNAME BEGINS WITH NUMERIC. RESPECIFY NAME PATTERN. RETRY DUMPDS**

The \&SYSNAME. symbol is defined with a leading numeric character. You must change the name pattern or the system name.

**xx**

The suffix of the SYS1.DUMP\text{n} name for a dump data set.

**resource-type**

Specifies SMS CLASSES or DASD VOLUMES that you are adding or deleting from the systems list of resources available for automatic allocation of dump data sets.

---

**IEE855I**

**DUMPDS COMMAND RESPONSE**

**DUMPDS COMMAND SYS1.DUMP DATA SET STATUS**

{NAME PATTERN [NOT] ACCEPTED: pattern}

reason-text1

{AUTOMATIC ALLOCATION IS: state}

reason-text2

{SYS1.DUMP DASD DATA SETS [NOT]}

{ADDED:|DELETED:| CLEARED:} xx,xx,xx-xx,...

{resource-type [NOT]}

{ADDED:|DELETED:}resources

reason-text3

{ (DASD VOLUMES | SMS CLASSES) NOT ADDED: AUTOMATIC ALLOCATION FAILED USING: resource, resource, ... }

**Explanation:** A DUMPDS command requested that the system display the status of SYS1.DUMP\text{n} data sets or automatic allocation resources.

- The first part of the message displays the dump data sets that were successfully processed.
- The second part of the message describes the dump data sets that could not be processed and gives the reasons for each failure.

In the message text:

**NAME PATTERN [NOT] ACCEPTED:**

The system accepted or did not accept the name pattern you specified on the NAME= command.

**pattern**

If the name pattern you specify on the NAME= command is accepted, it is displayed.

**reason-text1**

If the name pattern you specify on the NAME= command is not accepted, the system displays one of the following reasons:

**MISSING SYMBOLS: pattern**

You must specify the \&SEQ. symbol as part of pattern.

**DSNAME TOO LONG: dsname**

dsname is a sample resolution of the data set name pattern that you specified on the NAME= command. Resolution of the name pattern resulted in a data set name longer than 44 characters.

**INVALID DSNAME: dsname**

One or more of the qualifiers in dsname is not specified correctly. Possible errors are:

- Leading numeric character
- More than 8 characters
- Incorrect characters.

**state**

In response to the ALLOC= command, the system displays one of the following:

**ACTIVE**

The system will allocate dump data sets automatically.

**INACTIVE**

The system will not allocate dump data sets automatically.

**NOT ACTIVE**

If the system name begins with a numeric character, the ALLOC= command will not allow automatic allocation if the \&SYSNAME. symbol is used incorrectly in the name pattern.

**reason-text2**

If you use \&SYSNAME. incorrectly in the name pattern, the system does not allow automatic allocation and displays the reason:

**SYSNAME BEGINS WITH NUMERIC. RESPECIFY NAME PATTERN. RETRY DUMPDS**

The \&SYSNAME. symbol is defined with a leading numeric character. You must change the name pattern or the system name.

**xx**

The suffix of the SYS1.DUMP\text{n} name for a dump data set.

**resource-type**

Specifies SMS CLASSES or DASD VOLUMES that you are adding or deleting from the systems list of resources available for automatic allocation of dump data sets.
resources
The names of the automatic allocation resources, either SMS classes or DASD volumes.

reason-text3
If the system cannot complete an ADD, DELETE, or CLEAR request, it displays one of the following reasons:

ALREADY DEFINED TO SDUMP: xx,xx,xx-xx, ...
or resource
An attempt to add dump data sets or automatic allocation resources failed because the data sets are already defined to receive SVC dumps.

NOTDEFINED TO SDUMP: xx,xx,xx-xx, ...
or resource
An attempt to delete or clear dump data sets or automatic allocation resources failed because the dump data sets are not defined to receive SVC dumps.

LOCATE FAILED: (xx,rc),(xx,rc),...
An attempt to add dump data sets on a direct access storage device (DASD) failed when the locate function returned a bad return code. rc is the return code.

NOT A DASD DATA SET: xx,xx,xx-xx, ...
An attempt to add DASD dump data sets failed because the device type is not DASD.

TRACKSIZE TOO SMALL: xx,xx,xx-xx, ...
An attempt to add DASD dump data sets failed because the track size of the device is too small to hold a 4104-byte record.

DYNAMIC ALLOCATION FAILED: (xx,rc,err,rsn),(xx,rc,err,rsn)
A DYNALLOC macro to add DASD dump data sets failed because the dynamic allocation failed. See z/OS MVS Programming Authorized Assembler Services Guide for a description of DYNALLOC return codes, error codes, and reason codes.

In the message text:
xx The suffix of the SYS1. DUMPnn name for a data set.
rc The return code.
err The error code for dynamic allocation.
rsn The reason code for dynamic allocation.

OPEN FAILED: xx,xx,xx-xx, ...
An attempt to add or clear DASD dump data sets failed because the data sets failed to open.

READ FAILED: xx,xx,xx-xx, ...
An attempt to add DASD dump data sets failed because the system could not read the data set using BSAM READ.

MULTIPLE VOLUME DATA SET NOT ALLOWED: xx,xx,xx-xx,...
An attempt to add DASD dump data sets failed because they were multivolume data sets, which are not allowed.

EXCEEDS 100 DUMP DATA SET LIMIT: xx,xx,xx-xx,...
An attempt to add dump data sets failed because the limit of 100 data sets has been reached.

IN USE BY SDUMP: xx,xx,xx-xx,...
An attempt to delete or clear dump data sets failed because SVC dump was using the data sets.

INVALID PRIMARY EXTENT SPACE: xx,xx,xx-xx,...
An attempt to add DASD dump data sets failed because the data set was allocated with zero primary extent space.

UNEXPECTED ERROR: xx,xx,xx-xx,...
An attempt to add, delete, or clear a dump data set caused a program check or abnormal end. The system writes an SVC dump for this problem.

{ DASD VOLUMES | SMS CLASSES } NOT ADDED: AUTOMATIC ALLOCATION FAILED USING: resource, resource, ...
Automatic allocation failed for a resource, which is specified as a DASD volume serial number or an SMS storage class in a DUMPDS ADD command. The volume or class cannot be used.

System action: The system continues processing.

IEE857I hh.mm.ss DUMP OPTIONS [idr] dt mode opt

Explanation: The system issues this message in response to a DISPLAY DUMP,OPTIONS command. It is useful after you enter a CHNGDUMP command, to show the current system dump options and how they will be used.

In the message text:
hh.mm.ss The time when the dump was written, in hours (00 through 23), in minutes (00 through 59), and in seconds (00 through 59).
idr A 3-digit decimal identifier used with the CONTROL C,D command to cancel status displays either:
• Written on typewriter or printer consoles

4-218 z/OS V1R11.0 MVS System Messages, Vol 7 (IEB-IEE)
• Displayed in-line (not in a display area) on display (CRT) consoles

This identifier does not appear when the display is presented in a display area on a display console.

dt The dump type, which is one of the following:

SYSABEND-
SYSMDUMP-
SYSUDUMP-
SDUMP-
ABDUMP-

The message lists each dump type on a separate line with its corresponding options.

mode The dump mode, which describes how the system options are applied to each dump request of this dump type:

ADD OPTIONS
Add options.

ADD PARMLIB OPTIONS
The same as ADD OPTIONS except that it also indicates that the option list is the same as at initial program load (IPL).

OVERRIDE WITH
Override with.

ADD NO OPTIONS
There are no system dump options to be added to the dump request.

IGNORE DUMP REQUESTS
The NODUMP keyword was specified on a previous CHNGDUMP command. No options are listed following the last two modes.

opt List of the current dump options, which the system will add to, or use to override the options on each dump request for the dump type.

System action: The system continues processing.

Operator response: Compare the options displayed with those desired. Use the CHNGDUMP command to make any changes needed.

Source: Recovery termination manager (RTM)

Detecting Module: IEECB912

Descriptor Code: 5,8,9

IEE859I SUBSYSTEM xxxx NOT INITIALIZED - yyyyyyyy NOT FOUND

Explanation: The module containing the initialization entry point specified in an IEFSSNxx member of SYS1.PARMLIB could not be found in SYS1.LINKLIB or in a library concatenated to SYS1.LINKLIB through a LNKLSTxx member of SYS1.PARMLIB. In the message text xxxx is the subsystem name and yyyyyyyy is the entry point of the subsystem initialization routine.

System action: The subsystem will be defined to the system but not initialized. Some user jobs may consequently fail.

Operator response: Report the message to the system programmer.

System programmer response: If you use SMP/E to make all changes to the system, obtain a full list of the current maintenance from the SMP/E control data set (CDS).

Collect all printed output and output data sets related to the problem.

If the problem recurs and if the program is not in error, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: JES2

Descriptor Code: 4

IEE860I xx SIZE MUST BE BETWEEN 16K AND 999K

Explanation: A TRACE MT command requested that the system turn master tracing on or off or change the size of the master trace table. The TRACE command specified an incorrect size for the MT parameter.

System action: The system rejects the command. The system does not change the status of master trace or the size of the existing master trace table.

Operator response: Enter the TRACE command again, either:
• Omitting the nnnK portion of the MT parameter to allow the master trace table size to default to the value specified during initial program load (IPL).
• Specifying a valid table size in K bytes. The minimum allowable size is 16K bytes; the maximum size is 999K bytes.

4-219
IEE861I  DUMPDS COMMAND RESPONSE NO DUMPDS PROCESSING REQUIRED

Explanation: A DUMPDS command requested that either:
- All full SYS1.DUMPnn data sets be cleared
- Cataloged dump data sets be added to, or removed from the system's list of SYS1.DUMPnn data sets

The command specified data sets that do not require DUMPDS processing:
- A DUMPDS ADD, DSN=ALL command requested that all the cataloged dump data sets, SYS1.DUMP00 through SYS1.DUMP99, be added to the system's list of SYS1.DUMPnn data sets. However, there are no DASD data sets on this list.
- A DUMPDS CLEAR, DSN=ALL command requested that all full DASD data sets be cleared. However, there are no full DASD data sets.

System action: The system successfully processes the command without modifying any of the dump data sets.

Operator response: No response is necessary. Enter DISPLAY DUMP to get the status of SYS1.DUMPnn data sets.

Source: Recovery termination manager (RTM)

IEE870I  CONSOLE SWITCH, OLD=xxxxxxxx(cname,system), NEW=xxxxxxxx(cname,system), REASON=reason

Explanation: A console switch occurred. The console in the NEW field is now responsible for functions formerly performed by the console in the OLD field.

In the message text:

The device number or LU of the old or new console involved in the switch. This field may be blank in the OLD=portion of the message if the data for the switched console is not available.

cname The name of the old or new console involved in the switch. This field may be blank in the OLD=portion of the message if the data for the switched console is not available.

system The name of the system to which the old and new consoles are defined. If the console in the OLD field is inactive, this field is blank. This field may be blank in the OLD=portion of the message if the data for the switched console is not available.

reason Is one of the following:

ABTERM An extended MCS console was abnormally
terminated through the MCSOPER REQUEST=DEACTIVATE,ABTERM=YES service.

CF CHP
The operator entered a CONFIG CHP,OFFLINE command.

CQEER
The system cannot obtain the console queue element (CQE).

EXT
The external interrupt key was pressed.

HCSW
The system switched the hardcopy function from SYSLOG.

IOER
An I/O error occurred on the console.

KV
A K V,USE=FC command was issued.

LOGOFF
An SMCS console was deactivated.

LOGON
An SMCS console was activated.

OPER
An open failure forced the console switch.

OPSW
Operlog failed.

RESWCH
A second switch occurred for the specified console.

SFAIL
The system on which the console was attached failed, causing the console to switch.

SINIT
While the system was in a 'no consoles' condition, a new system in the sysplex was initialized.

SWCMD
A SWITCH command was entered.

SWER
A software error caused the console to fail.

VMST
The operator entered a VARY MSTCONS command.

System action: The system continues processing.

Source: Communications task (COMMTASK)

Detecting Module: IEAVSWCB, IEAVSWCR
Routing Code: 2,10
Descriptor Code: 12

IEE871I CN=nnnnnnnn NOT ACTIVE [insert]

Explanation: A command specified the name of an inactive console.

In the message text:

nnnnnnnn
The console name specified on the command.

insert=CANNOT CHANGE CONSOLE ATTRIBUTES
If the system issues this message, the system attempted a VARY command to change the attributes for an inactive console. You cannot change the attributes for inactive consoles (except for the LU and LOGON keywords for SMCS consoles).

System action: The system rejects the command.

Operator response: Verify that the console name specified is active. Consider activating the console, if inactive. If the name was incorrect on the command, enter the command correctly.

IEE889I hh.mm.ss CONSOLE DISPLAY [idr]

[CONSOLE ID----------]
[SYSLOG COND=cond AUTH=auth1 NBUF=nnnn [ROUTCDE=route] ]
[OPERLOG COND=cond AUTH=auth1 NBUF=nnnn [ROUTCDE=route] ]

[HARDCOPY SUSPENDED ON THIS SYSTEM]

[HARDCOPY NOT ACTIVE ON THIS SYSTEM]

BUFFERS IN USE: nnnnnn LOG BUFFER LIMIT: nnnnnn
A DISPLAY CONSOLES, VARY HARDCPY, or VARY CONSOLE command was entered. The system issues this message in response to that command.

In the message text:

\( hh.mm.ss \)

The time when the message was issued, in hours (00 through 23), minutes (00 through 59), and seconds (00 through 59).

\( idr \)

A 3-digit decimal identifier to be used in a CONTROL C,D command to cancel status displays.

\textbf{MSG:} CURR=xxxx

The number of write to operator (WTO) message buffers in use by the system at this time. If xxxx is greater than 9999, asterisks will appear.

\textbf{MSG:} LIM=yyyy

The limit of the number of WTO message buffers allowed outstanding.

\textbf{RPLY:} CURR=xxxx

The number of write to operator with reply (WTOR) message buffers in use by the system at this time.

\textbf{RPLY:} LIM=yyyy

The limit of the number of WTOR message buffers allowed outstanding. The maximum value of yyyy is specified by the RMAX parameter in the CONSOLxx parmlib member.

\textbf{RPLY:} SYS=sssssss

The name of the system where this command is processed. Note that this system might be different from the system where this output is displayed. sssssss is a system name.

\textbf{RPLY:} PFK=xx

The suffix of the PFKTABxx parmlib member which contains the current program function key (PFK) table definitions. If no member was specified in the CONSOLxx parmlib member, PFK=NONE will be displayed.

\textbf{SYSLOG}

The hardcopy log is the system log (SYSLOG).

\textbf{OPERLOG}

The operations log is active.

\( nnn \)

One of the following:

- Console identifier
- --- appears if no identifier is available for this entry

\( \textbf{COND=} \)

Indicates the console status. \( cond \) is one of the following:

\( H \)

Hard-copy log. This condition will be indicated only when the console is active on the system where the command processes.
A  Active console.

A,P  In the process of becoming an active console. This condition will be indicated only when the console is active on the system where the command is processing.

A,SM  Active SMCS console.

N  Inactive console.

N,P  In the process of becoming a non-active console. This condition will be indicated only when the console is active on the system where the command is processing.

N,SM  Inactive SMCS console.

PD  The active system console is in the problem determination mode. PD is indicated only for the system console.

SS  Subsystem-allocatable console.

AUTH=auth1
For SYSLOG or OPERLOG, auth1 is one of the following:

CMDS  Operator and system commands, responses, and status displays (static and time-interval updated) are to be written to the hardcopy log.

INCMDS  Operator and system commands and responses (but not status displays) are to be written to the hardcopy log.

NOCMDS  Operator and system commands and responses are not to be written to the hardcopy log.

STCMDS  Operator and system commands, responses, and status displays are to be written to the hardcopy log.

NBUF=nnnn
The number of WTO message buffers currently queued to this console. If nnnn is greater than 9999, nnnn is **.*. N/A will be shown for consoles not active on the system where the DISPLAY CONSOLES is run, as well as subsystem consoles.

ROUTCODE=routcde
routcde is one of the following:

ALL  All of the routing codes, 1 through 128.

NONE  None of the routing codes.

HARDCOPY SUSPENDED ON THIS SYSTEM
There was no hardcopy console available, or hardcopy was not sent to the system log or to the operations log.

HARDCOPY NOT ACTIVE ON THIS SYSTEM
Hardcopy is not active at all on this system.

LOG BUFFERS IN USE: nnnnnn LOG BUFFER LIMIT: nnnnnn
If SYSLOG has previously been the hardcopy medium, but is not suspended, or has been turned off, messages have been saved in the log buffers. This line of the messages informs you of how many of these buffers are in use.

If any other hardcopy medium has been turned off, messages are not saved in the log buffers.

consname/altnameid
consname is the name of the console as specified in the CONSOLxx parmlib member. This console can be a subsystem-allocatable console.

altname is the name of the alternate console, if an alternate group is defined.

id is the console identifier.

LOGON=logon
logon is one of the following:

AUTO, DEFAULT, OPTIONAL, REQUIRED

AUTH=auth2
For a display console, extended MCS console, or subsystem console, auth2 is one of the following:

ALL  Any INFO, SYS, IO, or CONS command may be entered from this console.

CONS  INFO commands as well as any command from the console control command group may be entered from this console.

INFO  Any command from the Informational command group may be entered from this console.

IO  INFO commands as well as any command from the I/O Control command group may be entered from this console.

MASTER  The specified console is authorized to enter any operator command.

SYS  INFO commands as well as any command from the system control command group may be entered from this console.
consname\compid\asid

consname is the name of the console as specified in the CONSOLxx parmlib member. This console can be a subsystem allocatable console.

compid is the component identifier for the system component to which this console or this subsystem allocatable console is allocated.

asid is the address space identifier (ASID) of the system component to which this console is allocated.

subsys
The name of the subsystem owning the console. A console is dedicated to a system component, but is currently associated with a specified subsystem.

AREA=area
area is one of the following:

Z,a-b
  The range of area designators defined for this console.
  Z is the identifier of the in-line message area.
  a is the bottom out-of-line area. Values can be letters between the values of A and J.
  b is the top out-of-line area. Values can be letters between the values of A and J.
  The presence of some or all of these designators depends on the area definitions currently in effect at this console.

NONE
If the console is an output only console, NONE will appear in place of an area because these consoles have no areas associated with them.

MFORM=mform
Specifies the format in which messages are displayed. One or more values may appear. M will appear if only the text of the message is being displayed at the console.

mform is one of the following:

J The system will display each message with the job identifier or name.

M The system will display only the text of each message (without a time stamp, job identifier or name, and system name).

S The system will display each message with the name of the system on which the message originated.

T The system will display each message with a time stamp.

X Whenever possible, the system will attempt to suppress the job name and system name, if they would not be meaningful.

dev / luname
The device number for MCS consoles, or the LU for SMCS consoles. This field will be omitted if the console is not active on any system within the sysplex, unless the console is a SMCS console with a predefined LU.

sysname
The name of the system where the console is active. This field will be omitted if the console is not active on any system.

DEL=mode
Specifies the message deletion mode of the console.

mode is one of the following:

N Indicates that manual message deletion is required.

R Indicates roll mode. The system deletes a specified number of messages from the screen when a time interval elapses. Deletion occurs only if the screen is full and messages are waiting to be displayed.

RD Indicates roll mode with the following exception: messages awaiting action will not roll off; they are gathered at the top of the screen.

W Wrap mode. The system overlays the newest message over the oldest message on the screen.

Y Indicates automatic mode of message deletion. All messages marked for deletion are deleted whenever the screen becomes full.

RTME=nnn
Specifies the number of seconds between message rolls. This is a decimal value from 1 to 999, or a value of 1/4 or 1/2.

Note: If an asterisk (*) appears as the RTME value, the console is not fully initialized. The actual RTME value cannot be determined until the console is fully initialized.

RNUM=nn
Specifies the maximum number of messages lines included in one message roll mode. This is a decimal value from 1 to the number of lines in the message area.

Note: If an asterisk (*) appears as the RNUM value, the console is not fully initialized. The actual RNUM value cannot be determined until the console is fully initialized.

SEG=nn
Specifies the number of lines in the message area that can be deleted with a CONTROL E,SEG
command. This is a decimal value from 1 to the number of lines in the message area.

Note: If an asterisk (*) appears as the SEG value, the console is not fully initialized. The actual SEG value cannot be determined until the console is fully initialized.

**CON=con**
Specifies the conversation mode for message deletion.

- con is one of the following:
  - **N** Indicates non-conversational mode for message deletion.
  - **Y** Indicates conversational mode for message deletion.

**CMDSYS=cmdsys**
Specifies the name of the system for which this console has command association. Note that this system might be different from the system where this console is physically attached.

**MSCOPE=mscope**
The name of the system or systems from which this console is receiving unsolicited messages. Note that these systems might be different from the system where this console is physically attached.

- sssssss The system name.
  - *ALL*
    Message scope is for all systems currently defined in SYSPLEX.
  - [ssssss[,ssssss,...]]
    List of system names enclosed in parentheses.

**USE=use**
Specifies the use of a display console.

- use is one of the following:
  - **FC** Indicates full-capability use of a display console.
  - **MS** Indicates message stream use of a display console.
  - **SD** Indicates status display use of a display console.

**LEVEL=level**
Specifies the message level(s) to be received by the console.

- level is one of the following:
  - **ALL** Indicates that all messages are to be received by the console.
  - **CE** Indicates that critical eventual action messages are to be received by the console.
  - **E** Indicates that eventual action messages are to be received by the console.
  - **IN** Indicates that information messages are to be received by the console.
  - **NB** Indicates that broadcast messages are not to be received by the console.
  - **R** Indicates that messages requiring a reply (WTORs) are to be received by the console.

**PFKTAB=nnnnnnn**
The name of the PFK table that is being used on this console. If the IBM default PFK definitions are being used for the console, **PFKTAB=*DEFAULT** will be displayed.

- **opername** Represents the name of the active operator in an extended MCS console class.
- **keyname** Represents a collection of extended MCS consoles logically grouped by name. The **keyname** is used for message queueing and message retrieval.

**NO MCS CONSOLES DEFINED**
There are no active consoles that are currently defined to the system.

**THE FOLLOWING DEVICES ARE NOT CONSOLES ON THIS SYSTEM:** devspec
AREA=area  MFORM=mform
devspec is one of the following:
  userid
    A userid.
  console compid
    Console name or number.
  dev dev dev ...
    A list of device numbers.
  lowdev-highdev
    A range of device numbers.

NO CONSOLES MEET SPECIFIED CRITERIA
A valid keyword was specified, but no consoles were found that match the search criteria.

MESSAGES ISSUED FROM THESE SYSTEMS SENT TO HARDCOPY ONLY: msgtype
No consoles on the specified system are to receive certain types of messages.

NO ADDRESS SPACES ARE USING MORE THAN nnnn WTO BUFFERS
No address space is using more than 33% of the available WTO buffers, where nnnn is 33% of the total number of WTO buffers.

MESSAGES BEING HELD FOR OTHER SYSTEMS - WTO BUFFER USAGE
SYSTEM=sysname NBUF=nnnnnnnnnn
Messages intended another system in the sysplex are being held because the receiving system has a WTO buffer shortage. The second line is repeated for each system for which messages are being held. nnnnnnnnnnn is the number of WTO requests that are being held. sysname is the name of the system for which messages are being held.

NO WTO BUFFERS ARE BEING HELD FOR OTHER SYSTEMS
No WTO buffers are being used to hold messages for other systems in the sysplex. This line is not displayed when there is only one system in the sysplex.

MESSAGES COMING FROM OTHER SYSTEMS - WTO BUFFER USAGE
SYSTEM=sysname NBUF=nnnnnnnnnn
Messages coming from other systems in the sysplex are using WTO message buffers. The second line is repeated for each system that has incoming messages in WTO buffers. sysname is the system name and nnnnnnnnnnn is the number of buffers being used for messages from that system.

NO WTO BUFFERS ARE IN USE FOR MESSAGES FROM OTHER SYSTEMS
There are no WTO buffers in use for messages from other systems in the sysplex. This line is not displayed when there is only one system in the sysplex.

Operator response: If the current WTO or WTOR message buffer count is close to the limit, check the message buffer counts for each console. A console with a high count may not be functioning properly. See the operator response to message IEA405E.

The number of message buffers queued to all consoles may:

- Not match the number of outstanding message buffers. If a message buffer is queued to two consoles, it would be counted twice, once for each console.
• Not match the number of messages to be displayed at that console. For multiple line messages, each message buffer can hold two lines.
• Be greater than the current number of message buffers in use. This condition may occur after a console switch.

The message buffer limit is not the actual limit at IPL time. The IPL limit is very high, and the limit displayed is correct once IPL is finished.

IEE921I cm REJECTED[ - ]text

[COMMAND ISSUED IS command]

Explanation: The operator entered a CONTROL Q, CONTROL S, CONTROL V, or CONTROL N command. An error occurred. In the message text:

cm  The command.
text One of the following:

DISPLAY AREA BUSY
A DISPLAY command specified an area (L= name-a) in which a display already existed.

NEEDS DISPLAY AREA
A DISPLAY command was issued to a console in STATUS DISPLAY mode without any areas defined.

DEVICE NOT SUPPORTED
One of the following occurred:
• A CONTROL V,USE=FC command was entered in a system that has no printer consoles online.
• A CONTROL V command was entered.

NO HARDCOPY
One of the following occurred:
• A CONTROL Q command was issued to reroute messages to the hardcopy device, but the system does not have a hardcopy device.
• A CONTROL Q command was issued to requeue messages to SYSLOG, but SYSLOG is not yet active.

FOR CRT ONLY
Only MFORM or REF is valid when the target console is a printer console.

dev OUTPUT ONLY
The operator cannot enter commands from the console. The console is only used to display messages.

dev  Console name or ID

console_name CONSOLE BUSY
The system cannot process the command because the target console is busy.

One possible reason is that the targeted console is attached through an OSA-ICC Control Emulator that is in a Deferred Host Disconnect (DHD=0) state.

case_name  The target console name.

NOT VALID IN LOCAL MODE
A CONTROL V, CMDSYS command was entered and the system is in XCF-local mode. The CMDSYS keyword is valid only for a system that is in a multisystem sysplex.

MESSAGE LOSS DETECTED
Do one of the following:
• Issue a CONTROL command from another console to cause the message to go to that console instead, and then reissue the failed command.

4-229
• Issue the command with the UNCOND operand to force the command to be executed, even though some messages may go only to hardcopy.

CANNOT CHANGE USE OF SMCS CONSOLE
The operator tried to issue the command K V, USE=MS or K V, USE=SD against a SMCS console.

CONSOLE NOT ONLINE
A CONTROL N or CONTROL S command was issued specifying a console that was not online.

System action: The system rejects the command.
Operator response: Depending on the message text, do the following:

NEEDS DISPLAY AREA
First enter a CONTROL A,i,l,l command to define areas; then enter a CONTROL V command to change the console mode to message stream.

DEVICE NOT SUPPORTED
Vary a printer console online, then enter a CONTROL V, USE=FC command.

NO HARDCOPY
Do either of the following:
• Enter a VARY command to assign the hardcopy function to the SYSLOG or OPERLOG or both. Then re-enter the CONTROL Q command.
• Reenter the CONTROL Q command to requeue messages to SYSLOG when SYSLOG becomes active.

FOR CRT ONLY
Enter the command again, without the erroneous operand.

dev OUTPUT ONLY
Issue a CONTROL command from an active console with sufficient authority if you want to change the characteristics of this console.

console_name CONSOLE BUSY
Enter the command at a later time.

NOT VALID IN LOCAL MODE
Enter the command again, without the erroneous operand.

MESSAGE LOSS DETECTED
Do one of the following:
• Issue a CONTROL command from another console to cause the message to go to that console instead, and then reissue the failed command.
• Issue the command with the UNCOND operand to force the command to be executed, even though some messages may go only to hardcopy.

CANNOT CHANGE USE OF SMCS CONSOLE
SMCS consoles can only be FC (full capability) consoles. If an MS or SD mode console is needed, issue the command against an MCS console instead.

CONSOLE NOT ONLINE
Bring the console online, or issue the CONTROL N command with L=name, where name is the name of a console that is online.

IEE923I K S,DEL = {Y|R|RD|N|W}, SEG = nn,CON = {Y|N},RTME = nnn,RNUM = nn, MFORM = {J|M|S|T|X},[L = name]

Explanation: A CONTROL S command requested that the system display or change console specifications. The system issues this message in response to that command.

In the message text:

DEL=mode
Specifies the message deletion mode of the console.

mode is one of the following:

Y Indicates automatic mode of message deletion. All messages marked for deletion are deleted whenever the screen becomes full.

R Indicates roll mode. The system deletes a specified number of messages from the screen when a time interval elapses. Deletion occurs only if the screen is full and messages are waiting to be displayed.

RD Indicates roll mode with the following exception: messages awaiting action will not roll off, rather they are gathered at the top of the screen.

N Indicates that manual message deletion is required.

W Wrap mode. The system overlays the newest message over the oldest message on the screen.

SEG=nn
Specifies the number of lines in the message area that can be deleted with a CONTROL E,SEG command. This is a decimal value from 1 to the number of lines in the message area.
CON
Indicates the conversational message mode, as follows:

Y Conversational message deletion is in effect.
N Non-conversational message deletion is in effect.

CON is valid for a full-capability display console only.

RTME=nnn
Specifies the number of seconds between message rolls. This is a decimal value from 1 to 999, or a value of 1/4 or 1/2.

Note: If an asterisk (*) appears as the RTME value, the console is not fully initialized. The actual RTME value cannot be determined until the console is fully initialized.

RNUM=nn
Specifies the maximum number of messages lines included in one message roll mode. This is a decimal value from 1 to the number of lines in the message area.

Note: If an asterisk (*) appears as the RNUM value, the console is not fully initialized. The actual RNUM value cannot be determined until the console is fully initialized.

MFORM=mform
Specifies the format in which messages are displayed. One or more values may appear. M will appear if only the text of the message is being displayed at the console.

mform is one of the following:

J The system will display each message with the job id/name.
M The system will display only the text of each message (without a time stamp, job id/name, and system name).
S The system will display each message with the name of the system on which the message originated.
T The system will display each message with a time stamp.
X Whenever possible, the system will attempt to suppress the job name and system name, if they would not be meaningful.

L=name
name is the name of the console whose specifications are displayed. This field appears if another console was specified in the routing parameter of the CONTROL command.

System action: The system continues processing.
Operator response: Change the indicated console specifications, if desired

Descriptor Code: 5

IEE924I INVALID AREA DEFINITION error [COMMAND ISSUED IS command]

Explanation: error is one of the following:
SCREEN SIZE EXCEEDED
DISPLAY IN OR ABOVE AREA
AREA TOO SMALL
TOO MANY AREAS DEFINED

A CONTROL A command requested that the system define or redefine screen areas.

In the message text:

SCREEN SIZE EXCEEDED
The sum of the lengths of the areas defined exceeded the size of the message area on the console for which the definition was requested.

DISPLAY IN OR ABOVE AREA
The error was one of the following:
• The requested redefinition affects an area with a display in or above it. Any area definition requested while a display is on the screen may differ from the previous definition only in regard to display areas above the area in use.
• The operator tried to clear the screen of all area definitions with a CONTROL A,NONE, but one of the areas contained a display.

AREA TOO SMALL
An attempt was made to define a display area of less than four lines.

TOO MANY AREAS DEFINED
An attempt was made to define more than 11 display areas on a console; 11 is the maximum number.

COMMAND ISSUED IS command
command is the text of the command that was originally entered.

System action: The system rejects the command.
Operator response: If the error occurred for a CONTROL A,NONE command, erase the display(s). Enter the command again.

If the error occurred for a CONTROL A command other
than CONTROL A,NONE, correct the command. Enter it again, if desired.

If the CONTROL command fails again, save the hard-copy log and contact the system programmer.

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the hard-copy log.

**IEE926I**  
```
L={namelnname,a} OPERAND INVALID-text [COMMAND ISSUED IS command]
```

**Explanation:** A CONTROL or DISPLAY command specified an L=`name-a` parameter incorrectly.

In the message text:

`L={namelnname,a}`  
The parameter.

---

One of the following lines:

**name-a NOT AN AREA**  
The area specified by the `name-a` parameter:
- Was not valid
- Does not exist
- Was other than Z for a non-cathode ray tube (CRT) console
- Was Z for a status display console.

**name NOT A CONSOLE**  
The console named `name` does not exist or is not active.

**name FULL CAPABILITY**  
The console named `name` is not one of the following:
- The requester's own console
- A message stream (MS) console
- A status display (SD) console

The console must have master authority or RACF approval to route something to an FC console.

**ON THIS COMMAND**  
The name parameter was specified, but should not have been, on one of the following commands:

- CONTROL S
- CONTROL E,N
- CONTROL E
- CONTROL C,E
- CONTROL C,A
- CONTROL C,I
- CONTROL C,E
- CONTROL C

**name OUTPUT ONLY**  
One of the following occurred:
- An attempt was made to make a console full capability using the CONTROL V,USE = FC command. The console was an output only device.
- An attempt was made to define areas using the CONTROL A,nn command on a console that is in message stream mode.

**name SUBSYSTEM CONSOLE**  
An attempt was made to route messages to a console under the control of another subsystem.

**name STATUS DISPLAY**  
An attempt was made to reroute messages to a status display console named `name` using the L=`name-a` parameter.

**name SYSTEM CONSOLE**  
An attempt was made to issue a CONTROL S command on the system console.
An attempt was made to issue a CONTROL S command on the system console that was not in Problem Determination (PD) mode.

**COMMAND ISSUED IS** `command`

`command` is the text of the command that was originally entered.

**System action:** The system rejects the command.

**Operator response:** Depending on the message `text`, do the following:

1. **name NOT IN PD MODE**
   - Change the system console to get into Problem Determination (PD) mode and enter the command again.

2. **name NOT AN AREA**
   - Change the area specification. Enter the command again.

3. **name NOT A CONSOLE**
   - Change the console name and reenter the command.

4. **name FULL CAPABILITY**
   - Reenter the command by omitting the `L=name-a` parameter to have the response come to your own console, if desired.

5. **ON THIS COMMAND**
   - Enter the command again without the name parameter.

6. **name OUTPUT ONLY**
   - The console may be altered to status display mode by using the CONTROL V,USE=SD command. Then enter the CONTROL A,nn command again.

7. **name SUBSYSTEM CONSOLE**
   - Change the console name specification. Enter the command again.

8. **name SYSTEM CONSOLE**
   - Change the console name specification and enter the command again.

9. **name NOT IN PD MODE**
   - Change the system console to get into Problem Determination (PD) mode and enter the command again.

`cm REQUEST AMBIGUOUS=text`

**[COMMAND ISSUED IS** `command`]**

*cm* The command verb.

*text*

One of the following lines:

**SPECIFY DISPLAY ID**

A CONTROL C,D command was entered without an ID parameter.

**SPECIFY L OPERAND**

A CONTROL command for an out-of-line display, such as a frame or erase command, was issued without the routing location parameter, `L=cca`, and more than one display exists on the screen.

**SPECIFY MESSAGE ID**

A CONTROL C,A or CONTROL C,E or CONTROL C,CE or CONTROL C,I command was entered without an ID parameter.

**DUPLICATE OPERAND**

A keyword was specified more than once on a CONTROL V command.

**COMMAND ISSUED IS** `command`

`command` is the text of the command that was originally entered.

**System action:** The system rejects the command.

**Operator response:** If `cm` is the following, do the following:

1. **CONTROL C,D**
   - To cancel a display with this command, specify the ID of the display to be ended: CONTROL C,D,ID. The ID is at the extreme right side of the control line of the display.

2. **CONTROL command for an out-of-line display, such as a FRAME or ERASE command**
   - The display area ID of must be specified in an `L` parameter.

3. **CONTROL command with additional parameters or data**
   - Specify the additional parameters or data.

4. **CONTROL V with duplicate keywords**
   - Respecify the command without duplicate keywords.

`DISPLAY AREA ID'S FOR CONSOLE name ARE {NONE|id, [id,...]}`

**Explanation:** The system issues this message in response to one of the following commands:
• A CONTROL A,xx[,xx] command to define areas to a console
• A CONTROL A,NONE to delete the screen areas on a console
• A CONTROL A or CONTROL A,REF to display the areas presently defined to a console

In the message text:

name
The console name.

NONE
No display areas are defined to the console.

id
The display area identifiers listed in the order in which the areas were defined, from the bottom of the screen to the top.

System action: None.

**IEE936I**  
**CONSOLE consname INITIALIZATION ERROR - RC: rc - text**

**Explanation:** During system initialization or in response to a command, multiple console support (MCS) cannot activate a console because MCS cannot determine the device type or the definition is not correct. The system will make the indicated changes to the console.

In the message text:

`consname` The console name.

`text` one of the following:

**DEVICE TYPE 'xx' NOT SUPPORTED**

The specified device type is not supported. This is probably a software error.

In the message text:

`xx` The internal device-type code.

**SCREEN SIZE NOT SUPPORTED:**

The system does not support the specified device.

`rrr` The number of rows on the screen.

`ccc` The number of columns

`yy` The device mode, as follows:

<table>
<thead>
<tr>
<th>yy</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>The device supports the 3270 extended data stream.</td>
</tr>
<tr>
<td>02</td>
<td>The device does not support the 3270 extended data stream.</td>
</tr>
</tbody>
</table>

**System action:** The system marks this console as unusable.

**Operator response:** If the device is a 3290 Information Panel that has had its logical screen size modified, change the logical screen size to one of the values supported for operator consoles. You can find the Maximum and default specifications for AREA and SEG in z/OS MVS Initialization and Tuning Reference.

**CONSOLE consname UNUSABLE. text**

**Explanation:** 'text' is one of the following:

**DEVICE TYPE 'xx' NOT SUPPORTED**

In the message text:

`consname` The console name.

**SCREEN SIZE NOT SUPPORTED:**

In the message text:

`xx` The internal device-type code.

**MODE:yy**

During system initialization or in response to a command, multiple console support (MCS) cannot make a console active because of an error.

In the message text:
02 - An I/O error on read modified while the system was trying to obtain the response to the read partition query.

03 - The result of the read partition query contained a bad attention identifier (AID).

04 - The system could not find the usable-area structure field in response to the read partition query.

**RNUM(xx) APPLIED**

where xx is the default roll number applied by the system.

**SEG(yy) APPLIED**

where yy is the default SEG value applied by the system.

**AREA(mm,nn,...)**

where mm,nn... are the default out-of-line area sizes applied by the system.

**System action:** The system applies the default indicated in the message.

**Operator response:** If the applied default RNUM, SEG, or AREA value is not acceptable, enter a CONTROL S or CONTROL A command to change them.

**System programmer response:** Check the specification for RNUM, SEG or AREA in the CONSOLxx parmlib member for incorrect values.

**IEE945I UNRECOGNIZABLE **

**OPTION|SUBOPTION**

`‘text’ IN input INPUT`

**Explanation:** The input to the system management facilities (SMF) contains an unrecognizable parameter or subparameter.

In the message text:

- **text** The text in which, or immediately after which, the error appears.
- **input** One of the following:
  - **INVALID** An invalid parameter.
  - **PARMLIB** The SMFPRMxx parmlib member specified for this IPL or in a SET SMF command.
  - **DEFAULT** The SMF-supplied default values for the SMF parameters.
  - **REPLY** The text of the reply to message IEE357A.

**SYSIN** Input parameters for the SMF dump program.

**System action:** SMF ignores the parameter in error and continues processing. If required parameters are missing after SMF checks all the available parameters, the system uses the default values for the remainder of this IPL or for this execution of the SMF dump program.

For all input except SYSIN, the system issues message IEE357A, which allows the operator to change the parameters.

**Operator response:** If SMF issues message IEE357A, respond to the message.

Descriptor Code: 5

IEE946I   UNEXPECTED END OF TEXT IN input INPUT

Explanation: The input to the system management facilities (SMF) ended unexpectedly.
In the message text:
input One of the following:

INVALID
An invalid parameter.

PARMLIB
The SMFPRMxx parmlib member specified for this IPL or in a SET SMF command.

DEFAULT
The SMF-supplied default values for the SMF parameters.

REPLY
The text of the reply to message IEE357A.

SYSIN
Input parameters for the SMF dump program.

System action: SMF processing continues. If required parameters are missing after SMF checks all the available parameters, the system uses the default values for the remainder of this IPL or for this execution of the SMF dump program. For all input except SYSIN, the system issues message IEE357A, which allows the operator to change the parameters.

Operator response: If SMF issues message IEE357A, respond to the message.

Source: System Management Facilities (SMF)
Detecting Module: IEEMB832
Routing Code: 2
Descriptor Code: 5

IEE948E INVALID keywd VALUE 'val' IN input INPUT

Explanation: During system management facilities (SMF) initialization, SMF detected an incorrect value in the SMFPRMxx parmlib member.
In the message text:
keywd The keyword.
val The incorrect value.
input The input to the SMF parameter.

System action: SMF ignores the erroneous value and continues processing. If the parameter is required and is missing after SMF checks all available parameters, SMF uses a default value for it for the remainder of this IPL.

Operator response: Notify the system programmer.

System programmer response: If the default parameter value is acceptable, no action is necessary. Otherwise, ask the operator to change it with a SET SMF or SETSMF command. Before the next system initialization, correct the parameter in the SMFPRMxx parmlib member.

Note: If the parameter is SID, SMF uses the default value. This default can be changed only by rel IPL.

Source: System Management Facilities (SMF)
Detecting Module: IEEMB832
Routing Code: 2,10
Descriptor Code: 11

IEE948I INVALID keywd VALUE 'val' IN input INPUT

Explanation: During processing of system management facilities (SMF) parameters, SMF detected an incorrect value for a keyword.

### IE949I  
*hh.mm.ss*  
**SMF DATA SETS [idn]**

**Explanation**: This message contains the status of all data sets being used to record system management facilities (SMF) data.

<table>
<thead>
<tr>
<th>NAME</th>
<th>VOLSER</th>
<th>SIZE(BLKS)</th>
<th>%FULL</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>P-name</td>
<td>volser</td>
<td>size</td>
<td>full</td>
<td>status</td>
</tr>
<tr>
<td>S-name</td>
<td>volser</td>
<td>size</td>
<td>full</td>
<td>status</td>
</tr>
</tbody>
</table>

It is displayed during IPL, if requested in the SMFPRMxx parmlib member or in response to a SET SMF or a DISPLAY SMF command.

**Note**: The system does not issue this message when there are no SMF data sets available. The system issues message IEE366I.

The header line contains the following information:

*hh.mm.ss*
The time given as the hours (00-23), the minutes (00-59), and the seconds (00-59). The value is 00.00.00 if the TOD clock is not working when the information is gathered for the display.

*idn* An identifier used in conjunction with the CONTROL C,D command to cancel status displays written on typewriter or printer consoles or displayed in-line (not in a display area) on display (CRT) consoles. This identification number does not appear when the display is presented in a display area on a display console.

The message text contains the following information for each SMF data set:

**P-name**
The name of the SMF recording data set. If the name is preceded by P, the data set is the primary SMF data set. If the name is preceded by S, the data set is a secondary SMF data set.

**S-name**
The volume serial number of the volume containing the SMF data set.

**size**
The size of the data set, in the number of control intervals. The control interval length is determined by the installation.

**full**
The percentage of the data set that is full.

**status**
The data set status as follows:

**ACTIVE**
The data set is now being used to record SMF data.

**ALTERNATE**
The data set is available for use to record SMF data.

**DUMP REQUIRED**
The data set must be dumped before it can be used to record additional SMF data.

**CLOSE PENDING**
The data set has been switched from and is waiting to be closed by SMF before it can be dumped.

***** ERROR *****
The status of the data set could not be determined or is not valid.

**System action**: SMF processing continues.

**Operator response**: If the data set status is *** ERROR ***, notify the system programmer. Otherwise, no action is needed.

**System programmer response**: Obtain a console.
dump of the SMF address space. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**IEE950I**

SMF SYS1.MAN\(n\) DATASET CANNOT BE {ALLOCATED|OPENED|CLOSED}

**RETURN CODE=** return-code. **ERROR CODE=** error-code. **INFO CODE=** info-code

**Explanation:** System Management Facilities (SMF) processing was unable to allocate, open, or close SMF recording data set SYS1.MAN\(n\).

In the message text:

**SYS1.MAN\(n\)**
The data set, with a suffix of \(n\).

**ALLOCATED**
The return code, error code, and information code from dynamic allocation are included in the message.

**OPENED**
If open processing failed, the return code and error code from VSAM open processing are included in the message. Message IEC161I precedes this message.

**CLOSED**
If close processing failed, the return code and error code from VSAM close processing are included in the message. Message IEC251I precedes this message.

**return-code**
The VSAM return code.

**error-code**
The VSAM error code.

**info-code**
The VSAM information code.

**System action:** SMF processing continues but ignores the SYS1.MAN\(n\) data set. If other SMF recording data sets are available, SMF continues recording and issues message IEE360I. Otherwise, SMF does no more recording.

**Operator response:** Notify the system programmer.

**System programmer response:** See the codes from dynamic allocation or VSAM. See the accompanying messages.

IEE953I  INVALID CONTROL INTERVAL SIZE IN DATA SET SYS1.MANx

Explanation: SMF initialization or SET SMF command processing found that the control interval size for SMF data set SYS1.MANx is not the control interval size of the data sets that are already in use by the system.

System action: Processing continues using the other data sets that have been defined. If no data sets are defined, then SMF continues processing in data buffering mode. If no SMF data sets have yet been written to, SMF chooses a CI size of 4K (4096), which then becomes the CI size which would be used for the duration of that IPL.

System programmer response: Recreate the SYS1.MANx data set using the access method services DEFINE utility and specify CONTROLINTERVALSIZE(xxxx), where xxx is the control interval size for data sets that are already in use by the system. See z/OS MVS System Management Facilities (SMF) for information about creating SMF data sets.

Source:        System Management Facilities (SMF)
Routing Code:    2,10
Descriptor Code: 5

IEE955I  SPECIFY IPL REASON

Explanation: During system initialization, the system issues this message to ask the operator for system management facilities (SMF) information.

System action: IPL continues. The system issues message IEE956A.

Operator response: Reply to message IEE956A.

Source:        System Management Facilities (SMF)
Detecting Module:  IEEMB823
Routing Code:    1

Explanation: System Management Facilities (SMF) processing encountered an error and is attempting to continue processing.
System action: SMF requests an SVC dump. SMF attempts to continue processing.
Operator response: Notify the system programmer.

System programmer response: Examine the SVC dump. If needed, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

IEE965I   SET SMF COMMAND INOPERATIVE FOR REMAINDER OF IPL
--or--
SETSMF COMMAND INOPERATIVE FOR REMAINDER OF IPL

4-242 z/OS V1R11.0 MVS System Messages, Vol 7 (IEB-IEE)
**Explanation:** SET SMF command processing has abnormally ended twice during this IPL and is now inoperative.

**System action:** SET SMF command processing is inoperative for the remainder of this system initialization.

Locate the preceding SET SMF error message. Notify the system programmer.

**System programmer response:** If it is necessary to use the SET SMF command, be sure the problem described in the preceding error message is resolved. If needed, ask the operator to re-IPL the system.

**Source:** System Management Facilities (SMF)

**Detecting Module:** IECEB913

**Routing Code:** 2,10

**Descriptor Code:** 5

---

**IEE966I** **SYS1.MAN**<sub>n</sub> **IS BEING FORMATTED**

**Explanation:** System Management Facilities (SMF) found that the SYS1.MAN<sub>n</sub> recording data set not been formatted or the previous format of the data set was not completed. Formatting is now taking place.

In the message text:

SYS1.MAN<sub>n</sub> The data set, with a suffix of <sub>n</sub>.

**System action:** SMF initialization or SET SMF command processing formats the SYS1.MAN<sub>n</sub> data set. This processing might take several minutes to complete, depending on the size of the data set. Normal IPL or SET processing resumes when formatting is complete.

**Operator response:** Notify the system programmer.

**System programmer response:** To avoid reformatting the data set during IPL or SET SMF command processing, use the SMF dump program when creating new SMF recording data sets.

**IEE968I** **NOTIFICATION OF SUBSYS xxxx FAILED - text**

**Explanation:** text is one of the following:

- SUBSYSTEM DOES NOT SUPPORT THIS FUNCTION
- SUBSYSTEM IS NOT OPERATIONAL
- SUBSYSTEM DOES NOT EXIST
- SYSTEM ERROR

The system could not notify a subsystem of a change in system management facilities (SMF) parameters.

In the message text:

xxxx The subsystem.

**SUBSYSTEM DOES NOT SUPPORT THIS FUNCTION**

The subsystem is not designed to process one or more of the function codes passed to it.
If SUBSYSTEM IS NOT OPERATIONAL
The subsystem has been defined, but it has not been initialized.

SUBSYSTEM DOES NOT EXIST
The subsystem is not defined.

SYSTEM ERROR
A system error prevented notification of the subsystem.

System action: Processing continues.

Operator response: Check the spelling of the subsystem name in the list of SMF parameters. If you entered the SETSMF command, check the spelling of the subsystem name in the command.

Note: The “SUBSYSTEM DOES NOT SUPPORT THIS FUNCTION” format of this message is expected and can be ignored if the name of the JES2 subsystem is not “JES2” or the name of the JES3 subsystem is not “JES3” or the name of the APPC scheduler is not “ASCH”.

System programmer response: If SUBSYSTEM IS NOT OPERATIONAL or SUBSYSTEM DOES NOT EXIST appears and the subsystem is necessary for system operations, correct the error. ReIPL the system.

Descriptor Code: 5

SETSMF COMMAND TERMINATED

Explanation: text is one of the following:
OLD OPTIONS REMAIN IN EFFECT
NEW OPTIONS IN EFFECT
OPTIONS IN EFFECT UNDETERMINABLE

System Management Facilities ended processing for a SETSMF command.

In the message text:

OLD OPTIONS REMAIN IN EFFECT
Processing of the SET SMF command ended because of a problem. The old options remain in effect for this system initialization.

NEW OPTIONS IN EFFECT
Processing of the SET SMF command added the new options. The new options in the SET command are in effect for this system initialization.

OPTIONS IN EFFECT UNDETERMINABLE
Processing of the SET SMF command may or may not have added new options. The options in effect for this system initialization cannot be determined.

System action: SMF processing continues, using the options in effect at the time the system ended SETSMF command processing. The system schedules an SVC dump.

Operator response: If OPTIONS IN EFFECT UNDETERMINABLE appears, you want to be sure that certain SMF parameters are in effect, reIPL the system.

SETSMF COMMAND NOT AUTHORIZED

Explanation: The operator entered a SETSMF command. The SMFPRMxx parmlib member in effect includes the NOPROMPT option, which makes SETSMF an incorrect operator command.

System action: The system ignores the SETSMF command. Other processing continues.

System programmer response: To allow the operator to use the SETSMF command, include the PROMPT(LIST) or the PROMPT(ALL) option in the SMFPRMxx parmlib member.

Source: System Management Facilities (SMF)

Detecting Module: IEECB913
Routing Code: 2,10
Descriptor Code: 5

xxxx IS IGNORED. SETSMF CAN CHANGE ONLY ONE SUBSYSTEM

Explanation: The SETSMF command contains both the SUBSYS keyword and the SUBPARM keyword. The keywords specified two different subsystem names. SMF ignores the second keyword. If both keywords appear on the command, they must specify the same subsystem name.

In the message text:

xxxx The subsystem specified by the second keyword.

System action: SMF makes the change specified on the first keyword. Processing continues.

Operator response: To change SMF parameters for more than one subsystem, enter a separate SETSMF command for each subsystem.

Source: System Management Facilities (SMF)

Detecting Module: IEECB913
Routing Code: 2,10
Descriptor Code: 5
IEE972I  SETSMF CANNOT BE USED TO CHANGE EXITS

Explanation: A SETSMF command was entered to change the exits that are invoked for an SMFPRMxx member of SYS1.PARMLIB. On the SETSMF command you can specify any SMF parameter except ACTIVE, PROMPT, SID, or EXITS.

System action: Processing continues.
Operator response: Issue a SET SMF command to specify which exits should be invoked for the SMFPRMxx member of SYS1.PARMLIB.

Source: System Management Facilities (SMF)
Routing Code: 2,10
Descriptor Code: 5

IEE973I  DATA SET CHANGE REQUEST IGNORED

Explanation: A SETSMF command was entered to change the SMF data set that is being used by the system to a different SMF data set. The request is ignored because the specified data set is in error.

System action: The system ignores the SETSMF command. Processing continues to use the SMF data set that was being used by the system prior to the SETSMF command.
Operator response: Notify the system programmer.
System programmer response: Check the codes from the access method services DEFINE utility used to create the requested SMF data set.

Routing Code: 2,10
Descriptor Code: 5

IEE974I  hh.mm.ss SMF DATA SETS [id] NAME VOLSER SIZE(BLKS) %FULL STATUS

Explanation: Where text is:
{x-name: volser size(blks) %full status}

This message contains the status of all data sets being used to record SMF data. It is displayed during IPL, if requested in the SMFPRMxx parmlib member or in response to a SET SMF or a DISPLAY SMF command.

Notes:
1. This message is issued instead of IEE949I only when an installation defines a data set name that does not use the SYS1.MANn naming convention.

2. The system does not issue this message when there are no SMF data sets available. The system issues message IEE366I.
3. The message text will split into two lines when the length of SMF data set name is greater than 18.

The header line contains the following information:

hh.mm.ss
The time, given as the hours (00-23), the minutes (00-59), and the seconds (00-59). The value is 00.00.00 if the TOD clock is not working when the information is gathered for the display.

[id]
An identifier used with the CONTROL C,D command to cancel status displays written on typewriter or printer consoles or displayed in-line (not in a display area) on display (CRT) consoles. This identification number does not appear when the display is presented in a display area on a display console.

The message text contains the following information for each SMF data set:

x Either a P or S to indicate whether the data set is a primary SMF data set or a secondary SMF data set.
name The name of the SMF recording data set.
volser The volume serial number of the volume containing the SMF data set.
size(blks) The size of the data set, in the number of control intervals. The control interval length is determined by the installation.
%full The percentage of the data set that is full.
status The data set status as follows:
ACTIVE The data set is now being used to record SMF data.
ALTERNATE The data set is available for use to record SMF data.
DUMP REQUIRED The data set must be dumped before it can be used to record additional SMF data.
CLOSE PENDING The data set has been switched from SMF and is waiting to be closed by SMF before it can be dumped.
*** ERROR ***
The status of the data set could not be determined or is not valid.

System action: SMF processing continues.

Operator response: If the data set status is *** ERROR ***, notify the system programmer. Otherwise, no action is needed.

System programmer response: Obtain a console dump of the SMF address space. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Note: When a data set name is up to 18 characters long, the message text is on one line. When the data set name is greater than 18 characters in length, the message text is split into two lines.

Routing Code: #/2
Descriptor Code: 4,5,8,9

IEE979W SMF DATA LOST - NO BUFFER SPACE AVAILABLE TIME=hh.mm.ss

Explanation: System Management Facilities (SMF) used all its available buffers and cannot obtain more because it has used all available buffer space in its address space and parmlib option NOBUFFS(MSG) is in effect. All records presented to SMF will be lost until buffers become available.

This message may be issued for the following conditions:

1. Before this message, SMF issued message IEE986E many times to indicate that SMF had obtained more and more buffers until 100% of the available buffers were used. In this case, all the available SMF buffers have been used and are filled.

2. Before this message, SMF may or may not have issued message IEE986E and it did not indicate 100% of the available buffers were used. The next SMF buffer to be used may not have been ready for use soon enough before all the previous SMF buffers filled.

3. During an IPL or SET (T) SMF command, SMF recording was requested but SMF buffers had not yet been made available.

In the message text:

hh.mm.ss
The time given as the hour (00-23), the minute (00-59), and the second (00-59).

System action: Processing continues. SMF records have been lost and more may be lost until SMF is able to write the buffered records to SMF data sets.

Operator response: Notify the system programmer. Check on SMF data set status, SMF buffer settings, and types of SMF recording being requested.

Use the DISPLAY SMF command to check on the status of the SMF data sets. If there are no data sets active, use the SMF dump program (IFASMFDP) to clear one and make it available for use. If SMF has a valid data set on which it is actively recording when this message is issued, look for a program caught in a loop while writing SMF records and cancel it. If SMF needs a data set, provide one.

The DISPLAY SMF,O command can be used to determine the maximum amount of buffer space available for SMF to use. If the percentage of available space for SMF buffering in use is already at the 100% level, consider increasing the BUFSIZMAX value to allow for additional SMF record buffering. This action can aid in reducing SMF record data loss when there is a spike of SMF recording activity and there is a temporary inhibitor to making the SMF data sets available for use. Since the BUFSIZMAX value can also be reduced from its current setting, if an increase is put into effect to handle a temporary constraint condition, then the BUFSIZMAX value can be lowered when the constraint clears.

Enter a SET SMF (T SMF) command to restart SMF recording.

Note: This command may not work if SMF is unable to obtain the storage necessary to fulfill the request.

System programmer response: If needed, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: System Management Facilities (SMF)

Detecting Module: IEEMB829

Descriptor Code: 1

IEE980I SMF IS BEING RESTARTED

Explanation: The operator entered a SET SMF command when the system management facilities (SMF) is not active.

System action: The system creates a new SMF address space.

Operator response: No response is needed if SMF had previously ended, as indicated by message IEE480I and other messages associated with a failure that caused SMF to end.

Otherwise, notify the system programmer.

System programmer response: If this message had not been preceded by IEE480I, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Note that an SMF failure may have occurred a long time before this restart.

**Descriptor Code:** 5

---

**IEE981I**  
**SMF RESTART REJECTED, SMF IS STILL ACTIVE WITH ASID=asid**

**Explanation:** System Management Facilities (SMF) could not restart because the system found that another SMF address space is active. The other SMF address space is still in the process of ending.

In the message text:

- **asid** The address space identifier (ASID) of the address space where SMF is still active.

**System action:** The system rejects the SMF restart. System processing continues without SMF recording.

**Operator response:** Issue a FORCE SMF,ARM command and ensure that the other SMF address space ends; then, restart SMF.

**System programmer response:** If the other SMF address space will not end, take an SVC dump of the SMF address space to determine the cause. To restore problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**IEE986I**  
**SMF DATASET OPEN ERROR - CHECK CONTROL INTERVAL**

**Explanation:** This message is displayed after IEE950I when the VSAM return code is 160 (incorrect control interval for ICI processing).

**System action:** SMF processing continues but ignores the SYS1.MANx data set. If other SMF recording data sets are available, recording continues and message IEE360I is issued. Otherwise, no SMF recording is done.

**System programmer response:** Check the definition of the control interval for the data set; it should match the physical record size for the data set. This physical size is chosen by VSAM based upon the control interval specified and the track size of the device that the data set is on. Use the LISTCAT utility to display the values for the data set and redefine the data set using a valid control interval for the device.

**System action:** Processing continues.

**Operator response:** Notify the system programmer.

**System programmer response:** Use the DISPLAY SMF command to check on the status of the other ACTIVE data sets and start the SMF dump program (IFASMFDP) on a data set that is awaiting dump.

**Source:** System Management Facilities (SMF)

**Detecting Module:** IEEMB835

**Routing Code:** 2,10

**IEE985A**  
**SMF IS PROCESSING ITS LAST AVAILABLE DATASET**

**Explanation:** SMF has just started writing to the last available ACTIVE data set. If there are no more data sets made available, the SMF last data set processing will run, as requested by parmlib option LASTDS. When a data set becomes available, this operator message will be deleted from the display.

**System action:** Processing continues.

**Operator response:** Notify the system programmer.

**System programmer response:** Use the DISPLAY SMF command to check on the status of the SMF data sets. If there are no data sets active, use the SMF dump program (IFASMFDP) to clear one and make it available for use.

**Source:** System Management Facilities (SMF)

**Detecting Module:** IEEMB835

**Routing Code:** 2,10

**Descriptor Code:** 5

---

**IEE984E**  
**SMF HAS USED nn% OF AVAILABLE BUFFER SPACE**

**Explanation:** The amount of in-use buffers in the SMF address space is at or exceeds the buffer usage warning percentage value (see BUFUSEWARN, the default value is 25%) for all the available storage (see BUFSIZMAX, the default value is 128M). As each additional SMF buffer (8M) is made ready for use or becomes available this message is redisplayed with an updated percentage value. When all available storage has been allocated and the buffers are filled, the SMF no buffers processing will be initiated, as requested by parmlib option NOBUFFS. However, if more buffers are de-allocated and the percentage falls below the BUFUSEWARN value (default 25%), this operator message is deleted from the display.

**System action:** Processing continues. Note that the NOBUFFS option determines SMF’s action when the percentage value has reached the 100% level.

**Operator response:** Notify the system programmer.

**System programmer response:** Use the DISPLAY SMF command to check on the status of the SMF data sets. If there are no data sets active, use the SMF dump program (IFASMFDP) to clear one and make it available for use.

**Source:** System Management Facilities (SMF)

**Detecting Module:** IEEMB835

**Routing Code:** 2,10

**Descriptor Code:** 5
determine the maximum amount of buffer space available for SMF to use. If the percentage of available space for SMF buffering in use is already at the 100% level, consider increasing the BUFSIZMAX value to allow for additional SMF record buffering. This action can aid in reducing SMF record data loss when there is a spike of SMF recording activity and there is a temporary inhibitor to making the SMF data sets available for use. Since the BUFSIZMAX value can also be reduced from its current setting, if an increase is put into effect to handle a temporary constraint condition, then the BUFSIZMAX value can be lowered when the constraint clears.

In addition, use the DISPLAY SMF,O command to check the record types that are being collected. Reducing the number of record types being collected will slow the allocation and use of the buffers.

Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features in z/OS enable users to:

- Use assistive technologies such as screen readers and screen magnifier software
- Operate specific or equivalent features using only the keyboard
- Customize display attributes such as color, contrast, and font size

Using assistive technologies

Assistive technology products, such as screen readers, function with the user interfaces found in z/OS. Consult the assistive technology documentation for specific information when using such products to access z/OS interfaces.

Keyboard navigation of the user interface

Users can access z/OS user interfaces using TSO/E or ISPF. Refer to z/OS TSO/E Primer and z/OS ISPF User’s Guide Vol I for information about accessing TSO/E and ISPF interfaces. These guides describe how to use TSO/E and ISPF, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

z/OS information

z/OS information is accessible using screen readers with the BookServer/Library Server versions of z/OS books in the Internet library at:

http://www.ibm.com/systems/z/os/zos/bkserv/

**Policy for unsupported hardware**

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

The comments you send should pertain to only the information in this manual or product and the way in which the information is presented.

For technical questions and information about products and prices, please contact your IBM branch office, your IBM business partner, or your authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you. IBM or any other organizations will only use the personal information that you supply to contact you about the issues that you state on this form.

Comments:

Thank you for your support.
Submit your comments using one of these channels:
