Language Environment for OS/390 & VM Debugging Guide and Run-Time Messages

SC28-1942-08

Note

Before using this information and the product it supports, be sure to read the general information under Appendix B, “Notices” on page 783.

Ninth Edition, March 2000

This is a major revision of SC28-1942-07.

This edition applies to Language Environment in OS/390 Version 2 Release 9 (5647-A01), and to all subsequent releases and modifications until otherwise indicated in new editions.

About This Book

IBM OS/390 Language Environment for OS/390 & VM (also called Language Environment) provides common services and language-specific routines in a single run-time environment for C, C++, COBOL, Fortran (OS/390 only; no support for VM/ESA, OS/390 UNIX System Services, or CICS), PL/I, and assembler applications. It offers consistent and predictable results for language applications, independent of the language in which they are written.

Language Environment is the prerequisite run-time environment for applications generated with the following IBM compiler products:

- OS/390 C/C++
- C for VM/ESA
- C/C++ Compiler for MVS/ESA
- AD/Cycle C/370 Compiler
- VisualAge for Java, Enterprise Edition for OS/390
- COBOL for OS/390 & VM
- COBOL for MVS & VM (formerly COBOL/370)
- VisualAge PL/I for OS/390
- PL/I for MVS & VM (formerly PL/I MVS & VM)
- VS FORTRAN and FORTRAN IV (in compatibility mode)

Language Environment supports, but is not required for, an interactive debug tool for debugging applications in your native OS/390 environment. The IBM interactive Debug Tool is available with OS/390, or with the latest releases of the C/C++, COBOL, PL/I and VisualAge for Java compiler products.

Language Environment supports, but is not required for, VS Fortran Version 2 compiled code (OS/390 only).

Language Environment consists of the common execution library (CEL) and the run-time libraries for C/C++, COBOL, Fortran, and PL/I.

For more information on VisualAge for Java, Enterprise Edition for OS/390, program number 5655-JAV, refer to the product documentation.

Using Your Documentation

The publications provided with Language Environment are designed to help you:

- Manage the run-time environment for applications generated with a Language Environment-conforming compiler.
- Write applications that use the Language Environment callable services.
- Develop interlanguage communication applications.
- Customize Language Environment.
- Debug problems in applications that run with Language Environment.
- Migrate your high-level language applications to Language Environment.

Language programming information is provided in the supported high-level language programming manuals, which provide language definition, library function syntax and semantics, and programming guidance information.

Each publication helps you perform different tasks, some of which are listed in Table 1. All books are available in printed and softcopy formats. For a complete list of publications that you may need, see "Bibliography" on page 787.

Table 1. How to Use OS/390 Language Environment for OS/390 & VM Publications

To ...	**Use ...**
Evaluate Language Environment	*OS/390 Language Environment Concepts Guide*
Plan for Language Environment	*OS/390 Language Environment Concepts Guide* *OS/390 Language Environment Run-Time Migration Guide*
Install Language Environment on OS/390	*OS/390 Program Directory*
Customize Language Environment on OS/390	*OS/390 Language Environment Customization*
Plan for, install, customize, and maintain Language Environment on VM/ESA	*VM/ESA Program Directory*
Understand Language Environment program models and concepts	*OS/390 Language Environment Concepts Guide* *OS/390 Language Environment Programming Guide*
Find syntax for Language Environment run-time options and callable services	*OS/390 Language Environment Programming Reference*
Develop applications that run with Language Environment	*OS/390 Language Environment Programming Guide* and your language programming guide
Debug applications that run with Language Environment, get details on run-time messages, diagnose problems with Language Environment	*OS/390 Language Environment Debugging Guide and Run-Time Messages*
Develop interlanguage communication (ILC) applications	*OS/390 Language Environment Writing Interlanguage Applications* and your language programming guide
Migrate applications to Language Environment	*OS/390 Language Environment Run-Time Migration Guide* and the migration guide for each Language Environment-enabled language

OS/390 Language Environment Debugging Guide and Run-Time Messages provides assistance with detecting and locating programming errors that occur during run time under Language Environment. It can help you establish a debugging process to analyze data and narrow the scope and location of where an error might have occurred. You can read about how to prepare a routine for debugging, how to classify errors, and how to use the debugging facilities Language Environment provides. Also included are chapters on debugging HLL-specific routines and routines that run under CICS. At the end of this book is a list of all Language Environment and HLL messages.

This book is for application programmers interested in techniques for debugging run-time programs. To use this book, you should be familiar with:

- The Language Environment product
- Appropriate languages that use the compilers listed above
- Program storage concepts

Summary of Changes

Summary of Changes
for SC28-1942-08
OS/390 Version 2 Release 9

This book contains information previously presented in *OS/390 Language Environment Debugging Guide and Run-Time Messages* SC28-1942-07, which supported OS/390 Version 2 Release 8.

The following summarizes the changes to that information, and applies only to OS/390 Version 2 Release 9.

New Information

- HEAP24 has been added as a Heap Storage Statistics.

The following are new messages :

- IGZ0174S
- IGZ0175S
- IGZ0176S
- IGZ0177S
- IGZ0178S
- IGZ0180S
- IGZ0181S
- IGZ0182W
- IGZ0183W
- IGZ0184W
- IGZ0185W

Changed Information

- IBM's recommended default suboption for the run-time option ABTERMENC has been changed from RETCODE to ABEND.
- Run-time option USRHDLR now has two suboptions. The first suboption specifies a user-written condition handler that gets control at stack frame 0. The second suboption specifies a user-written condition handler that will get conrtol first before any other user condition handler.
- The name OpenEdition has been changed to Unix System Services.
- Language Environment Dumps for COBOL have been updated.

The following are changed messages :

- IGZ0002S
- Language Environment Abend Code U4087
- Language Environment Abend Code U4093

This book includes terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations are indicated by a vertical line to the left of the change.

Summary of Changes
for SC28-1942-07
OS/390 Version 2 Release 8

This book contains information previously presented in *OS/390 Language Environment Debugging Guide and Run-Time Messages* SC28-1942-06, which supported OS/390 Version 2 Release 7.

The following summarizes the changes to that information, and applies only to OS/390 Version 2 Release 8.

New Information

- A new PL/I compiler, VisualAge PL/I for OS/390, is supported with Language Environment. It incorporates many new features and is a member of the VisualAge PL/I family of products. Numerous messages were added in support of this new compiler.
- A new MSGFILE suboption, ENQ was added. The ENQ suoption is specified when serialization around writes to the MSGFILE ddname is desired.
- A COBOL IPCS exit was added to format specific COBOL control blocks in a system dump. See “Understanding the COBOL-specific LEDATA Output” on page 101 for details.
- Language Environment message CEE3648 and abend U4093-AC were added in support of POSIX(ON) checking in nested enclaves within a Language Environment process.
- C run-time messages, EDC5170, EDC5232, and EDC8011 were added.

Changed Information

- The Storage, Run-Time Options, and User-created Heap Storage reports were updated to include the version, release, and module levels.
- The COBOL examples that demonstrate how to diagnose the error of calling a nonexistent subroutine were updated.
- Language Environment message CEE3535 was updated.
- C messages EDC5052 and EDC5053 had their error severities changed from an I (informational) to an S (severe).
- All PL/I messages with a system action of "application is terminated" were changed to "the ERROR condition is raised".

Summary of Changes
for SC28-1942-06
OS/390 Version 2 Release 7

This book contains information previously presented in *OS/390 Language Environment Debugging Guide and Run-Time Messages* SC28-1942-05, which supported OS/390 Version 2 Release 6.

The following summarizes the changes to that information, and applies only to OS/390 Version 2 Release 7, not to VM/ESA Version 2 Release 3.

New Information

- Language Environment message CEE0807 was added in support of the Language Environment service that allows a C application to create a heap using storage that is specified by the caller.
- Language Environment messages CEE3646 and CEE3647 were added in support of the new run-time options module, CEEROPT.
- Language Environment message CEE5234 was added.
- Language Environment messages, CEE5721, CEE5722, CEE5724, and CEE5764—CEE5791 were added in support of mutexes and read/write locks in shared memory.
- COBOL message IGZ0173 was added to indicate an invalid attempt to start a sort or merge.
- Three TERMTHDACT suboptions, UATRACE, UAONLY, and UAIMM, were added to provide greater control over Language Environment dumps and system dump requests. See “Generating a Language Environment Dump with TERMTHDACT” on page 36 to understand the level of information that each suboption provides.
- A user-created storage report was added and described. This new report is generated by the new C function, *__uheapreport()*, and is designed to assist in tuning the application's use of a user-created heap. See “C Function, __uheapreport, Storage Report” on page 163 for furter details.
- Procedures for generating a system dump in an IMS, CICS, and an OS/390 UNIX shell run-time environment were added. See “Generating a System Dump” on page 71 for details.
- OS/390 UNIX signal, SIGDUMP, was created to dynamically request a system dump.
- Twelve new floating-point registers are displayed in the Language Environment dump (CEEDUMP) if the C/C++ APF suboption of the FLOAT compiler option is specified and the registers are needed. See “Additional Floating-Point Registers” on page 145 for information.

Changed Information

- The detailed HeapPools Storage Statistics section of the Language Environment storage report was moved to Chapter 4, “Debugging C/C++ Routines” on page 111 since this function only applies to C/C++ applications.
- The Language Environment storage report was updated.
- Language Environment messages CEE3201–CEE3215 were modified to include the system completion code.

Deleted Information

- Eleven figures from Chapter 4, “Debugging C/C++ Routines” on page 111 were deleted. The figures duplicated information presented in the sample Language Environment dump. For easy reference, sections of the sample dump are now numbered to correspond with the description of each section.

Part 1. Introduction to Debugging in Language Environment

This part provides information about options and features you can use to prepare your routine for debugging. It describes some common errors that occur in routines and provides methods of generating dumps to help you get the information you need to debug your routine.

Chapter 1. Preparing Your Routine for Debugging

This chapter describes options and features that you can use to prepare your routine for debugging. The following topics are covered:

- Compiler options for C, C++, COBOL, Fortran, and PL/I
- Language Environment run-time options
- Use of storage in routines
- Options for modifying condition handling
- Assembler user exits
- Enclave termination behavior
- User-created messages
- Language Environment feedback codes and condition tokens

Setting Compiler Options

The following sections discuss language-specific compiler options important to debugging routines in Language Environment. These sections cover only the compiler options that are important to debugging. For a complete list of compiler options, refer to the appropriate HLL publications.

The use of some compiler options (such as TEST) can affect the performance of your routine. You must set these options before you compile. In some cases, you might need to remove the option and recompile your routine before delivering your application.

C and C++ Compiler Options

When using C, set the TEST(ALL) suboption, which is equivalent to setting the suboptions SYM, BLOCK, and LINE. Following is a list of TEST suboptions that you can use to simplify run-time debugging. For C++, the TEST option (which has no suboptions) is equivalent to the C option TEST(ALL).

ALL Sets all of the TEST suboptions.

SYM Generates symbol table information and enables Language Environment to generate a dump at run time.

When you specify SYM, you also get the value and type of variables displayed in the Local Variables section of the dump. For example, if in block 4 the variable x is a signed integer of 12, and in block 2 the variable x is a signed integer of 1, the following output appears in the Local Variables section of the dump:

```
%BLOCK4:>x   signed int          12
%BLOCK2:>x   signed int           1
```

If a nonzero optimization level is used, variables do not appear in the dump.

BLOCK Generates symbol information for nested blocks.

LINE Generates line number hooks and allows a debugging tool to generate a symbolic dump.

You can use these C/C++ compiler options to make run-time debugging easier:

AGGREGATE (C)	Specifies that a layout for `struct` and `union` type variables appear in the listing.
ATTRIBUTE	For C++ compile, cross reference listing with attribute information. If XREF is specified, the listing also contains reference, definition and modification information.
EXPMAC	Macro expansions with the original source.
LIST	Listing of the pseudo-assembly listing produced by the compiler.
OFFSET	Displays the offset addresses relative to the entry point of each function.
PPONLY	Completely expanded OS/390 C, or OS/390 C++ source code, by activating the preprocessor (PP) only. The output shows, for example, all the "#include" and "#define" directives.
SHOWINC	All included text in the listing.
SOURCE	Includes source input statements and diagnostic messages in the listing.
XREF	For C compile, cross reference listing with reference, definition, and modification information. For C++ compile, cross reference listing with reference, definition, and modification information. If you specify ATTRIBUTE, the listing also contains attribute information.
GONUMBER	Generates line number tables corresponding to the input source file. This option is turned on when the TEST option is used. This option is needed to show statement numbers in dump output.
FLAG	Specifies the minimum severity level that is tolerated.
TEST	Generates information for debugging interface. This also generates symbol tables needed for symbolic variables in the dump.
CHECKOUT	Provides informational messages indicating possible programming errors.
TERMINAL	Directs all error messages from the compiler to the terminal. If not specified, this is the default.
XREF	Includes a cross-reference table of names used in the routine and line numbers in the source listing.
INLINE (C)	Inline Summary and Detailed Call Structure Reports. (Specify with the REPORT sub-option).
INLRPT(C++)	Generates a report on status of functions that were inlined. The OPTIMIZE option must also be specified.
INFO (C++)	Indication of possible programming errors.
SRCMSG	Adds the corresponding source code lines to the diagnostic messages written to stderr.

See *OS/390 C/C++ Programming Guide* for a detailed explanation of these options and functions.

IPA Compile Step Sub-Options

You can use the following IPA compile sub-options to prepare your program for run-time debugging:

ATTRIBUTE | NOATTRIBUTE

Indicates whether the compiler generates information in the IPA object file that will be used in the IPA Link step if you specify the ATTR or XREF option on that step.

The difference between specifying IPA(ATTR) and specifying ATTR, or XREF, is that IPA(ATTR) does not cause the compiler to generate a Cross Reference listing section after IPA Compile step source analysis is complete. It also does not cause the compiler to generate a Storage Offset or External Symbol Cross Reference listing section during IPA Compile step code generation.

The default is IPA(NOATTRIBUTE). The abbreviations are IPA(ATTR|NOATTR). If you specify the ATTR or XREF option, it overrides the IPA(NOATTRIBUTE) option.

GONUMBER | NOGONUMBER

Indicates whether the compiler saves information about source file line numbers in the IPA object file. The difference between specifying IPA(GONUMBER) and GONUMBER is that IPA(GONUMBER) does not cause GONUMBER tables to be built during IPA Compile step code generation. If the compiler does not build GONUMBER tables, the size of the object module is smaller.

The default is IPA(NOGONUMBER). The abbreviations are IPA(GONUM|NOGONUM). If you specify the GONUMBER or LIST option, it overrides the IPA(NOGONUMBER) option.

LIST | NOLIST

Indicates whether the compiler saves information about source line numbers in the IPA object file. The difference between specifying IPA(LIST) and LIST is that IPA(LIST) does not cause a Pseudo-Assembly listing to be generated during IPA Compile step code generation.

The default is IPA(NOLIST). The abbreviations are IPA(LIS|NOLIS). If you specify the GONUMBER or LIST option, it overrides the IPA(NOLIST) option.

XREF | NOXREF

Indicates whether the compiler generates information in the IPA object file that will be used in the IPA Link step if you specify ATTR or XREF on that step.

The difference between specifying IPA(XREF) and specifying ATTR or XREF is that IPA(XREF) does not cause the compiler to generate a Cross Reference listing section after IPA Compile step source analysis is complete. It also does not cause the compiler to generate a Storage Offset or External Symbol Cross Reference listing section during IPA Compile step code generation.

The default is IPA(NOXREF). The abbreviations are IPA(XR|NOXR). If you specify the ATTR or XREF option, it overrides the IPA(NOXREF) option.

IPA Link Step Sub-Options

You can use these IPA Link Step sub-options to prepare your program for run-time debugging:

DUP | NODUP

Indicates whether the IPA Link step writes a message and a list of duplicate symbols to the console.

The default is IPA(DUP).

ER | NOER

Indicates whether the IPA Link step writes a message and a list of unresolved symbols to the console.

The default is IPA(NOER).

MAP | NOMAP

Specifies that the IPA Link step will produce a listing. The listing contains a Prolog and the following sections:

- Object File Map
- Source File Map
- Compiler Options Map
- Global Symbols Map
- Partition Map for each partition

The default is IPA(NOMAP).

Refer to the Inter-procedural Analysis chapter in the *OS/390 C/C++ Programming Guide* for an overview and more details about Inter-procedural Analysis.

COBOL Compiler Options

When using COBOL, set the SYM suboption of the TEST compiler option. The SYM suboption of TEST causes the compiler to add debugging information into the object program to resolve user names in the routine and to generate a symbolic dump of the DATA DIVISION. With this suboption specified, statement numbers will also be used in the dump output along with offset values.

To simplify debugging, use the NOOPTIMIZE compiler option. Program optimization can change the location of parameters and instructions in the dump output.

You can use the following COBOL compiler options to prepare your program for run-time debugging:

LIST	Produces a listing of the assembler expansion of your source code and global tables, literal pools, information about working storage, and size of routine's working storage.
MAP	Produces lists of items in data division including a data division map, global tables, literal pools, a nested program structure map, and attributes.
OFFSET	Produces a condensed PROCEDURE DIVISION listing containing line numbers, statement references, and location of the first instruction generated for each statement.
OUTDD	Specifies the destination of DISPLAY statement messages.
SOURCE	Produces a listing of your source program with any statements embedded by PROCESS, COPY, or BASIS statements.

TEST Produces object code that can run with a debugging tool, or adds information to the object program to produce formatted dumps. With or without any suboptions, this option forces the OBJECT option. When specified with any of the hook-location suboption values except NONE, this option forces the NOOPTIMIZE option. SYM suboption includes statement numbers in the Language Environment dump and produces a symbolic dump. For interactive debugging only, use TEST with any of the hook-location suboption values other than NONE.

VBREF Produces a cross-reference of all verb types used in the source program and a summary of how many times each verb is used.

XREF Creates a sorted cross-reference listing.

For more detail on these options and functions, see *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide.*

Fortran Compiler Options

You can use these Fortran compiler options to prepare your program for run-time debugging:

FIPS Specifies whether standard language flagging is to be performed. This is valuable if you want to write a program conforming to FORTRAN 77.

FLAG Specifies the level of diagnostic messages to be written. **I** (Information), **E** (Error), **W** (Warning), or **S** (Severe). You can also use FLAG to suppress messages that are below a specified level. This is useful if you want to suppress information messages, for example.

GOSTMT Specifies that statement numbers are included in the run-time messages and in the Language Environment dump.

ICA Specifies whether intercompilation analysis is to be performed, specifies the files containing intercompilation analysis information to be used or updated, and controls output from intercompilation analysis. Specify ICA when you have a group of programs and subprograms that you want to process together and you need to know if there are any conflicting external references, mismatched commons, and so on.

LIST Specifies whether the object module list is to be written. The LIST option lets you see the pseudo-assembly language code that is similar to what is actually generated.

MAP Specifies whether a table of source program variable names, named constants, and statement labels and their displacements is to be produced.

OPTIMIZE Specifies the optimizing level to be used during compilation. If you are debugging your program, it is advisable to use NOOPTIMIZE.

SDUMP Specifies whether dump information is to be generated.

SOURCE Specifies whether a source listing is to be produced.

SRCFLG Controls insertion of error messages in the source listing. SRCFLG allows you to view error messages after the initial line of each source statement that caused the error, rather than at the end of the listing.

SXM Formats SREF or MAP listing output to a 72-character width.

SYM Invokes the production of SYM cards in the object text file. SYM cards contain location information for variables within a Fortran program.

TERMINAL Specifies whether error messages and compiler diagnostics are to be written on the SYSTERM data set and whether a summary of messages for all the compilations is to be written at the end of the listing.

TEST Specifies whether to override any optimization level above OPTIMIZE(0). This option adds run-time overhead.

TRMFLG Specifies whether to display the initial line of source statements in error and their associated error messages at the terminal.

XREF Creates a cross-reference listing.

VECTOR Specifies whether to invoke the vectorization process. A vectorization report provides detailed information about the vectorization process.

For more detail on these options and functions, see *VS FORTRAN Version 2 Programming Guide for CMS and MVS* or *VS FORTRAN Version 2 Language and Library Reference.*

PL/I Compiler Options

When using PL/I, specify the TEST compiler option to control the level of testing capability that are generated as part of the object code. Suboptions of the TEST option such as SYM, BLOCK, STMT, and PATH control the location of test hooks and specify whether or not a symbol table is generated. For more information about TEST, its suboptions, and the placement of test hooks, see *PL/I for MVS & VM Programming Guide*.

To simplify debugging and decrease compile time, set optimization to NOOPTIMIZE or OPTIMIZE(0). Higher optimization levels can change the location where parameters and instructions appear in the dump output.

You can use these compiler options to prepare PL/I routines for debugging:

AGGREGATE Specifies that a layout for arrays and major structures appears in the listing.

ESD Includes the external symbol dictionary in the listing.

GONUMBER / GOSTMT Tells the compiler to produce additional information specifying that line numbers from the source routine can be included in run-time messages and in the Language Environment dump.

INTERRUPT Specifies that users can establish an ATTENTION ON-unit that gains control when an attention interrupt occurs.

LIST Produces a listing of the assembler expansion of source code and global tables, literal pools, information about working storage, and size of routine's working storage.

LMESSAGE Tells the compiler to produce run-time messages in a long form. If the cause of a run-time malfunction is a programmer's understanding of language semantics, specifying LMESSAGE could better explain warnings or other information generated by the compiler.

MAP Tells the compiler to produce tables showing how the variables are mapped in the static internal control section and in the stack frames, thus enabling static internal and automatic variables to be found in the Language Environment dump. If LIST is also specified, the MAP option also produces tables showing constants, control blocks, and INITIAL variable values.

OFFSET Specifies that the compiler prints a table of statement or line numbers for each procedure with their offset addresses relative to the primary entry point of the procedure.

SOURCE	Specifies that the compiler includes a listing of the source routine in the listing.
STORAGE	Includes a table of the main storage requirements for the object module in the listing.
TERMINAL	Specifies what parts of the compiler listing produced during compilation are directed to the terminal.
TEST	Specifies the level of testing capability that is generated as part of the object code. TEST also controls the location of test hooks and whether or not the symbol table is generated. Because the TEST option increases the size of the object code and can affect performance, limit the number and placement of hooks.
XREF and ATTRIBUTES	Creates a sorted cross-reference listing with attributes.

For more detail on PL/I compiler options, see *PL/I for MVS & VM Programming Guide*.

VisualAge PL/I Compiler Options

The following VisualAge PL/I compiler options can be specified when preparing your VisualAge PL/I routines for debugging:

AGGREGATE	Specifies that a layout for arrays and major structures appears in the listing.
GONUMBER / GOSTMT	Tells the compiler to produce additional information specifying that line numbers from the source routine can be included in run-time messages and in the Language Environment dump.
INTERRUPT	Specifies that users can establish an ATTENTION ON-unit that gains control when an attention interrupt occurs.
LIST	Produces a listing of the assembler expansion of source code and global tables, literal pools, information about working storage, and size of routine's working storage.
OFFSET	Displays the offset addresses relative to the entry point of each function.
SOURCE	Specifies that the compiler includes a listing of the source routine in the listing.
STORAGE	Includes a table of the main storage requirements for the object module in the listing.
TEST	Specifies the level of testing capability that is generated as part of the object code. TEST also controls the location of test hooks and whether or not the symbol table is generated. Because the TEST option increases the size of the object code and can affect performance, limit the number and placement of hooks.
XREF and ATTRIBUTES	Creates a sorted cross-reference listing with attributes.

See *VisualAge PL/I for OS/390 Programming Guide* for further details on the VisualAge PL/I compiler options.

Using Language Environment Run-Time Options

There are several run-time options that affect debugging in Language Environment. The TEST run-time option, for example, can be used with a debugging tool to specify the level of control the debugging tool has when the routine being initialized is started. The ABPERC, CHECK, DEPTHCONDLMT, ERRCOUNT, HEAPCHK, INTERRUPT, TERMTHDACT, TRACE, TRAP, and USRHDLR options affect condition handling. The ABTERMENC option affects how an application ends (that is, with an abend or with a return code and reason code) when an unhandled condition of severity 2 or greater occurs.

The following Language Environment run-time options affect debugging:

ABPERC Specifies that the indicated abend code bypasses the condition handler.

ABTERMENC Specifies enclave termination behavior for an enclave ending with an unhandled condition of severity 2 or greater.

CHECK Determines whether run-time checking is performed.

NODEBUG Controls the COBOL USE FOR DEBUGGING declarative.

DEPTHCONDLMT Specifies the limit for the depth of nested synchronous conditions in user-written condition handlers. (Asynchronous signals do not affect DEPTHCONDLMT.)

ERRCOUNT Specifies the number of synchronous conditions of severity 2 or greater tolerated. (Asynchronous signals do not affect ERRCOUNT.)

HEAPCHK Determines whether additional heap check tests are performed.

INFOMSGFILTER Filters user specified informational messages from the MSGFILE.

Note: Affects only those messages generated by Language Environment and any routine that calls CEEMSG. Other routines that write to the message file, such as CEEMOUT, do not have a filtering option.

INTERRUPT Causes Language Environment to recognize attention interrupts.

MSGFILE Specifies the ddname of the Language Environment message file.

MSGQ Specifies the number of instance specific information (ISI) blocks that are allocated on a per-thread basis for use by an application. Located within the Language Environment condition token is an ISI token. The ISI contains information used by the condition manager to identify and react to a specific occurrence of a condition.

PROFILE Controls the use of an optional profiler tool, which collects performance data for the running application. When this option is in effect, the profiler is loaded and the debugger cannot be loaded. If the TEST option is in effect when PROFILE is specified, the profiler tool will not be loaded.

STORAGE Specifies that Language Environment initializes all heap and stack storage to a user-specified value.

TERMTHDACT Controls response when an enclave terminates due to an unhandled condition of severity 2 or greater.

TEST Specifies the conditions under which a debugging tool assumes control.

TRACE Activates Language Environment run-time library tracing and controls the size of the trace table, the type of trace, and whether the trace table should be dumped unconditionally upon termination of the application.

TRAP When TRAP is set to ON, Language Environment traps routine interrupts and abends, and optionally prints trace information or invokes a user-written condition handling routine. With TRAP set to OFF, the operating system handles all interrupts and abends.

You should generally set TRAP to ON, or your run-time results can be unpredictable.

USRHDLR Specifies the behavior of two user-written condition handlers. The first handler specified will be registered at stack frame 0. The second handler specified will be registered before any other user-written condition handlers, once the handler is enabled by a condition.

XUFLOW Specifies whether or not an exponent underflow causes a routine interrupt.

See *OS/390 Language Environment Programming Reference* for a more detailed discussion of these run-time options.

Determining Run-Time Options in Effect

The run-time options in effect at the time the routine is run can affect routine behavior. Use RPTOPTS(ON) to generate an options report in the Language Environment message file when your routine terminates. The options report lists run-time options, and indicates where they were set.

Figure 1 on page 12 shows a sample options report.

```
Options Report for Enclave main 12/02/99 10:10:00 PM
   Language Environment V2 R9.0

   LAST WHERE SET                OPTION
   ------------------------------------------------------------------------------
   Installation default            ABPERC(NONE)
   Installation default            ABTERMENC(RETCODE)
   Installation default          NOAIXBLD

Figure 1. Options Report Produced by Language Environment Run-Time Option RPTOPTS(ON)

Controlling Storage Allocation

The following run-time options control storage allocation:

- STACK
- NONIPTSTACK
- LIBSTACK
- THREADHEAP
- HEAP
- ANYHEAP
- BELOWHEAP
- STORAGE
- HEAPPOOLS

OS/390 Language Environment Programming Guide provides useful tips to assist with the tuning process. Appropriate tuning is necessary to avoid performance problems.

To generate a report of the storage a routine (or more specifically, an enclave) used during its run, specify the RPTSTG(ON) run-time option. The storage report, generated during enclave termination provides statistics that can help you understand how space is being consumed as the enclave runs. If storage management tuning is desired, the statistics can help you set the corresponding storage-related run-time options for future runs. The output is written to the Language Environment message file.

Neither the storage report nor the corresponding run-time options include the storage that Language Environment acquires during early initialization, before run-time options processing, and before the start of space management monitoring.

Figure 2 on page 14 shows a sample storage report. The sections that follow describe the contents of the report.

```
 Storage Report for Enclave main 12/02/99 10:10:00 PM
Language Environment V2 R9.0

    STACK statistics:
      Initial size:                                    4096
      Increment size:                                  4096
      Maximum used by all concurrent threads:          6304
      Largest used by any thread:                      6304
      Number of segments allocated:                       2
      Number of segments freed:                           0
    NONIPTSTACK statistics:
      Initial size:                                    4096
      Increment size:                                  4096
      Maximum used by all concurrent threads:          3384
      Largest used by any thread:                      3384
      Number of segments allocated:                       6
      Number of segments freed:                           0
    LIBSTACK statistics:
      Initial size:                                    4096
      Increment size:                                  4096
      Maximum used by all concurrent threads:           816
      Largest used by any thread:                       816
      Number of segments allocated:                       1
      Number of segments freed:                           0
    THREADHEAP statistics:
      Initial size:                                    4096
      Increment size:                                  4096
      Maximum used by all concurrent threads:             0
      Largest used by any thread:                         0
      Successful Get Heap requests:                       0
      Successful Free Heap requests:                      0
      Number of segments allocated:                       0
      Number of segments freed:                           0
    HEAP statistics:
      Initial size:                                   49152
      Increment size:                                 16384
      Total heap storage used (sugg. initial size):   27192
      Successful Get Heap requests:                     242
      Successful Free Heap requests:                    213
      Number of segments allocated:                       1
      Number of segments freed:                           0
    HEAP24 statistics:
      Initial size:                                    8192
      Increment size:                                  4096
      Total heap storage used (sugg. initial size):       0
      Successful Get Heap requests:                       0
      Successful Free Heap requests:                      0
      Number of segments allocated:                       0
      Number of segments freed:                           0
    ANYHEAP statistics:
      Initial size:                                   32768
      Increment size:                                 16384
      Total heap storage used (sugg. initial size):   92624
      Successful Get Heap requests:                      37
      Successful Free Heap requests:                     19
      Number of segments allocated:                       6
      Number of segments freed:                           4
    BELOWHEAP statistics:
      Initial size:                                    8192
      Increment size:                                  8192
      Total heap storage used (sugg. initial size):   34480
      Successful Get Heap requests:                       6
      Successful Free Heap requests:                      6
      Number of segments allocated:                       6
      Number of segments freed:                           5
```

Figure 2 (Part 1 of 2). Storage Report Produced by Language Environment Run-Time Option RPTSTG(ON)

```
    Additional Heap statistics:
      Successful Create Heap requests:                      1
      Successful Discard Heap requests:                     1
      Total heap storage used:                           4912
      Successful Get Heap requests:                         3
      Successful Free Heap requests:                        3
      Number of segments allocated:                         2
      Number of segments freed:                             2
    Largest number of threads concurrently active:          2
End of Storage Report
```

Figure 2 (Part 2 of 2). Storage Report Produced by Language Environment Run-Time Option RPTSTG(ON)

The statistics for initial and incremental allocations of storage types that have a corresponding run-time option differ from the run-time option settings when their values have been rounded up by the implementation, or when allocations larger than the amounts specified were required during execution. All of the following are rounded up to an integral number of double-words:

- Initial STACK allocations
- Initial allocations of NONIPTSTACK
- Initial allocations of all types of heap
- Incremental allocations of all types of stack and heap

The run-time options should be tuned appropriately to avoid performance problems. Refer to *OS/390 Language Environment Programming Guide* for tips on tuning.

Stack Storage Statistics

Language Environment stack storage is managed at the thread level—each thread has its own stack-type resources.

STACK, NONIPTSTACK, and LIBSTACK Statistics

- Initial size—the actual size of the initial segment assigned to each thread. (If a pthread-attributes-table is provided on the invocation of pthread-create, then the stack size specified in the pthread-attributes-table will take precedence over the STACK run-time option.)
- Increment size—the size of each incremental segment acquired, as determined by the increment portion of the corresponding run-time option.
- Maximum used by all concurrent threads—The maximum amount allocated in total at any one time by all concurrently executing threads.
- Largest used by any thread—the largest amount allocated ever by any single thread.
- Number of segments allocated—the number of incremental segments allocated by all threads.
- Number of segments freed—the number of incremental segments freed by all threads.

The number of incremental segments freed could be less than the number allocated if any of the segments were not freed individually during the life of the thread, but rather were freed implicitly in the course of thread termination.

Determining the Applicable Threads

If the application is not a multithreading or PL/I multitasking application, then the STACK statistics are for the one and only thread that executed, and the NONIPTSTACK statistics are all zero.

If the application is a multithreading or PL/I multitasking application, and NONIPTSTACK was not suppressed by specification of NONONIPTSTACK, then the STACK statistics are for the initial thread (the IPT), and the NONIPTSTACK statistics are for the other threads. However, if NONIPTSTACK was suppressed by specification of NONONIPTSTACK, then the STACK statistics are for all of the threads, initial and other.

Allocating Stack Storage

Another type of stack, called the reserve stack, is allocated for each thread and used to handle out-of-storage conditions. Its size is controlled by the 4th subparameter of the STORAGE run-time option, but its usage is neither tracked nor reported in the storage report.

In a multithreaded environment, including PL/I multitasking applications, the initial allocations for all types of stack are made from library heap storage. Library stack and reserve stack are always allocated from BELOWHEAP. User stack is allocated from BELOWHEAP if STACK(,,BELOW) is specified or if ALL31(OFF) is specified; otherwise, it is allocated from ANYHEAP.

Language Environment acquires some initial storage, which is neither stack nor heap, at thread creation time; this storage is allocated from BELOWHEAP if ALL31(OFF) is in effect, or from ANYHEAP if ALL31(ON) is in effect.

Heap Storage Statistics

Language Environment heap storage, other than what is explicitly defined using THREADHEAP, is managed at the enclave level—each enclave has its own heap-type resources, which are shared by the threads that execute within the enclave. Heap storage defined using THREADHEAP is controlled at the thread level.

HEAP, HEAP24, THREADHEAP, ANYHEAP, and BELOWHEAP Statistics

- Initial size—the default initial allocation, as specified by the corresponding run-time option. Please note that for HEAP24, the initial size is the value of the initsz24 of the HEAP option.
- Increment size—the minimum incremental allocation, as specified by the corresponding run-time option. Please note that for HEAP24, the increment size is the value of the incrsz24 of the HEAP option.

THREADHEAP Statistics

- Maximum used by all concurrent threads—the maximum total amount used by all concurrent threads at any one time.
- Largest used by any thread—the largest amount used by any single thread.

HEAP, HEAP24, ANYHEAP, BELOWHEAP, and Additional Heap Statistics

- Total heap storage used—the largest total amount used by the enclave at any one time.

HEAP, HEAP24, THREADHEAP, ANYHEAP, BELOWHEAP, and Additional Heap Statistics

- Successful Get Heap requests—the number of Get Heap requests.
- Successful Free Heap requests—the number of Free Heap requests.
- Number of segments allocated—the number of incremental segments allocated.
- Number of segments freed—the number of incremental segments individually freed.

The number of Free Heap requests could be less than the number of Get Heap requests if the pieces of heap storage acquired by individual Get Heap requests were not freed individually, but rather were freed implicitly in the course of enclave termination.

The number of incremental segments individually freed could be less than the number allocated if the segments were not freed individually, but rather were freed implicitly in the course of enclave termination.

These statistics, in all cases, specify totals for the whole enclave. For THREADHEAP, they indicate the total across all threads in the enclave.

Additional Heap Statistics

Besides the fixed types of heap, additional types of heap can be created, each with its own heap ID. You can create and discard these additional types of heap by using the CEECRHP

- Successful Create Heap requests—the number of successful Create Heap requests.
- Successful Discard Heap requests—the number of successful Discard Heap requests.

The number of Discard Heap requests could be less than the number of Create Heap requests if the special heaps allocated by individual Create Heap requests were not freed individually, but rather were freed implicitly in the course of enclave termination.

HeapPools Storage Statistics

The HEAPPOOLS run-time option (for C/C++ applications only) controls usage of the heap pools storage algorithm at the enclave level. The heap pools algorithm allows for the definition of one to six heap pools, each consisting of a number of storage cells of a specified length. See “HeapPools Storage Statistics” on page 162 for further details regarding HeapPools storage statistics in the storage report.

Modifying Condition Handling Behavior

Setting the condition handling behavior of your routine affects the response that occurs when the routine encounters an error.

You can modify condition handling behavior in the following ways:

- Callable services
- Run-time options
- User-written condition handlers
- POSIX functions (used to specifically set signal actions and signal masks)

Language Environment Callable Services

You can use these callable services to modify condition handling:

CEE3ABD Terminates an enclave using an abend.

CEEMRCE Moves the resume cursor to an explicit location where resumption is to occur after a condition has been handled.

CEEMRCR Moves the resume cursor relative to the current position of the handle cursor.

CEE3CIB Returns a pointer to a condition information block (CIB) associated with a given condition token. The CIB contains detailed information about the condition.

CEE3GRO Returns the offset of the location within the most current Language Environment-conforming routine where a condition occurred.

CEE3SPM Specifies the settings of the routine mask. The routine mask controls:

- Fixed overflow
- Decimal overflow
- Exponent underflow
- Significance

You can use CEE3SPM to modify Language Environment hardware conditions. Because such modifications can affect the behavior of your routine, however, you should be careful when doing so.

CEE3SRP Sets a resume point within user application code to resume from a Language Environment user condition handler.

Fortran programs cannot directly call Language Environment callable services. See *OS/390 Language Environment Programming Reference* for more information about callable services. See also *Language Environment Fortran Run-Time Migration Guide* for more information about how to invoke callable services from Fortran.

Language Environment Run-Time Options

These Language Environment run-time options can affect your routine's condition handling behavior:

ABPERC Specifies a system- or user-specified abend code that percolates without further action while the Language Environment condition handler is enabled. Normal condition handling activities are performed for everything except the specified abend code. System abends are specified as S**hhh**, where **hhh** is a hexadecimal system abend code.

User abends are specified as U`dddd`, where `dddd` is a decimal user abend code. Any other 4-character EBCDIC string, such as NONE, that is not of the form S**hhh** can also be specified as a user-specified abend code. You can specify only one abend code with this option. This option assumes the use of TRAP(ON). ABPERC is not supported in CICS.

Language Environment ignores ABPERC(0Cx). No abend is percolated and Language Environment condition handling semantics are in effect.

CHECK Specifies that checking errors within an application are detected. The Language Environment-conforming languages can define error checking differently.

DEPTHCONDLMT Limits the extent to which synchronous conditions can be nested in a user-written condition handler. (Asynchronous signals do not affect DEPTHCONDLMT.) For example, if you specify 5, the initial condition and four nested conditions are processed. If the limit is exceeded, the application terminates with abend code 4091 and reason code 21 (X'15').

ERRCOUNT Specifies the number of synchronous conditions of severity 2, 3, and 4 that are tolerated before the enclave terminates abnormally. (Asynchronous signals do not affect ERRCOUNT.) If you specify 0 an unlimited number of conditions is tolerated.

INTERRUPT Causes attentions recognized by the host operating system to be passed to and recognized by Language Environment after the environment has been initialized.

TERMTHDACT Sets the level of information that is produced when a condition of severity 2 or greater remains unhandled within the enclave. There are five possible parameter settings for different levels of information:

- QUIET for no information
- MSG for message only
- TRACE for message and a traceback
- DUMP for message, traceback, and Language Environment dump
- UAONLY for message and a system dump of the user address space
- UATRACE for message, Language Environment dump with traceback information only, and a system dump of the user address space
- UADUMP for message, traceback, Language Environment dump, and system dump
- UAIMM for a system dump of the user address space of the original abend or program interrupt prior to the Language Environment condition manager processing the condition.

TRAP(ON) Fully enables the Language Environment condition handler. This causes the Language Environment condition handler to intercept error conditions and routine interrupts.

When TRAP(ON, NOSPIE) is specified, Language Environment handles all program interrupts and abends through an ESTAE. Use this feature when you do not want Language Environment to issue an ESPIE macro.

During normal operation, you should use TRAP(ON) when running your applications.

TRAP(OFF) Disables the Language Environment condition handler from handling abends and program checks/interrupts. ESPIE is not issued with TRAP(OFF), it is still possible to invoke the condition handler through the CEESGL callable service and pass conditions to registered user-written condition handlers.

Specify TRAP(OFF) when you do not want Language Environment to issue an ESTAE or an ESPIE.

When TRAP(OFF), TRAP(OFF,SPIE), or TRAP(OFF,NOSPIE) is specified and either a program interrupt or abend occurs, the user exit for termination is ignored.

TRAP(OFF) can cause several unexpected side effects. See the TRAP run-time option in *OS/390 Language Environment Programming Reference* for further information.

USRHDLR Specifies the behavior of two user-written condition handlers. The first handler specified will be registered at stack frame 0. The second handler specified will be registered before any other user-written condition handlers, once the handler is enabled by a condition.

When you specify USRHDLR(lastname,supername), lastname gets control at stack frame 0. Supername will get get control first, before any user-written condition handlers but after supername has gone through the enablement phase, when a condition occurs.

XUFLOW Specifies whether an exponent underflow causes a routine interrupt.

Customizing Condition Handlers

User-written condition handlers permit you to customize condition handling for certain conditions. You can register a user-written condition handler for the current stack frame by using the CEEHDLR callable service. You can use the Language Environment USRHDLR run-time option to register a user-written condition handler for stack frame 0. You can also use USRHDLR to register a user-written condition handler before any other user condition handlers.

When the Language Environment condition manager encounters the condition, it requests that the condition handler associated with the current stack frame handle the condition. If the condition is not handled, the Language Environment condition manager percolates the condition to the next (earlier) stack frame, and so forth to earlier stack frames until the condition has been handled. Conditions that remain unhandled after the first (earliest) stack frame has been reached are presented to the Language Environment condition handler. One of the following Language Environment default actions is then taken, depending on the severity of the condition:

- Resume
- Percolate
- Promote
- Fix-up and resume

See *OS/390 Language Environment Programming Guide* for more information about user-written condition handlers and the Language Environment condition manager.

Invoking the Assembler User Exit

For debugging purposes, the CEEBXITA assembler user exit can be invoked during:

- Enclave initialization
- Enclave termination
- Process termination

The functions of the CEEBXITA user exit depend on when the user exit is invoked and whether it is application-specific or installation-wide. Application-specific user exits must be linked with the application load module and run only when that application runs. Installation-wide user exits must be linked with the Language Environment initialization/termination library routines and run with all Language Environment library routines. Because an application-specific user exit has priority over any installation-wide user exit, you can customize a user exit for a particular application without affecting the user exit for any other applications.

At enclave initialization, the CEEBXITA user exit runs prior to the enclave establishment. Thus you can modify the environment in which your application runs in the following ways:

- Specify run-time options
- Allocate data sets/files in the user exit
- List abend codes to be passed to the operating system
- Check the values of routine arguments

At enclave termination, the CEEBXITA user exit runs prior to the termination activity. Thus, you can request an abend and perform specified actions based on received return and reason codes. (This does not apply when Language Environment terminates with an abend.)

At process termination, the CEEBXITA user exit runs after the enclave termination activity completes. Thus you can request an abend and deallocate files.

The assembler user exit must have an entry point of CEEBXITA, must be reentrant, and must be capable of running in AMODE(ANY) and RMODE(ANY).

You can use the assembler user exit to establish enclave termination behavior for an enclave ending with an unhandled condition of severity 2 or greater in the following ways:

- If you do not request an abend in the assembler user exit for the enclave termination call, Language Environment honors the setting of the ABTERMENC option to determine how to end the enclave.
- If you request an abend in the assembler user exit for the enclave termination call, Language Environment issues an abend to end the enclave.

See *OS/390 Language Environment Programming Guide* for more information on the assembler user exit.

Establishing Enclave Termination Behavior for Unhandled Conditions

To establish enclave termination behavior when an unhandled condition of severity 2 or greater occurs, use one of the following methods:

- The assembler user exit (see “Invoking the Assembler User Exit” on page 21 and *OS/390 Language Environment Programming Guide*)
- POSIX signal default action (see *OS/390 Language Environment Programming Guide*)
- The ABTERMENC run-time option (discussed below)

The ABTERMENC run-time option sets the enclave termination behavior for an enclave ending with an unhandled condition of severity 2 or greater.

If you specify the IBM-supplied default suboption ABEND, Language Environment issues an abend to end the enclave regardless of the setting of the CEEAUE_ABND flag. Additionally, the assembler user exit can alter the abend code, abend reason code, abend dump attribute, and on OS/390, the abend task/step attribute. See *OS/390 Language Environment Programming Reference* for more information on using ABTERMENC and *OS/390 Language Environment Programming Guide* for more information on the assembler user exit.

If you specify the RETCODE suboption, Language Environment uses the CEEAUE_ABND flag value set by the assembler user exit (which is called for enclave termination) to determine whether or not to issue an abend to end the enclave when an unhandled condition of severity 2 or greater occurs.

Using Messages in Your Routine

You can create messages and use them in your routine to indicate the status and progress of the routine during run time, and to display variable values. The process of creating messages and using them requires that you create a message source file, and convert the source file into loadable code for use in your routine.

You can use the Language Environment callable service CEEMOUT to direct user-created message output to the Language Environment message file. To direct the message output to another destination, use the Language Environment MSGFILE run-time option to specify the ddname of the file.

When multiple Language Environment environments are running in the same address space and the same MSGFILE ddname is specified, writing contention can occur. To avoid contention, use the MSGFILE suboption ENQ. ENQ tells Language Environment to perform serialization around writes to the MSGFILE ddname specified which eliminates writing contention. Writing contention can also be eliminated by specifying unique MSGFILE ddnames.

Each Language Environment-conforming language also provides ways to display both user-created and run-time messages. (See “Interpreting Run-Time Messages” on page 29 for an explanation of Language Environment run-time messages.)

The following sections discuss how to create messages in each of the HLLs. For a more detailed explanation of how to create messages and use them in C, C++, COBOL, Fortran, or PL/I routines, see *OS/390 Language Environment Programming Guide*.

C/C++

For C/C++ routines, output from the `printf` function is directed to `stdout`, which is associated with `SYSPRINT`. All C/C++ run-time messages and perror() messages are directed to `stderr`. `stderr` corresponds to the ddname associated with the Language Environment MSGFILE run-time option. The destination of the `printf` function output can be changed by using the redirection `1>&2` at routine invocation to redirect `stdout` to the `stderr` destination. Both streams can be controlled by the MSGFILE run-time option.

COBOL

For COBOL programs, you can use the DISPLAY statement to display messages. Output from the DISPLAY statement is directed to SYSOUT. SYSOUT is the IBM-supplied default for the Language Environment message file. The OUTDD compiler option can be used to change the destination of the DISPLAY messages.

Fortran

For Fortran programs, run-time messages, output written to the print unit, and other output (such as output from the SDUMP callable service) are directed to the file specified by the MSGFILE run-time option. If the print unit is different than the error message unit (PRTUNIT and ERRUNIT run-time options have different values), however, output from the PRINT statement won't be directed to the Language Environment message file.

PL/I

Under PL/I, run-time messages are directed to the file specified in the Language Environment MSGFILE run-time option, instead of the PL/I SYSPRINT STREAM PRINT file. User-specified output is still directed to the PL/I SYSPRINT STREAM PRINT file. To direct this output to the Language Environment MSGFILE file, specify the run-time option MSGFILE(SYSPRINT).

Using Condition Information

If a condition that might require attention occurs while an application is running, Language Environment builds a condition token. The condition token contains 12 bytes (96 bits) of information about the condition that Language Environment or your routines can use to respond appropriately. Each condition is associated with a single Language Environment run-time message.

You can use this condition information in two primary ways:

- To specify the feedback code parameter when calling Language Environment services (see “Using the Feedback Code Parameter” on page 24).
- To code a symbolic feedback code in a user-written condition handler (see “Using the Symbolic Feedback Code” on page 26).

Using the Feedback Code Parameter

The feedback code is an optional parameter of the Language Environment callable services. (For COBOL/370 programs, you must provide the **fc** parameter in each call to a Language Environment callable service. For C/C++, COBOL for OS/390 & VM, COBOL for MVS & VM, and PL/I routines, this parameter is optional. See *OS/390 Language Environment Programming Guide* for more information about **fc** and condition tokens.)

When you provide the feedback code (**fc**) parameter, the callable service in which the condition occurs sets the feedback code to a specific value called a condition token.

The condition token does not apply to asynchronous signals. For a discussion of the distinctions between synchronous signals and asynchronous signals with POSIX(ON), see *OS/390 Language Environment Programming Guide*.

When you do not provide the **fc** parameter, any nonzero condition is signaled and processed by Language Environment condition handling routines. If you have registered a user-written condition handler, Language Environment passes control to the handler, which determines the next action to take. If the condition remains unhandled, Language Environment writes a message to the Language Environment message file. The message is the translation of the condition token into English (or another supported national language).

Language Environment provides callable services that can be used to convert condition tokens to routine variables, messages, or signaled conditions. The following table lists these callable services and their functions.

CEEMSG Transforms the condition token into a message and writes the message to the message file.

CEEMGET Transforms the condition token into a message and stores the message in a buffer.

CEEDCOD Decodes the condition token; that is, separates it into distinct user-supplied variables. Also, if a language does not support structures, CEEDCOD provides direct access to the token.

CEESGL Signals the condition. This passes control to any registered user-written condition handlers. If a user-written condition handler does not exist, or the condition is not handled, Language Environment by default writes the corresponding message to the message file and terminates the routine for severity 2 or higher. For severity 0 and 1, Language Environment continues without writing a message. COBOL, however, issues severity 1 messages before continuing. CEESGL can signal a POSIX condition. For details, see *OS/390 Language Environment Programming Guide*.

There are two types of condition tokens. Case 1 condition tokens contain condition information, including the Language Environment message number. All Language Environment callable services and most application routines use case 1 condition tokens. Case 2 condition tokens contain condition information and a user-specified class and cause code. Application routines, user-written condition handlers, assembler user exits, and some operating systems can use case 2 condition tokens.

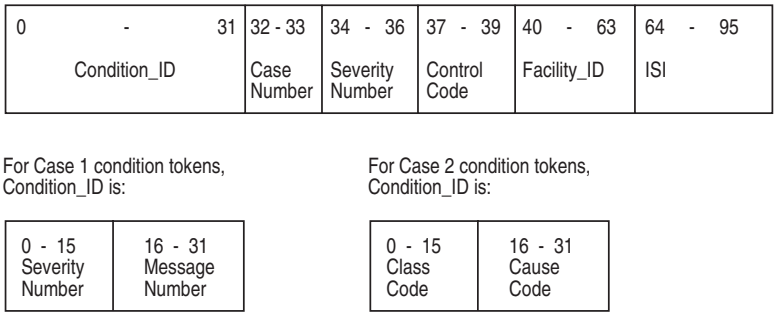

Figure 3. Language Environment Condition Token

For example, in the condition token: X'0003032D 59C3C5C5 00000000'

- X'0003' is severity.
- X'032D' is message number 813.
- X'59' are hexadecimal flags for case, severity, and control.
- X'C3C5C5' is the CEE facility ID.
- X'00000000' is the ISI. (In this case, no ISI was provided.)

If a Language Environment traceback or dump is generated while a condition token is being processed or when a condition exists, Language Environment writes the run-time message to the condition section of the traceback or dump.

If a condition is detected when a callable service is invoked without a feedback code, the condition token is passed to the Language Environment condition manager. The condition manager polls active condition handlers for a response. If a condition of severity 0 or 1 remains unhandled, Language Environment resumes without issuing a message. Language Environment does issue messages, however, for COBOL severity 1 conditions. For unhandled conditions of severity 2 or greater, Language Environment issues a message and terminates. See Part 3, “Run-Time Messages and Codes” on page 241 for a list of Language Environment run-time messages and corrective information.

If a second condition is raised while Language Environment is attempting to handle a condition, the message `CEE0374C CONDITION = <message no.>` is displayed using a write-to-operator (WTO). The message number in the CEE0374C message indicates the original condition that was being handled when the second condition was raised. This can happen when a critical error is signaled (for example, when internal control blocks are damaged).

If the output for this error message appears several times in sequence, the conditions appear in order of occurrence. Correcting the earliest condition can cause your application to run successfully.

Using the Symbolic Feedback Code

The symbolic feedback code represents the first 8 bytes of a 12-byte condition token. You can think of the symbolic feedback code as the nickname for a condition. As such, the symbolic feedback code can be used in user-written condition handlers to screen for a given condition, even if it occurs at different locations in an application.

See *OS/390 Language Environment Programming Guide* for more details on symbolic feedback codes.

Chapter 2. Classifying Errors

This chapter describes errors that commonly occur in Language Environment routines. It also explains how to use run-time messages and abend codes to obtain information about errors in your routine.

Identifying Problems in Routines

The following sections describe how you can identify errors in Language Environment routines. Included are common error symptoms and solutions.

Language Environment Module Names

You can identify Language Environment-supplied OS/390 module elements and VM text files by any of the following three-character prefixes:

- CEE (Language Environment)
- EDC (C/C++)
- FOR (Fortran)
- IBM (PL/I)
- IGZ (COBOL)

Module elements or text files with other prefixes are not part of the Language Environment product.

Common Errors in Routines

These common errors have simple solutions:

- If you do not have enough virtual storage, increase your region size or decrease your storage usage (stack size) by using the storage-related run-time options and callable services. (See “Controlling Storage Allocation” on page 13 for information about using storage in routines.)
- If you do not have enough disk space, increase your disk allocation.
- If executable files are not available, check your executable library to ensure that they are defined. For example, check your STEPLIB or JOBLIB definitions.

If your error is not caused by any of the items listed above, examine your routine or routines for changes since the last successful run. If there have been changes, review these changes for errors that might be causing the problem. One way to isolate the problem is to branch around or comment out recent changes and rerun the routine. If the run is successful, the error can be narrowed to the scope of the changes.

Duplicate names shared between Fortran routines and C library routines can produce unexpected results. Language Environment provides several cataloged procedures to properly resolve duplicate names. For more information on how to avoid name conflicts, see *OS/390 Language Environment Programming Guide*.

Changes in optimization levels, addressing modes, and input/output file formats can also cause unanticipated problems in your routine.

In most cases, generated condition tokens or run-time messages point to the nature of the error. The run-time messages offer the most efficient corrective action. To help you analyze errors and determine the most useful method to fix the problem, Table 2 on page 28 lists common error symptoms, possible causes, and programmer responses.

Table 2 (Page 1 of 2). Common Error Symptoms, Possible Causes, and Programmer Responses

Error Symptom	Possible Cause	Programmer Response
Numbered run-time message appears	Condition raised in routine	For any messages you receive, read the Programmer Response. For information about message structure, see "Interpreting Run-Time Messages" on page 29.
User abend code < 4000	a) A non-Language Environment abend occurred b) The assembler user exit requested an abend for an unhandled condition of severity ≥2	See Chapter 16, "Language Environment Abend Codes" on page 743. Check for a subsystem-generated abend or a user-specified abend.
User abend code ≥ 4000	a) Language Environment detected an error and could not proceed b) An unhandled software-raised condition occurred and ABTERMENC(ABEND) was in effect c) The assembler user exit requested an abend for an unhandled condition of severity 4	For any abends you receive, read the appropriate Explanation listed in Chapter 16, "Language Environment Abend Codes" on page 743.
System abend with TRAP(OFF)	Cause depends on type of malfunction	Respond appropriately. Refer to the messages and codes book of the operating system.
System abend with TRAP(ON)	System-detected error	Refer to the messages and codes book of the operating system.
No response (wait/loop)	Application logic failure	Check routine logic. Ensure ERRCOUNT and DEPTHCONDLMT run-time options are set to a nonzero value.
Unexpected message (message received was not from most recent service)	Condition caused by something related to current service	Generate a traceback using CEE3DMP.
Incorrect output	Incorrect file definitions, storage overlay, incorrect routine mask setting, references to uninitialized variables, data input errors, or application routine logic error	Correct the appropriate parameters.
No output	Check ddname, file definitions, and message file setting	Correct the appropriate parameters.
Nonzero return code from enclave	Unhandled condition of severity 2, 3, or 4, or the return code was issued by the application routine	Check the Language Environment message file for run-time message. Under CMS, if only the last five zeros (00000) of the severity code appear, a REXX macro can be created to print the entire code.

Table 2 (Page 2 of 2). Common Error Symptoms, Possible Causes, and Programmer Responses

Error Symptom	Possible Cause	Programmer Response
Unexpected output	Conflicting library module names	Refer to the name conflict resolution steps outlined in *OS/390 Language Environment Programming Guide*.

Interpreting Run-Time Messages

The first step in debugging your routine is to look up any run-time messages. To find run-time messages, check the message file:

- On OS/390, run-time messages are written by default to ddname SYSOUT. If SYSOUT is not specified, then the messages are written to SYSOUT=*.
- On CICS, the run-time messages are written to the CESE transient data QUEUE.
- On CMS, run-time messages are written by default to ddname SYSOUT. If SYSOUT is not specified, then the messages are written to the console.

The default message file ddname can be changed by using the MSGFILE run-time option. For information about displaying run-time messages for C/C++, COBOL, Fortran, or PL/I routines, see *OS/390 Language Environment Programming Guide*.

Run-time messages provide users with additional information about a condition, and possible solutions for any errors that occurred. They can be issued by Language Environment common routines or language-specific run-time routines and contain a message prefix, message number, severity code, and descriptive text.

In the following example Language Environment message:

```
CEE3206S The system detected a specification exception.
```

- The message prefix is CEE.
- The message number is 3206.
- The severity code is S.
- The message text is “The system detected a specification exception.”

Language Environment messages can appear even though you made no explicit calls to Language Environment services. C/C++, COBOL, and PL/I run-time library routines commonly use the Language Environment services. This is why you can see Language Environment messages even when the application routine does not directly call common run-time services.

Message Prefix

The message prefix indicates the Language Environment component that generated the message. The message prefix is the first three characters of the message number and is also the facility ID in the condition token. See the following table for more information about Language Environment run-time messages.

Message Prefix	Language Environment Component	For a list of messages, see:
CEE	Common run time	Chapter 9
EDC	C/C++ run time	Chapter 12
FOR	Fortran run time	Chapter 13
IBM	PL/I run time	Chapter 14
IGZ	COBOL run time	Chapter 15

Message Number

The message number is the 4-digit number following the message prefix. Leading zeros are inserted if the message number is less than four digits. It identifies the condition raised and references additional condition and programmer response information.

Severity Code

The severity code is the letter following the message number and indicates the level of attention called for by the condition. Messages with severity of `I` are informational messages and do not usually require any corrective action. In general, if more than one run-time message appears, the first noninformational message indicates the problem. For a complete list of severity codes, severity values, condition information, and default actions, see *OS/390 Language Environment Programming Guide*.

Message Text

The message text provides a brief explanation of the condition.

Understanding Abend Codes

Under Language Environment, abnormal terminations generate abend codes. There are two types of abend codes: 1) user (Language Environment and user-specified) abends and 2) system abends. User abends follow the format of U*dddd*, where *dddd* is a decimal user abend code. System abends follow the format of S*hhh*, where *hhh* is a hexadecimal abend code. Language Environment abend codes are usually in the range of 4000 to 4095. However, some subsystem abend codes can also fall in this range. User-specified abends use the range of 0 to 3999.

Example abend codes are:

```
User (Language Environment) abend code:U4041
User-specified abend code:U0005
System abend code:S80A
```

The Language Environment callable service CEE3ABD terminates your application with an abend. You can set the `clean-up` parameter value to determine how the abend is processed and how Language Environment handles the raised condition. For more information about CEE3ABD and `clean-up`, see *OS/390 Language Environment Programming Reference*.

You can specify the ABTERMENC run-time option to determine what action is taken when an unhandled condition of severity 2 or greater occurs. For more information on ABTERMENC, see “Establishing Enclave Termination Behavior for Unhandled Conditions” on page 22, as well as *OS/390 Language Environment Programming Reference*.

User Abends

If you receive a Language Environment abend code, see Chapter 16, “Language Environment Abend Codes” on page 743 for a list of abend codes, error descriptions, and programmer responses.

User abends, such as Language Environment 4xxx abends or abends raised by a call to the CEE3ABD service, can cause the generation of a system dump. Although system dumps are sometimes required for debugging complex error situations, it is usually better to generate a Language Environment-formatted dump. To request a Language Environment dump whenever an unhandled condition is raised, specify both TRAP(ON) and TERMTHDACT(DUMP) run-time options.

Your routine can also produce a Language Environment dump at any time by calling the CEE3DMP callable service (see “Generating a Language Environment Dump with CEE3DMP” on page 33). The TRAP(ON) run-time option causes the Language Environment condition handler to attempt to handle the system abend. For a detailed explanation of the run-time options and callable services discussed in this section, see *OS/390 Language Environment Programming Reference*.

System Abends

If you receive a system abend code, look up the code and the corresponding information in the publications for the system you are using.

When a system abend occurs, the operating system can generate a system dump. On OS/390, system dumps are written to ddname SYSMDUMP, SYSABEND, or SYSUDUMP. On VM, system dumps are sent to the user's virtual reader. System dumps show the memory state at the time of the condition. See “Generating a System Dump” on page 71 for more information about system dumps.

Chapter 3. Using Language Environment Debugging Facilities

This chapter describes methods of debugging routines in Language Environment. Currently, most problems in Language Environment and member language routines can be determined through the use of a debugging tool or through information provided in the Language Environment dump.

Debugging Tool

Debugging tools are designed to help you detect errors early in your routine. IBM offers Debug Tool, a comprehensive compile, edit, and debugging product that is provided with the C/C++, COBOL for OS/390 & VM, COBOL for MVS & VM, PL/I for MVS & VM, VisualAge PL/I, and VisualAge for Java compiler products.

You can use the IBM Debug Tool to examine, monitor, and control how your routines run, and debug your routines interactively or in batch mode. Debug Tool also provides facilities for setting breakpoints and altering the contents and values of variables. Language Environment run-time options can be used with Debug Tool to debug or analyze your routine. Refer to the Debug Tool publications for a detailed explanation of how to invoke and run Debug Tool.

You can also use **dbx** to debug Language Environment applications, including C/C++ programs. *OS/390 UNIX System Services Command Reference* has information on **dbx** subcommands, while *OS/390 UNIX System Services Programming Tools* contains usage information.

Language Environment Dump Service, CEE3DMP

The following sections provide information about using the Language Environment dump service, and describe the contents of the Language Environment dump.

There are three ways to invoke the Language Environment dump service:

- CEE3DMP callable service
- TERMTHDACT run-time option
- HLL-specific functions

Generating a Language Environment Dump with CEE3DMP

The CEE3DMP callable service generates a dump of the run-time environment for Language Environment and the member language libraries at the point of the CEE3DMP call. You can call CEE3DMP directly from an application routine.

Depending on the CEE3DMP options you specify, the dump can contain information about conditions, tracebacks, variables, control blocks, stack and heap storage, file status and attributes, and language-specific information.

On OS/390, all output from CEE3DMP is written to the default ddname CEEDUMP. CEEDUMP, by default, sends the output to the SDSF output queue. You can direct the output from the CEEDUMP to a specific sysout class by using the environment variable, _CEE_DMPTARG=SYSOUT(x), where x is the output class.

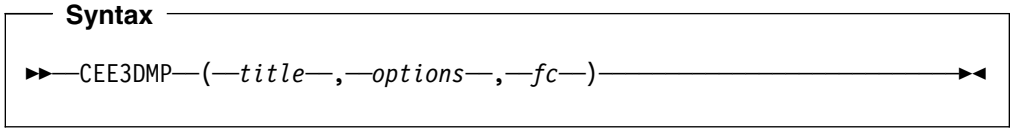
On CMS, output from the dump service is sent by default to the virtual printer. You can use the FNAME option to specify another ddname.

Under OS/390 UNIX System Services if the application is running in an address-space created as a result of a **fork()**, **spawn()**, **spawnp()**, **vfork()**, or one of the exec family of functions, then the CEEDUMP is placed in the HFS (or BFS on VM) in one of the following directories in the specified order:

1. the directory found in environment variable *_CEE_DMPTARG*, if found
2. the current working directory, if this is not the root directory (/), and the directory is writeable
3. the directory found in environment variable *TMPDIR* (an environment variable that indicates the location of a temporary directory if it is not /tmp)
4. the **/tmp** directory.

The syntax for CEE3DMP is:

Syntax



title
An 80-byte fixed-length character string that contains a title that is printed at the top of each page of the dump.

options
A 255-byte fixed-length character string that contains options describing the type, format, and destination of dump information. The options are declared as a string of keywords separated by blanks or commas. Some options also have suboptions that follow the option keyword, and are contained in parentheses. The last option declaration is honored if there is a conflict between it and any preceding options.

fc (output)
A 12-byte feedback token code that indicates the result of a call to CEE3DMP. If specified as an argument, feedback information, in the form of a condition token, is returned to the calling routine. If not specified, and the requested operation was not successfully completed, the condition is signaled to the condition manager.

Following is a list of CEE3DMP options and related information:

Dump Options	Abbreviation	Action Taken
ENCLAVE(ALL)	ENCL	Dumps all enclaves associated with the current process. (In ILC applications in which a C/C++ routine calls another member language routine, and that routine in turn calls CEE3DMP, traceback information for the C/C++ routine is not provided in the dump.) This is the default setting for ENCLAVE.

Dump Options	Abbreviation	Action Taken
ENCLAVE(CURRENT)	ENCL(CUR)	Dumps the current enclave. (On VM, only (CURRENT) and (1) values are supported for host services SVC LINK and CMSCALL, and PL/I FETCH/CALL of a fetchable main.)
ENCLAVE(n)	ENCL(n)	Dumps a fixed number of enclaves, indicated by *n*.
THREAD(ALL)	THR(ALL)	Dumps all threads in this enclave (including in a PL/I multitasking environment).
THREAD(CURRENT)	THR(CUR)	Dumps the current thread in this enclave.
TRACEBACK	TRACE	Includes a traceback of all active routines. The traceback shows transfer of control from either calls or exceptions. Calls include PL/I transfers of control from BEGIN-END blocks or ON-units.
NOTRACEBACK	NOTRACE	Does not include a traceback of all active routines.
FILES	FILE	Includes attributes of all open files. File control blocks are included when the BLOCKS option is also specified. File buffers are included when the STORAGE option is specified.
NOFILES	NOFILE	Does not include file attributes.
VARIABLES	VAR	Includes a symbolic dump of all variables, arguments, and registers.
NOVARIABLES	NOVAR	Does not include variables, arguments, and registers.
BLOCKS	BLOCK	Dumps control blocks from Language Environment and member language libraries. BLOCKS also dumps the Language Environment trace table if the TRACE run-time option is set to ON.
NOBLOCKS	NOBLOCK	Does not include control blocks.
STORAGE	STOR	Dumps the storage used by the routine. The number of routines dumped is controlled by the STACKFRAME option.
NOSTORAGE	NOSTOR	Suppresses storage dumps.
STACKFRAME(ALL)	SF(ALL)	Dumps all stack frames from the call chain. This is the default setting for STACKFRAME.

Dump Options	Abbreviation	Action Taken
STACKFRAME(n)	SF(n)	Dumps a fixed number of stack frames, indicated by *n*, from the call chain. The specific information dumped for each stack frame depends on the VARIABLES, BLOCK, and STORAGE options declarations. The first stack frame dumped is the caller of CEE3DMP, followed by its caller, and proceeding backward up the call chain.
PAGESIZE(n)	PAGE(n)	Specifies the number of lines on each page of the dump.
FNAME(s)	FNAME(s)	Specifies the ddname of the file to which the dump is written.
CONDITION	COND	Dumps condition information for each condition active on the call chain.
NOCONDITION	NOCOND	For each condition active on the call chain, does not dump condition information.
ENTRY	ENT	Includes a description of the program unit that called CEE3DMP and the registers on entry to CEE3DMP.
NOENTRY	NOENT	Does not include a description of the program unit that called CEE3DMP or registers on entry to CEE3DMP.

Note: On CICS, only (CURRENT) and (1) settings are supported.

The IBM-supplied default settings for CEE3DMP are:

```
TRACEBACK THREAD(CURRENT) FILES VARIABLES NOBLOCKS
NOSTORAGE STACKFRAME(ALL) PAGESIZE(60) FNAME(CEEDUMP)
CONDITION ENTRY
```

For additional information about the CEE3DMP callable service and dump options, see *OS/390 Language Environment Programming Reference*. For an example of a Language Environment dump, see “Understanding the Language Environment Dump” on page 40.

Generating a Language Environment Dump with TERMTHDACT

The TERMTHDACT run-time option produces a dump during program checks, abnormal terminations, or calls to the CEESGL service. You must use TERMTHDACT(DUMP) in conjunction with TRAP(ON) to generate a Language Environment dump.

You can use TERMTHDACT to produce a traceback, Language Environment dump, or user address space when a thread ends abnormally because of an unhandled condition of severity 2 or greater. If this is the last thread in the process, the enclave goes away. A thread terminating in a non-POSIX environment is analogous to an enclave terminating because Language Environment Version 1 supports only single threads. See *OS/390 Language Environment Programming Guide* for information on enclave termination.

The TERMTHDACT suboptions QUIET, MSG, TRACE, DUMP,UAONLY, UATRACE, UADUMP, and UAIMM control the level of information available. Following are the suboptions, the levels of information produced, and the destination of each.

Sub-option	Level of Information	Destination
QUIET	No information	No destination.
MSG	Message	Terminal or ddname specified in MSGFILE run-time option.
TRACE	Message and Language Environment dump containing only a traceback	Message goes to terminal or ddname specified in MSGFILE run-time option. Traceback goes to CEEDUMP file.
DUMP	Message and complete Language Environment dump	Message goes to terminal or ddname specified in MSGFILE run-time option. Language Environment dump goes to CEEDUMP file.
UAONLY	SYSMDUMP, SYSABEND dump, or SYSUDUMP depending on the DD card used in the JCL in OS/390. In CICS, a transaction dump is created. In non-CICS you will get a system dump of your user address space if the appropriate DD statement is used. **Note**: A Language Environment dump is not generated.	Language Environment generates a U4039 abend which allows a system dump of the user address space to be generated. For OS/390, the system dump is written to the ddname specified, for CMS it is written to FILEDEF, and for CICS the transaction dump goes to DFHDMPA or the DFHDMPB data set.
UATRACE	Message, Language Environment dump containing only a traceback, and a system dump of the user address space	Message goes to terminal or ddname specified in MSGFILE run-time option. Traceback goes to CEEDUMP file. Language Environment generates a U4039 abend which allows a system dump of the user address space to be generated. For OS/390 the system dump is written to the ddname specified, for CMS it is written to FILEDEF, and for CICS the transaction dump goes to DFHDMPA or the DFHDMPB data set.
UADUMP	Message, Language Environment dump, and SYSMDUMP, SYSABEND dump, or SYSUDUMP depending on the DD card used in the JCL in OS/390. In CICS, a transaction dump is created. In CMS, the VMDUMP facility is called.	Message goes to terminal or ddname specified in MSGFILE run-time option. Language Environment dump goes to CEEDUMP file. Language Environment generates a U4039 abend which allows a system dump of the user address space to be generated. For OS/390 the system dump is written to the ddname specified, for CMS it is written to FILEDEF, and for CICS the transaction dump goes to DFHDMPA or the DFHDMPB data set.

Sub-option	Level of Information	Destination
UAIMM	Language Environment generates a system dump of the original abend/program interrupt of the user address space. In CICS, a transaction dump is created. In non-CICS you will get a system dump of your user address space if the appropriate DD statement is used. After the dump is taken by the operating system, Language Environment condition manager continues processing. **Note**: Under CICS, UAIMM yields UAONLY behavior. Under non-CICS, TRAP(ON,NOSPIE) must be in effect. When TRAP(ON,SPIE) is in effect, UAIMM yields UAONLY behavior. For software raised conditions or signals, UAIMM behaves the same as UAONLY.	Message goes to terminal or ddname specified in MSGFILE run-time option. User address space dump goes to ddname specified for OS/390, FILEDEF for CMS, or CICS transaction dump goes to DFHDMPA or DFHDMPB data set.

The TRACE and UATRACE suboptions of TERMTHDACT use these dump options:

- ENCLAVE(ALL)
- NOENTRY
- CONDITION
- TRACEBACK
- THREAD(ALL)
- NOBLOCKS
- NOSTORAGE
- VARIABLES
- FILES
- STACKFRAME(ALL)
- PAGESIZE(60)
- FNAME(CEEDUMP)

The DUMP and UADUMP suboptions of TERMTHDACT use these dump options:

- ENCLAVE(ALL)
- NOENTRY
- CONDITION
- TRACEBACK
- THREAD(CURRENT)
- BLOCKS
- STORAGE
- VARIABLES
- FILES
- STACKFRAME(ALL)
- PAGESIZE(60)
- FNAME(CEEDUMP)

Although you can modify CEE3DMP options, you cannot change options for a traceback or dump produced by TERMTHDACT.

Considerations for Setting TERMTHDACT Options

The output of TERMTHDACT may vary depending upon which languages and subsystems are processing the request. This section describes the considerations associated with issuing the TERMTHDACT suboptions.

- COBOL Considerations
  - The following TERMTHDACT suboptions for COBOL are recommended, UAONLY, UATRACE, and UADUMP. A system dump will always be generated when one of these suboptions is specified.
- PL/I Considerations
  - After a normal return from a PL/I ERROR ON-unit, or from a PL/I FINISH ON-unit, Language Environment considers the condition unhandled. If a GOTO is not performed and the resume cursor is not moved, then the thread terminates. The TERMTHDACT setting guides the amount of information that is produced, so the message is not presented twice.
- PL/I MTF Considerations
  - TERMTHDACT applies to a task that terminates abnormally due to an unhandled condition of severity 2 or higher that is percolated beyond the initial routine's stack frame. All active subtasks that were created from the incurring task will terminate abnormally, but the enclave will continue to run.
- CICS Considerations
  - All TERMTHDACT output is written to a transient data queue named CESE. Since Language Environment does not own the ESTAE, the suboption UAIMM will be treated as UAONLY.
  - All associated Language Environment dumps will be suppressed if termination processing is the result of an EXEC CICS ABEND with NODUMP.
- OS/390 UNIX Considerations
  - The TERMTHDACT option applies when a thread terminates abnormally. Abnormal termination of a single thread causes termination of the entire enclave. If an unhandled condition of severity 2 or higher percolates beyond the first routine's stack frame the enclave terminates abnormally.
  - If an enclave terminates due to a POSIX default signal action, then TERMTHDACT applies to conditions that result from software signals, program checks, or abends.
  - If running under a shell and Language Environment generates a system dump, then a core dump is generated to a file based on the kernel environment variable, _BPXK_MDUMP.

See *OS/390 Language Environment Programming Reference* for more information about the TERMTHDACT run-time option.

Generating a Language Environment Dump with Language-Specific Functions

In addition to the CEE3DMP callable service and the TERMTHDACT run-time option, you can use language-specific routines such as C functions, the Fortran SDUMP service, and the PL/I PLIDUMP service to generate a dump.

C/C++ routines can use the functions *cdump()*, *csnap()*, and *ctrace()* to produce a Language Environment dump. All three functions call the CEE3DMP callable service, and each function includes an options string consisting of different CEE3DMP options that you can use to control the information contained in the dump. For more information on these functions, see “Generating a Language Environment Dump of a C/C++ Routine” on page 130.

Fortran programs can call SDUMP, DUMP/PDUMP, or CDUMP/CPDUMP to generate a Language Environment dump. CEE3DMP cannot be called directly from a Fortran program. For more information on these functions, see “Generating a Language Environment Dump of a Fortran Routine” on page 192.

PL/I routines can call PLIDUMP instead of CEE3DMP to produce a dump. PLIDUMP includes options that you can specify to obtain a variety of information in the dump. For a detailed explanation about PLIDUMP, see “Generating a Language Environment Dump of a PL/I Routine” on page 216.

Understanding the Language Environment Dump

The Language Environment dump service generates output of data and storage from the Language Environment run-time environment on an enclave basis. This output contains the information needed to debug most basic routine errors.

Figure 6 on page 46 illustrates a dump for enclave main. The example assumes full use of the CEE3DMP dump options. Ellipses are used to summarize some sections of the dump and information regarding unhandled conditions may not be present at all. Sections of the dump are numbered to correspond with the descriptions given in “Sections of the Language Environment Dump” on page 52.

The CEE3DMP was generated by the C program CELSAMP shown in Figure 4 on page 41. CELSAMP uses the DLL CELDLL shown in Figure 5 on page 45.

Figure 6 (Part 7 of 7). Example Dump Using CEE3DMP

Sections of the Language Environment Dump

The sections of the dump listed here appear independently of the Language Environment-conforming languages used. Each conforming language adds language-specific storage and file information to the dump.

For a detailed explanation of language-specific dump output:

- For C/C++ routines, see “Finding C/C++ Information in a Language Environment Dump” on page 142.
- For COBOL routines, see “Finding COBOL Information in a Dump” on page 173.
- For Fortran routines, see “Finding Fortran Information in a Language Environment Dump” on page 197.
- For PL/I routines, see “Finding PL/I Information in a Dump” on page 218.

[1] Page Heading

The page heading section appears on the top of each page of the dump and contains:

- CEE3DMP identifier
- Title

  For dumps generated as a result of an unhandled condition, the title is “Condition processing resulted in the Unhandled condition.”

- Product abbreviation of Language Environment
- Version number
- Release number
- Date
- Time
- Page number

[2] Caller Program Unit and Offset

This information identifies the routine name and offset in the calling routine of the call to the dump service.

[3] Registers on Entry to CEE3DMP

This section of the dump shows data at the time of the call to the dump service.

- Program mask

  The program mask contains the bits for the fixed-point overflow mask, decimal overflow mask, exponent underflow mask, and significance mask.

- General purpose registers (GPRs) 0–15

  On entry to CEE3DMP, the GPRs contain:

GPR 0	Working register
GPR 1	Pointer to the argument list
GPR 2–11	Working registers
GPR 12	Address of CAA
GPR 13	Pointer to caller's stack frame
GPR 14	Address of next instruction to run if the ALL31 run-time option is set to ON
GPR 15	Entry point of CEE3DMP

- Floating point registers (FPRs) 0, 2, 4, 6
- Storage pointed to by General Purpose Registers

  Treating the contents of each register as an address, 32 bytes before and 64 bytes after the address are shown.

[4]-[14] Enclave Information

These sections show information that is specific to an enclave. When multiple enclaves are dumped, these sections will appear for each enclave.

[4] Enclave Identifier

This statement names the enclave for which information in the dump is provided. If multiple enclaves exist, the dump service generates data and storage information for the most current enclave, followed by previous enclaves in a last-in-first-out (LIFO) order. For more information about dumps for multiple enclaves, see “Multienclave Dumps” on page 69.

[5]-[11] Thread Information

These sections show information that is specific to a thread. When multiple threads are dumped, these sections will appear for each thread.

[5] Information for thread

This section shows the system identifier for the thread. Each thread has a unique identifier.

[6] Traceback

In a multithread case, the traceback reflects only the current thread. For all active routines, the traceback section shows:

- Stack frame (DSA) address
- Program unit

  The primary entry point of the external procedure. For COBOL programs, this is the PROGRAM-ID name. For C, Fortran, and PL/I routines, this is the compile unit name. For Language Environment-conforming assemblers, this is either the EPNAME = value on the CEEPPA macro, or a fully qualified path name.
- Program unit address
- Program unit offset

  The offset of the last instruction to run in the routine. If the offset is a negative number, zero, or a very large positive number, the routine associated with the offset probably did not allocate a save area or the routine could have been called using SVC-assisted linkage. Adding the program unit address to the offset gives you the location of the current instruction in the routine. This offset is from the starting address of the routine.
- Entry

  For COBOL, Fortran, PL/I, and VisualAge PL/I routines, this is the entry point name. For C/C++ routines, this is the function name. If a function name or entry point was not specified for a particular routine, then the string '** NoName **' will appear.
- Entry point address
- Entry point offset
- Load module
- Service level

  The latest service level applied to the compile unit (for example, for IBM products, it would be the PTF number).
- Statement number

  The last statement to run in the routine. The statement number appears only if your routine was compiled with the options required to generate statement numbers.
- Status

  The reason Language Environment left the program or routine. The status can be either call or exception.

[7] Condition Information for Active Routines

This section displays the following information for all conditions currently active on the call chain:

- Statement showing failing routine and stack frame address of routine

- Condition information block (CIB) address
- Current condition, in the form of an Language Environment message for the condition raised or a Language Environment abend code, if the condition was caused by an abend
- Location

  For the failing routine, this is the program unit, entry routine, statement number, and offset.
- Machine state, which shows:
  - Instruction length counter (ILC)
  - Interruption code
  - *Program status word (PSW)*
  - Contents of GPRs 0–15
  - Storage dump near condition (2 hex-bytes of storage near the PSW)

  These values are the current values at the time the condition was raised.

[8] Arguments, Registers, and Variables for Active Routines

For each active routine, this section shows:

- Routine name and stack frame address
- Arguments

  For C/C++ and Fortran, arguments are shown here rather than with the local variables. For COBOL, arguments are shown as part of local variables. PL/I arguments are not displayed in the Language Environment dump.
- Saved registers

  This lists the contents of GPRs 0–15 at the time the routine transferred control.
- Storage pointed to by the saved registers

  Treating the saved contents of each register as an address, 32 bytes before and 64 bytes after the address shown.
- Local variables

  This section displays the local variables and arguments for the routine. This section also shows the variable type. Variables are displayed only if the symbol tables are available. To generate a symbol table and display variables, use the following compile options:
  - For C, use TEST(SYM).
  - For C++, use TEST.
  - For VS COBOL II, use FDUMP.
  - For COBOL/370, use TEST(SYM).
  - For COBOL for OS/390 & VM, use TEST(SYM).
  - For Fortran, use SDUMP.
  - For PL/I arguments and variables are not displayed.

[9] Control Blocks for Active Routines

For each active routine controlled by the STACKFRAME option, this section lists contents of related control blocks. The Language Environment-conforming language determines which language-specific control blocks appear. The possible control blocks are:

- Stack frame
- Condition information block
- Language-specific control blocks

[10] Storage for Active Routines

This displays local storage for each active routine. The storage is dumped in hexadecimal, with EBCDIC translations on the right side of the page. There can be other information, depending on the language used. For C/C++ routines, this is the stack frame storage. For COBOL programs, this is language-specific information, WORKING-STORAGE, and LOCAL-STORAGE.

[11] Control Blocks Associated with the Thread

This section lists the contents of the Language Environment common anchor area (CAA), thread synchronization queue element (SQEL) and dummy stack frame. Other language-specific control blocks can appear in this section.

[12] Enclave Control Blocks

This section lists the contents of the Language Environment enclave data block (EDB) and enclave member list (MEML). The information presented may vary depending on which run-time options are set.

- C If the POSIX run-time option is set to ON, this section lists the contents of the mutex and condition variable control blocks, the enclave level latch table, and the thread synchronization trace block and trace table.
- If DLLs have been loaded, this section shows information for each DLL including the DLL name, load address, use count, writeable static area (WSA) address, and the thread id of the thread that loaded the DLL.
- If the TRACE run-time option is set to ON, this section shows the contents of the Language Environment trace table.
- If the HEAPCHK run-time option is set to ON, this section shows the contents of the HEAPCHK options control block (HCOP) and the HEAPCHK element tables (HCEL). A HEAPCHK element table contains the location and length of all allocated storage elements for a heap in the order that they were allocated.

Other language-specific control blocks can appear in this section.

[13] Enclave Storage

This section shows the Language Environment heap storage. For C/C++ and PL/I routines, heap storage is the dynamically allocated storage. For COBOL programs, it is the storage used for WORKING-STORAGE data items. This section also shows the writeable static area (WSA) storage for program objects. Other language-specific storage can appear in this section.

[14] Process Control Blocks

This section lists the contents for the Language Environment process control block (PCB), process member list (MEML), and if the POSIX run-time option is set to ON, the process level latch table. Other language-specific control blocks can appear in this section.

Debugging with Specific Sections of the Language Environment Dump

The following sections describe how you can use particular blocks of the dump to help you debug errors.

The Tracebacks, Condition Information, and Data Values Section

The CEE3DMP call with dump options TRACEBACK, CONDITION, and VARIABLES generates output that contains a traceback, information about any conditions, and a list of arguments, registers, and variables.

The traceback, condition, and variable information provided in the Language Environment dump can help you determine the location and context of the error without any additional information. The traceback section includes a sequential list for all active routines and the routine name, statement number, and offset where the exception occurred. The condition information section displays a message describing the condition and the address of the condition information block. The arguments, registers, and variables section shows the values of your arrays, structures, arguments, and data during the sequence of calls in your application. Static data values do not appear. Single quotes indicate character fields.

These sections of the dump are shown in Figure 6 on page 46.

The Stack Frame Section

The stack frame, also called dynamic save area (DSA), for each active routine is listed in the full dump.

A stack frame chain is associated with each thread in the run-time environment and is acquired every time a separately compiled procedure or block is entered. A stack frame is also allocated for each call to a Language Environment service. All stack frames are back-chained with a stopping stack frame (also called a dummy DSA) as the first stack frame on the stack. Register 13 addresses the recently active stack frame or a standard register save area (RSA). The standard save area back chain must be initialized, and it holds the address of the previous save area. Not all Language Environment-conforming compilers set the forward chain; thus, it cannot be guaranteed in all instances. Calling routines establish the member-defined fields.

When a routine makes a call, registers 0–15 contain the following values:

- R1 is a pointer to parameter list or 0 if no parameter list passed.
- R0, R2–R11 is unreferenced by Language Environment. Caller's values are passed transparently.
- R12 is the pointer to the CAA if entry to an external routine.
- R13 is the pointer to caller's stack frame.
- R14 is the return address.
- R15 is the address of the called entry point.

With an optimization level other than 0, C/C++ routines save only the registers used during the running of the current routine. Non-Language Environment RSAs can be in the save area chain. The length of the save area and the saved register contents do not always conform to Language Environment conventions. For a detailed description of stack frames Language Environment storage management, see *OS/390 Language Environment Programming Guide*. Figure 7 on page 58 shows the format of the stack frame.

Note: The *Member defined* fields are reserved for the specific, higher level language.

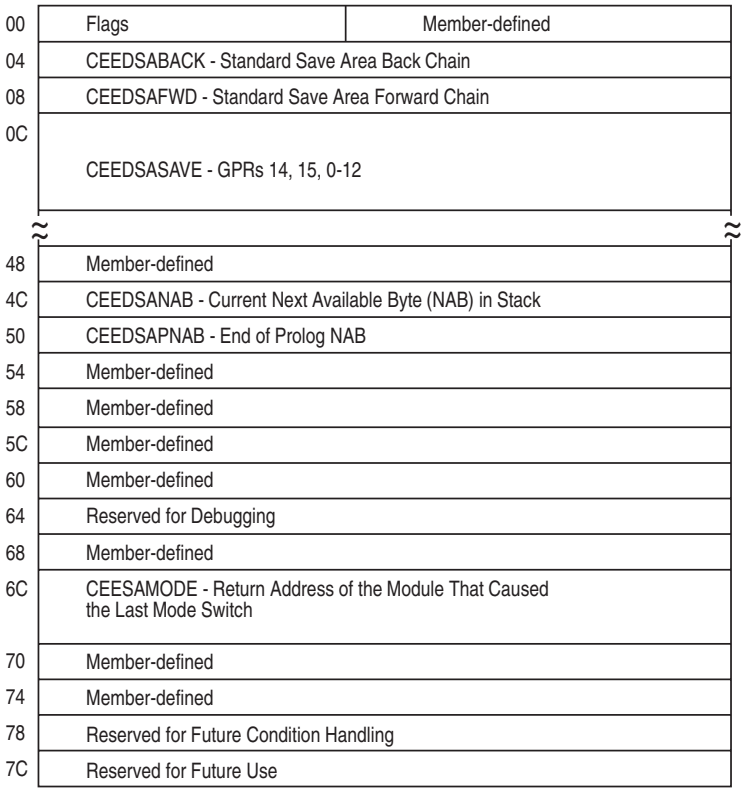

Figure 7. Stack Frame Format

The Common Anchor Area

Each thread is represented by a common anchor area (CAA), which is the central communication area for Language Environment. All thread- and enclave-related resources are anchored, provided for, or can be obtained through the CAA. The CAA is generated during thread initialization and deleted during thread termination. When calling Language Environment-conforming routines, register 12 points to the address of the CAA.

Use CAA fields as described. Do not modify fields and do not use routine addresses as entry points, except as specified. Fields marked 'Reserved' exist for migration of specific languages, or internal use by Language Environment. Language Environment defines their location in the CAA, but not their use. Do not use or reference them except as specified by the language that defines them.

Figure 8 on page 59 shows the format of the Language Environment CAA.

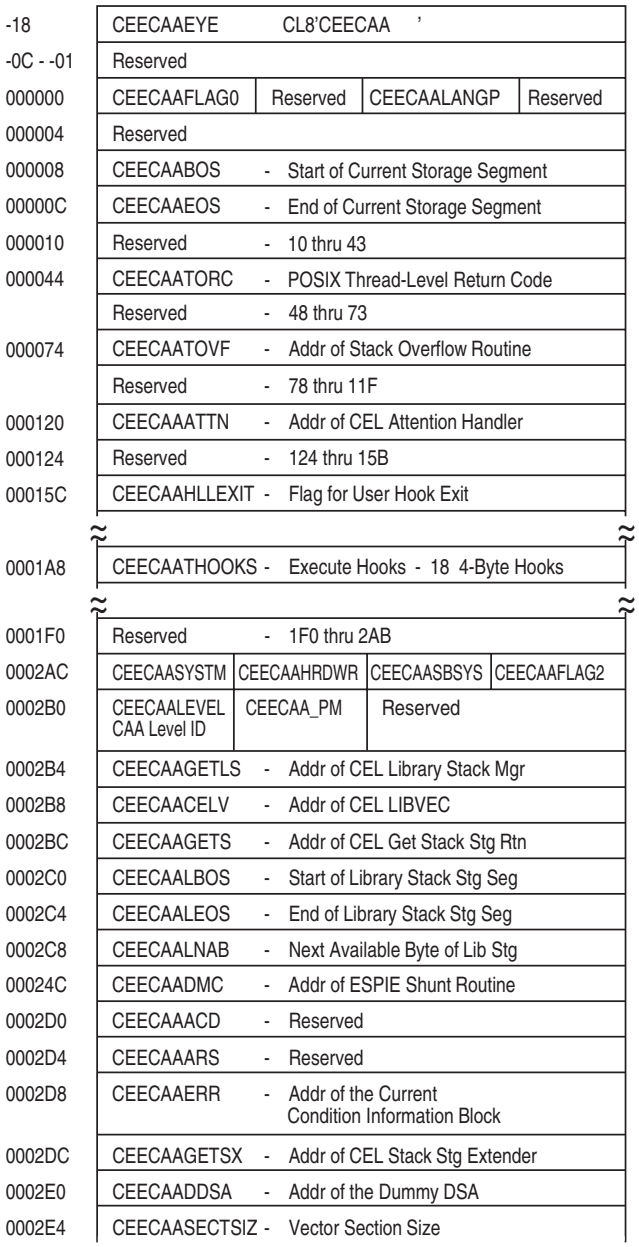

Figure 8 (Part 1 of 2). Common Anchor Area

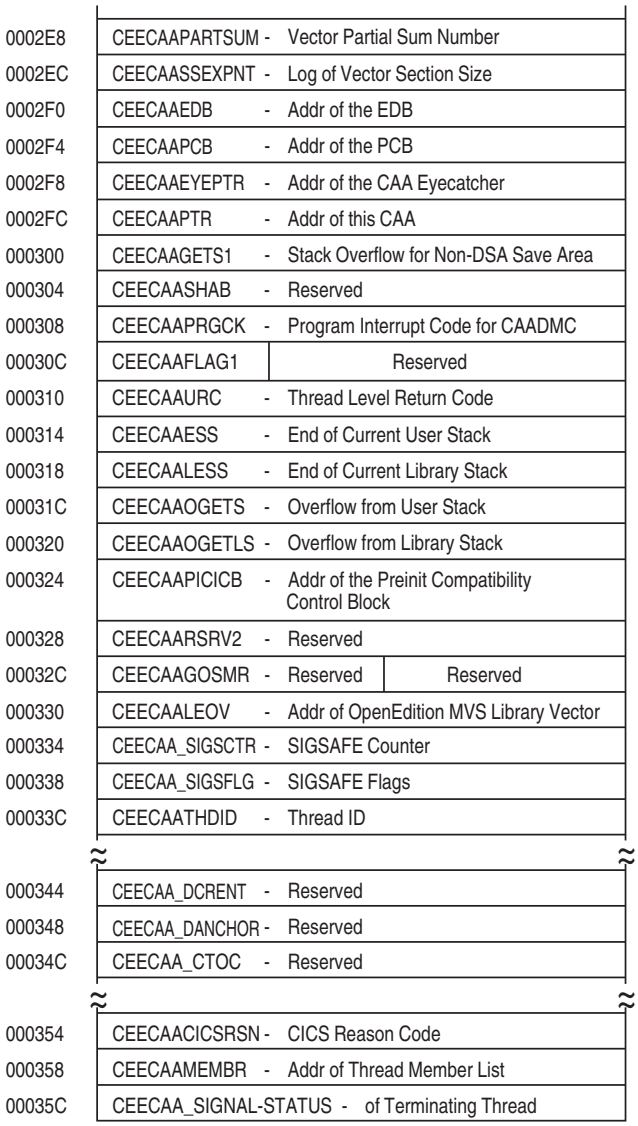

Figure 8 (Part 2 of 2). Common Anchor Area

Table 3 contains a list of CAA fields:

Table 3 (Page 1 of 6). List of CAA Fields

CAA Field	Explanation
CEECAAFLAG0	CAA flag bits. The bits are defined as follows: **Bit** **Description** **0–5** Reserved. **6** CEECAAXHDL. A flag used by the condition handler. If the flag is set to 1, the application requires immediate return/percolation to the system on any interrupt or condition handler event. **7** Reserved.

Table 3 (Page 2 of 6). List of CAA Fields

CAA Field	Explanation
CEECAALANGP	PL/I language compatibility flags external to Language Environment. The bits are defined as follows: **Bit** **Description** **0–3** Reserved. **4** CEECAATHFN. A flag set by PL/I to indicate a PL/I FINISH ON-unit is active. If the flag is set to 1, no PL/I FINISH ON-unit is active. If the flag is set to 0, a PL/I FINISH ON-unit could be active. **5–7** Reserved.
CEECAABOS	Start of the current storage segment. This field is initially set during thread initialization. It indicates the start of the current stack storage segment. It is altered when the current stack storage segment is changed.
CEECAAEOS	End of the current storage segment. This field is initially set during thread initialization. It indicates the end of the current stack storage segment. It is altered when the current stack storage segment is changed.
CEECAATORC	Thread level return code. The thread level return code set by CEESRC callable service.
CEECAATOVF	Address of stack overflow routine.
CEECAAATTN	Address of the Language Environment attention handling routine. The address of the Language Environment attention handling routine supports common run-time environment's polling code convention for attention processing.
CEECAAHLLEXIT	Address of the Exit List Control Block set by the HLL user exit CEEBINT.
CEECAAHOOKS	Hook area. This is the start of 18 fullword execute hooks. Language Environment initializes each fullword to X'07000000'. The hooks can be altered to support various debugging hook mechanisms.
CEECAASYSTM	Underlying operating system. The value indicates the operating system supporting the active environment. **Value** **Operating System** **0** Undefined. This value should not appear after Language Environment is initialized. **1** Unsupported. **2** VM. **3** OS/390.

Table 3 (Page 3 of 6). List of CAA Fields

CAA Field	Explanation
CEECAAHRDWR	Underlying hardware. This value indicates the type of hardware on which the routine is running. **Value** **Hardware** **0** Undefined. This value should not appear after Language Environment is initialized. **1** Unsupported. **2** System/370, non-XA. **3** System/370, XA. **4** System/370, ESA.
CEECAASBSYS	Underlying subsystem. This value indicates the subsystem (if any) on which the routine is running. **Value** **Subsystem** **0** Undefined. This value should not occur after Language Environment is initialized. **1** Unsupported. **2** None. The routine is not running under a Language Environment-recognized subsystem. **3** TSO. **4** IMS. **5** CICS.
CEECAAFLAG2	CAA Flag 2. **Bit** **Description** **0** Bimodal addressing is available. **1** Vector hardware is available. **2** Thread terminating. **3** Initial thread. **4** Library trace is active. The TRACE run-time option was set. **5** Reserved. **6** CEECAA_ENQ_Wait_Interruptible. Thread is in an enqueue wait. **7** Reserved.
CEECAALEVEL	Language Environment level identifier. This contains a unique value that identifies each release of Language Environment. This number is incremented for each new release of Language Environment.
CEECAA_PM	Image of current program mask.
CEECAAGETLS	Address of stack overflow for library routines.
CEECAACELV	Address of the Language Environment library vector. This field is used to locate dynamically loaded Language Environment routines.

Table 3 (Page 4 of 6). List of CAA Fields

CAA Field	Explanation
CEECAAGETS	Address of the Language Environment prolog stack overflow routine. The address of the Language Environment get stack storage routine is included in prolog code for fast reference.
CEECAALBOS	Start of the library stack storage segment. This field is initially set during thread initialization. It indicates the start of the library stack storage segment. It is altered when the library stack storage segment is changed.
CEECAALEOS	End of the library stack storage segment. This field is initially set during thread initialization. It indicates the end of the library stack storage segment. It is altered when the library stack storage segment is changed.
CEECAALNAB	Next available library stack storage byte. This contains the address of the next available byte of storage on the library stack. It is modified when library stack storage is obtained or released.
CEECAADMC	Language Environment shunt routine address. Its value is initially set to 0 during thread initialization. If it is nonzero, this is the address of a routine used in specialized exception processing.
CEECAAACD	Most recent CAASHAB abend code.
CEEAAABCODE	Most recent abend completion code.
CEECAAARS	Most recent CAASHAB reason code.
CEECAAARSNCODE	Most recent abend reason code.
CEECAAERR	Address of the current condition information block. After completion of initialization, this always points to a condition information block. During exception processing, the current condition information block contains information about the current exception being processed. Otherwise, it indicates no exception being processed.
CEECAAGETSX	Address of the user stack extender routine. This routine is called to extend the current stack frame in the user stack. Its address is in the CEECAA for performance reasons.
CEECAADDSA	Address of the Language Environment dummy DSA. This address determines whether a stack frame is the dummy DSA, also known as the zeroth DSA.
CEECAASECTSIZ	Vector section size. This field is used by the vector math services.
CEECAAPARTSUM	Vector partial sum number. This field is used by the vector math services.
CEECAASSEXPNT	Log of the vector section size. This field is used by the vector math services.
CEECAAEDB	Address of the Language Environment EDB. This field points to the encompassing EDB.
CEECAAPCB	Address of the Language Environment PCB. This field points to the encompassing PCB.

Table 3 (Page 5 of 6). List of CAA Fields

CAA Field	Explanation
CEECAAEYEPTR	Address of the CAA eye catcher. The CAA eye catcher is CEECAA. This field can be used for validation of the CAA.
CEECAAPTR	Address of the CAA. This field points to the CAA itself and can be used in validation of the CAA.
CEECAAGETS1	Non-DSA stack overflow. This field is the address of a stack overflow routine, which cannot guarantee that the current register 13 is pointing at a stack frame. Register 13 must point, at a minimum, to a save area.
CEECAASHAB	ABEND shunt routine. Its value is initially set to zero during thread initialization. If it is nonzero, this is the address of a routine used in specialized exception processing for ABENDs that are intercepted in the ESTAE exit.
CEECAAPRGCK	Routine interrupt code for CEECAADMC. If CEECAADMC is nonzero, and a routine interrupt occurs, this field is set to the routine interrupt code and control is passed to the address in CEECAAMDC.
CEECAAFLAG1	CAA flag bits. The bits are defined as follows: **Bit** **Description** **0** CEECAASORT. A call to DFSORT is active. **1–7** Reserved.
CEECAAURC	Thread level return code. This is the common place for members to set the return codes for subroutine-to-subroutine return code processing.
CEECAAESS	End of current user stack.
CEECAALESS	End of current library stack.
CEECAAOGETS	Overflow from user stack allocations.
CEECAAOGETLS	Overflow from library stack allocations.
CEECAARSRV1	Reserved.
CEECAAPICICB	Address of the preinitialization compatibility control block.
CEECAAOGETSX	User DSA exit from OPLINK.
CEECAARSRV2	Reserved.
CEECAAGOSMR	Go some more—Used CEEHTRAV multiple.
CEECAALEOV	This field is the address of the Language Environment library vector for OS/390 UNIX support.
CEECAA_SIGSCTR	SIGSAFE counter.

Table 3 (Page 6 of 6). List of CAA Fields

CAA Field	Explanation
CEECAA_SIGSFLG	SIGSAFE flags. SIGSAFE flags indicate the signal safety of the library. **Bit** **Description** **0** CEECAA_SIGPUTBACK. The signal cannot be delivered, therefore the signal is put back to the kernel. **1–2** Reserved. **3** CEECAA_SIGSAFE. It is safe to deliver the signal, while in library code. **4** CEECAA_CANCELSAFE. It is safe to deliver the cancel signal, while in library code.
CEECAATHDID	Thread id. This field is the thread identifier.
CEECAA_DCRENT	DCE's read/write static external anchor.
CEECAA_DANCHOR	DCE's per-thread anchor.
CEECAA_CTOC	TOC anchor for CRENT.
CEECAACICSRSN	CICS reason code from member language.
CEECAAMEMBR	Address of thread-level member list.
CEECAA_SIGNAL_STATUS	Signal status of the terminating thread member list.

The Condition Information Block

The Language Environment condition manager creates a condition information block (CIB) for each condition encountered in the Language Environment environment. The CIB holds data required by the condition handling facilities and pointers to locations of other data. The address of the current CIB is located in the CAA.

For COBOL, Fortran, and PL/I applications, Language Environment provides macros (in the SCEESAMP data set) that map the CIB. For C/C++ applications, the macros are in `leawi.h`.

Figure 9 on page 66 shows the condition information block.

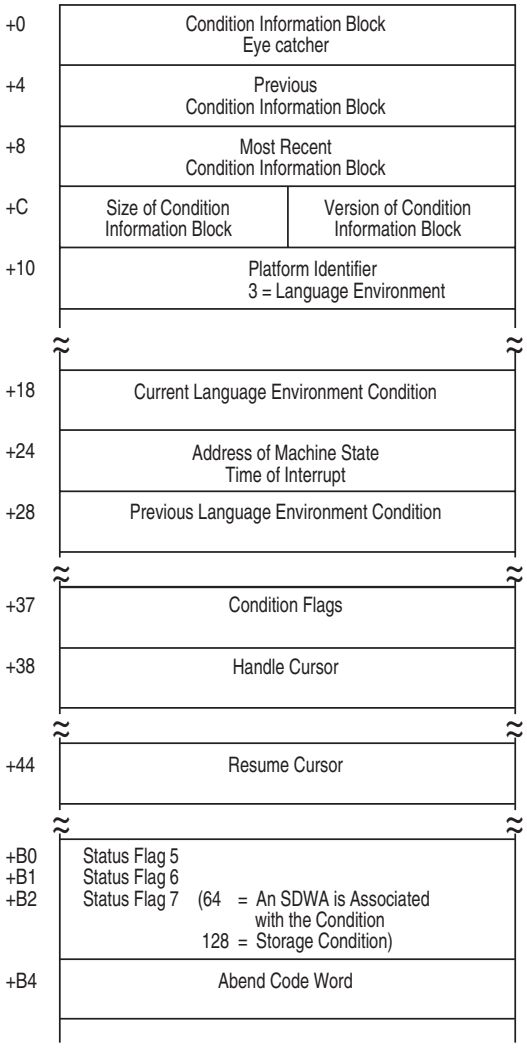

Figure 9 (Part 1 of 2). Condition Information Block

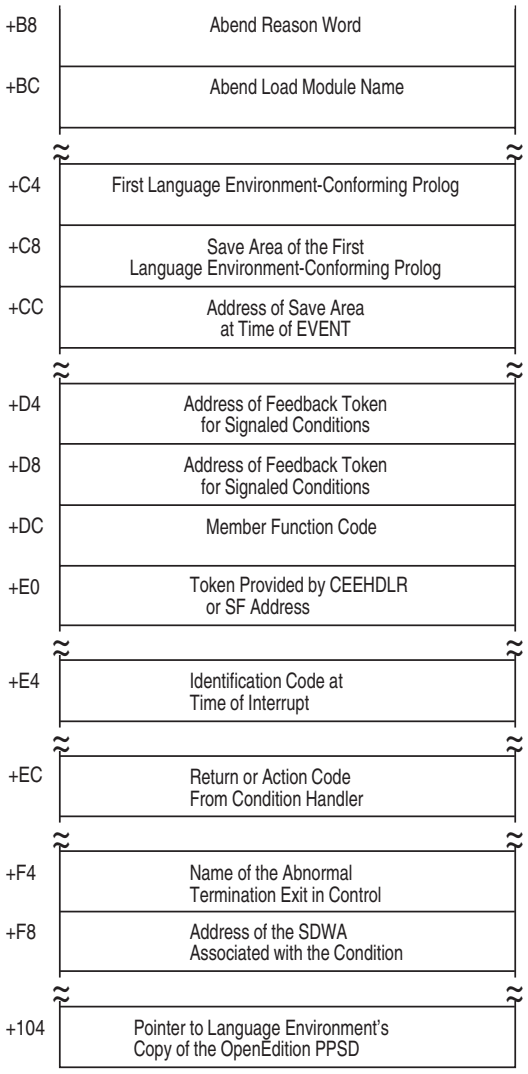

Figure 9 (Part 2 of 2). Condition Information Block

The flags for Condition Flag 4:

2 The resume cursor has been moved
4 Message service has processed the condition
8 The resume cursor has been moved explicitly

The flags for Status Flag 5, Language Environment events:

1 Caused by an attention interrupt
2 Caused by a signaled condition
4 Caused by a promoted condition
8 Caused by a condition management raised TIU
32 Caused by a condition signaled via CEEOKILL [1]
64 Caused by a program check

[1] The signaled via CEEOKILL flag is always set with the signaled flag; thus, a signaled condition can have a value of either 2 or 34. (The value is 2 if the signaled condition does not come through CEEOKILL. If it comes through CEEOKILL, its value is 2+32=34.)

128 Caused by an abend

The flags for Status Flag 6, Language Environment actions:

2 Doing stack frame zero scan
4 H-cursor pointing to owning SF
8 Enable only pass (no condition pass)
16 MRC type 1
32 Resume allowed
64 Math service condition
128 Abend reason code valid

The language-specific function codes for the CIB:

X'1' For condition procedure
X'2' For enablement
X'3' For stack frame zero conditions

Using the Machine State Information Block: The Language Environment machine state information block contains condition information pertaining to the hardware state at the time of the error. Figure 10 shows the machine state information block.

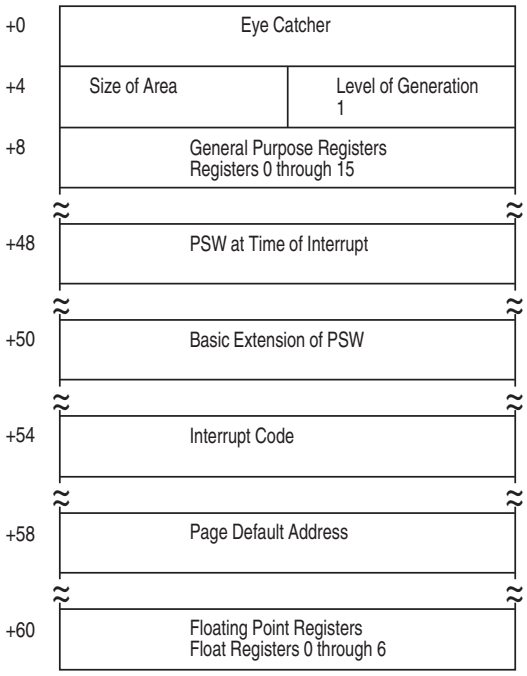

Figure 10. Machine State Information Block

Multienclave Dumps

If multiple enclaves are used, the dump service generates data and storage information for the most current enclave and moves up the chain of enclaves to the starting enclave in a LIFO order. For example, if two enclaves are used, the dump service first generates output for the most current enclave. Then the service creates output for the previous enclave. A thread terminating in a non-POSIX environment is analogous to an enclave terminating because Language Environment Version 1 supports only single threads.

Figure 11 on page 70 illustrates the information available in the Language Environment dump and the order of information for multiple enclaves.

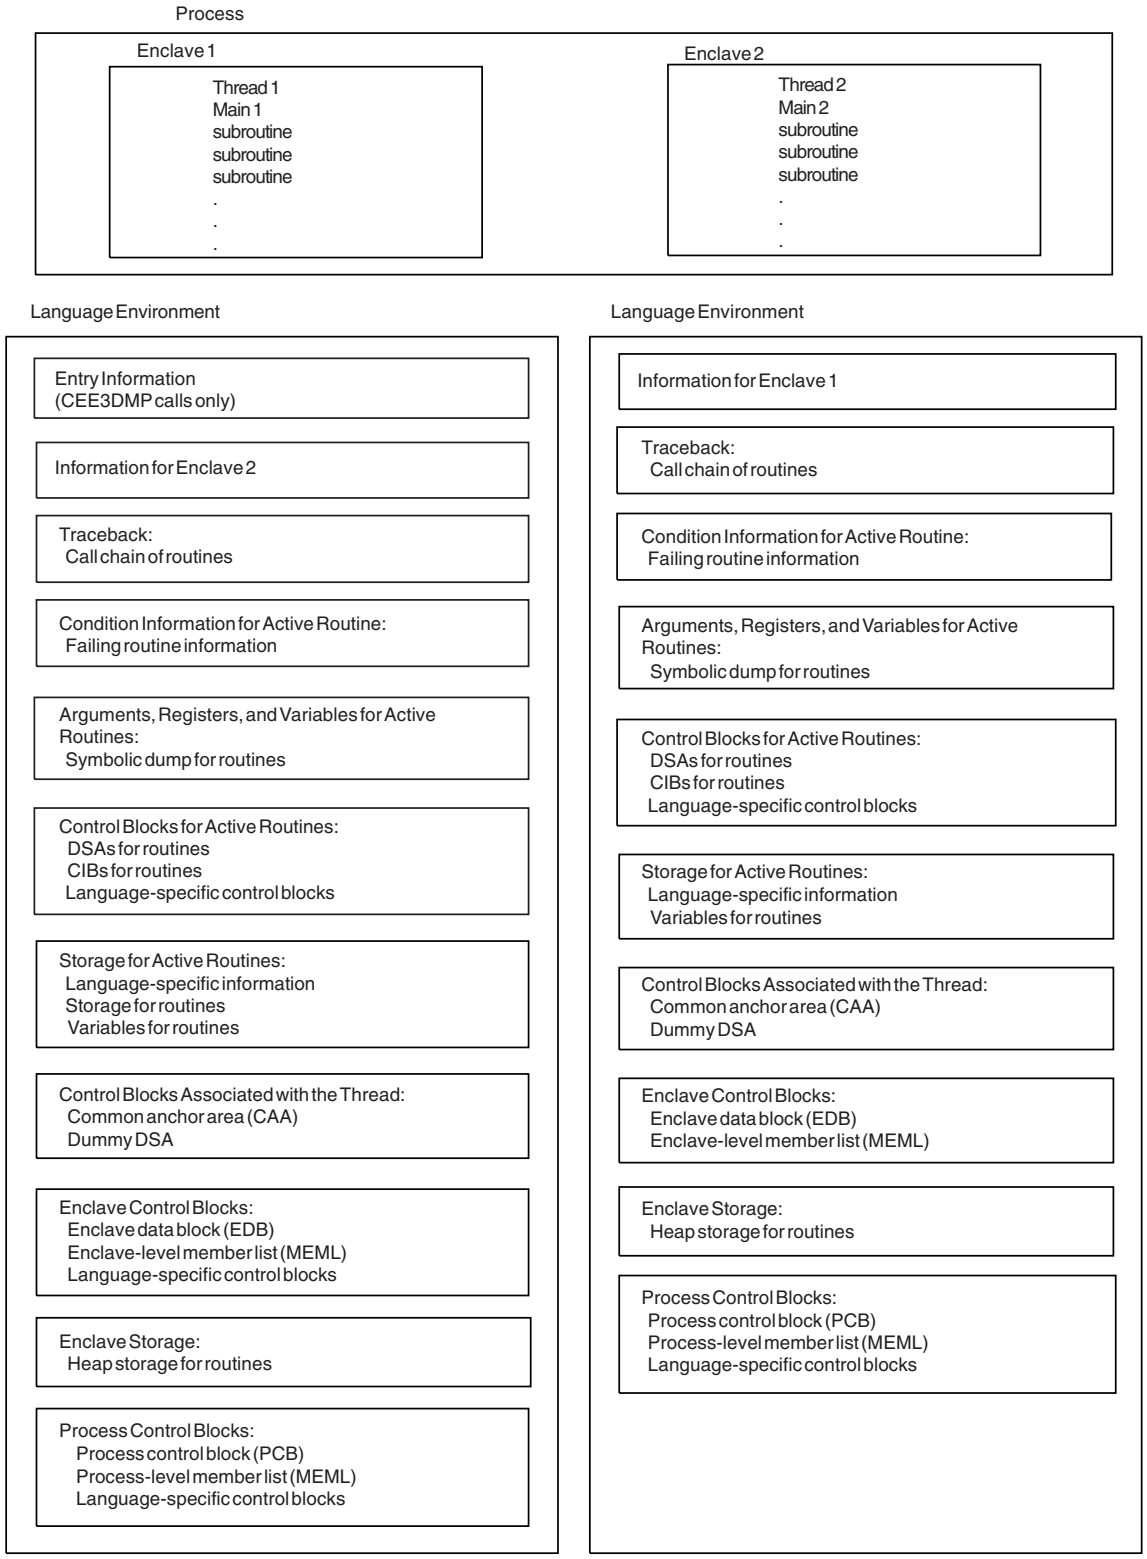

Figure 11. Language Environment Dump of Multiple Enclaves

Generating a System Dump

A system dump contains the storage information needed to diagnose errors. You can use Language Environment to generate a system dump though any of the following methods:

TERMTHDACT(UAONLY, UATRACE, or UADUMP)
You can use these run-time options, with TRAP(ON), to generate a system dump if an unhandled condition of severity 2 or greater occurs. See “Generating a Language Environment Dump with TERMTHDACT” on page 36 for further details regarding the level of dump information produced by each of the TERMTHDACT suboptions.

TRAP(ON,NOSPIE) TERMTHDACT(UAIMM)
TRAP(ON,NOSPIE) TERMTHDACT(UAIMM) generates a system dump of the user address space of the original abend or program interrupt prior to the Language Environment condition manager processing the condition.

ABPERC(abcode)
The ABPERC run-time option specifies one abend code that is exempt from the Language Environment condition handler. The Language Environment condition handler percolates the specified abend code to the operating system. The operating system handles the abend and generates a system dump.

ABPERC is ignored under CICS.

Abend Codes in Initialization Assembler User Exit
Abend codes listed in the initialization assembler user exit are passed to the operating system. The operating system can then generate a system dump.

CEE3ABD
You can use the CEE3ABD callable service to cause the operating system to handle an abend.

Refer to system or subsystem documentation for detailed system dump information. If you are running under VM, refer to the system documentation for the procedures to generate and interpret a system dump.

The method for generating a system dump varies for each of the Language Environment run-time environments. The following sections describe the recommended steps needed to generate a system dump in a batch, IMS, CICS, and the OS/390 UNIX shell run-time environments. Other methods may exist, but these are the recommended steps for generating a system dump.

See *OS/390 Language Environment Programming Guide* for details on setting Language Environment run-time options.

Generating a System Dump in a Batch Run-Time Environment

To generate a system dump in a batch run-time environment complete the following steps:

1. Specify run-time options TERMTHDACT(UAONLY, UADUMP, UATRACE, or UAIMM), and TRAP(ON). If you specify the suboption UAIMM then you must set TRAP(ON,NOSPIE). The TERMTHDACT suboption determines the level of detail of the Language Environment formatted dump. See “Generating a Language Environment Dump with TERMTHDACT” on page 36 for further details on the TERMTHDACT suboptions.

2. Include a SYSMDUMP DD card with the desired data set name and DCB information: LRECL=4160, BLKSIZE=4160, and RECFM=FBS.
3. Rerun the program.

Generating a System Dump in an IMS Run-Time Environment

To generate a system dump in an IMS run-time environment you must complete the following steps:

1. Specify run-time options TERMTHDACT(UAONLY, UADUMP, UATRACE, or UAIMM), ABTERM(ABEND), and TRAP(ON). If you specify the suboption UAIMM then you must set TRAP(ON,NOSPIE). The TERMTHDACT suboption determines the level of detail of the Language Environment formatted dump. See “Generating a Language Environment Dump with TERMTHDACT” on page 36 for further details on the TERMTHDACT suboptions.

   Note: In an IMS environment you can only use CEEUOPT, CEEDOPT, or CEEROPT to change run-time options. CEEUOPT cannot be used by OS/VS COBOL or non-Language Environment assembler.
2. Include a SYSMDUMP DD card with the desired data set name and DCB information: LRECL=4160, BLKSIZE=4160, and RECFM=FBS.
3. Rerun the program.

Generating a System Dump in a CICS Run-Time Environment

Under CICS, a system dump provides the most useful information for diagnosing problems. To generate a system dump perform the following steps:

1. Specify run-time options TERMTHDACT(UAONLY, UADUMP, or UATRACE), ABTERM(ABEND), and TRAP(ON). The TERMTHDACT suboption determines the level of detail of the Language Environment formatted dump. See “Generating a Language Environment Dump with TERMTHDACT” on page 36 for further details on the TERMTHDACT suboptions.
2. Update the transaction dump table with the CICS supplied CEMT command,

   ```
   CEMT SET TRD(40XX) SYS ADD
   ```

   A sample CEMT output is shown:

   ```
   STATUS: RESULTS - OVERTYPE TO MODIFY
   Trd(4088)  Sys    Loc Max( 999 )  Cur(0000)
   ```
3. Rerun the program.

If you have a Language Environment U4038 abend CICS will not generate a system dump. In order to generate diagnostic information you must create a Language Environment U4039 abend by performing the following steps:

1. Specify DUMP=YES in CICS DFHSIT
2. Relink your program by including CEEUOPT.

   Note: CEEUOPT cannot be used by OS/VS COBOL or non-Language Environment assembler.
3. Take CEECOPT from SCEESAMP and modify the Language Environment run-time options TERMTHDACT(UAONLY, UATRACE, or UADUMP), ABTERM(ABEND), and TRAP(ON). By setting these run-time options a Language Environment U4039 abend occurs which generates a system dump.

4. Rerun the program

Note: In the CICS run-time environment the TERMTHDACT suboption UAIMM is processed the same as UAONLY.

Generating a System Dump in an OS/390 UNIX Shell

To generate a system dump from an OS/390 UNIX shell perform the following steps:

1. Specify where to write the system dump
   - To write the system dump to an OS/390 data set, issue the command:

     ```
     export _BPXK_MDUMP=filename
     ```

     where *filename* is a fully qualified OS/390 data set name with DCB information: LRECL=4160, BLKSIZE=4160, and RECFM=FBS, e.g.

     ```
     export _BPXK_MDUMP=hlq.mydump
     ```

   - To write the system dump to an HFS file, issue the command:

     ```
     export _BPXK_MDUMP=filename
     ```

     where *filename* is a fully qualified HFS filename, e.g.

     ```
     export _BPXK_MDUMP=/tmp/mydump.dmp
     ```

2. Specify Language Environment run-time options:

   ```
   export _CEE_RUNOPT="termthdact(suboption)"
   ```

   where *suboption* = UAONLY, UADUMP, UATRACE, or UAIMM. If UAIMM is set, TRAP(ON,NOSPIE) must also be set. The TERMTHDACT suboption determines the level of detail of the Language Environment formatted dump. See “Generating a Language Environment Dump with TERMTHDACT” on page 36 for further details regarding the TERMTHDACT suboptions.
3. Rerun the program.
4. The system dump is written to the data set name or HFS filename specified.

See *OS/390 UNIX System Services Command Reference* for additional BPXK_MDUMP information.

You can also specify the signal SIGDUMP on the kill command to generate a system dump of the user address space. See *OS/390 UNIX System Services Command Reference* for more information regarding the SIGDUMP signal.

Formatting and Analyzing System Dumps on OS/390

On OS/390, you can use the interactive problem control system (IPCS) to format and analyze OS/390 system dumps. Language Environment provides an IPCS verbexit LEDATA that can be used to format Language Environment control blocks.

For more information on using IPCS, refer to *OS/390 MVS IPCS User's Guide*.

Preparing to Use the Language Environment IPCS Verbexit LEDATA

Before you can use IPCS to format Language Environment control blocks, you must:

- Ensure that your IPCS job can find the CEEIPCSP member.

  IPCS provides an exit control table with imbed statements to enable other products to supply exit control information. The IPCS default table, BLSCECT, normally in the SYS1.PARMLIB library, has the following entry for Language Environment:

  ```
  IMBED MEMBER(CEEIPCSP) ENVIRONMENT(IPCS)
  ```

  The Language Environment-supplied CEEIPCSP member, installed in the SYS1.PARMLIB library, contains the Language Environment-specific entries for the IPCS exit control table.

  Provide an IPCSPARM DD statement to specify the libraries containing the IPCS control tables. For example:

  ```
  //IPCSPARM  DD  DSN=SYS1.PARMLIB,DISP=SHR
  ```

- Ensure that your IPCS job can find the Language Environment-supplied dump exit routines installed in the SYS1.MIGLIB library.

Language Environment IPCS Verbexit – LEDATA

Use the LEDATA verbexit to format data for the Language Environment component of OS/390. This verbexit provides information about the following topics:

- A summary of the Language Environment at the time of the dump
- Run-time Options
- Storage Management Control Blocks
- Condition Management Control Blocks
- Message Handler Control Blocks
- C/C++ Control Blocks
- COBOL Control Blocks

Format

Syntax

```
VERBEXIT LEDATA [ 'parameter[,parameter]...']

    Report Type Parameters:
        [ SUM ]
        [ HEAP  |  STACK  | SM ]
        [ CM ]
        [ MH ]
        [ CEEDUMP ]
        [ ALL ]
    Data Selection Parameters:
        [ DETAIL  |  EXCEPTION ]
    Control Block Selection Parameters:
        [ CAA(caa-address) ]
        [ DSA(dsa-address) ]
        [ TCB(tcb-address) ]
        [ ASID(address-space-id) ]
```

Parameters

Report Type Parameters

Use these parameters to select the type of report. You can specify as many reports as you wish. If you omit these parameters, the default is SUMMARY.

SUMmary

Requests a summary of the Language Environment at the time of the dump. The following information is included:

- TCB address
- Address Space Identifier
- Language Environment Release
- Active members
- Formatted CAA, PCB, RCB, EDB and PMCB
- Run-time Options in effect

HEAP | STACK | SM

HEAP

Requests a report on Storage Management control blocks pertaining to HEAP storage, as well as a detailed report on heap segments. The detailed report includes information about the free storage tree in the heap segment, and information about each allocated storage element.

STACK

Requests a report on Storage Management control blocks pertaining to STACK storage.

SM

Requests a report on Storage Management control blocks. This is the same as specifying both HEAP and STACK.

CM
Requests a report on Condition Management control blocks.

MH
Requests a report on Message Handler control blocks.

CEEdump
Requests a CEEDUMP-like report. Currently this includes the traceback, the Language Environment trace, and thread synchronization control blocks at process, enclave and thread levels.

ALL
Requests all above reports, as well as C/C++ and COBOL reports.

Data Selection Parameters: Data selection parameters limit the scope of the data in the report. If no data selection parameter is selected, the default is DETAIL.

DETail
Requests formatting all control blocks for the selected components. Only significant fields in each control block are formatted.

Note: For the Heap and Storage Management Reports, the DETAIL parameter will provide a detailed heap segment report for each heap segment in the dump. The detailed heap segment report includes information on the free storage tree in the heap segments, and all allocated storage elements. This report will also identify problems detected in the heap management data structures. For more information about the Heap Reports, see “Understanding the HEAP LEDATA Output” on page 89.

EXCeption
Requests validating all control blocks for the selected components. Output is only produced naming the control block and its address for the first control block in a chain that is invalid. Validation consists of control block header verification at the very least.

Note: For the Summary, CEEDUMP, C/C++, and COBOL reports, the EXCEPTION parameter has not been implemented. For these reports, DETAIL output is always produced.

Control Block Selection Parameters: Use these parameters to select the CAA and DSA control blocks used as the starting points for formatting.

CAA(caa-address)
specifies the address of the CAA. If not specified, the CAA address is obtained from the TCB.

DSA(dsa-address)
specifies the address of the DSA. If not specified, the DSA address is assumed to be the register 13 value for the TCB.

TCB(tcb-address)
specifies the address of the TCB. If not specified, the TCB address of the current TCB from the CVT is used.

ASID(address-space-id)
specifies the hexadecimal address space id. If not specified, the IPCS default address space id is used. This parameter is not needed when the dump only has one address space.

Understanding the Language Environment IPCS Verbexit LEDATA Output

The Language Environment IPCS Verbexit LEDATA generates formatted output of the Language Environment run-time environment control blocks from a system dump. Figure 12 illustrates the output produced when the LEDATA Verbexit is invoked with the ALL parameter. The system dump being formatted was obtained by specifying the TERMTHDACT(UADUMP) run-time option when running the program CELSAMP in Figure 4 on page 41. “Sections of the Language Environment LEDATA Verbexit Formatted Output” on page 85 describes the information contained in the formatted output. Ellipses are used to summarize some sections of the dump.

For easy reference, the sections of the dump are numbered to correspond with the description of each section that follows.

```

 Summary of analysis for Heap Segment 25995000:

    Amounts of identified storage:  Free:00007F50  Allocated:00000090  Total:00007FE0
    Number of identified areas   :  Free:       1  Allocated:       4  Total:       5
    00000000 bytes of storage were not accounted for.
    No errors were found while processing this heap segment.
    This is the last heap segment in the current heap.

Exiting Language Environment Data
```

Figure 12 (Part 9 of 9). Example Formatted Output from LEDATA Verbexit

Sections of the Language Environment LEDATA Verbexit Formatted Output

The sections of the output listed here appear independently of the Language Environment-conforming languages used.

[1]-[8] Summary

These sections are included when the SUMMARY parameter is specified on the LEDATA invocation.

[1] Summary Header

The summary header section contains:

- Address of Thread control block (TCB)
- Release number
- Address Space ID (ASID)

[2] Active Members List

This list of active members is extracted from the enclave member list (MEML).

[3] CEECAA

This section formats the contents of the Language Environment common anchor area (CAA). Refer to "The Common Anchor Area" on page 58 for a description of the fields in the CAA.

[4] CEEPCB

This section formats the contents of the Language Environment process control block (PCB), and the process level member list.

[5] CEERCB

This section formats the contents of the Language Environment region control block (RCB).

[6] CEEEDB

This section formats the contents of the Language Environment enclave data block (EDB), and the enclave level member list.

[7] PMCB

This section formats the contents of the Language Environment program management control block (PMCB).

[8] Run-Time Options

This section lists the run-time options in effect at the time of the dump, and indicates where they were set.

[9] Heap Storage Control Blocks

This section is included when the HEAP or SM parameter is specified on the LEDATA invocation.

This section formats the Enclave-level storage management control block (ENSM) and for each different type of heap storage:

- Heap control block (HPCB)
- Chain of heap anchor blocks (HANC). A HANC immediately precedes each segment of heap storage.

This section includes a detailed heap segment report for each segment in the dump. See “Understanding the HEAP LEDATA Output” on page 89 for more information about the detailed heap segment report.

[10] Stack Storage Control Blocks

This section is included when the STACK or SM parameter is specified on the LEDATA invocation.

This section formats:

- Storage management control block (SMCB)
- Chain of dynamic save areas (DSA)

  Refer to “The Stack Frame Section” on page 57 for a description of the fields in the DSA.
- Chain of stack segment headers (STKH)

  An STKH immediately precedes each segment of stack storage.

[11] Condition Management Control Blocks

This section is included when the CM parameter is specified on the LEDATA invocation.

This section formats the chain of Condition Information Block Headers (CIBH) and Condition Information Blocks. The Machine State Information Block is contained with the CIBH starting with the field labeled MCH_EYE. Refer to “The Condition Information Block” on page 65 for a description of fields in these control blocks.

[12] Message Processing Control Blocks

This section is included when the MH parameter is specified on the LEDATA invocation.

[13]-[19] CEEDUMP Formatted Control Blocks

These sections are included when the CEEDUMP parameter is specified on the LEDATA invocation.

[13] Enclave Identifier

This statement names the enclave for which information is provided.

[14] Information for thread

This section shows the system identifier for the thread. Each thread has a unique identifier.

[15] Traceback

For all active routines, the traceback section shows:

- Stack frame (DSA) address
- Program unit

The primary entry point of the external procedure. For COBOL programs, this is the PROGRAM-ID name. For C, Fortran, and PL/I routines, this is the compile unit name. For Language Environment-conforming assemblers, this is the EPNAME = value on the CEEPPA macro.

- Program unit address
- Program unit offset

  The offset of the last instruction to run in the routine. If the offset is a negative number, zero, or a very large positive number, the routine associated with the offset probably did not allocate a save area, or the routine could have been called using SVC-assisted linkage. Adding the program unit address to the offset gives you the location of the current instruction in the routine. This offset is from the starting address of the routine.

- Entry

  For COBOL, Fortran, and PL/I routines, this is the entry point name. For C/C++ routines, this is the function name. If a function name or entry point was not specified for a particular routine, then the string '** NoName **' will appear.

- Entry point address
- Entry point offset
- Statement number

  This field is always blank.

- Load module

  This field is always blank.

- Service level

  This field is always blank.

- Status

  Routine status can be call, exception, or running.

[16] Control Blocks Associated with the Thread

This section lists the contents of the thread synchronization queue element (SQEL).

[17] Enclave Control Blocks

If the POSIX run-time option was set to ON, this section lists the contents of the mutex and condition variable control blocks, the enclave level latch table, and the thread synchronization trace block and trace table. If the HEAPCHK run-time option is set to ON, this section lists the contents of the HEAPCHK options control block (HCOP) and the HEAPCHK element tables (HCEL). A HEAPCHK element table contains the location and length of all allocated storage elements for a heap in the order that they were allocated.

[18] Language Environment Trace Table

If the TRACE run-time option was set to ON, this section shows the contents of the Language Environment trace table.

[19] Process Control Blocks

If the POSIX run-time option was set to ON, this section lists the contents of the process level latch table.

Understanding the HEAP LEDATA Output

The Language Environment IPCS Verbexit LEDATA generates a detailed heap segment report when the HEAP option is used with the DETAIL option, or when the SM,DETAIL option is specified. The detailed heap segment report is useful when trying to pinpoint damage because it provides very specific information. The report describes the nature of the damage, and specifies where the actual damage occurred. The report can also be used to diagnose storage leaks, and to identify heap fragmentation. Figure 13 on page 90 illustrates the output produced by specifying the HEAP option. "Heap Report Sections of the LEDATA Output" on page 93 describes the information contained in the formatted output.

For easy reference, the sections of the dump are numbered to correspond with the description of each section that follows. Ellipses are used to summarize some sections of the dump.

Exiting Language Environment Data
```

Figure 13 (Part 4 of 4). Example Formatted Detailed Heap Segment Report from LEDATA Verbexit

Heap Report Sections of the LEDATA Output

The Heap Report sections of the LEDATA output provide information for each heap segment in the dump. The detailed heap segment reports include information on the free storage tree in the heap segments, the allocated storage elements, and the cause of heap management data structure problems.

[1]Free Storage Tree Report

Within each heap segment, Language Environment keeps track of unallocated storage areas by chaining them together into a tree. Each free area represents a node in the tree. Each node contains a header, which points to its left and right child nodes. The header also contains the length of each child.

The LEDATA HEAP option formats the free storage tree within each heap, and validates all node addresses and lengths within each node. Each node address is validated to ensure that it:

- Falls on a doubleword boundary
- Falls within the current heap segment
- Does not point to itself
- Does not point to a node that was previously traversed

Each node length is validated to ensure that it:

- Is a multiple of 8
- Is not larger than the heap segment length
- Does not cause the end of the node to fall outside of the current heap segment
- Does not cause the node to overlap another node

If the formatter finds a problem, then it will place an error message describing the problem directly after the formatted line of the node that failed validation

[2]Heap Segment Map Report

The LEDATA HEAP option produces a report that lists all of the storage areas within each heap segment, and identifies the area as either allocated or freed. For

each allocated area the contents of the first X'20' bytes of the area are displayed in order to help identify the reason for the storage allocation.

Each allocated storage element has an 8 byte prefix used by Language Environment to manage the area. The first fullword contains a pointer to the start of the heap segment. The second fullword contains the length of the allocated storage element. The formatter validates this header to ensure that its heap segment pointer is valid. The length is also validated to ensure that it:

- Is a multiple of 8
- Is not zero
- Is not larger than the heap segment length
- Does not cause the end of the element to fall outside of the current heap segment
- Does not cause the element to overlap a free storage node

If the heap_free_value of the STORAGE run-time option was specified, then the formatter also checks that the free storage within each free storage element is set to the requested heap_free_value. If a problem is found, then an error message describing the problem is placed after the formatted line of the storage element that failed validation.

Diagnosing Heap Damage Problems

Heap storage errors can occur when an application allocates a heap storage element that is too small for it to use, and therefore, accidently overlays heap storage. If this situation occurs then some of the typical error messages generated are:

- The node address does not represent a valid node within the heap segment
- The length of the segment is not valid, or
- The heap segment pointer is not valid.

If one of the above error messages is generated by one of the reports, then examine the storage element that immediately precedes the damaged node to determine if this storage element is owned by the application program. Check the size of the storage element and ensure that it is sufficient for the program's use. If the size of the storage element is not sufficient then adjust the allocation size.

If an error occurs indicating that the node's pointers form a circular loop within the free storage tree, then check the Free Storage Tree Report to see if such a loop exists. If a loop exists, then contact the IBM support center for assistance because this may be a problem in the Language Environment heap management routines.

Additional diagnostic information regarding heap damage can be obtained by using the HEAPCHK run-time option. This option provides a more accurate time perspective on when the heap damage actually occurred, which could help to determine the program that caused the damage. See *OS/390 Language Environment Programming Reference* for more information on HEAPCHK.

Diagnosing Storage Leak Problems

A storage leak occurs when a program does not return storage back to the heap after it has finished using it. To determine if this problem exists, examine the Heap Segment Map report to see if any data areas, within the allocated storage elements, appear more frequently than expected. If they do, then check to see if these data areas are still being used by the application program. If the data areas are not

being used, then change the program to free the storage element after it is done with it.

Diagnosing Heap Fragmentation Problems

Heap fragmentation occurs when allocated storage is interlaced with many free storage areas that are too small for the application to use. Heap fragmentation could indicate that the application is not making efficient use of its heap storage. Check the Heap Segment Map report for frequent free storage elements that are interspersed with the allocated storage elements.

Understanding the C/C++-specific LEDATA Output

The Language Environment IPCS Verbexit LEDATA generates formatted output of C/C++-specific control blocks from a system dump when the ALL parameter is specified and C/C++ is active in the dump. Figure 14 on page 96 illustrates the C/C++-specific output produced. The system dump being formatted was obtained by specifying the TERMTHDACT(UADUMP) run-time option when running the program CELSAMP Figure 4 on page 41. “C/C++-specific Sections of the LEDATA Output” on page 100 describes the information contained in the formatted output. Ellipses are used to summarize some sections of the dump.

For easy reference, the sections of the dump are numbered to correspond with the description of each section that follows.

Figure 14 (Part 5 of 5). Example Formatted C/C++ Output from LEDATA Verbexit

C/C++-specific Sections of the LEDATA Output

For the LEDATA output:

[1] CGEN

This section formats the C/C++-specific portion of the Language Environment common anchor area (CAA).

[2] CGENE

This section formats the extension to the C/C++-specific portion of the Language Environment common anchor area (CAA).

[3] CEDB

This section formats the C/C++-specific portion of the Language Environment enclave data block (EDB).

[4] CTHD

This section formats the C/C++ thread-level control block (CTHD).

[5] CPCB

This section formats the C/C++-specific portion of the Language Environment process control block (PCB).

[6] CIO

This section formats the C/C++ IO control block (CIO).

[7] File Control Blocks

This section formats the C/C++ file control block (FCB). The FCB and its related control blocks represent the information needed by each open stream.

Related Control Blocks

FSCE The file specific category extension control block. The FSCE represents the specific type of IO being performed. The following is a list of FSCEs that may be formatted.

OSNS — OS no seek

OSFS — OS fixed text

OSVF — OS variable text

OSUT — OS undefined format text

Other FSCEs will be displayed using a generic overlay.

OSIO The OS IO interface control block.

DCB The data control block. For more information about the DCB, refer to *DFSMS/MVS Macro Instructions for Data Sets*.

DCBE The data control block extension. For more information about the DCBE, refer to *DFSMS/MVS Macro Instructions for Data Sets*.

JFCB The job file control block (JFCB). For more information about the JFCB, refer to *OS/390 MVS Data Areas, Vol 3 (IVT-RCWK)*.

Understanding the COBOL-specific LEDATA Output

The Language Environment IPCS Verbexit LEDATA generates formatted output of COBOL-specific control blocks from a system dump when the ALL parameter is specified and COBOL is active in the dump. Figure 15 on page 102 illustrates the COBOL-specific output produced. The system dump being formatted was obtained by specifying the TERMTHDACT(UADUMP) run-time option. “COBOL-specific Sections of the LEDATA Output” on page 103 describes the information contained in the formatted output.

For easy reference, the sections of the dump are numbered to correspond with the description of each section that follows.

```

Exiting COBOL Environment Data
```

Figure 15 (Part 2 of 2). Example Formatted COBOL Output from LEDATA Verbexit

COBOL-specific Sections of the LEDATA Output

For the LEDATA output:

[1] RUNCOM

This section formats the COBOL enclave-level control block (RUNCOM).

[2] THDCOM

This section formats the COBOL process-level control block (THDCOM).

[3] COBCOM

This section formats the COBOL region-level control block (COBCOM).

[4] CLLE

This section formats the COBOL loaded program control blocks (CLLE).

[5] TGT

This section formats the COBOL TGT control blocks.

Requesting a Language Environment Trace for Debugging

Language Environment provides an in-storage, wrapping trace facility that can reconstruct the events leading to the point where a dump is taken. The trace facility can record two types of events: entry and exit library calls and, if the POSIX run-time option is set to ON, user mutex and condition variable activity such as init, lock/unlock, and wait. Language Environment produces a trace table in its dump report under the following conditions:

- The CEE3DMP callable service is invoked with the BLOCKS option and the TRACE run-time option is set to ON.
- The TRACE run-time option is set to NODUMP and the TERMTHDACT run-time option is set to DUMP, UADUMP, TRACE, or UATRACE.
- The TRACE run-time option is set to DUMP (the default).

For more information about the CEE3DMP callable service, the TERMTHDACT run-time option, or the TRACE run-time option, see *OS/390 Language Environment Programming Reference*.

The TRACE run-time option activates Language Environment run-time library tracing and controls the size of the trace buffer, the type of trace events to record, and it determines whether a dump containing only the trace table should be unconditionally taken when the application (enclave) terminates. The trace table contents can be written out either upon demand or at the termination of an enclave.

The contents of the Language Environment dump depend on the values set in the TERMTHDACT run-time option. Under abnormal termination, the following dump contents are generated:

- TERMTHDACT(QUIET) generates a Language Environment dump containing the trace table only
- TERMTHDACT(MSG) generates a Language Environment dump containing the trace table only
- TERMTHDACT(TRACE) generates a Language Environment dump containing the trace table and the traceback
- TERMTHDACT(DUMP) generates a Language Environment dump containing thread/enclave/process storage and control blocks (the trace table is included as an enclave control block)
- TERMTHDACT(UAONLY) generates a system dump of the user address space

- TERMTHDACT(UATRACE) generates a Language Environment dump that contains traceback information, and a system dump of the user address space
- TERMTHDACT(UADUMP) generates a Language Environment dump containing thread/enclave/process storage and control blocks (the trace table is included as an enclave control block), and a user address space dump
- TERMTHDACT(UAIMM) generates a system dump of the user address space of the original abend or program interrupt that occurred prior to the Language Environment condition manager processing the condition.

  Note: Under CICS, UAIMM yields UAONLY behavior. Under non-CICS, TRAP(ON,NOSPIE) must be in effect. When TRAP(ON,SPIE) is in effect, UAIMM yields UAONLY behavior. For software raised conditions or signals, UAIMM behaves the same as UAONLY.

Under normal termination, the following dump contents are generated:

- Independent of the TERMTHDACT setting, Language Environment generates a dump containing the trace table only based on the TRACE run-time option

Language Environment quiesces all threads that are currently running except for the thread that issued the call to CEE3DMP. When you call CEE3DMP in a multithread environment, only the current thread is dumped. Enclave- and process-related storage could have changed from the time the dump request was issued.

Locating the Trace Dump

If your application calls CEE3DMP, the Language Environment dump is written to the file specified in the FNAME parameter of CEE3DMP (the default is CEEDUMP).

If your application is running under TSO or OS/390 batch, and a CEEDUMP DD is not specified, Language Environment writes the CEEDUMP to the batch log (SYSOUT=* by default). You can change the SYSOUT class by specifying a CEEDUMP DD, or by setting the environment variable, *_CEE_DMPTARG=SYSOUT(x)*, where x is the preferred SYSOUT class.

If your application is running under OS/390 UNIX and is either running in an address space you issued a `fork()` to, or if it is invoked by one of the `exec` family of functions, the dump is written to the hierarchical file system (HFS). Language Environment writes the CEEDUMP to one of the following directories in the specified order:

1. The directory found in environment variable *_CEE_DMPTARG*, if found
2. The current working directory, if the directory is not the root directory (/), and the directory is writeable
3. The directory found in environment variable *TMPDIR* (an environment variable that indicates the location of a temporary directory if it is not /tmp)
4. The **/tmp** directory

The name of this file changes with each dump and uses the following format:

```
/path/Fname.Date.Time.Pid
```

path The path determined from the above algorithm.

Fname The name specified in the FNAME parameter on the call to CEE3DMP (default is CEEDUMP).

Date The date the dump is taken, appearing in the format YYYYMMDD (such as 19980918 for September 18, 1998).

Time The time the dump is taken, appearing in the format HHMMSS (such as 175501 for 05:55:01 p.m.).

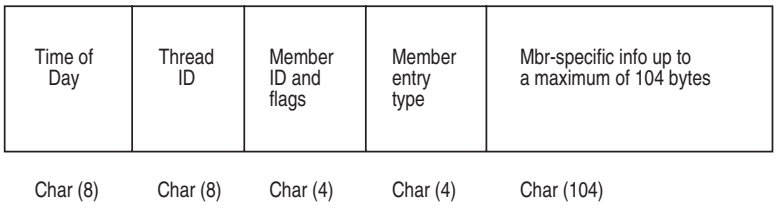
Pid The process ID the application is running in when the dump is taken.

Using the Language Environment Trace Table Format in a Dump Report

The Language Environment trace table is established unconditionally at enclave initialization time if the TRACE run-time option is set to ON. All threads in the enclave share the trace table; there is no thread-specific table, nor can the table be dynamically extended or enlarged.

Understanding the Trace Table Entry (TTE)

Each trace table entry is a fixed-length record consisting of a fixed-format portion (containing such items as the timestamp, thread ID, and member ID) and a member-specific portion. The member-specific portion has a fixed length, of which some (or all) can be unused. For information about how participating products use the trace table entry, refer to the product-specific documentation. The format of the trace table entry is as follows:



Following is a definition of each field:

Time
The 64-bit value obtained from a store clock (STCK).

Thread ID
The 8-byte thread ID of the thread that is adding the trace table entry.

Member ID and Flags
Contains 2 fields:

Member ID
The 1-byte member ID of the member making the trace table entry.

Flags
24 flags reserved for internal use.

Member Entry Type
A number that indicates the type of the member-specific trace information that follows the field.

To uniquely identify the information contained in a specific TTE, you must consider Member ID as well as Member Entry Type. Following is a list of member IDs:

ID	Name
01	CEL
03	C/C++
05	COBOL

07 Fortran
08 DCE
10 PL/I
12 Sockets

Member Specific Information
Based on the member ID and the member entry type, this field contains the specific information for the entry, up to 104 bytes.

For C/C++, the entry type of 1 is a record that records an invocation of a base C run-time library function. The entry consists of the name of the invoking function and the name of the invoked function. Entry type 2 is a record that records the return from the base library function. It contains the returned value and the value of errno.

Sample Dump for the Trace Table Entry

The following is an example of a dump of the trace table when you specify the LE=1 suboption (the library call/return trace):

```

Figure 16 (Part 2 of 2). Trace Table in Dump Output

Part 2. Debugging Language-Specific Routines

This part provides specific information for debugging applications written in C/C++, COBOL, Fortran, and PL/I. It also discusses techniques for debugging under CICS.

Chapter 4. Debugging C/C++ Routines

This chapter provides specific information to help you debug applications that contain one or more C/C++ routines. It includes the following topics:

- Debugging C/C++ I/O routines
- Using C/C++ compiler listings
- Generating a Language Environment dump of a C/C++ routine
- Finding C/C++ information in a Language Environment dump
- Debugging example of C/C++ routines

There are several debugging features that are unique to C/C++ routines. Before examining the C/C++ techniques to find errors, you might want to consider the following areas of potential problems:

- If you suspect that you are using uninitialized storage, you may want to use the `STORAGE` run-time option.
- If you are using the `fetch()` function, refer to *OS/390 C/C++ Programming Guide* to ensure that you are creating the fetchable module correctly.
- If you are using `DLL`s, refer to *OS/390 C/C++ Programming Guide* to ensure that you are using the DLL correctly.
- For non-System Programming C routines, ensure that the entry point of the load module is CEESTART.
- You should avoid:
  - Incorrect casting
  - Referencing an array element with a subscript outside the declared bounds
  - Copying a string to a target with a shorter length than the source string
  - Declaring but not initializing a pointer variable, or using a pointer to allocated storage that has already been freed

  If a routine exception occurred and you need more information than the condition handler provided, run your routine with the following run-time options, TRAP(ON, NOSPIE) and TERMTHDACT(UAIMM). Setting these run-time options generates a system dump of the user address space of the original abend or program interrupt prior to the Language Environment condition manager processing the condition. After the system dump is taken by the operating system the Language Environment condition manager continues processing.

Debugging C/C++ Input/Output Programs

You can use C/C++ conventions such as `__amrc` and `perror()` when you debug I/O operations.

Using the __amrc and __amrc2 Structures

__amrc, a structure defined in **stdio.h**, can help you determine the cause of errors resulting from an I/O operation, because it contains diagnostic information (for example, the return code from a failed VSAM operation).

There are two structures:

__amrc (defined by type __amrc_type
__amrc2 (defined by type __amrc2_type)

The __amrc2_type structure contains secondary information that C can provide.

Because any I/O function calls, such as printf(), can change the value of __amrc or __amrc2, make sure you save the contents into temporary structures of __amrc_type and __amrc2_type respectively, before dumping them.

Figure 17 shows the structure as it appears in **stdio.h**.

```
    typedef struct __amrctype {
[1]    union {
[2]       long int __error;
          struct {
            unsigned short __syscode,
                           __rc;
[3]       } __abend;
          struct {
             unsigned char __fdbk_fill,
                           __rc,
                           __ftncd,
                           __fdbk;
[4]       } __feedback;
          struct {
             unsigned short __svc99_info,
                            __svc99_error;
[5]       } __alloc;
       } __code;
[6]    unsigned long __RBA;
[7]    unsigned int      __last_op;
       struct {
        unsigned long  __len_fill; /* __len + 4       */
        unsigned long  __len;
        char           __str[120];
        unsigned long  __parmr0;
        unsigned long  __parmr1;
        unsigned long  __fill2[2];
        char           __str2[64];
[8]    } __msg;
    } __amrc_type;
```

Figure 17. __amrc Structure

Figure 18 on page 113 shows the __amrc2 structure as it appears in **stdio.h**.

```
    struct {
[9]       long int   __error2;
[10]      FILE      *__fileptr;
[11]      long int   __reserved{6};
    }
```

Figure 18. __amrc2 Structure

[1] `__code`
The error or warning value from an I/O operation is in `__error`, `__abend`, `__feedback`, or `__alloc`. Look at `__last_op` to determine how to interpret the `__code` union.

[2] `__error`
A structure that contains error codes for certain macros or services your application uses. Look at `__last_op` to determine the error codes. `__syscode` is the system abend code.

[3] `__abend`
A structure that contains the abend code when `errno` is set to indicate a recoverable I/O abend. `__rc` is the return code. For more information on abend codes, see *OS/390 MVS System Codes*.

[4] `__feedback`
A structure that is used for VSAM only. The `__rc` stores the VSAM register 15, `__fdbk` stores the VSAM error code or reason code, and `__RBA` stores the RBA after some operations.

[5] `__alloc`
A structure that contains errors during `fopen` or `freopen` calls when defining files to the system using `SVC 99`.

[6] `__RBA`
The RBA value returned by VSAM after an ESDS or KSDS record is written out. For an RRDS, it is the calculated value from the record number. It can be used in subsequent calls to `flocate`.

[7] `__last_op`
A field containing a value that indicates the last I/O operation being performed by C/C++ at the time the error occurred. These values are shown in Table 4 on page 114.

[8] `__msg`
May contain the system error messages from read or write operations emitted from the DFSMS/MVS `SYNADAF` macro instruction. Because the message can start with a hexadecimal address followed by a short integer, it is advisable to start printing at MSG+6 or greater so the message can be printed as a string. Because the message is not null-terminated, a maximum of 114 characters should be printed. This can be accomplished by specifying a `printf` format specifier as %.114s.

[9] `__error2`
A secondary error code. For example, an unsuccessful rename or remove operation places its reason code here.

[10] `__fileptr`
A pointer to the file that caused a SIGIOERR to be raised. Use an `fldata()` call to get the actual name of the file.

[11] __reserved
Reserved for future use.

__last_op Values

The __last_op field is the most important of the __amrc fields. It defines the last I/O operation C/C++ was performing at the time of the I/O error. You should note that the structure is neither cleared nor set by non-I/O operations, so querying this field outside of a SIGIOERR handler should only be done immediately after I/O operations. Table 4 lists __last_op values you could receive and where to look for further information.

Table 4 (Page 1 of 4). __last_op Values and Diagnosis Information

Value	Further Information
__IO_INIT	Will never be seen by SIGIOERR exit value given at initialization.
__BSAM_OPEN	Sets __error with return code from OS OPEN macro.
__BSAM_CLOSE	Sets __error with return code from OS CLOSE macro.
__BSAM_READ	No return code (either __abend (errno == 92) or __msg (errno == 66) filled in).
__BSAM_NOTE	NOTE returned 0 unexpectedly, no return code.
__BSAM_POINT	This will not appear as an error lastop.
__BSAM_WRITE	No return code (either __abend (errno == 92) or __msg (errno == 65) filled in).
__BSAM_CLOSE_T	Sets __error with return code from OS CLOSE TYPE=T.
__BSAM_BLDL	Sets __error with return code from OS BLDL macro.
__BSAM_STOW	Sets __error with return code from OS STOW macro.
__TGET_READ	Sets __error with return code from TSO TGET macro.
__TPUT_WRITE	Sets __error with return code from TSO TPUT macro.
__IO_DEVTYPE	Sets __error with return code from I/O DEVTYPE macro.
__IO_RDJFCB	Sets __error with return code from I/O RDJFCB macro.
__IO_TRKCALC	Sets __error with return code from I/O TRKCALC macro.
__IO_OBTAIN	Sets __error with return code from I/O CAMLST OBTAIN.
__IO_LOCATE	Sets __error with return code from I/O CAMLST LOCATE.
__IO_CATALOG	Sets __error with return code from I/O CAMLST CAT. The associated macro is CATALOG.
__IO_UNCATALOG	Sets __error with return code from I/O CAMLST UNCAT. The associated macro is CATALOG.
__IO_RENAME	Sets __error with return code from I/O CAMLST RENAME.
__SVC99_ALLOC	Sets __alloc structure with info and error codes from SVC 99 allocation.
__SVC99_ALLOC_NEW	Sets __alloc structure with info and error codes from SVC 99 allocation of NEW file.
__SVC99_UNALLOC	Sets __unalloc structure with info and error codes from SVC 99 unallocation.

Table 4 (Page 2 of 4). __last_op Values and Diagnosis Information

Value	Further Information
__C_TRUNCATE	Set when C or C++ truncates output data. Usually this is data written to a text file with no newline such that the record fills up to capacity and subsequent characters cannot be written. For a record I/O file this refers to an fwrite() writing more data than the record can hold. Truncation is always rightmost data. There is no return code.
__C_FCBCHECK	Set when C or C++ FCB is corrupted. This is due to a pointer corruption somewhere. File cannot be used after this.
__C_DBCS_TRUNCATE	This occurs when writing DBCS data to a text file and there is no room left in a physical record for anymore double byte characters. A new-line is not acceptable at this point. Truncation will continue to occur until an SI is written or the file position is moved. Cannot happen if MB_CUR_MAX is 1.
__C_DBCS_SO_TRUNCATE	This occurs when there is not enough room in a record to start any DBCS string or else when a redundant SO is written to the file before an SI. Cannot happen if MB_CUR_MAX is 1.
__C_DBCS_SI_TRUNCATE	This occurs only when there was not enough room to start a DBCS string and data was written anyways, with an SI to end it. Cannot happen if MB_CUR_MAX is 1.
__C_DBCS_UNEVEN	This occurs when an SI is written before the last double byte character is completed, thereby forcing C or C++ to fill in the last byte of the DBCS string with a padding byte X'FE'. Cannot happen if MB_CUR_MAX is 1.
__C_CANNOT_EXTEND	This occurs when an attempt is made to extend a file that allows writing, but cannot be extended. Typically this is a member of a partitioned data set being opened for update.
__VSAM_OPEN_FAIL	Set when a low level VSAM OPEN fails, sets __rc and __fdbk fields in the __amrc struct.
__VSAM_OPEN_ESDS	Does not indicate an error; set when the low level VSAM OPEN succeeds, and the file type is ESDS.
__VSAM_OPEN_RRDS	Does not indicate an error; set when the low level VSAM OPEN succeeds, and the file type is ESDS.
__VSAM_OPEN_KSDS	Does not indicate an error; set when the low level VSAM OPEN succeeds, and the file type is ESDS.
__VSAM_OPEN_ESDS_PATH	Does not indicate an error; set when the low level VSAM OPEN succeeds, and the file type is ESDS.
__VSAM_OPEN_KSDS_PATH	Does not indicate an error; set when the low level VSAM OPEN succeeds, and the file type is ESDS.
__VSAM_MODCB	Set when a low level VSAM MODCB macro fails, sets __rc and __fdbk fields in the __amrc struct.
__VSAM_TESTCB	Set when a low level VSAM TESTCB macro fails, sets __rc and __fdbk fields in the __amrc struct.
__VSAM_SHOWCB	Set when a low level VSAM SHOWCB macro fails, sets __rc and __fdbk fields in the __amrc struct.
__VSAM_GENCB	Set when a low level VSAM GENCB macro fails, sets __rc and __fdbk fields in the __amrc struct.
__VSAM_GET	Set when the last op was a low level VSAM GET; if the GET fails, sets __rc and __fdbk in the __amrc struct.

Table 4 (Page 3 of 4). __last_op Values and Diagnosis Information

Value	Further Information
__VSAM_PUT	Set when the last op was a low level VSAM PUT; if the PUT fails, sets __rc and __fdbk in the __amrc struct.
__VSAM_POINT	Set when the last op was a low level VSAM POINT; if the POINT fails, sets __rc and __fdbk in the __amrc struct.
__VSAM_ERASE	Set when the last op was a low level VSAM ERASE; if the ERASE fails, sets __rc and __fdbk in the __amrc struct.
__VSAM_ENDREQ	Set when the last op was a low level VSAM ENDREQ; if the ENDREQ fails, sets __rc and __fdbk in the __amrc struct.
__VSAM_CLOSE	Set when the last op was a low level VSAM CLOSE; if the CLOSE fails, sets __rc and __fdbk in the __amrc struct.
__QSAM_GET	__error is not set (if abend (errno == 92), __abend is set, otherwise if read error (errno == 66), look at __msg.
__QSAM_PUT	__error is not set (if abend (errno == 92), __abend is set, otherwise if write error (errno == 65), look at __msg.
__QSAM_TRUNC	This is an intermediate operation. You will only see this if an I/O abend occurred.
__QSAM_FREEPOOL	This is an intermediate operation. You will only see this if an I/O abend occurred.
__QSAM_CLOSE	Sets __error to result of OS CLOSE macro.
__QSAM_OPEN	Sets __error to result of OS OPEN macro.
__CMS_OPEN	Sets __error to result of FSOPEN.
__CMS_CLOSE	Sets __error to result of FSCLOSE.
__CMS_READ	Sets __error to result of FSREAD.
__CMS_WRITE	Sets __error to result of FSWRITE.
__CMS_STATE	Sets __error to result of FSSTATE.
__CMS_ERASE	Sets __error to result of FSERASE.
__CMS_RENAME	Sets __error to result of CMS RENAME command.
__CMS_EXTRACT	Sets __error to result of DMS EXTRACT call.
__CMS_LINERD	Sets __error to result of LINERD macro.
__CMS_LINEWRT	Sets __error to result of LINEWRT macro.
__CMS_QUERY	__error is not set.
__HSP_CREATE	Indicates last op was a DSPSERV CREATE to create a hiperspace for a hiperspace memory file. If CREATE fails, stores abend code in __amrc__code__abend__syscode, reason code in __amrc__code__abend__rc.
__HSP_DELETE	Indicates last op was a DSPSERV DELETE to delete a hiperspace for a hiperspace memory file during termination. If DELETE fails, stores abend code in __amrc__code__abend__syscode, reason code in __amrc__code__abend__rc.
__HSP_READ	Indicates last op was a HSPSERV READ from a hiperspace. If READ fails, stores abend code in __amrc__code__abend__syscode, reason code in __amrc__code__abend__rc.

Table 4 (Page 4 of 4). __last_op Values and Diagnosis Information

Value	Further Information
__HSP_WRITE	Indicates last op was a HSPSERV WRITE to a hiperspace. If WRITE fails, stores abend code in __amrc__code__abend__syscode, reason code in __amrc__code__abend__rc.
__HSP_EXTEND	Indicates last op was a HSPSERV EXTEND during a write to a hiperspace. If EXTEND fails, stores abend code in __amrc__code__abend__syscode, reason code in __amrc__code__abend__rc.
__CICS_WRITEQ_TD	Sets __error with error code from EXEC CICS WRITEQ TD.
__LFS_OPEN	Sets __error with reason code from HFS services. Reason code from HFS services must be broken up. The low order 2 bytes can be looked up in *OS/390 UNIX System Services Programming: Assembler Callable Services Reference*.
__LFS_CLOSE	Sets __error with reason code from HFS services. Reason code from HFS services must be broken up. The low order 2 bytes can be looked up in *OS/390 UNIX System Services Programming: Assembler Callable Services Reference*.
__LFS_READ	Sets __error with reason code from HFS services. Reason code from HFS services must be broken up. The low order 2 bytes can be looked up in *OS/390 UNIX System Services Programming: Assembler Callable Services Reference*.
__LFS_WRITE	Sets __error with reason code from HFS services. Reason code from HFS services must be broken up. The low order 2 bytes can be looked up in *OS/390 UNIX System Services Programming: Assembler Callable Services Reference*.
__LFS_LSEEK	Sets __error with reason code from HFS services. Reason code from HFS services must be broken up. The low order 2 bytes can be looked up in *OS/390 UNIX System Services Programming: Assembler Callable Services Reference*.
__LFS_FSTAT	Sets __error with reason code from HFS services. Reason code from HFS services must be broken up. The low order 2 bytes can be looked up in *OS/390 UNIX System Services Programming: Assembler Callable Services Reference*.

Displaying an Error Message with the perror() Function

To find a failing routine, check the return code of all function calls. After you have found the failing routine, use the `perror()` function after the routine to display the error message. `perror()` displays the string that you pass to it and an error message corresponding to the value of `errno`. `perror()` writes to the standard error stream (`stderr`).

If you need additional diagnostic information set the environment variable, _EDC_ADD_ERRNO2 to 1, and that will append the current errno2 value to the end of the perror() string.

Figure 19 on page 118 is an example of a routine using `perror()`.

```
#include <stdio.h>
int main(void){
   FILE *fp;

   fp = fopen("myfile.dat", "w");
   if (fp == NULL)
      perror("fopen error");
}
```

Figure 19. Example of a Routine Using perror()

Using __errno2() to Diagnose Application Problems

Use __errno2() when diagnosing problems in an OS/390 UNIX or OpenEdition VM application. This function enables C/C++ application programs to access diagnostic information returned to the C/C++ run-time library from an underlying kernel callable service. __errno2() returns the reason code of the last failing kernel callable service called by the C/C++ run-time library. The returned value is intended for diagnostic display purposes only. The function call is always successful.

Note: Since the __errno2() function returns the reason code of the kernel callable service that last failed, and not all function calls invoke the kernel, the value returned by __errno2() may be misleading.

Figure 20 is an example of a routine using __errno2().

```
#include <stdio.h>
#include <errno.h>
FILE *myfopen(const char *fn, const char *mode) {
   FILE *f;
   f = fopen(fn,mode);
   if (f==NULL) {
      perror("fopen() failed");
      printf("__errno2 = %08x\n", __errno2());
   }
   return(f);
}
```

Figure 20. Example of a Routine Using __errno2()

Figure 21 on page 119 is an example of a routine using the environment variable _EDC_ADD_ERRNO2, and Figure 22 on page 119 shows the sample output from that routine.

```
#include <stdio.h>
#include <errno.h>

int main(void) {
   FILE *fp;

   /* add errno2 to perror message */
   setenv("_EDC_ADD_ERRNO2","1",1);

   fp = fopen("testfile.dat", "r");
   if (fp == NULL)
      perror("fopen error");

 }
```

Figure 21. Example of a Routine Using _EDC_ADD_ERRNO2

```
fopen error:  EDC5129I  No such file or directory.
(errno2=0x05620062)
```

Figure 22. Sample Output of a Routine Using _EDC_ADD_ERRNO2

Using C/C++ Listings

The following sections discuss C/C++ listings generated when the executable program is created. They also explain how to use these listings to locate information, such as variable values and the timestamp, in the dump.

Generating C/C++ Listings and Maps

The two techniques for creating an executable program are:

- When the executable program is to be stored in a PDSE or HFS, use the binder to combine the output from the C/C++ compiler.
- When the executable program is to be stored in a PDS, use Language Environment Prelinker Utility to combine the output from the C/C++ compiler and pass the prelinker output to the binder.

The listings and maps created by the compile, prelink (optional), and link-edit steps provide many pieces of information necessary for performing problem analysis tasks. When creating an executable program without using the prelink step, the map of the Writable Static Area (WSA) is provided by the binder in the output listing in the C_WSA section.

In addition, the @STATIC is replaced by the binder with $PRIVnnnnnn and to find the source listing use the cross reference to associate $PRIVnnnnnn with the defining section name and use the section name to find the source in the module map. So, the output listing provided by the binder should be used when locating variables in executable programs created without using the prelink step.

When you are debugging, you can use various options depending upon which compiler you are using. The following section provides a overview of each listing and specifies the compiler option to use. For a detailed description of available listings, see *OS/390 C/C++ Programming Guide*.

Table 5. Contents of Listing and Associated Compiler Options

Name	Compiler Option	Function
Pseudo-assembler listing	LIST	Generates a pseudo-assembler listing, which shows the source listing for the current routine.
Storage Offset Listing	XREF	Produces a storage offset listing, which includes in the source listing a cross reference table of names used in the routine and the line numbers on which they were declared or referenced.
Structure Map	AGGREGATE	Causes a structure map to be included in the source listing. The structure map shows the layout of variables for the type `struct` or `union`.
Inline Report	INLINE(,REPORT,...) for C INLRPT for C++	Generates an inline report that summarizes all functions inlined and provides a detailed call structure of all the functions.
Prelinker Map	MAP (prelink option)	Creates the prelinker map when invoking the Prelinker. It is the default under OS/390. You can use prelinker maps to determine the location of static and external C variables compiled with the RENT option and all C++ variables.
Link-edit Output Listing	MAP, LIST, XREF	These options control the listing output from the link-edit process.
Source Listing	SOURCE	Generates the source listing, which contains the original source input statements and any compiler diagnostic messages issued for the source.
Cross-Reference Listing	XREF	Cross-reference table containing a list of the identifiers from the source program and the line numbers in which they appear.
External Symbol Cross Reference Listing	ATTR or XREF	Shows the original name and corresponding mangled name for each symbol.
Object File Map	IPA(MAP) LIST	Displays the names of the object files that were used as input to the IPA Link step.
Source File Map	IPA(MAP) LIST	Identifies the source files included in the object files.
Compiler Options Map	IPA(MAP) LIST	Identifies the compiler options that were specified during the IPA Compile step for each compilation unit that is encountered when the object file is processed.
Global Symbols Map	IPA(MAP) LIST	Shows how global symbols are mapped into members of global data structures by the global variable coalescing optimization process.
Inline Report for IPA Inliner	IPA(MAP) LIST	Describes the actions performed by the IPA Inliner.

C, C++, and C/C++ IPA Listings

The options for each listing vary depending upon which Compiler is used. The following section illustrates which options are available for each listing.

C Compiler Listings: The following table specifies which listings are available for the C compiler, and which option(s) must be specified to obtain it.

Table 6. OS/390 C Compiler Listings

Name	Compiler Option
Source Program	Source
Cross-Reference Listing	XREF
Structure and Union Maps	AGGREGATE
Inline Report	OPTIMIZE INLINE(,REPORT,,)
Pseudo Assembly Listing	LIST
Storage Offset Listing	XREF

C++ Compiler Listings: The following table specifies which listings are available for the C++ compiler, and which option(s) must be specified to obtain it.

Table 7. OS/390 C++ Compiler Listings

Name	Compiler Option
Source Program	Source
Cross-Reference Listing	ATTR or XREF
Inline Report	OPTIMIZE INLINE(,REPORT,,)
Pseudo Assembly Listing	LIST
External Symbol Cross Reference Listing	ATTR or XREF

C/C++ IPA Link Step Listings: The following table specifies which listings are available for the C/C++ IPA Link Step, and which option(s) must be specified to obtain it.

Table 8. C/C++ IPA Link Step Listings

Name	Compiler Option
Object File Map	IPA (MAP) LIST
Source File Map	IPA (MAP) LIST
Compiler Options Map	IPA (MAP) LIST
Global Symbols Map	IPA (MAP) LIST
Inline Report for IPA Inliner	IPA (MAP) LIST
Partition Map	IPA (MAP) LIST

Finding Variables

You can determine the value of a variable in the routine at the point of interrupt by using the compiled code listing as a guide to its address, then finding this address in the Language Environment dump. The method you use depends on the storage class of variable.

This method is generally used when no symbolic variables have been dumped (by using the TEST compiler option).

It is possible for the routine to be interrupted before the value of the variable is placed in the location provided for it. This can explain unexpected values in the dump.

Finding Automatic Variables

To find automatic variables in the Language Environment dump, use the following steps:

1. Identify the start of the stack frame. If a dump has been taken, each stack frame is dumped. The stack frames can be cross-referenced to the function name in the traceback.
2. Add the offset of the variable (which is given in decimal) in the storage offset listing to the stack frame address.

   ```
   aa1    85-0:85   Class = automatic, Offset = 164(r13),    Length = 40
   ```

   In the example, variable `aa1` can be found in the dump by first determining the value of the base register (in this case, GPR13) in the Saved Registers section for the function you are interested in. Add this base address to the offset of the variable. The contents of the variable can then be read in the DSA Frame section corresponding to the function the variable is contained in.

Finding the Writable Static Area

If you have C code compiled with the RENT option or C++ code (hereafter called `RENT` code):

- You must determine the base address of the writable static area (WSA) if you want to calculate the address of a static or external variable.
- The WSA base address for application code is in the WSA address field in the Enclave Control Blocks section (see page 143 for an explanation of WSA).
- The WSA base address for a fetched module is in the WSA address field of the Fetch() Information section for the fetch() function pointer for which you are interested.
- The WSA base address for a DLL is the corresponding WSA address in the DLL Information section.
- Use the WSA base address to locate the WSA in the Enclave Storage section.

Finding the Static Storage Area

If you have C code compiled with the NORENT option (hereafter called `NORENT` code):

- You must determine the base address of the static storage area if you want to calculate the address of a static variable. A CSECT is generated for the static storage area for each source file. In order to determine the origin and length of

the CSECT from the linker map, you must name the static storage area CSECT by using the `pragma csect` directive.

- External variables are stored in a corresponding CSECT with the same name. The origin and length of the external variable CSECT can be determined from the linker map.

Address calculation for static and external variables uses the static storage area as a base address with 1 or more offsets added to this address.

The storage associated with these CSECTs is not dumped when an exception occurs. It is dumped when `cdump` or CEE3DMP is called, but it is written to a separate ddname called CEESNAP. See “Generating a Language Environment Dump of a C/C++ Routine” on page 130 for information about `cdump`, CEE3DMP, and enabling the CEESNAP ddname.

Finding RENT Static Variables

1. Find the address of the WSA (see “Finding the Writable Static Area” on page 122). For this example, the address of writable static is X'02D66E40'.
2. Find the offset of `@STATIC` (associated with the file where the static variable is located) in the Writable Static Map section of the prelinker map, shown in Figure 23 on page 124. In this example, the offset is X'58'. Add this offset to the WSA to get the base address of static variables. The result is X'2D66E98' (X'02D66E40' + X'58').

```
=========================================================================
|                          Writable Static Map                          |
=========================================================================

  OFFSET    LENGTH  FILE ID  INPUT NAME

       0         1   00001   DFHC0011
       4         1   00001   DFHC0010
       8         2   00001   DFHDUMMY
       C         2   00001   DFHB0025
      10         2   00001   DFHB0024
      14         2   00001   DFHB0023
      18         2   00001   DFHB0022
      1C         2   00001   DFHB0021
      20         2   00001   DFHB0020
      24         2   00001   DFHEIB0
      28         4   00001   DFHEIPTR
      2C         4   00001   DFHCP011
      30         4   00001   DFHCP010
      34         4   00001   DFHBP025
      38         4   00001   DFHBP024
      3C         4   00001   DFHBP023
      40         4   00001   DFHBP022
      44         4   00001   DFHBP021
      48         4   00001   DFHBP020
      4C         4   00001   DFHEICB
      50         4   00001   DFHEID0
      54         4   00001   DFHLDVER
      58       278   00001   @STATIC
     720        30   00002   @STATIC
```

Figure 23. Writable Static Map Produced by Prelinker

3. Find the offset of the static variable in the partial storage offset compiler listing. The offset is 96 (X'60').

   ```
   sa0  66-0:66 Class = static, Location = WSA + @STATIC + 96, Length = 4
   ```

4. Add this offset to the base address of static variables, calculated above. The sum is X'2D66EF8' (X'2D66E98' + X'60'). This is the address of the value of the static variable in the Language Environment dump.

   Figure 24 shows the path to locate RENT C++ and C static variables by adding the address of writable static, the offset of @STATIC, and the variable offset.

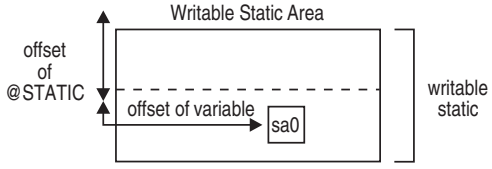

Figure 24. Location of RENT Static Variable in Storage

Finding External RENT Variables

Locating external variables in the Language Environment dump requires several steps:

1. Find the address of the WSA (see “Finding the Writable Static Area” on page 122). In this example, the address of writable static is X'02D66E40'.
2. Find the offset of the external variable in the Prelinker Writable Static Map, shown in Figure 25 In this example, the offset for DFHEIPTR is X'28'.

```
=========================================================================

      28         4   00001   DFHEIPTR
      2C         4   00001   DFHCP011
      30         4   00001   DFHCP010
      34         4   00001   DFHBP025
      38         4   00001   DFHBP024
      3C         4   00001   DFHBP023
      40         4   00001   DFHBP022
      44         4   00001   DFHBP021
      48         4   00001   DFHBP020
      4C         4   00001   DFHEICB
      50         4   00001   DFHEID0
      54         4   00001   DFHLDVER
      58       420   00001   @STATIC
```

Figure 25. Writable Static Map Produced by Prelinker

3. Add the offset of the external variable to the address of writable static. The result is X'2D66E68' (X'02D66E40' + X'28'). This is the address of the value of the external variable in the Language Environment dump.

Finding NORENT Static Variables

1. Find the name and address of the static storage area (see “Finding the Static Storage Area” on page 122). For this example, the static storage area is called **STATSTOR** and has an address of X'02D66E40'.
2. Find the offset of the static variable in the partial storage offset compiler listing shown in the following example. The offset is 96 (X'60').

```
sa0   66-0:66   Class = static,   Location = STATSTOR +96,   Length = 4
```

3. Add this offset to the base address of static variables, calculated above. The sum is X'2D66EA0' (X'2D66E40' + X'60'). This is the address of the value of the static variable in the Language Environment dump.

   Figure 26 shows how to locate NORENT C static variables by adding the Static Storage Area CSECT address to the variable offset.

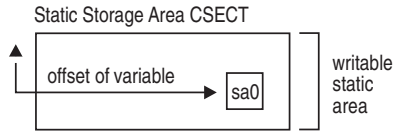

Figure 26. Location of NORENT Static Variable in Storage

Finding External NORENT Variables

Find the address of the external variable CSECT (see "Finding the Static Storage Area" on page 122). In this example, the address is X'02D66E40'. This is the address of the value of the external variable in the Language Environment dump.

Finding the C/370 Parameter List

A pointer to the parameter list is passed to the called function in register 1. is the address of the start of the parameter list. Figure 27 shows an example code for the parameter variable.

```
func0() {
  ⋮
 func1(a1,a2);
  ⋮
}

func1(int ppx, int pp0) {
  ⋮
}
```

Figure 27. Example Code for Parameter Variable

Parameters *ppx* and *pp0* correspond to copies of *a1* and *a2* in the stack frame belonging to `func0`.

To locate a parameter in the Language Environment dump:

1. Find the register and offset in the partial storage offset listing shown in the following example. In this example the offset is 4 (X'4') from register 1.

   ```
   pp0     62-0:62    Class = parameter,   Location = 4(r1),     Length = 4
   ```

2. Determine the value of `GPR1` in the Saved Registers section for the function that called the function you are interested in. Add this base address to the offset of the parameter. The contents of the variable can then be read in the DSA frame section corresponding to the function the parameter was passed from.

Finding the C++ Parameter List

Parameters are passed to the called function in a combination of registers and a parameter list. Figure 28 shows the example code for the parameter variable.

```
func0() {
  ⋮
 func1(a1,a2);
  ⋮
}

func1(int ppx, int pp0) {
  ⋮
}
```

Figure 28. Example Code for Parameter Variable

Parameters *ppx* and *pp0* correspond to copies of *a1* and *a2* in the stack frame belonging to `func1`. To locate C++ functions with `extern C` attributes, use the C/370 Parameter List section.

To locate the parameters in the Language Environment dump:

- If the base register is GPR1, use the C/370 Parameter List scheme. If the base register is not GPR1, you can locate the value of the base register in the Saved Registers section of the function you are interested in. Add to this value the offset, and you can then locate the parameter. Note that when OPTIMIZE is on, the parameter value might never be stored, since the first few parameters might be passed in registers and there might be no need to save them.

```
ppx    62-0:62    Class = parameter,    Location = 188(r13),    Length = 4
pp0    62-0:62    Class = parameter,    Location = 192(r13),    Length = 4
```

Figure 29. Partial Storage Offset Listing

Finding Members of Aggregates

You can define aggregates in any of the storage classes or pass them as parameters to a called function. The first step is to find the start of the aggregate. You can compute the start of the aggregate as described in previous sections, depending on the type of aggregate used.

The aggregate map provided for each declaration in a routine can further assist in finding the offset of a specific variable within an aggregate. Structure maps are generated using the AGGREGATE compiler option. Figure 30 on page 128 shows an example of a static aggregate.

```
static struct {
    short int ss01;
    char      ss02[56];
    int       sz0[6];
    int       ss03;
} ss0;
```

Figure 30. Example Code for Structure Variable

Figure 31 shows an example aggregate map.

```
================================================================================
| Aggregate map for:  ss0                                                      |
================================================================================
|      Offset       |      Length       | Member Name                          |
|    Bytes(Bits)    |    Bytes(Bits)    |                                      |
====================|===================|======================================
|       0           |       2           |  ss01                                |
|       2           |      56           |  ss02[56]                            |
|      58           |       2           |  ***PADDING***                       |
|      60           |      24           |  sz0[6]                              |
|      84           |       4           |  ss03                                |
================================================================================
```

Figure 31. Example of Aggregate Map

Assume the structure has been compiled as RENT. To find the value of variable *sz0[0]*:

1. Find the address of the writable static. For this example the address of writable static is X'02D66E40'.
2. Find the offset of @STATIC in the Writable Static Map. In this example, the offset is X'58'. Add this offset to the address of writable static. The result is X'2D66E98' (X'02D66E40' + X'58'). Figure 32 on page 129 shows the Writable Static Map produced by the prelinker.

```
=========================================================================
|                          Writable Static Map                          |
=========================================================================

  OFFSET    LENGTH  FILE ID  INPUT NAME

       0         1   00001   DFHC0011
       4         1   00001   DFHC0010
       8         2   00001   DFHDUMMY
       C         2   00001   DFHB0025
      10         2   00001   DFHB0024
      14         2   00001   DFHB0023
      18         2   00001   DFHB0022
      1C         2   00001   DFHB0021
      20         2   00001   DFHB0020
      24         2   00001   DFHEIB0
      28         4   00001   DFHEIPTR
      2C         4   00001   DFHCP011
      30         4   00001   DFHCP010
      34         4   00001   DFHBP025
      38         4   00001   DFHBP024
      3C         4   00001   DFHBP023
      40         4   00001   DFHBP022
      44         4   00001   DFHBP021
      48         4   00001   DFHBP020
      4C         4   00001   DFHEICB
      50         4   00001   DFHEID0
      54         4   00001   DFHLDVER
      58       320   00001   @STATIC
```

Figure 32. Writable Static Map Produced by Prelinker

3. Find the offset of the static variable in the storage offset listing. The offset is 96 (X'60'). Following is an example of a partial storage offset listing.

   ```
   ss0     66-0:66    Class = static,    Location = GPR13(96),    Length = 4
   ```

   Add this offset to the result from step 2. The result is X'2D66EF8' (X'2D66E98' + X'60'). This is the address of the value of the static variable in the dump.

4. Find the offset of sz0 in the Aggregate Map, shown in Figure 31 on page 128. The offset is 60.

Add the offset from the Aggregate Map to the address of the ss0 struct. The result is X'60' (X'3C' + X'60'). This is the address of the values of sz0 in the dump.

Finding the Timestamp

The timestamp is in the compile unit block. The address for the compile unit block is located at eight bytes past the function entry point. The compile unit block is the same for all functions in the same compilation. The fourth word of the compile unit block points to the timestamp. The timestamp is 16 bytes long and has the following format:

```
YYYYMMDDHHMMSSSS
```

Generating a Language Environment Dump of a C/C++ Routine

You can use either the CEE3DMP callable service or the `cdump()`, `csnap()`, and `ctrace()` C/C++ functions to generate a Language Environment dump of C/C++ routines. These C/C++ functions call CEE3DMP with specific options.

cdump()

If your routine is running under OS/390, VM, or CICS, you can generate useful diagnostic information by using the `cdump()` function. `cdump()` produces a main storage dump with the activation stack. This is equivalent to calling CEE3DMP with the option string: TRACEBACK BLOCKS VARIABLES FILES STORAGE STACKFRAME(ALL) CONDITION ENTRY.

When `cdump()` is invoked from a user routine, the C/C++ library issues an OS SNAP macro to obtain a dump of virtual storage. The first invocation of `cdump()` results in a SNAP identifier of 0. For each successive invocation, the ID is increased by one to a maximum of 256, after which the ID is reset to 0.

The output of the dump is directed to the CEESNAP data set. Under OS/390, the DD definition for CEESNAP is as follows:

```
//CEESNAP DD SYSOUT= *
```

Under VM, the definition statement is:

```
FILEDEF CEESNAP PRINTER (NOCHANGE PER
```

If the data set is not defined, or is not usable for any reason, `cdump()` returns a failure code of 1. This occurs even if the call to CEE3DMP is successful.

If the SNAP is not successful, the CEE3DMP DUMP file displays the following message:

```
Snap was unsuccessful
```

If the SNAP is successful, CEE3DMP displays this message:

```
Snap was successful; snap ID = nnn
```

Where *nnn* corresponds to the SNAP identifier described above. An unsuccessful SNAP does not result in an incrementation of the identifier.

Because `cdump()` returns a code of 0 only if the SNAP was successful or 1 if it was unsuccessful, you cannot distinguish whether a failure of `cdump()` occurred in the call to CEE3DMP or SNAP. A return code of 0 is issued only if both SNAP and CEE3DMP are successful.

Support for SNAP dumps using the `_cdump` function is provided only under VM and OS/390. SNAP dumps are not supported under CICS; no SNAP is produced in this environment. Under OS/390 and VM, a successful SNAP results in a large quantity of output. A routine calling `cdump()` under CICS receives a return code of 0 if the ensuing call to CEE3DMP is successful. In addition to a SNAP dump, an LE formatted dump is also taken.

csnap()

The `csnap()` function produces a condensed storage dump. `csnap()` is equivalent to calling CEE3DMP with the option string: TRACEBACK FILES BLOCKS VARIABLES NOSTORAGE STACKFRAME(ALL) CONDITION ENTRY.

To use these functions, you must add `#include <ctest.h>` to your C/C++ code. The dump is directed to output *dumpname*, which is specified in either a `//CEEDUMP DD` statement in MVS/JCL or a FILEDEF CEEDUMP command in VM.

`cdump()`, `csnap()`, and `ctrace()` all return a 1 code in the SPC environment because they are not supported in SPC.

Refer to the *OS/390 C/C++ Run-Time Library Reference* for more details about the syntax of these functions.

ctrace()

The `ctrace()` function produces a traceback and includes the offset addresses from which the calls were made. `ctrace()` is equivalent to calling CEE3DMP with the option string: TRACEBACK NOFILES NOBLOCKS NOVARIABLES NOSTORAGE STACKFRAME(ALL) NOCONDITION NOENTRY.

Sample C Routine that Calls cdump

Figure 33 on page 132 shows a sample C routine that uses the `cdump` function to generate a dump.

Figure 38 on page 135 shows the dump output.

```
#include <stdio.h>
#include <signal.h>
#include <stdlib.h>

void hsigfpe(int);
void hsigterm(int);
void atf1(void);

typedef int (*FuncPtr_T)(void);

int st1    =  99;
int st2    = 255;
int xcount =   0;

int main(void) {
  /*
   * 1) Open multiple files
   * 2) Register 2 signals
   * 3) Register 1 atexit function
   * 4) Fetch and execute a module
   */

  FuncPtr_T fetchPtr;
  FILE*     fp1;
  FILE*     fp2;
  int       rc;

  fp1 = fopen("myfile.data", "w");
  if (!fp1) {
    perror("Could not open myfile.data for write");
    exit(101);
  }

  fprintf(fp1, "record 1\n");

  ++st2;
  return;
}

void atf1() {
  ++xcount;
}
```

Figure 33 (Part 2 of 2). Example C Routine Using cdump to Generate a Dump

Figure 34 shows a fetched C module:

```
#include <ctest.h>

#pragma linkage(func1, fetchable)
int func1(void) {
  cdump("This is a sample dump");
  return(0);
}
```

Figure 34. Fetched module for C routine

Sample C++ Routine that Generates a Language Environment Dump

Figure 35 shows a sample C++ routine that uses a protection exception to generate a dump.

```
#include <iostream.h>
#include <ctest.h>
#include "stack.h"

int main() {
  cout << "Program starting:\n";
  cerr << "Error report:\n";

  Stack<int> x;
  x.push(1);
  cout << "Top value on stack : " << x.pop() << '\n';
  cout << "Next value on stack: " << x.pop() << '\n';
  return(0);
}
```

Figure 35. Example C++ Routine with Protection Exception Generating a Dump

Figure 36 shows a DLL for a C++ routine:

```
#ifndef __STACK__
  #include "stack.h"
#endif

template <class T> T Stack<T>::pop() {
  T value = head->value;
  head = head->next;

  return(value);
}

template <class T> void Stack<T>::push(T value) {
  Node* newNode  = new Node;
  newNode->value = value;
  newNode->next  = head;
  head = newNode;
}
```

Figure 36. DLL for C++ routine

Figure 37 on page 135 shows the header file **stack.h**:

```
#ifndef __STACK_
  #define __STACK__
  template <class T> class Stack {
    public:
      Stack() {
        char* badPtr = 0; badPtr -= (0x01010101);
        head = (Node*) badPtr; /* head initialized to 0xFEFEFEFF */
      }
      T pop();
      void push(T);
    private:
      struct Node {
        T value;
        struct Node* next;
      }* head;
  };
#endif
```

Figure 37. Header file STACK.H

Sample Language Environment Dump with C/C++Specific Information

This sample dump was produced by compiling the routine in Figure 33 on page 132 with the TEST(SYM) compiler option, then running it. Notice the sequence of calls in the traceback section - EDCZMINV is the C-C++ management module that invokes `main` and @@FECBMODULE1 fetches the user-defined function `func1`, which in turn calls the library routine `__cdump`.

If source code is compiled with the `GONUMBER` or `TEST` compile option, statement numbers are shown in the traceback. If source code is compiled with the `TEST(SYM)` compile option, variables and their associated type and value are dumped out. See “Finding C/C++ Information in a Language Environment Dump” on page 142 for more information about C/C++-specific information contained in a dump.

```
CEE3DMP V1 R8.0: This is a sample dump

CEE3DMP called by program unit  (entry point __cdump) at offset +00000184.

Snap was unsuccessful

Figure 38 (Part 8 of 8). Example Dump from Sample C Routine

Finding C/C++ Information in a Language Environment Dump

When a Language Environment traceback or dump is generated for a C/C++ routine, information is provided that is unique to C/C++ routines. C/C++-specific information includes:

- Control block information for active routines
- Condition information for active routines
- Enclave level data

Each of the unique C/C++ sections of the Language Environment dump are described.

[1] Storage for Active Routines

The Storage for Active Routines section of the dump shows the DSAs for the active C and C++ routines. To relate a DSA frame to a particular function name, use the address associated with the frame to find the corresponding DSA. In this example, the function `func1` DSA address is X'00030440'.

[2] Control Blocks Associated with the Active Thread

In the Control Blocks Associated with the Thread section of the dump, the following information appears:

- C/C++ fields from the CAA
- C/C++Specific CAA

- Signal information

[2A] C/C++ CAA Fields

The CAA contains several fields that the C/C++ programmer can use to find information about the run-time environment. For each C/C++ program, there is a C-C++ Specific Thread area and a C-C++ Specific Enclave area.

[2B] C-C++ Specific CAA

The C-C++ specific CAA fields that are of interest to users are described below.

errno value
A variable used to display error information. Its value can be set to a positive number that corresponds to an error message. The functions `perror()` and `strerror()` print the error message that corresponds to the value of `errno`.

Memory file control block
You can use the memory file control block (MFCB) to locate additional information about memory files. This control block resides at the C/C++ thread level. See 144 for more information about the MFCB.

Open FCB chain
A pointer to the start of a linked list of open file control blocks (FCBs). For more information about FCBs, see 144.

[3] Signal Information

When the POSIX(OFF) run-time option is specified, signal information is provided in the dump to aid you in debugging. For each signal that is disabled with `SIG_IGN`, an entry value of 00000001 is made in the first field of the Signal Information field for the specified signal name.

For each signal that has a handler registered, the signal name and the handler name are listed. If the handler is a fetched C function, the value `@@FECB` is entered as the function name and the address of the fetched pointer is in the first field.

If you compile a C routine as `NORENT`, the WSA address is not available (`N/A`). See *OS/390 C/C++ Programming Guide* for more information about the `signal` function.

[4] WSA Address

The `WSA Address` is the base address of the writable static area which is available for all C and C++ programs except C programs compiled with the `NORENT` compile option.

[5] atexit() Information

The `atexit()` information lists the functions registered with the `atexit()` function that would be run at normal termination. The functions are listed in chronological order of registration.

If you compile a C routine as `NORENT`, the WSA address is not available (`N/A`). See *OS/390 C/C++ Run-Time Library Reference* for more information about the `atexit()` function.

[6] fetch() Information

The `fetch()` information shows information about modules that you have dynamically loaded using `fetch()`. For each module that was fetched, the `fetch()` pointer and the function pointer are included.

```
ptr1 = fetch("MOD");
```

If you compile a C routine as `NORENT`, the WSA address is not available (`N/A`). See *OS/390 C/C++ Programming Guide* for more information about the `fetch()` function.

[7] File Control Block Information

This section of the dump includes the file control block (FCB) information for each C/C++ file. The FCB contains file status and attributes for files open during C/C++ active routines. You can use this information to find the data set or file name.

The FCB is a handle that points to the following file information, which is displayed when applicable, for the file:

- Access method control block (ACB) address
- Data control block (DCB) address
- Data control block extension (DCBE) address
- Job file control block (JFCB) address
- RPL address
- Current buffer address
- Saved buffer address
- ddname

Not all FCB fields are always filled in. For example, RPLs are used only for VSAM data sets. The ddname field contains blanks if it is not used.

The save block buffer represents auxiliary buffers that are used to save the contents of the main buffers. Such saving occurs only when a reposition is performed and there is new data; for example, an incomplete text record or an incomplete fixed-block standard (FBS) block in the buffers that cannot be flushed out of the system.

Because the main buffers represent the current position in the file, while the save buffers merely indicate a save has occurred, check the save buffers only if data appears to be missing from the external device and is not found in the main buffers. Also, do not infer that the presence of save buffers means that data present there belongs at the end of the file. (The buffers remain, even when the data is eventually written.)

For information about the job file control block, refer to *OS/390 MVS Data Areas, Vol 3 (IVT-RCWK)*.

Memory File Control Block

This section of the dump holds the memory file control block information for each memory file the routine uses. A sample memory file control block is shown in Figure 39 on page 145.

Figure 39. Memory File Control Block

Memory file name
The name assigned to this memory file.

First memory data space
A dump of the first 1K maximum of actual user data associated with this memory file.

[8] Information for __amrc

__amrc is a structure defined in the **stdio.h** header file to assist in determining errors resulting from I/O operations. The contents of __amrc can be checked for system information, such as the return code for VSAM. Certain fields of the __amrc structure can provide useful information about what occurred previously in your routine.

For more information about __amrc refer to “Debugging C/C++ Input/Output Programs” on page 111 and to *OS/390 C/C++ Programming Guide*.

[9] Errno Information

The Errno information shows the thread id of the thread that generated the dump and the settings of the errno and errnojr variables for that thread.

Both the errno and the errnojr variables contain the return code of the last failing OS/390 UNIX system service call. These variables provide OS/390 UNIX application programs access to diagnostic information returned from an underlying OS/390 UNIX callable service. Refer to *OS/390 UNIX System Services Messages and Codes* for more information on these return and reason codes.

Additional Floating-Point Registers

The Language Environment dump formats Additional Floating Point (AFP) registers and Floating Point Control (FPC) registers when the APF suboption of the FLOAT C/C++ compiler option is specified and the registers are needed. These floating-point registers are displayed in three sections of the CEEDUMP; Registers on Entry to CEE3DMP; Parameters, Registers, and Variables; and Condition Information for Active Routines. Samples of each section are given. See *OS/390 C/C++ User's Guide* for information on the FLOAT C/C++ compiler option.

Registers on Entry to CEE3DMP: This section of the Language Environment dump displays the twelve floating-point registers. A sample output is shown.

```

Figure 42. Condition Information for Active Routines

C/C++ Contents of the Language Environment Trace Table

Language Environment provides four C/C++ trace table entry types that contain character data:

- Trace entry 1 occurs when a base C library function is called.
- Trace entry 2 occurs when a base C library function returns.
- Trace entry 3 occurs when a POSIX C library function is called.
- Trace entry 4 occurs when a POSIX C library function returns.

The format for trace table entry 1 is:

```
—>(xxx) NameOfCallingFunction NameOfCalledFunction
 or, for called functions calloc, free, malloc, and realloc:
—>(xxx) NameOfCallingFunction NameOfCalledFunction(input_parameters)
```

The format for trace table entry 2 is:

```
<—(xxx) R15=value ERRNO=value
```

The format for trace table entry 3 is:

```
—>(xxx) NameOfCallingFunction NameOfCalledFunction
```

The format for trace table entry 4 is:

```
<—(xxx) R15=value ERRNO=value ERRNO2=value
```

In all four entry types, (xxx) is a number associated with the called library function and is used to associate a specific entry record with its corresponding return record.

Figure 43 on page 148 shows a trace which has examples of all four C/C++ trace table entry types.

```

For more information about the Language Environment trace table format, see "Understanding the Trace Table Entry (TTE)" on page 106.

Debugging Examples of C/C++ Routines

This section contains examples that demonstrate the debugging process for C/C++ routines. Important areas of the output are highlighted. Data unnecessary to the debugging examples has been replaced by ellipses.

Divide-by-Zero Error

Figure 44 on page 150 illustrates a C program that contains a divide-by-zero error. The code was compiled with `RENT` so static and external variables need to be calculated from the WSA field. The code was compiled with `XREF, LIST` and `OFFSET` to generate a listing, which is used to calculate addresses of functions and data. The code was processed by the binder with `MAP` to generate a binder map, which is used to calculate the addresses of static and external variables.

```
#include <stdio.h>
#include <stdlib.h>
#include <errno.h>
int statint = 73;
int fa;
void funcb(int *pp);

int main(void) {
  int aa, bb=1;
  aa = bb;
  funcb(&aa);
  return(99);
}

void funcb(int *pp) {
  int result;
  fa = *pp;
  result = fa/(statint-73);
  return;
}
```

Figure 44. C Routine with a Divide-by-Zero Error

To debug this routine, use the following steps:

1. Locate the Current Condition message in the Condition Information for Active Routines section of the dump. In this example, the message is `CEE3209S`. The system detected a fixed—point divide exception. This message indicates the error was caused by an attempt to divide by zero. See Chapter 9, “Language Environment Run-Time Messages” on page 243 for additional information about CEE3209S.

   The traceback section of the dump indicates that the exception occurred at offset X'7E' within function `funcb`. This information is used along with the compiler-generated Pseudo Assembly Listing to determine where the problem occurred.

   If the `TEST` compiler option is specified, variable information is in the dump. If the `GONUMBER` compiler option is specified, statement number information is in the dump. Figure 45 on page 151 shows the generated traceback from the dump.

Figure 45. Sections of the Dump from Example C/C++ Routine

2. Locate the instruction with the divide-by-zero error in the Pseudo Assembly Listing in Figure 46 on page 152.

   The offset (within `funcb`) of the exception from the traceback (X'7E') reveals the divide instruction: `DR r6,r8` at that location. Instructions X'66' through X'80' refer to the `result = fa/(statint-73);` line of the C/C++ routine.

Figure 46. Pseudo Assembly Listing

3. Verify the value of the divisor `statint`. The procedure specified below is to be used for determining the value of static variables only. If the divisor is an automatic variable, there is a different procedure for finding the value of the variable. See “Finding Automatic Variables” on page 122 for more information about finding automatic variables in a dump.

Because this routine was compiled with the RENT option, find the WSA address in the Enclave Control Blocks section of the dump. In this example, this address is X'0B3076C8'. Figure 47 on page 153 shows the WSA address.

```
Enclave Control Blocks:

  ⋮
  WSA address.................. 0B3076C8
  ⋮
```

Figure 47. C/C++ CAA Information in Dump

4. Routines compiled with the RENT option must also be processed by the binder. The binder prodcues the Writable Static Map. Find the offset of `statint` in the Writable Static Map in Figure 48. In this example, the offset is X'4'.

```

            CLASS
           OFFSET  NAME                TYPE    LENGTH   SECTION

                0  fa                PART             4  fa
                4  statint           PART             4  statint
⋮
```

Figure 48. Writable Static Map

5. Add the WSA address of X'0B3076C8' to the offset of `statint`. The result is X'0B3076CC'. This is the address of the variable `statint`, which is in the writable static area. The writable static area is storage allocated by the C/C++ runtime for the C/C++ user, so it is in the user heap. The heap content is displayed in the Enclave Storage section of the dump, shown in Figure 49 on page 154.
6. To find the variable `statint` in the heap, locate the closest address listed that is before the address of `statint`. In this case, that address is X'0B3076CB'. Count across X'04' to location X'0B3076CC'. The value at that location is X'49' (that is, `statint` is 73), and hence the fixed point divide exception.

Figure 49. Enclave Storage Section of Dump

Calling a Nonexistent Function

Figure 50 demonstrates the error of calling a nonexistent function. This routine was compiled with the compiler options LIST and RENT and was run with the option TERMTHDACT(DUMP).

This routine was not compiled with the TEST(ALL) compile option. As a result, arguments and variables do not appear in the dump.

The only prelinker option used was MAP.

```
#include <stdio.h>
#include <stdlib.h>
#include <errno.h>
#include <signal.h>
void funca(int* aa);
int (*func_ptr)(void)=0;
int main(void) {
  int aa;
  funca(&aa);
  printf("result of funca = %d\n",aa);
  return;
}
void funca(int* aa) {
  *aa = func_ptr();
  return;
}
```

Figure 50. C/C++ Example of Calling a Nonexistent Subroutine

To debug this routine, use the following steps:

1. Locate the Current Condition message in the Condition Information for Active Routines section of the dump, shown in Figure 51 on page 155. In this example, the message is `CEE3201S. The system detected an Operations exception.` This message suggests that the error was caused by an attempt to branch to an unknown address. See Chapter 9, “Language Environment Run-Time Messages” on page 243 for additional information about CEE3201S.

   The traceback section of the dump indicates that the exception occurred at offset X'-04500616' within function `funca`. The negative offset indicates that the offset cannot be used to locate the instruction that caused the error. Another indication of bad data is the value of X'80000004' in the instruction

address of the PSW. This address indicates that an instruction in the routine branched outside the bounds of the routine.

3. Find the offset of FUNC@PTR in the Writable Static Map, shown in Figure 53, as produced by the prelinker.

```
 ⋮
================================================================================
|                          Writable Static Map                                 |
================================================================================

 OFFSET    LENGTH  FILE ID  INPUT NAME

      0         4   00001   FUNC@PTR
      8        18   00001   @STATIC
 ⋮
```

Figure 53. Writable Static Map

4. Add the offset of FUNC@PTR (X'0') to the address of WSA (X'46E5618'). The result (X'46E5618') is the address of the function pointer func_ptr in the writable static storage area within the heap. This value is 0, indicating the variable is uninitialized.

   Figure 54 shows the sections of the dump.

Handling Dumps Written to the OS/390 UNIX File System

When an OS/390 UNIX C application program is running in an address space created as a result of a call to `spawnp()`, `vfork`, or one of the `exec` family of functions, the SYSMDUMP DD allocation information is not inherited. Even though the SYSMDUMP allocation is not inherited, a SYSMDUMP allocation must exist in the parent in order to obtain a HFS core dump. If the program terminates abnormally while running in this new address space, the kernel causes an unformatted core dump to be written to an HFS file in the user's working directory or a VM/ESA BFS file. The file is placed in the current working directory or into /tmp if the current working directory is not defined. The file name has the following format:

```
/directory/coredump.pid
```

where directory is the current working directory or tmp, and pid is the hexadecimal process ID (PID) for the process that terminated. See “Generating a System Dump in an OS/390 UNIX Shell” on page 73 for details on how to generate the system dump.

To debug the dump, use the MVS Interactive Problem Control System (IPCS). If the dump was written to an HFS file, you must allocate an OS/390 data set that is large enough and has the correct attributes for receiving a copy of the HFS file. For example, from the ISPF DATA SET UTILITY panel you can specify a volume serial and data set name to allocate. Doing so brings up the DATA SET INFORMATION panel for specifying characteristics of the data set to be allocated. The following filled-in panel shows the characteristics defined for the URCOMP.JRUSL.COREDUMP dump data set:

```
-------------------------  DATA SET INFORMATION  ----------------------
Command ===>

Data Set Name  . . . : URCOMP.JRUSL.COREDUMP

General Data                          Current Allocation
 Management class . . : STANDARD       Allocated cylinders : 30
 Storage class  . . . : OS390          Allocated extents . : 1
  Volume serial . . . : DPXDU1
  Device type . . . . : 3380
 Data class . . . . . :
  Organization  . . . : PS            Current Utilization
  Record format . . . : FB             Used cylinders. . . : 0
  Record length . . . : 4160           Used extents  . . . : 0
  Block size  . . . . : 4160
  1st extent cylinders: 30
  Secondary cylinders : 10
  Data set name type  :

  Creation date . . . : 1997/09/18
  Expiration date . . : ***None***

F1=Help     F2=Split     F3=End       F4=Return    F5=Rfind     F6=Rchange
F7=Up       F8=Down      F9=Swap     F10=Left     F11=Right    F12=Cancel
```

Fill in the information for your data set as shown, and estimate the number of cylinders required for the dump file you are going to copy.

Use the TSO/E OGET or OCOPY command with the BINARY keyword to copy the file into the data set. For example, to copy the HFS core dump file `coredump.00060007` into the OS/390 data set URCOMP.JRUSL.COREDUMP just allocated, a user with the user ID URCOMP enters the following command:

```
OGET '/u/urcomp/coredump.00060007' 'urcomp.jrusl.coredump' BINARY
```

See *OS/390 UNIX System Services User's Guide* for more information on using the copy commands.

After you have copied the core dump file to the data set, you can use IPCS to analyze the dump. Refer to "Formatting and Analyzing System Dumps on OS/390" on page 73 for information about formatting Language Environment control blocks.

Multithreading Consideration

Certain control blocks are locked while a dump is in progress. For example, a `csnap()` of the file control block would prevent another thread from using or dumping the same information. An attempt to do so causes the second thread to wait until the first one completes before it can continue.

Understanding C/C++ Heap Information in Storage Reports

Storage reports that contain specific C/C++ heap information can be generated in two ways:

- By setting the Language Environment RPTSTG(ON) run-time option for Language Environment created heaps
- By issuing a stand-alone call to the C function, __uheapreport() for user–created heaps.

Details on how to request and interpret the reports are provided in the following sections.

Language Environment Run-Time Options Report

To request a Language Environment run-time options report set RPTSTG(ON). If the C/C++ application specified a value for the HEAPPOOLS run-time option then the storage report displays HeapPools statistic data. See Figure 55 on page 159 for a sample storage report showing HeapPools Statistics for a multithreaded C/C++ application.

Immediately following the report, the C/C++ specific heap pool information is described.

```

Figure 55 (Part 4 of 4). Language Environment Storage Report with HeapPools Statistics

HeapPools Storage Statistics

The HEAPPOOLS run-time option controls usage of the heap pools storage algorithm at the enclave level. The heap pools algorithm allows for the definition of one to six heap pools, each consisting of a number of storage cells of a specified length.

HeapPools Statistics

- Pool *p* size: *ssss*
  - *p* — the number of the pool
  - *ssss* — the cell size specified for the pool.
- Successful Get Heap requests: *xxxx-yyyy n*
  - *xxxx* — the low side of the 8 byte range
  - *yyyy* — the high side of the 8 byte range
  - *n* — the number of requests in the 8 byte range.
- Requests greater than the largest cell size — the number of storage requests that are not satisfied by heap pools.

Note: Values displayed in the HeapPools Statistics report are not serialized when collected, therefore the values are not necessarily exact.

HeapPools Summary: The HeapPools Summary displays a report of the HeapPool Statistics and provides suggested percentages for current cell sizes as well as suggested cell sizes.

- Cell Size — the size of the cell specified in the HEAPPOOLS run-time option
- Extent Percent — the cell pool percent specified by the HEAPPOOLS run-time option
- Cells Per Extent — the number of cells per extent. This number is calculated using the following formula:

  ```
  Initial Heap Size * (Extent Percent/100))/(8 + Cell Size)
  ```

  with a minimum of one cell.

Note: Having only one cell per extent is not recommended since the pool could allocate many extents, which would cause the HeapPool algorithm to perform inefficiently.

- Extents Allocated — the number of times that each pool allocated an extent.

  In order to optimize storage usage, the extents allocated should be either one or two. If the number of extents allocated is too high, then increase the percentage for the pool.

- Maximum Cells Used — the maximum number of cells used for each pool.
- Cells In Use — the number of cells that were never freed.

  Note: A large number in this field could indicate a storage leak.

- Suggested Percentages for current Cell Sizes — percentages calculated to find the optimal size of the cell pool extent. The calculation is based on the following formula:

  ```
  (Maximum Cells Used * (Cell Size + 8) * 100) / Initial Heap Size
  With a minimum of 1% and a maximum of 90%
  ```

  Make sure that your cell pool extents are neither too large nor too small. If your percentages are too large then additional, unreferenced virtual storage will be allocated, thereby causing the program to exhaust the region size. If the percentages are too small (only one cell per extent — the worst case scenario) then the HeapPools algorithm will run inefficiently.

- Suggested Cell Sizes — sizes that are calculated to optimally use storage (assuming that the application will malloc/free with the same frequency).

  Note: The suggested cell sizes are given with no percentages because the usage of each new cell pool size is not known. If there are less than 6 pool sizes calculated then the last pool will be set at 2048.

See *OS/390 Language Environment Programming Guide* for more information about stack and heap storage.

C Function, __uheapreport, Storage Report

To generate a user-created heap storage report use the C function, *__uheapreport()*. Use the information in the report to assist with tuning your application's use of the user-created heap. See “HeapPools Storage Statistics” on page 162 for a description of the information contained in the report.

For more information on the *__uheapreport()* function, see *OS/390 C/C++ Run-Time Library Reference*. For tuning tips, see *OS/390 Language Environment Programming Guide*.

A sample storage report generated by *__uheapreport()* is shown in Figure 56 on page 164.

Chapter 5. Debugging COBOL Programs

This chapter provides information for debugging applications that contain one or more COBOL programs. It includes information about:

- Determining the source of error
- Generating COBOL listings and the Language Environment dump
- Finding COBOL information in a dump
- Debugging example COBOL programs

Determining the Source of Error

The following sections describe how you can determine the source of error in your COBOL program. They explain how to simplify the process of debugging COBOL programs by using features such as the DISPLAY statement, declaratives, and file status keys. The following methods for determining errors are covered:

- Tracing program logic
- Finding and handling input/output errors
- Validating data
- Assessing switch problems
- Generating information about procedures

After you have located and fixed any problems in your program, you should delete all debugging aids and recompile it before running it in production. Doing so helps the program run more efficiently and use less storage.

Tracing Program Logic

You can add DISPLAY statements to help you trace through the logic of the program in a non-CICS environment. If, for example, you determine that the problem appears in an EVALUATE statement or in a set of nested IF statements, DISPLAY statements in each path tell you how the logic flows. You can also use DISPLAY statements to show you the value of interim results.

For example, to check logic flow, you might insert:

```
DISPLAY "ENTER CHECK PROCEDURE".
        .
        .  (checking procedure routine)
        .
DISPLAY "FINISHED CHECK PROCEDURE".
```

to determine whether you started and finished a particular procedure. After you are sure that the program works correctly, comment out the DISPLAY statement lines by putting asterisks in position 7 of the appropriate lines. See *COBOL Language Reference* for a detailed description of the DISPLAY statement.

Scope terminators can also help you trace the logic of your program because they clearly indicate the end of a statement. See *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide* for a detailed description of scope terminators.

Finding Input/Output Errors

VSAM file status keys can help you determine whether routine errors are due to the logic of your routine or are I/O errors occurring on the storage media.

To use file status keys as a debugging aid, include a test after each I/O statement to check for a value other than 0 in the file status key. If the value is other than 0, you can expect to receive an error message. You can use a nonzero value to indicate how the I/O procedures in the routine were coded. You can also include procedures to correct the error based on the file status key value.

The file status key values and their associated meanings are described in *COBOL Language Reference*.

Handling Input/Output Errors

If you have determined that the problem lies in one of the I/O procedures in your program, you can include the USE EXCEPTION/ERROR declarative to help debug the problem. If the file does not open, the appropriate USE EXCEPTION/ERROR declarative is activated. You can specify the appropriate declarative for the file or for the different open attributes—INPUT, OUTPUT, I/O, or EXTEND.

Code each USE AFTER STANDARD ERROR statement in a separate section immediately after the Declarative Section keyword of the Procedure Division. See the rules for coding such usage statements in *COBOL Language Reference*.

Validating Data (Class Test)

If you suspect that your program is trying to perform arithmetic on nonnumeric data or is somehow receiving the wrong type of data on an input record, you can use the class test to validate the type of data. See *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide* for a detailed discussion of how to use the class test to check for incompatible data.

Assessing Switch Problems

Using INITIALIZE or SET statements to initialize a table or data item is useful when you suspect that a problem is caused by residual data left in those fields. If your problem occurs intermittently and not always with the same data, the problem could be that a switch is not initialized, but is generally set to the right value (0 or 1). By including a SET statement to ensure that the switch is initialized, you can determine whether or not the uninitialized switch is the cause of the problem. See *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide* for a detailed discussion of how to use the INITIALIZE and SET statements.

Generating Information about Procedures

You can use the USE FOR DEBUGGING declarative to include COBOL statements in a COBOL program and specify when they should run. Use these statements to generate information about your program and how it is running.

For example, to check how many times a procedure is run, include a special procedure for debugging (in the USE FOR DEBUGGING declarative) that adds 1 to a counter each time control passes to that procedure. The adding-to-a-counter technique can be used as a check for:

- How many times a PERFORM ran. This shows you whether the control flow you are using is correct.
- How many times a loop routine actually runs. This tells you whether the loop is running and whether the number you have used for the loop is accurate.

Code each USE FOR DEBUGGING declarative in a separate section in the DECLARATIVES SECTION of the PROCEDURE DIVISION. See the rules for coding them in *COBOL Language Reference*.

You can use debugging lines, debugging statements, or both in your program. Debugging lines are placed in your program, and are identified by a `D` in position 7. Debugging statements are coded in the DECLARATIVES SECTION of the PROCEDURE DIVISION.

- The USE FOR DEBUGGING declaratives must:
  - Be only in the DECLARATIVES SECTION
  - Follow a DECLARATIVES header USE FOR DEBUGGING

  With USE FOR DEBUGGING, the TEST compiler option must have the NONE hook-location suboption specified or the NOTEST compiler option must be specified. The TEST compiler option and the DEBUG run-time option are mutually exclusive, with DEBUG taking precedence.
- Debugging lines must have a `D` in position 7 to identify them.

To use debugging lines and statements in your program, you must include both:

- WITH DEBUGGING MODE in the SOURCE-COMPUTER paragraph in the ENVIRONMENT DIVISION
- The DEBUG run-time option

Figure 57 shows how to use the DISPLAY statement and the USE FOR DEBUGGING declarative to debug a program.

```
Environment Division
Source Computer . . . With Debugging Mode.

⋮
Data Division.

⋮
  File Section.

  Working-Storage Section.

 *(among other entries you would need:)

  01  Trace-Msg    PIC X(30)
                   Value "  Trace for Procedure-Name : ".
  01  Total        PIC 99  Value Zeros.

 *(balance of Working-Storage Section)
```

Debug-Declar Section.
    Use For Debugging On 501-Some-Routine.
Debug-Declar-Paragraph.
    Display Trace-Msg, Debug-Name, Total.
Debug-Declar-End.
    Exit.

End Declaratives.

Begin-Program Section.
⋮
    Perform 501-Some-Routine.

   *(within the module where you want to test, place:)

    Add 1 To Total

  * (whether you put a period at the end depends on
  * where you put this statement.)
```

Figure 57 (Part 2 of 2). Example of Using the WITH DEBUGGING MODE Clause

In the example in Figure 57 on page 167, portions of a program are shown to illustrate the kind of statements needed to use the USE FOR DEBUGGING declarative. The DISPLAY statement specified in the DECLARATIVES SECTION issues the:

```
Trace For Procedure-Name : 501-Some-Routine nn
```

message every time the PERFORM 501-SOME-ROUTINE runs. The total shown, *nn*, is the value accumulated in the data item named TOTAL.

Another use for the DISPLAY statement technique shown above is to show the flow through your program. You do this by changing the USE FOR DEBUGGING declarative in the DECLARATIVES SECTION to:

```
USE FOR DEBUGGING ON ALL PROCEDURES.
```

and dropping the word TOTAL from the DISPLAY statement.

Using COBOL Listings

When you are debugging, you can use one or more of the following listings:

- Sorted Cross-Reference listing
- Data Map listing
- Verb Cross-Reference listing
- Procedure Division Listings

This section gives an overview of each of these listings and specifies the compiler option you use to obtain each listing. For a detailed description of available listings, sample listings, and a complete description of COBOL compiler options, see *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide.*

Name	Contents	Compiler Option
Sorted Cross-Reference Listings	Provides sorted cross-reference listings of DATA DIVISION, PROCEDURE DIVISION, and program names. The listings provide the location of all references to this information.	XREF
Data Map listing	Provides information about the locations of all DATA DIVISION items and all implicitly declared variables. This option also supplies a nested program map, which indicates where the programs are defined and provides program attribute information.	MAP
Verb Cross-Reference listing	Produces an alphabetic listing of all the verbs in your program and indicates where each is referenced.	VBREF
Procedure Division listings	Tells the COBOL compiler to generate a listing of the PROCEDURE DIVISION along with the assembler coding produced by the compiler. The list output includes the assembler source code, a map of the task global table (TGT), information about the location and size of WORKING-STORAGE and control blocks, and information about the location of literals and code for dynamic storage usage.	LIST
Procedure Division listings	Instead of the full PROCEDURE DIVISION listing with assembler expansion information, you can use the OFFSET compiler option to get a condensed listing that provides information about the program verb usage, global tables, WORKING-STORAGE, and literals. The OFFSET option takes precedence over the LIST option. That is, OFFSET and LIST are mutually exclusive; if you specify both, only OFFSET takes effect.	OFFSET

Generating a Language Environment Dump of a COBOL Program

The two sample programs shown in Figure 58 on page 170 and Figure 59 on page 170 generate Language Environment dumps with COBOL-specific information.

COBOL Program that Calls Another COBOL Program

In this example, program COBDUMP1 calls COBDUMP2, which in turn calls the Language Environment dump service CEE3DMP.

```
CBL  TEST(STMT,SYM),RENT
     IDENTIFICATION DIVISION.
       PROGRAM-ID.   COBDUMP1.
       AUTHOR. USER NAME

     ENVIRONMENT DIVISION.

     DATA DIVISION.

     WORKING-STORAGE SECTION.
     01 SOME-WORKINGSTG.
        05 SUB-LEVEL PIC X(80).

     01   SALARY-RECORDA.
      02    NAMEA   PIC X(10).
      02    DEPTA   PIC 9(4).
      02    SALARYA PIC 9(6).

     PROCEDURE DIVISION.
     START-SEC.
         DISPLAY "STARTING TEST COBDUMP1".
         MOVE "THIS IS IN WORKING STORAGE" TO SUB-LEVEL.
         CALL "COBDUMP2" USING SALARY-RECORDA.
         DISPLAY "END OF TEST COBDUMP1"
         STOP RUN.
     END PROGRAM COBDUMP1.
```

Figure 58. COBOL Program COBDUMP1 Calling COBDUMP2

COBOL Program that Calls the Language Environment CEE3DMP Callable Service

In the example in Figure 59, program COBDUMP2 calls the Language Environment dump service CEE3DMP.

```
CBL  TEST(STMT,SYM),RENT
     IDENTIFICATION DIVISION.
       PROGRAM-ID.   COBDUMP2.
       AUTHOR. USER NAME

     ENVIRONMENT DIVISION.
     INPUT-OUTPUT SECTION.
     FILE-CONTROL.
         SELECT OPTIONAL IOFSS1 ASSIGN AS-ESDS1DD
             ORGANIZATION SEQUENTIAL ACCESS SEQUENTIAL.
```

Figure 59 (Part 1 of 2). COBOL Program COBDUMP2 Calling the Language Environment Dump Service CEE3DMP

```
DATA DIVISION.
FILE SECTION.
FD  IOFSS1 GLOBAL.
  1 IOFSS1R PIC X(40).

WORKING-STORAGE SECTION.
  01  TEMP4.
      05  A-1 OCCURS 2 TIMES.
          10  A-2 OCCURS 2 TIMES.
              15 A-3V PIC X(3).
              15 A-6  PIC X(3).
77   DMPTITLE   PIC X(80).
77   OPTIONS    PIC X(255).
77   FC         PIC X(12).

 02    NAME   PIC X(10).
 02    DEPT   PIC 9(4).
 02    SALARY PIC 9(6).

PROCEDURE DIVISION USING SALARY-RECORD.
START-SEC.
    DISPLAY "STARTING TEST COBDUMP2"
    MOVE "COBOL DUMP" TO DMPTITLE.
    MOVE "XXX" TO A-6(1, 1).
    MOVE "YYY" TO A-6(1, 2).
    MOVE "ZZZ" TO A-6(2, 1).
    MOVE " BLOCKS STORAGE PAGE(55) FILES" TO OPTIONS.
    CALL "CEE3DMP" USING DMPTITLE, OPTIONS, FC.
    DISPLAY "END OF TEST COBDUMP2"
    GOBACK.
END PROGRAM COBDUMP2.
```

Figure 59 (Part 2 of 2). COBOL Program COBDUMP2 Calling the Language Environment Dump Service CEE3DMP

Sample Language Environment Dump with COBOL-Specific Information

The call in program COBDUMP2 to CEE3DMP generates a Language Environment dump, shown in Figure 60 on page 172. The dump includes a traceback section, which shows the names of both programs; a section on register usage at the time the dump was generated; and a variables section, which shows the storage and data items for each program. Character fields in the dump are indicated by single quotes. For an explanation of these sections of the dump, see “Finding COBOL Information in a Dump” on page 173.

Figure 60 (Part 2 of 2). Sections of the Language Environment Dump Called from COBDUMP2

Finding COBOL Information in a Dump

Like the standard Language Environment dump format, dumps generated from COBOL programs contain:

- Control block information for active programs
- Storage for each active program
- Enclave-level data
- Process-level data

Control Block Information for Active Routines

The Control Blocks for Active Routines section of the dump, shown in Figure 61 on page 174, displays the following information for each active COBOL program:

- DSA
- Program name and date/time of compile
- COBOL compiler Version, Release, Modification, and User Level
- COBOL control blocks TGT and CLLE

```

Figure 61. Control Block Information for Active COBOL Routines

Storage for Each Active Routines

The Storage for Active Routines section of the dump, shown in Figure 62 on page 175, displays the following information for each COBOL program:

- Program name
- Contents of the base locators for files, WORKING-STORAGE, LINKAGE SECTION, LOCAL-STORAGE SECTION, variably-located areas, and EXTERNAL data.
- File record contents.
- WORKING-STORAGE, including the base locator for WORKING-STORAGE (BLW) and program class storage.

```

Figure 63. Enclave-Level Data for COBOL Programs

Process-Level Data

The Process Control Block section of the dump, shown in Figure 64, displays COBOL process-level control blocks THDCOM, COBCOM, COBVEC, and ITBLK.

In a non-CICS environment, the ITBLK control block only appears when a VS COBOL II program is active. In a CICS environment, the ITBLK control block always appears.

Figure 64. Process-Level Control Blocks for COBOL Programs

Debugging Example COBOL Programs

The following examples help demonstrate techniques for debugging COBOL programs. Important areas of the dump output are highlighted. Data unnecessary to debugging has been replaced by ellipses.

Subscript Range Error

Figure 65 on page 178 illustrates the error of using a subscript value outside the range of an array. This program was compiled with LIST, TEST(STMT,SYM), and SSRANGE. The SSRANGE compiler option causes the compiler to generate code that checks (during run time) for data that has been stored or referenced outside of its defined area because of incorrect indexing and subscripting. The SSRANGE option takes effect during run time, unless you specify CHECK(OFF) as a run-time option.

The program was run with TERMTHDACT(TRACE) to generate the traceback information shown in Figure 66 on page 178.

```
CBL  LIST,SSRANGE,TEST(STMT,SYM)
     ID DIVISION.
     PROGRAM-ID. COBOLX.
     ENVIRONMENT DIVISION.
     DATA DIVISION.
     WORKING-STORAGE SECTION.
     77  J     PIC 9(4) USAGE COMP.
     01  TABLE-X.
      02  SLOT PIC 9(4) USAGE COMP OCCURS 8 TIMES.
     PROCEDURE DIVISION.
         MOVE 9 TO J.
         MOVE 1 TO SLOT (J).
         GOBACK.
```

Figure 65. COBOL Example of Moving a Value Outside an Array Range

To understand the traceback information and debug this program, use the following steps:

1. Locate the current error message in the Condition Information for Active Routines section of the Language Environment traceback, shown in Figure 66. The message is `IGZ0006S The reference to table SLOT by verb number 01 on line 000011 addressed an area outside the region of the table.` The message indicates that line 11 was the current COBOL statement when the error occurred. For more information about this message, see Chapter 15, "COBOL Run-Time Messages" on page 711.
2. Statement 11 in the traceback section of the dump occurred in program COBOLX.

```
CEE3DMP V2 R9.0: Condition processing resulted in the unhandled condition.        11/04/99 11:48:58 AM                Page:    1

⋮
```

Figure 67. COBOL Listing for COBOLX

4. Find the values of the local variables in the Parameters, Registers, and Variables for Active Routines section of the traceback, shown in Figure 66 on page 178. J, which is of type PIC 9(4) with usage COMP, has a 9 value. J is the index to the array SLOT.

   The array SLOT contains eight positions. When the program tries to move a value into the J or 9th element of the 8-element array named SLOT, the error of moving a value outside the area of the array occurs.

Calling a Nonexistent Subroutine

Figure 68 demonstrates the error of calling a nonexistent subroutine in a COBOL program. In this example, the program COBOLY was compiled with the compiler options LIST, MAP and XREF. The TEST option was also specified with the suboptions NONE and SYM. Figure 68 shows the program.

```
 CBL  LIST,MAP,XREF,TEST(NONE,SYM)
      ID DIVISION.
      PROGRAM-ID. COBOLY.
      ENVIRONMENT DIVISION.
      DATA DIVISION.
      WORKING-STORAGE SECTION.
      77  SUBNAME PIC X(8) USAGE DISPLAY VALUE 'UNKNOWN'.
      PROCEDURE DIVISION.
          CALL SUBNAME.
          GOBACK.
```

Figure 68. COBOL Example of Calling a Nonexistent Subroutine

To understand the traceback information and debug this program, use the following steps:

1. Locate the error message for the original condition under the Condition Information for Active Routines section of the dump, shown in Figure 69 on page 181. The message is `CEE3501S The module UNKNOWN  was not found.` For more information about this message, see Chapter 9, “Language Environment Run-Time Messages” on page 243.
2. Note the sequence of calls in the Traceback section of the dump. COBOLY called IGZCFCC; IGZCFCC (a COBOL library subroutine used for dynamic calls) called IGZCLDL; then IGZCLDL (a COBOL library subroutine used to

load library routines) called CEESGLT, a Language Environment condition handling routine.

This sequence indicates that the exception occurred in IGZCLDL when COBOLY was attempting to make a dynamic call. The call statement in COBOLY is located at offset +00000338.

```
CEE3DMP V2 R9.0: Condition processing resulted in the unhandled condition.        11/08/99 5:17:40 PM                Page:    1

Figure 70. COBOL Listing for COBOLY

4. Find the value of the local variables in the Parameters, Registers, and Variables for Active Routines section of the dump, shown in Figure 71 on page 183. Notice that the value of SUBNAME with usage DISP, has a value of 'UNKNOWN'.

   Correct the problem by either changing the subroutine name to one that is defined, or by ensuring that the subroutine is available at compile time.

Divide-by-Zero Error

The following example demonstrates the error of calling an assembler routine that tries to divide by zero. Both programs were compiled with TEST(STMT,SYM) and run with the TERMTHDACT(TRACE) run-time option. Figure 72 shows the main COBOL program (COBOLZ1), the COBOL subroutine (COBOLZ2), and the assembler routine.

```
[Main Program]

 CBL  TEST(STMT,SYM),DYN,XREF(FULL),MAP
      ID DIVISION.
      PROGRAM-ID. COBOLZ1.
      ENVIRONMENT DIVISION.
      DATA DIVISION.

         END   ASSEMZ3
```

Figure 72 (Part 2 of 2). Main COBOL Program, COBOL Subroutine, and Assembler Routine

To debug this application, use the following steps:

1. Locate the error message for the current condition in the Condition Information section of the dump, shown in Figure 73 on page 185. The message is `CEE3209S The system detected a fixed-point divide exception (System Completion Code=0C9).`

   See Chapter 9, “Language Environment Run-Time Messages” on page 243 for additional information about this message.

2. Note the sequence of calls in the call chain. COBOLZ1 called IGZCFCC, which is a COBOL library subroutine used for dynamic calls; IGZCFCC called COBOLZ2; COBOLZ2 then called IGZCFCC; and IGZCFCC called ASSEMZ3. The exception occurred at this point, resulting in a call to CEEHDSP, a Language Environment condition handling routine.

   The call to ASSEMZ3 occurred at statement 11 of COBOLZ2. The exception occurred at offset +64 in ASSEMZ3.

```

Figure 74. COBOL Listing for COBOLZ2

4. Check offset +64 in the listing for the assembler routine ASSEMZ3, shown in Figure 75.

   This shows an instruction to divide the contents of register 4 by the variable pointed to by register 6. You can see the two instructions preceding the divide instruction load register 6 from the first word pointed to by register 1 and prepare register 6 for the divide. Because of linkage conventions, you can infer that register 1 contains a pointer to a parameter list that passed to ASSEMZ3. Register 6 points to a 0 value because that was the value passed to ASSEMZ3 when it was called by a higher level routine.

   Note: To translate assembler instructions, see *IBM ESA/390 Principles of Operation.*

Chapter 6. Debugging Fortran Routines

This chapter provides information to help you debug applications that contain one or more Fortran routines. It includes the following topics:

- Determining the source of errors in Fortran routines
- Using Fortran compiler listings
- Generating a Language Environment dump of a Fortran routine
- Finding Fortran information in a dump
- Examples of debugging Fortran routines

Determining the Source of Errors in Fortran Routines

Most errors in Fortran routines can be identified by the information provided in Fortran run-time messages, which begin with the prefix FOR.

The Fortran compiler cannot identify all possible errors. The following list identifies several errors not detected by the compiler that could potentially result in problems:

- Failing to assign values to variables and arrays before using them in your program.
- Specifying subscript values that are not within the bounds of an array. If you assign data outside the array bounds, you can inadvertently destroy data and instructions.
- Moving data into an item that is too small for it, resulting in truncation.
- Making invalid data references to EQUIVALENCE items of differing types (for example, integer or real).
- Transferring control into the range of a DO loop from outside the range of the loop. The compiler issues a warning message for all such branches if you specify OPT(2), OPT(3), or VECTOR.
- Using arithmetic variables and constants that are too small to give the precision you need in the result. For example, to obtain more than 6 decimal digits in floating-point results, you must use double precision.
- Concatenating character strings in such a way that overlap can occur.
- Trying to access services that are not available in the operating system or hardware.
- Failing to resolve name conflicts between Fortran and C library routines using the procedures described in *OS/390 Language Environment Programming Guide*.

Identifying Run-Time Errors

Fortran has several features that help you find run-time errors. Fortran run-time messages are discussed in Chapter 13, “Fortran Run-Time Messages” on page 449. Other debugging aids include the optional traceback map, program interruption messages, abnormal termination dumps, and operator messages.

- The optional traceback map helps you identify where errors occurred while running your application. The TERMTHDACT(TRACE) run-time option, which is

set by default under Language Environment, generates a dump containing the traceback map.

You can also get a traceback map at any point in your routine by invoking the ERRTRA subroutine.

- Program interruption messages are generated whenever the program is interrupted during execution. Program interruption messages are written to the Language Environment message file.

  The program interruption message indicates the exception that caused the termination; the completion code from the system indicates the specification or operation exception resulting in termination.

- Program interruptions causing an abnormal termination produce a dump, which displays the completion code and the contents of registers and system control fields.

  To display the contents of main storage as well, you must request an abnormal termination (ABEND) dump by including a SYSUDUMP DD statement in the appropriate job step. The following example shows how the statement can be specified for IBM-supplied cataloged procedures:

  ```
  //GO.SYSUDUMP DD SYSOUT=A
  ```

- You can request various dumps by invoking any of several dump service routines while your program runs. These dump service routines are discussed in "Generating a Language Environment Dump of a Fortran Routine" on page 192.

- Operator messages are displayed when your program issues a PAUSE or STOP *n* statement. These messages help you understand how far execution has progressed before reaching the PAUSE or STOP statement.

  The operator message can take the following forms:

  n
  : String of 1–5 decimal digits you specified in the PAUSE or STOP statement. For the STOP statement, this number is placed in R15.

  'message'
  : Character constant you specified in the PAUSE or STOP statement.

  0
  : Printed when a PAUSE statement containing no characters is executed (not printed for a STOP statement).

  A PAUSE message causes the program to stop running pending an operator response. The format of the operator's response to the message depends on the system being used.

- Under Language Environment, error messages produced by Language Environment and Fortran are written to a common message file. Its ddname is specified in the MSGFILE run-time option. The default ddname is SYSOUT.

  Fortran information directed to the message file includes:

  – Error messages resulting from unhandled conditions
  – Printed output from any of the dump services (SDUMP, DUMP/PDUMP, CDUMP/CPDUMP)
  – Output produced by a WRITE statement with a unit identifier having the same value as the Fortran error message unit

– Output produced by a WRITE statement with * given as the unit identifier (assuming the Fortran error message unit and standard print unit are the same unit)

– Output produced by the PRINT statement (assuming the Fortran error message unit and the standard print unit are the same unit)

For more information about handling message output using the Language Environment MSGFILE run-time option, see *OS/390 Language Environment Programming Guide*.

Using Fortran Compiler Listings

Fortran listings provide you with:

- The date of compilation including information about the compiler
- A listing of your source program
- Diagnostic messages telling you of errors in the source program
- Informative messages telling you the status of the compilation

The following table contains a list of the contents of the various compiler-generated listings that you might find helpful when you use information in dumps to debug Fortran programs.

Name	Contents	Compiler Option
Diagnostic message listing	Error messages detected during compilation.	FLAG
Source program	Source program statements.	SOURCE
Source program	Source program statements and error messages.	SRCFLG
Storage map and cross reference	Variable use, statement function, subprogram, or intrinsic function within a program.	MAP and XREF
Cross reference	Cross reference of names with attributes.	XREF
Source program map	Offsets of automatic and static internal variables (from their defining base).	MAP
Object code	Contents of the program control section in hexadecimal notation and translated into a pseudo-assembler format. To limit the size of the object code listing, specify the statement or range of statements to be listed; for example, LIST(20) or LIST(10,30).	LIST
Variable map, object code, static storage	Same as MAP and LIST options above, plus contents of static internal and static external control sections in hexadecimal notation with comments.	MAP and LIST
Symbolic dump	Internal statement numbers, sequence numbers, and symbol (variable) information.	SDUMP

Generating a Language Environment Dump of a Fortran Routine

To generate a dump containing Fortran information, call either DUMP/PDUMP, CDUMP/CPDUMP, or SDUMP.

DUMP/PDUMP and CDUMP/CPDUMP produce output that is unchanged from the output generated under Fortran. Under Language Environment, however, the output is directed to the message file.

When SDUMP is invoked, the output is also directed to the Language Environment message file. The dump format differs from other Fortran dumps, however, reflecting a common format shared by the various HLLs under Language Environment.

You cannot make a direct call to CEE3DMP from a Fortran program. It is possible to call CEE3DMP through an assembler routine called by your Fortran program. Fortran programs are currently restricted from directly invoking Language Environment callable services.

DUMP/PDUMP
Provides a dump of a specified area of storage.

CDUMP/CPDUMP
Provides a dump of a specified area of storage in character format.

SDUMP
Provides a dump of all variables in a program unit.

DUMP/PDUMP Subroutines

The DUMP/PDUMP subroutine dynamically dumps a specified area of storage to the system output data set. When you use DUMP, the processing stops after the dump; when you use PDUMP, the processing continues after the dump.

Syntax

CALL {DUMP | PDUMP} (a_1, b_1,k_1, a_2,b_2, k_2,...**)**

a and *b*
Variables in the program unit. Each indicates an area of storage to be dumped. Either *a* or *b* can represent the upper or lower limit of the storage area.

k The dump format to be used. The values that can be specified for *k*, and the resulting dump formats, are:

Value	Format Requested
0	Hexadecimal
1	LOGICAL*1
2	LOGICAL*4
3	INTEGER*2
4	INTEGER*4
5	REAL*4
6	REAL*8
7	COMPLEX*8
8	COMPLEX*16
9	CHARACTER

10	REAL*16
11	COMPLEX*32
12	UNSIGNED*1
13	INTEGER*1
14	LOGICAL*2
15	INTEGER*8
16	LOGICAL*8

Usage Considerations for DUMP/PDUMP

A load module or phase can occupy a different area of storage each time it is executed. To ensure that the appropriate areas of storage are dumped, the following conventions should be observed.

If an array and a variable are to be dumped at the same time, a separate set of arguments should be used for the array and for the variable. The specification of limits for the array should be from the first element in the array to the last element. For example, assume that A is a variable in common, B is a real number, and TABLE is an array of 20 elements. The following call to the storage dump routine could be used to dump TABLE and B in hexadecimal format, and stop the program after the dump is taken:

```
CALL DUMP(TABLE(1),TABLE(20),0,B,B,0)
```

If an area of storage in common is to be dumped at the same time as an area of storage not in common, the arguments for the area in common should be given separately. For example, the following call to the storage dump routine could be used to dump the variables A and B in REAL*8 format without stopping the program:

```
CALL PDUMP(A,A,6,B,B,6)
```

If variables not in common are to be dumped, each variable must be listed separately in the argument list. For example, if R, P, and Q are defined implicitly in the program, the statement

```
CALL PDUMP(R,R,5,P,P,5,Q,Q,5)
```

should be used to dump the three variables in REAL*4 format. If the statement

```
CALL PDUMP(R,Q,5)
```

is used, all main storage between R and Q is dumped, which might or might not include P, and could include other variables.

CDUMP/CPDUMP Subroutines

The CDUMP/CPDUMP subroutine dynamically dumps a specified area of storage containing character data. When you use CDUMP, the processing stops after the dump; when you use CPDUMP, the processing continues after the dump.

Syntax

CALL {CDUMP | CPDUMP} (a_1, b_1, a_2, b_2,...**)**

a and *b*
: Variables in the program unit. Each indicates an area of storage to be dumped. Either *a* or *b* can represent the upper or lower limit of each storage area.

The dump is always produced in character format. A dump format type (unlike for DUMP/PDUMP) must not be specified.

Usage Considerations for CDUMP/CPDUMP

A load module can occupy a different area of storage each time it is executed. To ensure that the appropriate areas of storage are dumped, the following conventions should be observed.

If an array and a variable are to be dumped at the same time, a separate set of arguments should be used for the array and for the variable. The specification of limits for the array should be from the first element in the array to the last element. For example, assume that B is a character variable and TABLE is a character array of 20 elements. The following call to the storage dump routine could be used to dump TABLE and B in character format, and stop the program after the dump is taken:

```
CALL CDUMP(TABLE(1), TABLE(20), B, B)
```

SDUMP Subroutine

The SDUMP subroutine provides a symbolic dump that is displayed in a format dictated by variable type as coded or defaulted in your source. Data is dumped to the error message unit. The symbolic dump is created by program request, on a program unit basis, using CALL SDUMP. Variables can be dumped automatically after abnormal termination using the compiler option SDUMP. For more information on the SDUMP compiler option, see *VS FORTRAN Version 2 Programming Guide for CMS and MVS.*

Items displayed are:

- All referenced, local, named, and saved variables in their Fortran-defined data representation
- All variables contained in a static common area (blank or named) in their Fortran-defined data representation
- All variables contained in a dynamic common area in their Fortran-defined data representation
- Nonzero or nonblank character array elements only
- Array elements with their correct indexes

The amount of output produced can be very large, especially if your program has large arrays, or large arrays in common blocks. For such programs, you might want to avoid calling SDUMP.

Syntax

CALL SDUMP [(*rtn*$_1$**,***rtn*$_2$**,...)]**

rtn$_1$**,***rtn*$_2$**,...**
Names of other program units from which data will be dumped. These names must be listed in an EXTERNAL statement.

Usage Considerations for SDUMP

- To obtain symbolic dump information and location of error information, compilation must be done either with the SDUMP option or with the TEST option.
- Calling SDUMP and specifying program units that have not been entered gives unpredictable results.
- Calling SDUMP with no parameters produces the symbolic dump for the current program unit.
- An EXTERNAL statement must be used to identify the names being passed to SDUMP as external routine names.
- At higher levels of optimization (1, 2, or 3), the symbolic dump could show incorrect values for some variables because of compiler optimization techniques.
- Values for uninitialized variables are unpredictable. Arguments in uncalled subprograms or in subprograms with argument lists shorter than the maximum can cause the SDUMP subroutine to fail.
- The display of data can also be invoked automatically. If the run-time option TERMTHDACT(DUMP) is in effect and your program abends in a program unit compiled with the SDUMP option or with the TEST option, all data in that program unit is automatically dumped. All data in any program unit in the save area traceback chain compiled with the SDUMP option or with the TEST option is also dumped. Data occurring in a common block is dumped at each occurrence, because the data definition in each program unit could be different.

Examples of calling SDUMP from the main program and from a subprogram follow. Figure 79 on page 196 shows a sample program calling SDUMP and Figure 80 on page 197 shows the resulting output that is generated. In the main program, the statement

```
EXTERNAL PGM1,PGM2,PGM3
```

makes the address of subprograms PGM1, PGM2, and PGM3 available for a call to SDUMP as follows:

```
CALL SDUMP (PGM1,PGM2,PGM3)
```

This causes variables in PGM1, PGM2, and PGM3 to be printed.

In the subprogram PGM1, the statement

```
EXTERNAL PGM2,PGM3
```

makes PGM2 and PGM3 available. (PGM1 is missing because the call is in PGM1.) The statements

```
CALL SDUMP
CALL SDUMP (PGM2,PGM3)
```

dump variables PGM1, PGM2, and PGM3.

Figure 80. Language Environment Dump Generated Using SDUMP

Finding Fortran Information in a Language Environment Dump

To locate Fortran-specific information in a Language Environment dump, you must understand how to use the traceback section and the section in the symbol table dump showing parameters and variables.

Figure 81. Sections of the Language Environment Dump

Understanding the Language Environment Traceback Table

Examine the traceback section of the dump, labeled with **[1]** in Figure 81, for condition information about your routine and information about the statement number and address where the exception occurred. The traceback section helps you locate where an error occurred in your program. The information in this section begins with the most recent program unit and ends with the first program unit.

Identifying Condition Information

The section labeled **[2]** in Figure 81 on page 198 shows the condition information for the active routines, indicating the program message, program unit name, the statement number, and the offset within the program unit where the error occurred.

Identifying Variable Information

The local variable section of the dump, shown in the section labeled **[3]** in Figure 81 on page 198, contains information on all variables and arrays in each program unit in the save area chain, including the program causing the dump to be invoked. The output shows variable items (one line only) and array (more than one line) items.

Use the local variable section of the dump to identify the variable name, type, and value at the time the dump was called. Variable and array items can contain either character or noncharacter data, but not both.

Identifying File Status Information

The section labeled **[4]** in Figure 81 on page 198 shows the file status and attribute section of the dump. This section displays the total number of units defined, the default units for error messages, and the default unit numbers for formatted input or formatted output.

Examples of Debugging Fortran Routines

This section contains examples of Fortran routines and instructions for using information in the Language Environment dump to debug them.

Calling a Nonexistent Routine

Figure 82 illustrates an error caused by calling a nonexistent routine. The options in effect at compile time appear at the top of the listing.

```
OPTIONS IN EFFECT: LIST NOMAP NOXREF NOGOSTMT NODECK SOURCE TERM OBJECT FIXED TRMFLG SRCFLG NODDIM NORENT SDUMP(ISN)

    The default unit for formatted sequential output is 6.
    The default unit for formatted sequential input is 5.
```

Figure 83. Sections of the Language Environment Dump Resulting from a Call to a Nonexistent Routine

To understand the traceback section, and debug this example routine, do the following:

1. Find the Current Condition information in the Condition Information for Active Routines section of the dump. The message is CEE3201S. The system detected an operation exception at statement 3. For more information about this message, see Chapter 9, “Language Environment Run-Time Messages” on page 243. This section of the dump also provides such information as the name of the active routine and the current statement number at the time of the dump.
2. Locate statement 3 in the routine shown in Figure 82 on page 199. This statement calls subroutine SUBNAM. The message CEE3201S in the Condition

Information section of the dump indicates that the operation exception was generated because of an unresolved external reference.

3. Check the linkage editor output for error messages.

Divide-by-Zero Error

Figure 84 demonstrates a divide-by-zero error. In this example, the main Fortran program passed 0 to subroutine DIVZEROSUB, and the error occurred when DIVZEROSUB attempted to use this data as a divisor.

```
OPTIONS IN EFFECT: LIST NOMAP NOXREF NOGOSTMT NODECK SOURCE TERM OBJECT FIXED TRMFLG SRCFLG NODDIM NORENT SDUMP(ISN)

          ANY_ARRAY(1)                              1          2          3

          ANY_NUMBER      INTEGER*4                 0

  File Status and Attributes:
    The total number of units defined is 100.
    The default unit for the PUNCH statement is 7.
    The default unit for the Fortran error messages is 6.
    The default unit for formatted sequential output is 6.
    The default unit for formatted sequential input is 5.
```

Figure 85. Language Environment Dump from Divide-By-Zero Fortran Example

To debug this application, do the following:

1. Locate the error message for the current condition in the Condition Information section of the dump, shown in Figure 85. The message is CEE3209S. The system detected a fixed-point divide exception. See Chapter 9, “Language Environment Run-Time Messages” on page 243 for additional information about this message.
2. Note the sequence of the calls in the call chain:

a. DIVZERO called AFHLCLNR, which is a Fortran library subroutine.

b. AFHLCLNR called DIVZEROSUB. (Note that when a program-unit name is longer than 7 characters, the name as it appears in the dump consists of the first 4 and last 3 characters concatenated together.)

c. DIVZEROSUB attempted a divide-by-zero operation (at statement 5).

d. This resulted in a call to CEEHDSP, a Language Environment condition handling routine.

3. Locate statement 5 in the Fortran listing for the DIVZEROSUB subroutine in Figure 85 on page 202. This is an instruction to divide the contents of DIVIDEND(3) by DIVISOR.

4. Since DIVISOR is a parameter of subroutine DIVZEROSUB, go to the Parameters section of the dump shown in Figure 85 on page 202. The parameter DIVISOR shows a value of 0.

5. Since DIVISOR contains the value passed to DIVZEROSUB, check its value. ANY_NUMBER is the actual argument passed to DIVZEROSUB, and the dump and listing of DIVZERO indicate that ANY_NUMBER had value 0 when passed to DIVZEROSUB, leading to the divide-by-zero exception.

Chapter 7. Debugging PL/I Routines

This chapter contains information that can help you debug applications that contain one or more PL/I routines. Following a discussion about potential errors in PL/I routines, the first part of this chapter discusses how to use compiler-generated listings to obtain information about PL/I routines, and how to use PLIDUMP to generate a Language Environment dump of a PL/I routine. The last part of the chapter provides examples of PL/I routines and explains how to debug them using information contained in the traceback information provided in the dump. The topics covered are listed below.

- Determining the source of errors in PL/I routines
- Using PL/I compiler listings
- Generating a Language Environment dump of a PL/I routine
- Finding PL/I information in a dump
- Debugging example of PL/I routines

Determining the Source of Errors in PL/I Routines

Most errors in PL/I routines can be identified by the information provided in PL/I run-time messages, which begin with the prefix IBM. For a list of these messages, see Chapter 14, “PL/I Run-Time Messages” on page 617.

A malfunction in running a PL/I routine can be caused by:

- Logic errors in the source routine
- Invalid use of PL/I
- Unforeseen errors
- Invalid input data
- Compiler or run-time routine malfunction
- System malfunction
- Unidentified routine malfunction
- Overlaid storage

Logic Errors in the Source Routine

Errors of this type are often difficult to detect because they often appear as compiler or library malfunctions.

Some common errors in source routines are:

- Incorrect conversion from arithmetic data
- Incorrect arithmetic and string manipulation operations
- Unmatched data lists and format lists

Invalid Use of PL/I

A misunderstanding of the language or a failure to provide the correct environment for using PL/I can result in an apparent malfunction of a PL/I routine.

Any of the following, for example, might cause a malfunction:

- Using uninitialized variables
- Using controlled variables that have not been allocated
- Reading records into incorrect structures

- Misusing array subscripts
- Misusing pointer variables
- Incorrect conversion
- Incorrect arithmetic operations
- Incorrect string manipulation operations

Unforeseen Errors

If an error is detected during run time and no ON-unit is provided in the routine to terminate the run or attempt recovery, the job terminates abnormally. However, the status of a routine at the point where the error occurred can be recorded by using an ERROR ON-unit that contains the statements:

```
ON ERROR
 BEGIN;
  ON ERROR SYSTEM;
  CALL PLIDUMP;          /*generates a dump*/
  PUT DATA;              /*displays variables*/
 END;
```

The statement ON ERROR SYSTEM ensures that further errors do not result in a permanent loop.

Invalid Input Data

A routine should contain checks to ensure that any incorrect input data is detected before it can cause the routine to malfunction.

Use the COPY option of the GET statement to check values obtained by stream-oriented input. The values are listed on the file named in the COPY option. If no file name is given, SYSPRINT is assumed.

Compiler or Run-Time Routine Malfunction

If you are certain that the malfunction is caused by a compiler or run-time routine error, you can either open a PMR or submit an APAR for the error. See either *PL/I for MVS & VM Diagnosis Guide* or *VisualAge PL/I for OS/390 Diagnosis Guide* for more information about handling compiler and run-time routine malfunctions. Meanwhile, you can try an alternative way to perform the operation that is causing the trouble. A bypass is often feasible, since the PL/I language frequently provides an alternative method of performing operations.

System Malfunction

System malfunctions include machine malfunctions and operating system errors. System messages identify these malfunctions and errors to the operator.

Unidentified Routine Malfunction

In most circumstances, an unidentified routine malfunction does not occur when using the compiler. If your routine terminates abnormally without an accompanying Language Environment run-time diagnostic message, the error causing the termination might also be inhibiting the production of a message. Check for the following:

- Your job control statements might be in error, particularly in defining data sets.

- Your routine might overwrite main storage areas containing executable instructions. This can happen if you have accidentally:
  - Assigned a value to a nonexistent array element. For example:

    ```
    DCL ARRAY(10);

    ⋮
    DO I = 1 TO 100;
    ARRAY(I) = VALUE;
    ```

    To detect this type of error in a compiled module, set the SUBSCRIPTRANGE condition so that each attempt to access an element outside the declared range of subscript values raises the SUBSCRIPTRANGE condition. If there is no ON-unit for this condition, a diagnostic message is printed and the ERROR condition is raised. This facility, though expensive in run time and storage space, is a valuable routine-testing aid.
  - Used an incorrect locator value for a locator (pointer or offset) variable. This type of error can occur if a locator value is obtained by means of record-oriented transmission. Ensure that locator values created in one routine, transmitted to a data set, and subsequently retrieved for use in another routine, are valid for use in the second routine.
  - Attempted to free a nonbased variable. This can happen when you free a based variable after its qualifying pointer value has been changed. For example:

    ```
    DCL A STATIC,B BASED (P);
    ALLOCATE B;
    P = ADDR(A);
    FREE B;
    ```
  - Used the SUBSTR pseudovariable to assign a string to a location beyond the end of the target string. For example:

    ```
    DCL X CHAR(3);
    I=3
    SUBSTR(X,2,I) = 'ABC';
    ```

    To detect this type of error, enable the STRINGRANGE condition during compilation.

Storage Overlay Problems

If you suspect an error in your PL/I application is a storage overlay problem, check for the following:

1. The use of a subscript outside the declared bounds (check the SUBSCRIPTRANGE condition)
2. An attempt to assign a string to a target with an insufficient maximum length (check the STRINGSIZE condition)
3. The failure of the arguments to a SUBSTR reference to comply with the rules described for the SUBSTR built-in function (check the STRINGRANGE condition)
4. The loss of significant last high-order (left-most) binary or decimal digits during assignment to an intermediate result or variable or during an input/output operation (check the SIZE condition)

5. The reading of a variable-length file into a variable
6. The misuse of a pointer variable
7. The invocation of a Language Environment callable service with fewer arguments than are required

The first four situations are associated with the listed PL/I conditions, all of which are disabled by default. If you suspect one of these problems exists in your routine, use the appropriate condition prefix on the suspected statement or on the BEGIN or PROCEDURE statement of the containing block.

The fifth situation occurs when you read a data record into a variable that is too small. This type of problem only happens with variable-length files. You can often isolate the problem by examining the data in the file information and buffer.

The sixth situation occurs when you misuse a pointer variable. This type of storage overlay is particularly difficult to isolate. There are a number of ways pointer variables can be misused:

- When a READ statement runs with the SET option, a value is placed in a pointer. If you then run a WRITE statement or another READ SET option with another pointer, you overlay your storage if you try to use the original pointer.
- When you try to use a pointer to allocate storage that has already been freed, you can also cause a storage overlay.
- When you attempt to use a pointer set with the ADDR built-in function as a base for data with different attributes, you can cause a storage overlay.

The seventh situation occurs when a Language Environment callable service is passed fewer arguments than its interface requires. The following example might cause a storage overlay because Language Environment assumes that the fourth item in the argument list is the address of a feedback code, when in reality it could be residue data pointing anywhere in storage.

Invalid calls:

```
DCL CEEDATE ENTRY OPTIONS(ASM);
CALL CEEDATE(x,y,z);      /* invalid */
```

Valid calls:

```
DCL CEEDATE ENTRY(*,*,*,* OPTIONAL) OPTIONS(ASM);
CALL CEEDATE(x,y,z,*);    /* valid   */
CALL CEEDATE(x,y,z,fc);   /* valid   */
```

Using PL/I Compiler Listings

The following sections explain how to generate listings that contain information about your routine. PL/I listings show machine instructions, constants, and external or internal addresses that the linkage editor resolves. This information can help you find other information, such as variable values, in a dump of a PL/I routine.

Note: VisualAge PL/I shares a common compiler back-end with C/C++. The VisualAge PL/I assembler listing will, consequently, have a similar form to those from the C/C++ compiler.

The PL/I compiler listings included below are from the PL/I for MVS & VM product.

Generating PL/I Listings and Maps

Note

VisualAge PL/I does not support the MAP option or LIST suboptions.

The following table shows compiler-generated listings that you might find helpful when you use information in dumps to debug PL/I routines. For more information about supported compiler options that generate listings, reference either the *PL/I for MVS & VM Programming Guide* or the *VisualAge PL/I for OS/390 Programming Guide*.

Name	Contents	Compiler Option
Source program	Source program statements	SOURCE
Cross reference	Cross reference of names with attributes	XREF and ATTRIBUTES
Aggregate table	Names and layouts of structures and arrays	AGGREGATE
Variable map	Offsets of automatic and static internal variables (from their defining base)	MAP **Note:** VisualAge PL/I does not support the MAP compiler option.
Object code	Contents of the program control section in hexadecimal notation and translated into a pseudo-assembler format. To limit the size of the object code listing, specify a certain statement or range of statements to be listed; for example, LIST(20) or LIST(10,30).	LIST
Variable map, object code, static storage	Same as MAP and LIST options above, plus contents of static internal and static external control sections in hexadecimal notation with comments	MAP and LIST **Note:** VisualAge PL/I does not support the MAP compiler option.

Finding Information in PL/I Listings

Figure 86 on page 210 shows an example PL/I routine that was compiled with LIST and MAP.

```
*PROCESS SOURCE, LIST, MAP;

                  SOURCE LISTING

   STMT

      1  |EXAMPLE: PROC OPTIONS(MAIN);
      2  |           DCL EXTR ENTRY EXTERNAL;
      3  |           DCL A FIXED BIN(31);
      4  |           DCL B(2,2)  FIXED BIN(31) STATIC EXTERNAL INIT((4)0);
      5  |           DCL C CHAR(20) STATIC INIT('SAMPLE CONSTANT');
      6  |           DCL D FIXED BIN(31) STATIC;
      7  |           DCL E FIXED BIN(31);
      8  |           FETCH EXTR;
      9  |           CALL EXTR(A,B,C,D,E);
     10  |           DISPLAY(C);
     11  |         END;
```

Figure 86. PL/I Routine Compiled with LIST and MAP

Figure 87 on page 211 shows the output generated from this routine, including the static storage map, variable storage map, and the object code listing. The sections following this example describe the contents of each type of listing.

Figure 87 (Part 2 of 2). Compiler-Generated Listings from Example PL/I Routine

Static Internal Storage Map

Note

VisualAge PL/I does not support the MAP option or LIST suboptions. Therefore the Static Internal Storage Map is not available when compiling under VisualAge PL/I.

To get a complete variable storage map and static storage map, but not a complete LIST, specify a single statement for LIST to minimize the size of the listing; for example, LIST(1).

Each line of the static storage map contains the following information:

1. Six-digit hexadecimal offset.
2. Hexadecimal text, in 8-byte sections where possible.
3. Comment, indicating the type of item to which the text refers. The comment appears on the first line of the text for an item.

Some typical comments you might find in a static storage listing:

Comment	Explanation
A..*xxx*	Address constant for *xxx*
COMPILER LABEL CL.*n*	Compiler-generated label *n*
CONDITION CSECT	Control section for programmer-named condition
CONSTANT	Constant
CSECT FOR EXTERNAL VARIABLE	Control section for external variable
D..*xxx*	Descriptor for *xxx*
DED..*xxx*	Data element descriptor for *xxx*
DESCRIPTOR	Data descriptor
ENVB	Environment control block
FECB..*xxx*	Fetch control block for *xxx*

Comment	Explanation
DCLCB	Declare control block
FED..*xxx*	Format element descriptor for *xxx*
KD..*xxx*	Key descriptor for *xxx*
LOCATOR..*xxx*	Locator for *xxx*
ONCB	ON statement control block
PICTURED DED..*xxx*	Pictured data element descriptor for *xxx*
PROGRAM ADCON	Program address constant
RD..*xxx*	Record descriptor for *xxx*
SYMBOL TABLE ELEMENT	Symbol table address
SYMBOL TABLE..*xxx*	Symbol table for *xxx*
SYMTAB DED..*xxx*	Symbol table DED for *xxx*
USER LABEL..*xxx*	Source program label for *xxx*
xxx	Variable with name *xxx*. If the variable is not initialized, no text appears against the comment. There is also no static offset if the variable is an array (the static offset can be calculated from the array descriptor, if required).

Variable Storage Map

Note

VisualAge PL/I does not support the MAP option or LIST suboptions. Therefore the Variable Storage Map is not available when compiling under VisualAge PL/I.

For automatic and static internal variables, the variable storage map contains the following information:

- PL/I identifier name
- Level
- Storage class
- Name of the PL/I block in which it is declared
- Offset from the start of the storage area, in both decimal and hexadecimal form

If the LIST option is also specified, a map of the static internal and external control sections, called the static storage map, is also produced.

Object Code Listing

Note

VisualAge PL/I does not support the MAP option or LIST suboptions. Therefore the Object Code Listing is not available when compiling under VisualAge PL/I.

The object code listing consists of the machine instructions and a translation of these instructions into a form that resembles assembler and includes comments, such as source program statement numbers.

The machine instructions are formatted into blocks of code, headed by the statement or line number in the PL/I source program listing. Generally, only executable statements appear in the listing. DECLARE statements are not normally included.

The names of PL/I variables, rather than the addresses that appear in the machine code, are listed. Special mnemonics are used to refer to some items, including test hooks, descriptors, and address constants.

Statements in the object code listing are ordered by block, as they are sequentially encountered in the source program. Statements in the external procedure are given first, followed by the statements in each inner block. As a result, the order of statements frequently differs from that of the source program.

Every object code listing begins with the name of the external procedure. The actual entry point of the external procedure immediately follows the heading comment `REAL ENTRY`. The subsequent machine code is the prolog for the block, which performs block activation. The comment `PROCEDURE BASE` marks the end of the prolog. Following this is a translation of the first executable statement in the PL/I source program.

Following are the comments used in the listing:

Comment	Function
BEGIN BLOCK *xxx*	Indicates the start of the begin block with label *xxx*
BEGIN BLOCK NUMBER *n*	Indicates the start of the begin block with number *n*
CALCULATION OF COMMONED EXPRESSION FOLLOWS	Indicates that an expression used more than once in the routine is calculated at this point
CODE MOVED FROM STATEMENT NUMBER *n*	Indicates object code moved by the optimization process to a different part of the routine and gives the number of the statement from which it originated
COMPILER GENERATED SUBROUTINE *xxx*	Indicates the start of compiler-generated subroutine *xxx*
CONTINUATION OF PREVIOUS REGION	Identifies the point at which addressing from the previous routine base recommences
END BLOCK	Indicates the end of a begin block
END INTERLANGUAGE PROCEDURE *xxx*	Identifies the end of an ILC procedure *xxx*
END OF COMMON CODE	Identifies the end of code used in running more than one statement
END OF COMPILER GENERATED SUBROUTINE	Indicates the end of the compiler-generated subroutine
END PROCEDURE	Identifies the end of a procedure
END PROGRAM	Indicates the end of the external procedure
INITIALIZATION CODE FOR *xxx*	Indicates the start of initialization code for variable *xxx*
INITIALIZATION CODE FOR OPTIMIZED LOOP FOLLOWS	Indicates that some of the code that follows was moved from within a loop by the optimization process
INTERLANGUAGE PROCEDURE *xxx*	Identifies the start of an implicitly generated ILC procedure *xxx*
METHOD OR ORDER OF CALCULATING EXPRESSIONS CHANGED	Indicates that the order of the code following was changed to optimize the object code

Comment	Function
ON-UNIT BLOCK NUMBER *n*	Indicates the start of an ON-unit block with number *n*
ON-UNIT BLOCK END	Indicates the end of the ON-unit block
PROCEDURE *xxx*	Identifies the start of the procedure labeled *xxx*
PROCEDURE BASE	Identifies the address loaded into the base register for the procedure
PROGRAM ADDRESS-ABILITY REGION BASE	Identifies the address where the routine base is updated if the routine size exceeds 4096 bytes and consequently cannot be addressed from one base
PROLOGUE BASE	Identifies the start of the prolog code common to all entry points into that procedure
REAL ENTRY	Precedes the actual executable entry point for a procedure
STATEMENT LABEL *xxx*	Identifies the position of source program statement label *xxx*
STATEMENT NUMBER *n*	Identifies the start of code generated for statement number *n* in the source listing

In certain cases the compiler uses mnemonics to identify the type of operand in an instruction and, where applicable, follows the mnemonic by the name of a PL/I variable.

Mnemonic	Explanation
A..*xxx*	Address constant for *xxx*
ADD..*xxx*	Aggregate descriptor for *xxx*
BASE..*xxx*	Base address of variable *xxx*
BLOCK.*n*	Identifier created for an otherwise unlabeled block
CL.*n*	Compiler-generated label number *n*
D..*xxx*	Descriptor for *xxx*
DED..*xxx*	Data element descriptor for *xxx*
HOOK...ENTRY	Debugging tool block entry hook
HOOK...BLOCK-EXIT	Debugging tool block exit hook
HOOK...PGM-EXIT	Debugging tool program exit hook
HOOK...PRE-CALL	Debugging tool pre-call hook
HOOK...INFO	Additional pre-call hook information
HOOK...POST-CALL	Debugging tool post call hook
HOOK...STMT	Debugging tool statement hook
HOOK...IF-TRUE	Debugging tool IF true hook
HOOK...IF-FALSE	Debugging tool ELSE hook
HOOK...WHEN	Debugging tool WHEN true hook
HOOK...OTHERWISE	Debugging tool OTHERWISE true hook
HOOK...LABEL	Debugging tool label hook
HOOK...DO	Debugging tool iterative DO hook
HOOK...ALLOC	Debugging tool ALLOCATE controlled hook

Mnemonic	Explanation
WSP.*n*	Workspace, followed by identifying number *n*
L..*xxx*	Length of variable *xxx*
PR..*xxx*	Pseudoregister vector slot for *xxx*
LOCATOR..*xxx*	Locator for *xxx*
RKD..*xxx*	Record or key descriptor for *xxx*
VO..*xxx*	Virtual origin for *xxx* (the address where element 0 is held for a one-dimensional array, element 0,0 for a two-dimensional array, and so on)

Generating a Language Environment Dump of a PL/I Routine

To generate a dump of a PL/I routine, you can call either the Language Environment callable service CEE3DMP or PLIDUMP. For information about calling CEE3DMP, see “Generating a Language Environment Dump with CEE3DMP” on page 33.

PLIDUMP Syntax and Options

PLIDUMP calls intermediate PL/I library routines, which convert most PLIDUMP options to CEE3DMP options. The following list contains PLIDUMP options and the corresponding CEE3DMP option, if applicable.

Some PLIDUMP options do not have corresponding CEE3DMP options, but continue to function as PL/I default options. The list following the syntax diagram provides a description of those options.

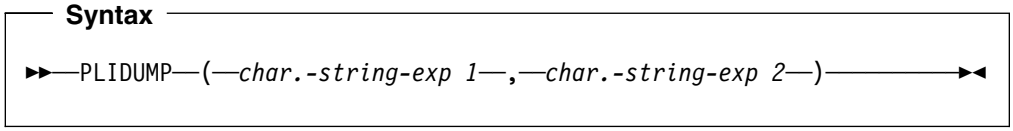
Note: VisualAge PL/I does not support multitasking, therefore, the PLIDUMP options that refer to multitasking do not apply to VisualAge PL/I.

PLIDUMP now conforms to National Language Support standards.

PLIDUMP can supply information across multiple Language Environment enclaves. If an application running in one enclave fetches a main procedure (an action that creates another enclave), PLIDUMP contains information about both procedures.

The syntax and options for PLIDUMP are shown below.

Syntax



char.-string-exp 1
A dump options character string consisting of one or more of the following:

A All. Results in a dump of all tasks including the ones in the WAIT state.

B BLOCKS (PL/I hexadecimal dump). Dumps the control blocks used in Language Environment and member language libraries. For PL/I, this includes the DSA for every routine on the call chain and PL/I "global" control blocks, such as Tasking Implementation Appendage (TIA), Task Communication Area (TCA), and the PL/I Tasking Control Block (PTCB).

PL/I file control blocks and file buffers are also dumped if the F option is specified.

C Continue. The routine continues after the dump.

E Exit. The enclave terminates after the dump. In a multitasking environment, if PLIDUMP is called from the main task, the enclave terminates after the dump. If PLIDUMP is called from a subtask, the subtask and any subsequent tasks created from the subtask terminate after the dump. In a multithreaded environment, if PLIDUMP is called from the Initial Process Thread (IPT), the enclave terminates after the dump. If PLIDUMP is called from a non-IPT, only the non-IPT terminates after the dump.

F FILE INFORMATION. A set of attributes for all open files is given. The contents of the file buffers are displayed if the B option is specified.

H STORAGE in hexadecimal. A SNAP dump of the region is produced. A ddname of CEESNAP must be provided to direct the CEESNAP dump report.

K BLOCKS (when running under CICS). The Transaction Work Area is included.

Note: This option is not supported under VisualAge PL/I.

NB NOBLOCKS.

NF NOFILES.

NH NOSTORAGE.

NK NOBLOCKS (when running under CICS).

NT NOTRACEBACK.

O THREAD(CURRENT). Results in a dump of only the current task or current thread (the invoker of PLIDUMP).

S Stop. The enclave terminates after the dump. In a multitasking environment, regardless of whether PLIDUMP is called from the main task or a subtask, the enclave terminates after the dump. In a multithreaded environment, regardless of whether PLIDUMP is called from the IPT or a non-IPT, the enclave terminates after the dump (in which case there is no fixed order as to which thread terminates first).

T TRACEBACK. Includes a traceback of all routines on the call chain. The traceback shows transfers of control from either calls or exceptions. BEGIN blocks and ON-units are also control transfers and are included in the trace. The traceback extends backwards to the main program of the current thread.

T, F, C, and A are the default options.

char.-string-exp 2

A user-identified character string up to 80 characters long that is printed as the dump header.

PLIDUMP Usage Notes

If you use PLIDUMP, the following considerations apply:

- If a routine calls PLIDUMP a number of times, use a unique user-identifier for each PLIDUMP invocation. This simplifies identifying the beginning of each dump.
- In MVS or TSO, you can use ddnames of CEEDUMP, PLIDUMP, or PL1DUMP to direct dump output. If no ddname is specified, CEEDUMP is used. In VM, you can use a FILEDEF command to direct dump output.
- The data set defined by the PLIDUMP, PL1DUMP, or CEEDUMP DD statement should specify a logical record length (LRECL) of at least 131 to prevent dump records from wrapping.
- When you specify the H option in a call to PLIDUMP, the PL/I library issues an OS SNAP macro to obtain a dump of virtual storage. The first invocation of PLIDUMP results in a SNAP identifier of 0. For each successive invocation, the ID is increased by one to a maximum of 256, after which the ID is reset to 0.
- Support for SNAP dumps using PLIDUMP is provided only under VM and MVS. SNAP dumps are not produced in a CICS environment.
  - If the SNAP does not succeed, the CEE3DMP DUMP file displays the message:

    ```
    Snap was unsuccessful
    ```

    Failure to define a CEESNAP data set is the most likely cause of an unsuccessful CEESNAP.
  - If the SNAP is successful, CEE3DMP displays the message:

    ```
    Snap was successful; snap ID = nnn
    ```

    where *nnn* corresponds to the SNAP identifier described above. An unsuccessful SNAP does not result in an incrementation of the identifier.
- To ensure portability across system platforms, use PLIDUMP to generate a dump of your PL/I routine.

Finding PL/I Information in a Dump

The following sections discuss PL/I-specific information located in the following sections of a Language Environment dump:

- Traceback
- Control Blocks for Active Routines
- Control Block Associated with the Thread
- File Status and Attributes

Traceback

Examine the traceback section of the dump, shown in Figure 88 on page 219, for condition information about your routine and information about the statement number and address where the exception occurred.

```
CEE3DMP V1 r5.0: PLIDUMP called from error ON-unit.                              08/05/95 4:04:12 PM         Page:   1

Figure 89. Task Traceback Section

Condition Information

If the dump was called from an ON-unit, the type of ON-unit is identified in the traceback as part of the entry information. For ON-units, the values of any relevant condition built-in functions (for example, ONCHAR and ONSOURCE for conversion errors) appear. In cases where the cause of entry into the ON-unit is not stated, usually when the ERROR ON-unit is called, the cause of entry appears in the condition information.

Statement Number and Address Where Error Occurred

This information, which is the point at which the condition that caused entry to the ON-unit occurred, can be found in the traceback section of the dump.

If the condition occurs in compiled code, and you compiled your routine with either GOSTMT or GONUMBER, the statement numbers appear in the dump. To identify the assembler instruction that caused the error, use the traceback information in the dump to find the program unit (PU) offset of the statement number in which the error occurred. Then find that offset and the corresponding instruction in the object code listing.

Control Blocks for Active Routines

This section shows the stack frames for all active routines, and the static storage. Use this section of the dump to identify variable values, determine the contents of parameter lists, and locate the timestamp.

Figure 90 on page 221 shows this section of the dump.

```

Figure 90. Control Blocks for Active Routines Section of the Dump

Automatic Variables

To find automatic variables, use an offset from the stack frame of the block in which they are declared. This information appears in the variable storage map generated when the MAP compiler option is in effect. If you have not used the MAP option, you can determine the offset by studying the listing of compiled code instructions.

Static Variables

If your routine is compiled with the MAP option, you can find static variables by using an offset in the variable storage map. If the MAP option is not in effect, you can determine the offset by studying the listing of compiled code.

Based Variables

To locate based variables, use the value of the defining pointer. Find this value by using one of the methods described above to find static and automatic variables. If the pointer is itself based, you must find its defining pointer and follow the chain until you find the correct value.

The following is an example of typical code for X BASED (P), with P AUTOMATIC:

```
58 60 D 0C8        L 6,P

58 E0 6 000        L 14,X
```

P is held at offset X'C8' from register 13. This address points to X.

Take care when examining a based variable to ensure that the pointers are still valid.

Area Variables

Area variables are located using one of the methods described above, according to their storage class.

The following is an example of typical code: for an area variable A declared AUTOMATIC:

```
41 60 D 0F8        LA 6,A
```

The area starts at offset X'F8' from register 13.

Variables in Areas

To find variables in areas, locate the area and use the offset to find the variable.

Contents of Parameter Lists

To find the contents of a passed parameter list, first find the register 1 value in the save area of the calling routine's stack frame. Use this value to locate the parameter list in the dump. If R1=0, no parameters passed. For additional information about parameter lists, see either *PL/I for MVS & VM Programming Guide* or *VisualAge PL/I for OS/390 Programming Guide*.

Timestamp

If the TSTAMP compiler installation option is in effect, the date and time of compilation appear within the last 32 bytes of the static internal control section. The last three bytes of the first *word* give the offset to this information. The offset indicates the end of the timestamp. Register 3 addresses the static internal control section. If the BLOCK option is in effect, the timestamp appears in the static storage section of the dump.

Control Blocks Associated with the Thread

This section of the dump, shown in Figure 91, includes information about PL/I fields of the CAA and other control block information.

Figure 91 (Part 2 of 2). Control Blocks Associated with the Thread Section of the Dump

The CAA

The address of the CAA control block appears in this section of the dump. If the BLOCK option is in effect, the complete CAA (including the PL/I implementation appendage) appears separately from the body of the dump. Register 12 addresses the CAA.

File Status and Attribute Information

This part of the dump includes the following information:

- The default and declared attributes of all open files
- Buffer contents of all file buffers
- The contents of FCBs, DCBs, DCLCBs, IOCBs, and control blocks for the process or enclave

PL/I Contents of the Language Environment Trace Table

Language Environment provides three PL/I trace table entry types that contain character data:

- Trace entry 100 occurs when a task is created.
- Trace entry 101 occurs when a task that contains the tasking CALL statements is terminated.
- Trace entry 102 occurs when a task that does not contain a tasking CALL statement is terminated.

The format for trace table entries 100, 101, and 102 is:

```
—>(100) NameOfCallingTask NameOfCalledTask OffsetOfCallStmt
            UserAgrPtr CalledTaskPtr TaskVarPtr EventVarPtr
            PriorityPtr CallingR2-R5 CallingR12-R14

—>(101) NameOfReturnTask ReturnerR2-R5 ReturnerR12-R14

—>(102) NameOfReturnTask
```

For more information about the Language Environment trace table format, see “Understanding the Trace Table Entry (TTE)” on page 106.

Debugging Example of PL/I Routines

This section contains examples of PL/I routines and instructions for using information in the Language Environment dump to debug them. Important areas in the source code and in the dump for each routine are highlighted.

Subscript Range Error

Figure 92 on page 225 illustrates an error caused by an array subscript value outside the declared range. In this example, the declared array value is 10.

This routine was compiled with the options LIST, TEST, GOSTMT, and MAP. It was run with the TERMTHDACT(TRACE) option to generate a traceback for the condition.

Figure 93. Sections of the Language Environment Dump

To debug this routine, use the following steps:

1. In the dump, PLIDUMP was called by the ERROR ON-unit in statement 6. The traceback information in the dump shows that the exception occurred following statement 11.
2. Locate the Original Condition message in the Condition Information for Active Routines section of the dump. The message is `IBM0421S ONCODE=520 The SUBSCRIPTRANGE condition was raised.` This message indicates that the exception occurred when an array element value exceeded the subscript range value (in this case, 10). For more information about this message, see Chapter 14, “PL/I Run-Time Messages” on page 617.
3. Locate statement 9 in the routine in Figure 92 on page 225. The instruction is `Array_End = 20`. This statement assigns a 20 value to the variable `Array_End`.

4. Statement 10 begins the DO-loop instruction `Do I = 1 to Array_End`. Since the previous instruction (statement 9) specified that `Array_End = 20`, the loop in statement 10 should run until `I` reaches a 20 value.

   The instruction in statement 2, however, declared a 10 value for the array range. Therefore, when the `I` value reached 11, the SUBSCRIPTRANGE condition was raised.

The following steps provide another method for finding the value that raised the SUBSCRIPTRANGE condition.

1. Locate the offset of variable `I` in the variable storage map in Figure 92 on page 225. Use this offset to find the `I` value at the time of the dump. In this example, the offset is X'C8'.
2. Now find offset X'C8' from the start of the stack frame in Figure 93 on page 226.

   The block located at this offset contains the value that exceeded the array range, X'B' or 11.

Calling a Nonexistent Subroutine

Figure 94 demonstrates the error of calling a nonexistent subroutine. This routine was compiled with the LIST, MAP, and GOSTMT compiler options. It was run with the TERMTHDACT(DUMP) run-time option to generate a traceback.

Figure 95. Sections of the Language Environment Dump

To understand the traceback and debug this example routine, use the following steps:

1. Find the Current Condition message in the Condition Information for Active Routines section of the dump. The message is `CEE3201S. The system detected an Operation exception.` For more information about this message, see Chapter 9, “Language Environment Run-Time Messages” on page 243.

   This section of the dump also provides such information as the name of the active routine and the current statement number at the time of the dump.

2. Locate statement 7 in the routine (Figure 94 on page 227). This statement calls subroutine Prog01. The message CEE3201S, which indicates an operations exception, was generated because of an unresolved external reference.

3. Check the linkage editor output for error messages.

Divide-by-Zero Error

Figure 96 demonstrates a divide-by-zero error. In this example, the main PL/I routine passed bad data to a PL/I subroutine. The bad data in this example is 0, and the error occurred when the subroutine SUB1 attempted to use this data as a divisor.

```

Figure 96. PL/I Routine with a Divide-by-Zero Error

Since variables are not normally displayed in a PLIDUMP dump, this routine included a PUT DATA statement, which generated a listing of arguments and variables used in the routine. Figure 97 shows this output.

```
1Sample Starting
 Sub1 Starting        A_NUMBER=            0 MY_NAME='Tery Gillaspy' AN_ARRAY(1)=            1
 AN_ARRAY(2)=         3                      AN_ARRAY(3)=            5;
```

Figure 97. Variables from Routine SAMPLE

The routine in Figure 96 was compiled with the LIST compiler option, which generated the object code listing shown in Figure 98 on page 230.

```

Figure 99 (Part 3 of 3). Language Environment Dump from Example PL/I Routine

To understand the dump information and debug this routine, use the following steps:

1. Notice the title of the dump:`PLIDUMP called from error ON-unit`. This was the title specified when PLIDUMP was invoked, and it indicates that the ERROR condition was raised and PLIDUMP was called from within the ERROR ON-unit.
2. Locate the messages in the Condition Information section of the dump.

   There are two messages. The current condition message indicates that a prior condition was promoted to the ERROR condition. The promotion of a condition occurs when the original condition is left unhandled (no PL/I ON-units are assigned to gain control). The original condition message is `CEE3209S. The system detected a Fixed Point divide exception`. The original condition usually indicates the actual problem. For more information about this message, see Chapter 9, “Language Environment Run-Time Messages” on page 243.
3. In the traceback section, note the sequence of calls in the call chain. SAMPLE called SUB1 at statement 11, and SUB1 raised an exception at statement 15, PU offset X'39E'.
4. Find the statement in the listing for SUB1 that raised the ZERODIVIDE condition. If SUB1 was compiled with GOSTMT and SOURCE, find statement 15 in the source listing.

   Since the object listing was generated in this example, you can also locate the actual assembler instruction causing the exception at offset X'39E' in the object listing for this routine, shown in Figure 98 on page 230. Either method shows that *divisor* was used as the divisor in a divide operation.
5. You can see from the declaration of SUB1 that *divisor* is a parameter passed from SAMPLE. Because of linkage conventions, you can infer that register 1 in the SAMPLE save area points to a parameter list that was passed to SUB1. *divisor* is the first parameter in the list.
6. In the SAMPLE DSA, the R1 value is X'20558'. This is the address of the parameter list, which is located in static storage.

7. Find the parameter list in the stack frame; the value of the first parameter is X'00000000'. Thus, the exception occurred when SAMPLE passed a 0 value used as a divisor in subroutine SUB1.

Chapter 8. Debugging under CICS

This chapter provides information for debugging under the Customer Information Control System (CICS). The following sections explain how to access debugging information under CICS, and describe features unique to debugging under CICS.

Use the following list as a quick reference for debugging information:

- Language Environment run-time messages (CESE Transient Data Queue)
- Language Environment traceback (CESE Transient Data Queue)
- Language Environment dump output (CESE Transient Data Queue)
- CICS Transaction Dump (CICS DFHDMPA or DFHDMPB data set)
- Language Environment abend and reason codes (system console)
- Language Environment return codes to CICS (system console)

If the EXEC CICS HANDLE ABEND command is active and the application, or CICS, initiates an abend or application interrupt, then Language Environment does not produce any run-time messages, tracebacks, or dumps.

If EXEC CICS ABEND NODUMP is issued, then no Language Environment dumps or CICS transaction dumps are produced.

Accessing Debugging Information

The following sections list the debugging information available to CICS users, and describe where you can find this information.

Under CICS, the Language Environment run-time messages, Language Environment traceback, and Language Environment dump output are written to the CESE transient data queue. The transaction identifier, terminal identifier, date, and time precede the data in the queue. For detailed information about the format of records written to the transient data queue, see *OS/390 Language Environment Programming Guide*.

The CESE transient data queue is defined in the CICS destination control table (DCT). The CICS macro DFHDCT is used to define entries in the DCT. See *CICS Resource Definition Guide* for a detailed explanation of how to define a transient data queue in the DCT. If you are not sure how to define the CESE transient data queue, see your system programmer.

Locating Language Environment Run-Time Messages

Under CICS, Language Environment run-time messages are written to the CESE transient data queue. A sample Language Environment message that appears when an application abends due to an unhandled condition from an EXEC CICS command is:

```
P039UTV9 19910916145313 CEE3250C The System or User ABEND AEI0 was issued.
P039UTV9 19910916145313          From program unit UT9CVERI at entry point UT9CVERIT
                                 +0000011E at P039UTV9 19910916145313
                                 at offset address 0006051E.
```

Locating the Language Environment Traceback

Under CICS, the Language Environment traceback is written to the CESE transient data queue. Because Language Environment invokes your application routine, the Language Environment routines that invoked your routine appear in the traceback. Figure 100 shows an example Language Environment traceback written to the CESE transient data queue. Data unnecessary for this example has been replaced by ellipses.

```

Figure 100. Language Environment Traceback Written to the Transient Data Queue

Locating the Language Environment Dump

Under CICS, the Language Environment dump output is written to the CESE transient data queue. For active routines, the Language Environment dump contains the traceback, condition information, variables, storage, and control block information for the thread, enclave, and process levels. Use the Language Environment dump with the CICS transaction dump to locate problems when operating under CICS.

For a sample Language Environment dump, see “Understanding the Language Environment Dump” on page 40.

Using CICS Transaction Dump

The CICS transaction dump is generated to the DFHDMPA or DFHDMPB data set. The offline CICS dump utility routine converts the transaction dump into formatted, understandable output.

The CICS transaction dump contains information for the storage areas and resources associated with the current transaction. This information includes the Communication Area (COMMAREA), Transaction Work Area (TWA), Exec Interface Block (EIB), and any storage obtained by the CICS EXEC commands. This information does not appear in the Language Environment dump. It can be helpful to use the CICS transaction dump with the Language Environment dump to locate problems when operating under CICS.

When the location of an error is uncertain, it can be helpful to insert EXEC CICS DUMP statements in and around the code suspected of causing the problem. This generates CICS transaction dumps close to the error for debugging reference.

For information about interpreting CICS dumps, see *CICS/ESA Version 3 Release 3 Problem Determination Guide.*

Using CICS Register and Program Status Word Contents

When a routine interrupt occurs (code = ASRA) and a CICS dump is generated, CICS formats the contents of the program status word (PSW) and the registers at the time of the interrupt. This information is also contained in the CICS trace table entry marked `SSRP * EXEC* – ABEND DETECTED`. The format of the information contained in this trace entry is described in *CICS/ESA Data Areas* manual, under KERRD - KERNEL ERROR DATA.

The address of the interrupt can be found from the second word of the PSW, giving the address of the instruction following the point of interrupt. The address of the entry point of the function can be subtracted from this address. The offset compared to this listing gives the statement that causes the interrupt.

For C routines, you can find the address of the entry point in register 3.

If register 15 is corrupted, the contents of the first load module of the active enclave appear in the program storage section of the CICS transaction dump.

Using Language Environment Abend and Reason Codes

An application can end with an abend in two ways:

- User-specified abend (that is, an abend requested by the assembler user exit or the ABTERMENC run-time option).
- Language Environment-detected unrecoverable error (in which case there is no Language Environment condition handling).

When Language Environment detects an unrecoverable error under CICS, Language Environment terminates the transaction with an EXEC CICS abend. The abend code has a number between 4000 and 4095. A write-to-operator (WTO) is performed to write a CEE1000S message to the system console. This message contains the abend code and its associated reason code. The WTO is performed only for unrecoverable errors detected by Language Environment. No WTO occurs for user-requested abends.

Although this type of abend is performed only for unrecoverable error conditions, an abend code of 4000–4095 does not necessarily indicate an internal error within Language Environment. For example, an application routine can write a variable outside its storage and corrupt the Language Environment control blocks.

Possible causes of a 4000–4095 abend are corrupted Language Environment control blocks and internal Language Environment errors. See Chapter 16, “Language Environment Abend Codes” on page 743 for more information about abend codes 4000–4095. Following is a sample Language Environment abend and reason code. Abend codes appear in decimal, and reason codes appear in hexadecimal.

```
12.34.27 JOB05585  IEF450I XCEPII03 GO CEPII03 - ABEND=S000 U4094 REASON=0000002C
```

Using Language Environment Return Codes to CICS

When the Language Environment condition handler encounters a severe condition that is specific to CICS, the condition handler generates a CICS-specific return code. This return code is written to the system console.

Possible causes of a Language Environment return code to CICS are:

- Incorrect region size
- Incorrect DCT
- Incorrect CSD definitions

See Chapter 18, “Return Codes to CICS” on page 761 for a list of the reason codes written only to CICS. Following is a sample of a return code that was returned to CICS.

```
+DFHAP1200I LE03CC01 A CICS request to Language Environment has
failed. Reason code '0012030'.
```

Ensuring Transaction Rollback

If your application does not run to normal completion and there is no CICS transaction abend, take steps to ensure that transaction rollback (the backing out of any updates made by the malfunctioning application) takes place.

There are two ways to ensure that a transaction rollback occurs when an unhandled condition of severity 2 or greater is detected:

- Use the ABTERMENC run-time option with the ABEND suboption (ABTERMENC(ABEND))
- Use an assembler user exit that requests an abend for unhandled conditions of severity 2 or greater

The IBM-supplied assembler user exit for CICS (CEECXITA), available in the Language Environment SCEESAMP sample library, ensures that a transaction abend and rollback occur for all unhandled conditions of severity 2 or greater. See “Invoking the Assembler User Exit” on page 21 and *OS/390 Language Environment Programming Guide* for more information about the assembler user exit.

Finding Data When Language Environment Returns a Nonzero Reason Code

Language Environment does not write any messages to the CESE transient data queue. Following is the output generated when Language Environment returns a nonzero reason code to CICS and the location where the output appears:

Output Message	Location	Issued By
DFHAC2206 14:43:54 LE03CC01 Transaction UTV2 has failed with abend AEC7. Resource backout was successful.	User's terminal	CICS
DFHAP1200I LE03CC01 A CICS request to the Language Environment has failed. Reason code '0012030'.	System console	CICS
DFHAC2236 06/05/91 14:43:48 LE03CC01 Transaction UTV2 abend AEC7 in routine UT2CVERI term P021 backout successful.	Transient data queue CSMT	CICS

Finding Data When Language Environment Abends Internally

Language Environment does not write any messages to the CESE transient data queue. Following is the output generated when Language Environment abends internally and the location where the output appears:

Output Message	Location	Issued By
DFHAC2206 14:35:24 LE03CC01 Transaction UTV8 has failed with abend 4095. Resource backout was successful.	User's terminal	CICS
CEE1000S LE INTERNAL abend. ABCODE = 00000FFF REASON = 00001234	System console	Language Environment
DFHAC2236 06/05/91 14:35:24 LE03CC01 Transaction UTV8 abend 4095 in routine UT8CVERI term P021 backout successful.	Transient data queue CSMT	CICS

Finding Data When Language Environment Abends from an EXEC CICS Command

This section shows the output generated when an application abends from an EXEC CICS command and the location where the output appears.

This error assumes the use of Language Environment run-time option TERMTHDACT(MSG).

Output Message	Location	Issued By
DFHAC2206 14:35:34 LE03CC01 Transaction UTV8 has failed with abend AEI. Resource backout was successful.	User's terminal	CICS
No message.	System console	CICS
DFHAC2236 06/05/91 14:35:17 LE03CC01 Transaction UTV9 abend AEI0 in routine UT9CVERI term P021 backout successful.	Transient data queue CSMT	CICS
P021UTV9 091156 143516 CEE3250C The System or User Abend AEI0 was issued.	Transient data queue CESE	Language Environment

Part 3. Run-Time Messages and Codes

This part of the book provides lists of Language Environment and Language Environment-component run-time messages and abend and reason codes that can appear as a result of errors in your routine.

Chapter 9. Language Environment Run-Time Messages

The following messages pertain to Language Environment. Each message is followed by an explanation describing the condition that caused the message, a programmer response suggesting how you might prevent the message from occurring again, and a system action indicating how the system responds to the condition that caused the message.

The messages also contain a symbolic feedback code, which represents the first 8 bytes of a 12-byte condition token. You can think of the symbolic feedback code as the nickname for a condition. As such, the symbolic feedback code can be used in user-written condition handlers to screen for a given condition, even if it occurs at different locations in an application.

The messages in this section contain alphabetic suffixes that have the following meaning:

I Informational message
W Warning message
E Error message
S Severe error message
C Critical error message

CEE0102S An unrecognized condition token was passed to *routine* and could not be used.

Explanation: The condition token passed to *routine* contained fields that were not within the range of accepted values.

Programmer Response: Verify that the condition token passed to *routine* does not contain invalid fields.

System Action: Unless the condition is handled, the defualt action is to terminate the enclave.

Symbolic Feedback Code: CEE036

CEE0110S For data conversion from character form to internal floating-point form, an invalid character was specified in the input character string *character_string*.

Programmer Response: Ensure the input character string specified for conversion contains only numerical characters. Signs, decimal points, commas, exponents are not allowed in the string. If the feedback token was omitted on the call to the conversion routine, then the condition is signaled. Otherwise, examine the feedback token upon return and take appropriate action.

System Action: The output value from the conversion routine is undefined.

Symbolic Feedback Code: CEE03E

CEE0111S For data conversion from internal floating-point form to character form, the number of fraction digits specified was either negative or greater than the value specified for the length of the character string.

Programmer Response: Ensure the input value specified for fraction digits is non-negative and less than the value specified for the length of the character string. If the feedback token was omitted on the call to the conversion routine, then the condition is signaled. Otherwise, examine the feedback token upon return and take appropriate action.

System Action: The output value from the conversion routine is undefined.

Symbolic Feedback Code: CEE03F

CEE0112S For data conversion from internal floating-point form to character form, the value specified for the length of the output character string is outside the acceptable range. The valid range for E-format conversion is 1 to 35, and for F-format conversion is 2 to 36.

Programmer Response: Ensure the input value specified for the length of the output character string is within limit. If the feedback token was omitted on the call to the conversion routine, then the condition is signaled. Otherwise, examine the feedback token upon return and take appropriate action.

System Action: The output value from the conversion routine is undefined.

Symbolic Feedback Code: CEE03G

CEE0113S For data conversion from character form to internal floating-point form, the value specified for the length of the input character string is outside the acceptable range. The valid range is 1 to 35.

Programmer Response: Ensure the input value specified for the length of the input character string is within limit. If the feedback token was omitted on the call to the conversion routine, then the condition is signaled. Otherwise, examine the feedback token upon return and take appropriate action.

System Action: The output value from the conversion routine is undefined.

Symbolic Feedback Code: CEE03H

CEE0198S The termination of a thread was signaled due to an unhandled condition.

Explanation: Termination imminent due to an unhandled condition was signaled or was the target of a promote.

Programmer Response: Call CEEITOK from a user-written condition handler to determine what condition was unhandled. With that information, you can either recover appropriately or allow termination to continue.

System Action: If this condition is signaled, or is the target of a promote, and it remains unhandled at stack frame zero, the thread will terminate without re-raising this condition. If this condition was signaled with CEESGL specifying a feedback code, the feedback code is returned to the caller of CEESGL and control is returned to the next sequential instruction following the call to CEESGL.

Symbolic Feedback Code: CEE066

CEE0199W The termination of a thread was signaled due to a STOP statement.

Explanation: The termination of a thread was signaled.

Programmer Response: No response is required. A thread is terminating normally.

System Action: The thread is terminated in a normal manner.

Symbolic Feedback Code: CEE067

CEE0201I An unhandled condition was returned in a feedback code.

Explanation: No language run-time component event handler or CEEHDL routine handled the condition.

Programmer Response: See the original condition.

System Action: Language Environment returns to the point at which the original condition was signaled.

Symbolic Feedback Code: CEE069

CEE0250S An unrecognized label variable was detected. The stack frame address could not be associated with an active stack frame.

Explanation: A call to CEEGOTO was made with a bad label variable. The label variable should be a valid code point that is subject to a current save area.

Programmer Response: The label variable applies to a program that is no longer active, or the label variable was not initialized. Make sure that the program is active.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE07Q

CEE0252W CEEHDLU was unable to find the requested user-written condition handler routine.

Explanation: A call to CEEHDLU was made to unregister a user-written condition handler that was not registered.

Programmer Response: Ensure that the user-written condition handler you are trying to free is registered.

System Action: No user-written condition handlers are removed.

Symbolic Feedback Code: CEE07S

CEE0253W A user-written condition handler was unregistered. Additional registration remain in the queue.

Explanation: A call to CEEHDLU was made to unregister a user-written condition handler. The user-written condition handler had been registered a multiple number of times.

Programmer Response: No programmer action is required.

System Action: The first occurrence of the user-written condition handler is removed from the queue. Other registrations remain on the queue.

Symbolic Feedback Code: CEE07T

CEE0254W The first parameter passed to CEEMRCR was not 0 or 1.

Explanation: The first parameter passed to CEEMRCR was neither 0 nor 1.

Programmer Response: Change the first parameter (type_of_move) passed to CEEMRCR to a valid value (0 or 1).

System Action: The resume cursor is not moved.

Symbolic Feedback Code: CEE07U

CEE0255S The first parameter passed to CEEMRCE was an unrecognized label.

Explanation: A move resume cursor must be made to a valid label pointed to by CEEMRCE.

Programmer Response: Change the position parameter pointed to by CEEMRCE to a valid label.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE07V

CEE0256W The user-written condition handler routine specified was already registered for this stack frame. It was registered again.

Explanation: CEEHDLR provided for multiple registration of user-written condition handler routines but the registration of the same routine again for the same stack frame is considered unusual.

Programmer Response: No response is required. This message is just a warning.

System Action: The handler is registered.

Symbolic Feedback Code: CEE080

CEE0257S The routine specified contained an invalid entry variable.

Explanation: CEEHDLR could not validate the entry variable passed.

Programmer Response: Build and pass CEEHDLR a valid entry variable.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE081

CEE0259S A move to stack frame zero using CEEMRCR was attempted from a MAIN routine.

Explanation: The handler for the first stack frame beyond stack frame zero attempted to do a move of the resume cursor with type_of_move = 1. The resume cursor was not moved.

Programmer Response: Do not attempt to move the resume cursor to the caller of the main routine. If you want to end the thread, signal Termination Imminent.

System Action: The resume cursor is not moved. The thread is terminated.

Symbolic Feedback Code: CEE083

CEE0260S No condition was active when a call to a condition management routine was made. The requested function was not performed.

Explanation: The condition manager had no record of an active condition.

Programmer Response: No response is required. Calls to these routines should only be made within the handler routine.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE084

CEE0264S An invalid request to resume a condition was detected.

Explanation: A user-written condition handler attempted to resume for a condition for which resumption is not allowed unless the resume cursor is moved.

Note: CEE088 might not be handled and resumed without moving the resume cursor. If resumption is requested without moving the resume cursor, the environment is terminated with ABEND 4091-12.

Programmer Response: Move the resume cursor as part of handling the condition.

System Action: The resume request that triggered this condition is ignored.

Symbolic Feedback Code: CEE088

CEE0277W CEEMRCR was called to perform an unnecessary move.

Explanation: A user-written condition handler attempted to move the resume cursor with type_of_move = 0 and with the handle and resume cursors pointing to the same stack frame. The handle and resume cursor might point to the same stack frame either because the handler is for the incurring frame or because the resume cursor has already been moved to the frame being handled.

Programmer Response: No response is necessary.

System Action: No action is taken by the Condition Manager. The resume cursor is not moved.

Symbolic Feedback Code: CEE08L

CEE0355C The user-written condition handler that was scheduled using CEEHDLR returned an unrecognized result code.

Explanation: A user written condition handler passed an invalid result code. A user-written condition handler has either returned without setting a reason code variable to a valid response code or has moved the resume cursor that caused a return to condition management without a valid response code being set.

Programmer Response: Supply a valid result code.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE0B3

CEE0356C An internal condition handler returned an unrecognized result code.

Explanation: A language run-time component condition handler passed an invalid result code.

Programmer Response: Contact your service representative.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE0BA

CEE0374C CONDITION = *condition-id* **TOKEN =** *condition-token* **WHILE RUNNING PROGRAM** *program-name* **WHICH STARTS AT** *program-address* **AT THE TIME OF INTERRUPT**

PSW *psw* **GPR 0-3** *gpr0 gpr1 gpr2 gpr3*
GPR 4-7 *gpr4 gpr5 gpr6 gpr7* **GPR 8-B** *gpr8 gpr9 gprA gprB* **GPR C-F** *gprC gprD gprE gprF*
FLT 0-2 *flt0 flt2*
FLT 4-6 *flt4 flt6*

Explanation: An unrecoverable condition occurred while processing a previous condition. This message is issued with a WTO because Language Environment has encountered a

critical error while handling a previous condition. The CONDITION indicates the message representing the condition being handled and the TOKEN is the three word Language Environment Condition Token. The *program-name*, *program-address* (starting address of program), psw, and registers are for the condition being handled when the unrecoverable condition occurred. If the CEE0374C message appears several times in sequence, the conditions appear in order of occurrence. Correcting the earliest condition may allow the application to run successfully.

Programmer Response: Attempt to correct the original condition by looking up the condition-token specified in the message.

System Action: The thread is terminated abnormally.

Symbolic Feedback Code: CEE0BM

CEE0398W Resume with new input.

Explanation: This condition was returned from a user-written condition handler to tell Language Environment to retry the operation with new input.

Programmer Response: No programmer response is required.

System Action: Language Environment attempts to retry the operation.

Symbolic Feedback Code: CEE0CE

CEE0399W Resume with new output.

Explanation: This condition was returned from a user-written condition handler to tell Language Environment to retry the operation with new output.

Programmer Response: No programmer response is required.

System Action: Language Environment resumes execution with new output.

Symbolic Feedback Code: CEE0CF

CEE0400E An invalid action code *action-code* **was passed to routine** *routine-name***.**

Explanation: An action code parameter passed to *routine* did not contain a valid value.

Programmer Response: Provide a valid action code.

System Action: No system action is performed. The output is undefined.

Symbolic Feedback Code: CEE0CG

CEE0401S An invalid case code *case-code* **was passed to routine** *routine-name***.**

Explanation: A case code parameter must be a 2-byte integer with a value of 1 or 2.

Programmer Response: Provide a valid case code.

System Action: No system action is performed. The output is undefined.

Symbolic Feedback Code: CEE0CH

CEE0402S An invalid control code *control-code* **was passed to routine** *routine-name***.**

Explanation: A control code parameter must be a 2-byte integer with a value of 0 or 1.

Programmer Response: Provide a valid control code.

System Action: No system action is performed.

Symbolic Feedback Code: CEE0CI

CEE0403S An invalid severity code *severity-code* **was passed to routine** *routine-name***.**

Explanation: A severity code parameter must be a 2-byte integer with a value between 0 and 4.

Programmer Response: Provide a valid severity code.

System Action: No system action is performed.

Symbolic Feedback Code: CEE0CJ

CEE0404W Facility ID *facility-id* **with non-alphanumeric characters was passed to routine** *routine-name***.**

Explanation: A facility ID parameter was passed with characters not in the range of A-Z, a-z, 0-9.

Programmer Response: Verify that the facility ID passed is the correct value.

System Action: No system action is performed. Processing continues.

Symbolic Feedback Code: CEE0CK

CEE0450S The message inserts for the condition token with message number *message-number* **and facility ID** *facility-id* **could not be located.**

Explanation: An insert area for the given condition token did not exist. It possibly was never allocated, or was reused by another condition.

Programmer Response: Verify that the *message-number* and *Facility-ID* passed contain the correct values. If so, verify that the program was run with the MSGQ option specifying a large enough value to contain all the insert areas necessary for this program to run.

System Action: No system action is performed.

Symbolic Feedback Code: CEE0E2

CEE0451S An invalid destination code *destination-code* **was passed to routine** *routine-name***.**

Explanation: A destination code must be a 4-byte integer with a value of 2.

Programmer Response: Provide a valid destination code.

System Action: No system action is performed. The message is not written.

Symbolic Feedback Code: CEE0E3

CEE0452S An invalid facility ID *facility-id* **was passed to routine** *routine-name***.**

Explanation: A facility id parameter must be a 3-alphanumeric character field.

Programmer Response: Provide a facility id made up of 3-alphanumeric characters that corresponds to a product recognized by Language Environment. The IBM-supplied facility ids are IBM, CEE, IGZ, and EDC.

System Action: No system action is performed. The output is undefined.

Symbolic Feedback Code: CEE0E4

CEE0454S The message number *message-number* **could not be found for facility ID** *facility-id***.**

Explanation: The message could not be located within the source message files for *facility-id*.

Programmer Response: Ensure the message number is contained within the source message file for *facility-id*.

System Action: No system action is performed. The message is not written.

Symbolic Feedback Code: CEE0E6

CEE0455W The message with message number *message-number* **and facility ID** *facility-id* **was truncated.**

Explanation: The message could not fit within the message buffer supplied. Msg_index contains the index into the message returned.

Programmer Response: Subsequent calls to CEEMGET with the previously returned msg_index value will retrieve the remainder of the message.

System Action: The index into the message is returned in msg_ptr.

Symbolic Feedback Code: CEE0E7

CEE0457S The message file destination *ddname* **could not be located.**

Explanation: An error was detected trying to access the given message file *ddname*.

Programmer Response: Verify that the file exists and is usable.

System Action: No system action is performed. The message is not written.

Symbolic Feedback Code: CEE0E9

CEE0458S The message repository *repository-name* **could not be located.**

Explanation: The file containing the table of message file names could not be located. The name of the file was txxxMSGT, where t was either the letter "I" for an IBM-assigned facility id, or "U" for a user-assigned facility id. xxx was the facility id. MSGT was the letters "MSGT".

Programmer Response: Verify that the table exists and is appropriately named.

System Action: No system action is performed. The message is not written.

Symbolic Feedback Code: CEE0EA

CEE0459S Not enough storage was available to create a new instance specific information block.

Explanation: A new ISI could not be created because not enough storage was available.

Programmer Response: Ensure that the REGION size is sufficient to run the application. Verify that the storage sizes specified in the HEAP run-time option is reasonable, given the region size allocated to the application.

System Action: No storage is allocated.

Symbolic Feedback Code: CEE0EB

CEE0460W Multiple instances of the condition token with message number *message-number* **and facility ID** *facility-id* **were detected.**

Explanation: A message insert block for the given condition token already existed. A new message insert block was created. The two were differentiated by the I_S_info field in the condition token.

Programmer Response: No response is required.

System Action: A call to CEEMSG or CEEMGET will format the message associated with the instance of the message insert block indicated by the I_S_info field of the condition token.

Symbolic Feedback Code: CEE0EC

CEE0461S The maximum number of unique message insert blocks was reached. This condition token had its I_S_info field set to 1.

Explanation: The maximum number of 2,147,483,647 unique message insert blocks was reached. The condition token passed had its I_S_info field set to 1.

Programmer Response: No response is required.

System Action: The I_S_info field in the condition token is set to 1.

Symbolic Feedback Code: CEE0ED

CEE0462S Instance specific information for the condition token with message number *message-number* **and facility ID** *facility-id* **could not be found.**

Explanation: The ISI associated with the condition token was not located. It possibly was reused by another condition if the number specified in the MSGQ run-time option was exceeded.

Programmer Response: Specify a MSGQ run-time option that is sufficient to contain all the active ISIs.

System Action: No system action is performed. The message is not written.

Symbolic Feedback Code: CEE0EE

CEE0463S The maximum size for an insert data item was exceeded.

Explanation: The maximum size of 254 for the length of an insert data item was exceeded.

Programmer Response: Make the insert 254 characters or less. If this is not possible, divide the insert into 2 or more inserts.

System Action: No system action is performed. The insert is not created.

Symbolic Feedback Code: CEE0EF

CEE0464S Instance-specific information for the condition token with message number *message-number* **and facility ID** *facility-id* **did not exist.**

Explanation: No ISI was associated with the condition token. It is most likely that the information was never created.

Programmer Response: If this condition was returned by a Language Environment service, contact your service representative. Otherwise, make sure that the correct I_S_info was identified.

System Action: No system action is performed. The message is not written.

Symbolic Feedback Code: CEE0EG

CEE0502S The operational descriptor for the argument list was missing in routine *routine-name***.**

Explanation: The high order bit of register 1 was off or the constant X'81C3C501' was missing from the storage location immediately preceding the argument list.

Programmer Response: Contact your service representative.

System Action: No system action is performed.

Symbolic Feedback Code: CEE0FM

CEE0553S An internal error was detected in creating the inserts for a condition.

Explanation: An invalid insert number was passed to the routine to format inserts.

Programmer Response: Contact your service representative.

System Action: No system action is performed.

Symbolic Feedback Code: CEE0H9

CEE0554W A value outside the range of 0 through 999,999 was supplied. However, the value was still used as the enclave return code.

Explanation: Language Environment prefers the user to set the enclave return code to a value of 0 through 999,999.

Programmer Response: If possible, change the return code to be within the range of 0 through 999,999.

System Action: The value will still be used as the enclave return code.

Symbolic Feedback Code: CEE0HA

CEE0802C Heap storage control information was damaged.

Explanation: Internal control information saved in header records within the heap was damaged.

Programmer Response: Ensure that your program does not write data to an area larger than the original allocation. For example, allocating a 100 byte area and then writing 120 bytes to this area could cause damage to a storage header.

System Action: No storage is allocated. A severity 4 condition is signaled and the application is terminated.

Symbolic Feedback Code: CEE0P2

CEE0803S The heap identifier in a get storage request or a discard heap request was unrecognized.

Explanation: The heap identifier supplied in a call to CEEGTST or CEEDSHP did not match any known heap identifier, or the heap had already been discarded by a call to CEEDSHP (discard heap) prior to the request.

Programmer Response: For get heap storage requests, ensure that the value in the heap identifier parameter is either 0, indicating the default heap, or an identifier returned by the CEECRHP (create heap) service. For all other requests, ensure that the heap is not discarded prior to the request.

System Action: No storage is allocated. The value of the address parameter is undefined.

Symbolic Feedback Code: CEE0P3

CEE0804S The initial size value supplied in a create heap (CEECRHP) request was invalid.

Explanation: The initial size value supplied to CEECRHP was a negative number.

Programmer Response: Ensure that the value in the initial size parameter is either 0, indicating same as the initial heap, or a positive integer.

System Action: No heap is created. The value of the heap identifier is undefined.

Symbolic Feedback Code: CEE0P4

CEE0805S The increment size value supplied in a create heap (CEECRHP) request was invalid.

Explanation: The increment size value supplied to CEECRHP was a negative number.

Programmer Response: Ensure that the value in the increment size parameter is either 0, indicating same as the initial heap, or a positive integer.

System Action: No heap is created. The value of the heap identifier is undefined.

Symbolic Feedback Code: CEE0P5

CEE0806S The options value supplied in a create heap (CEECRHP) request was unrecognized.

Explanation: The value of the options parameter supplied to CEECRHP was not recognized.

Programmer Response: Ensure that the value in the options parameter is either 0, indicating same as the initial heap, or one of the supported options values documented in the *OS/390 Language Environment Programming Guide*.

System Action: No heap is created. The value of the heap identifier is undefined.

Symbolic Feedback Code: CEE0P6

CEE0807S An input supplied to a create user heap request (CEEVUHCR) was not valid.

Explanation: The value of an input parameter supplied to CEEVUHCR was not correct.

Programmer Response: Ensure that all of the input parameters have been properly specified on the call to CEEVUHCR.

System Action: No heap is created. The value of the heap token is undefined.

Symbolic Feedback Code: CEE0P7

CEE0808S Storage size in a get storage request (CEEGTST) or a reallocate request (CEECZST) was not a positive number.

Explanation: The size parameter supplied in a get storage request call to CEEGTST or a reallocate call to CEECZST was less than or equal to 0.

Programmer Response: Ensure that the size parameter is a positive integer representing the number of bytes of storage to be obtained.

System Action: No storage is allocated. The value of the address parameter is undefined.

Symbolic Feedback Code: CEE0P8

CEE0809S The maximum number of heaps was reached.

Explanation: The maximum number of heaps had already been created.

Programmer Response: Modify the program to discard unneeded heaps before attempting to create a new heap or restructure the application so that it requires fewer heaps.

System Action: No heap is created. The value of the heap identifier is undefined.

Symbolic Feedback Code: CEE0P9

CEE0810S The storage address in a free storage (CEEFRST) request was not recognized, or heap storage (CEECZST) control information was damaged.

Explanation: The address parameter supplied in a call to CEEFRST or CEECZST did not contain the starting address of a currently allocated area in the heap. Either the supplied address was invalid, or the area had been freed previously.

Programmer Response: Ensure that the address parameter contains a value returned by a call to CEEGTST or CEECZST. Ensure that the storage area to be freed has not been freed previously.

System Action: No storage is freed. The address parameter is left unchanged so that its value can be examined.

Symbolic Feedback Code: CEE0PA

CEE0812S An invalid attempt to discard the initial heap was made.

Explanation: The heap identifier supplied in a discard heap request was zero (indicating the initial heap) but the initial heap could not be discarded.

Programmer Response: Ensure that the heap identifier supplied in the discard heap call is an identifier returned by the create heap (CEECRHP) service.

System Action: No storage is freed. The value of the heap identifier remains unchanged.

Symbolic Feedback Code: CEE0PC

CEE0813S Insufficient storage was available to satisfy a get storage (CEECZST) request.

Explanation: There was not enough free storage available to satisfy a get storage call to CEEGTST or reallocate request call to CEECZST.

Programmer Response: Ensure that the REGION size is sufficient to run the application. Ensure that the size parameter in the get storage request is not an unusually large number. Verify that the storage sizes specified in the HEAP and STACK run-time options are reasonable, given the region size allocated to the application. Verify that you are using storage options that get your storage from above the line, if you can, since you can run out of storage below the line much more easily.

System Action: No storage is allocated. The value of the address parameter is undefined.

Symbolic Feedback Code: CEE0PD

CEE0814S Insufficient storage was available to extend the stack.

Explanation: During prologue processing, a new stack frame could not be obtained because there was not enough free storage available.

Programmer Response: Ensure that the REGION size is sufficient to run the application.

System Action: A SIGSEGV signal is raised. If the process is blocking or ignoring this signal, or is catching it but has not specified that the catcher function should run on an alternate stack, the signal will be unblocked and its action set to default (i.e., terminate the process) before the signal is raised.

Symbolic Feedback Code: CEE0PE

CEE1000S Language Environment internal abend. ABCODE = *abcode* **REASON =** *rsncode*

Explanation: This message was issued to the operators console in CICS to indicate that Language Environment had abended, with the abend code and reason code as specified in the message.

Programmer Response: Refer to the Language Environment Abend and Reason Codes appendix in this book for information on the cause of the abend.

System Action: The transaction is terminated abnormally with the abend code stated in this message.

Symbolic Feedback Code: CEE0V8

CEE1001E A cross program branching was attempted as a result of a CICS HANDLE command with the LABEL options. This was not supported by the language used by program *program-name***.**

Explanation: The HLL did not support transferring control to specified LABEL.

Programmer Response: This is a language-specific restriction. See *OS/390 Language Environment Programming Guide* for information on EXEC CICS.

System Action: No system action is performed.

Symbolic Feedback Code: CEE0V9

CEE2001E For an exponentiation operation (RS) where R and S are real values, R was less than zero in math routine** *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UH

CEE2002E The argument value was too close to one of the singularities (plus or minus pi/2, plus or minus 3pi/2, for the tangent; or plus or minus pi, plus or minus 2pi, for the cotangent) in math routine *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UI

CEE2003E For an exponentiation operation (IJ) where I and J are integers, I was equal to zero and J was less than or equal to zero in math routine** *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UJ

CEE2004E For an exponentiation operation (RI) where R is real and I is an integer, R was equal to zero and I was less than or equal to zero in math routine** *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UK

CEE2005E The value of the argument was outside the valid range *range* **in math routine** *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UL

CEE2006E For an exponentiation operation (RS) where R and S are real values, R was equal to zero and S was less than or equal to zero in math routine** *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UM

CEE2007E The exponent exceeded *limit* **in math routine** *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UN

CEE2008E For an exponentiation operation (ZP) where the complex base Z equals zero, the real part of the complex exponent P, or the integer exponent P was less than or equal to zero in math routine** *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UO

CEE2009E The value of the real part of the argument was greater than *limit* **in math routine** *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UP

CEE2010E The argument was less than *limit* **in math routine** *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UQ

CEE2011E The argument was greater than *limit* **in math routine** *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UR

CEE2012E The argument was less than or equal to *limit* **in math routine** *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1US

CEE2013E The absolute value of the imaginary part of the argument was greater than *limit* in math routine *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UT

CEE2014E Both arguments were equal to *limit* in math routine *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UU

CEE2015E The absolute value of the imaginary part of the argument was greater than or equal to *limit* in math routine *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1UV

CEE2016E The absolute value of the argument was greater than *limit* in math routine *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V0

CEE2017E The absolute value of the argument was greater than or equal to *limit* in math routine *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V1

CEE2018E The real and imaginary parts of the argument were equal to *limit* in math routine *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V2

CEE2019E The absolute value of the real part of the argument was greater than or equal to *limit* in math routine *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V3

CEE2020E For an exponentiation operation (RS) where R and S are real values, either R is equal to zero and S is negative, or R is negative and S is not an integer whose absolute value is less than or equal to *limit* in math routine *routine-name*.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V4

CEE2021E For an exponentiation operation (XY), the argument combination of Y*log2(X) generated a number greater than or equal to *limit* in math routine *routine-name*.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V5

CEE2022E The value of the argument was plus or minus *limit* in math routine *routine-name*.

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V6

CEE2024E An overflow has occurred in math routine *routine-name*.

Explanation: An overflow had occurred in calculating the results in the scalar math routine.

Programmer Response: Ensure the input arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V8

CEE2025W An underflow has occurred in math routine *routine-name*.

Explanation: An underflow had occurred in calculating the results in the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1V9

CEE2028E The value of the second argument was outside the valid range *range* **in math routine** *routine-name***.**

Explanation: Invalid arguments were specified to the scalar math routine.

Programmer Response: Ensure the arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1VC

CEE2029E The value of the argument was equal to *limit* **in math routine** *routine-name***.**

Explanation: Invalid input arguments were specified to the scalar math routine.

Programmer Response: Ensure the input arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1VD

CEE2030E The value of the second argument was equal to *limit* **in math routine** *routine-name***.**

Explanation: Invalid input arguments were specified to the scalar math routine.

Programmer Response: Ensure the input arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1VE

CEE2031E The value of the argument was a non-positive whole number in math routine *routine-name***.**

Explanation: Invalid input arguments were specified to the scalar math routine.

Programmer Response: Ensure the input arguments are valid to the math routine. You might want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1VF

CEE2040E The value of the third argument was outside the valid range *range* **in math routine** *routine-name***.**

Explanation: Invalid input arguments were specified to the scalar math routine.

Programmer Response: Ensure the input arguments are valid to the math routine. You may want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1VO

CEE2041E The absolute value of the second argument was greater than either the value of the third argument or the number of bits in the first argument in math routine *routine-name***.**

Explanation: Invalid input arguments were specified to the scalar math routine.

Programmer Response: Ensure the input arguments are valid to the math routine. You may want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1VP

CEE2042E The sum of the second and the third arguments was greater than the number of bits in the first argument in math routine *routine-name***.**

Explanation: Invalid input arguments were specified to the scalar math routine.

Programmer Response: Ensure the input arguments are valid to the math routine. You may want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1VQ

CEE2043E The value of the second or third argument was less than 0 in math routine *routine-name***.**

Explanation: Invalid input arguments were specified to the scalar math routine.

Programmer Response: Ensure the input arguments are valid to the math routine. You may want to register a user handler that will gain control if this condition is signaled (if the feedback token was omitted on the call to the math routine, then the condition is signaled). If you specify the feedback token on the call to the math routine, examine the feedback token upon return from the math routine and take appropriate action.

System Action: The output value from the math routine is undefined.

Symbolic Feedback Code: CEE1VR

CEE2050S The length of the first argument was less than 0 or greater than 32767 in routine *routine-name***.**

Explanation: Invalid length of input argument was specified.

Programmer Response: Ensure the length of input argument is valid.

System Action: The output value is undefined.

Symbolic Feedback Code: CEE202

CEE2051S The length of the second argument was less than 0 or greater than 32767 in routine *routine-name***.**

Explanation: Invalid length of input argument was specified.

Programmer Response: Ensure the length of input argument is valid.

System Action: The output value is undefined.

Symbolic Feedback Code: CEE203

CEE2052S The length of the result was less than 0 or greater than 32767 in routine *routine-name***.**

Explanation: Invalid length of result was specified.

Programmer Response: Ensure the length of result is valid.

System Action: The output value is undefined.

Symbolic Feedback Code: CEE204

CEE2053S The value of the second argument was not positive in routine *routine-name***.**

Explanation: Invalid input argument was specified.

Programmer Response: Ensure the input argument is valid.

System Action: The output value is undefined.

Symbolic Feedback Code: CEE205

CEE2502S The UTC/GMT was not available from the system.

Explanation: A call to CEEUTC or CEEGMT failed because the system clock was in an invalid state. The current time could not be determined.

Programmer Response: Notify systems support personnel that the system clock is in an invalid state.

System Action: All output values are set to 0.

Symbolic Feedback Code: CEE2E6

CEE2503S The offset from UTC/GMT to local time was not available from the system.

Explanation: A call to CEEGMTO failed because either (1) the current operating system could not be determined, or (2) the time zone field in the operating system control block appears to contain invalid data.

Programmer Response: Notify systems support personnel that the local time offset stored in the operating system appears to contain invalid data.

System Action: All output values are set to 0.

Symbolic Feedback Code: CEE2E7

CEE2505S The input_seconds value in a call to CEEDATM or CEESECI was not within the supported range.

Explanation: The *input_seconds* value passed in a call to CEEDATM or CEESECI was not a floating-point number between 86,400.0 and 265,621,679,999.999. The input parameter should represent the number of seconds elapsed since 00:00:00 on 14 October 1582, with 00:00:00.000 15 October 1582 being the first supported time/date, and 23:59:59.999 31 December 9999 being the last supported time/date.

Programmer Response: Verify that input parameter contains a floating-point value between 86,400.0 and 265,621,679,999.999.

System Action: For CEEDATM, the output value is set to blanks. For CEESECI, all output parameters are set to 0.

Symbolic Feedback Code: CEE2E9

CEE2506S Japanese (<JJJJ>) or Republic of China (<CCCC> or <CCCCCCCC>) Era was used in a picture string passed to CEEDATM, but the input number-of-seconds value was not within the supported range. The era could not be determined.

Explanation: In a CEEDATM call, the picture string indicated that the input value was to be converted to a Japanese (<JJJJ>) or Republic of China (<CCCC> or <CCCCCCCC>) Era; however, the input value that was specified lies outside the range of supported eras.

Programmer Response: Verify that the input value contains a valid number-of-seconds value within the range of supported eras.

System Action: The output value is set to blanks.

Symbolic Feedback Code: CEE2EA

CEE2507S Insufficient data was passed to CEEDAYS or CEESECS. The Lilian value was not calculated.

Explanation: The picture string passed in a CEEDAYS or CEESECS call did not contain enough information. For example, it is an error to use the picture string MM/DD (month and day only) in a call to CEEDAYS or CEESECS, because the year value is missing. The minimum information required to calculate a Lilian value is either (1) month, day and year, or (2) year and Julian day.

Programmer Response: Verify that the picture string specified in a call to CEEDAYS or CEESECS specifies, as a minimum, the location in the input string of either (1) the year, month, and day, or (2) the year and Julian day.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EB

CEE2508S The date value passed to CEEDAYS or CEESECS was invalid.

Explanation: In a CEEDAYS or CEESECS call, the value in the DD or DDD field was not valid for the given year and/or month. For example, MM/DD/YY with 02/29/90, or YYYY.DDD with 1990.366 are invalid because 1990 is not a leap year. This code can also be returned for any nonexistent date value such as June 31st or January 0.

Programmer Response: Verify that the format of the input data matches the picture string specification and that input data contains a valid date.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EC

CEE2509S The Japanese or Republic of China Era passed to CEEDAYS or CEESECS was not recognized.

Explanation: The value in the Japanese (<JJJJ>) or Republic of China (<CCCC> or <CCCCCCCC>) Era field passed in a call to CEEDAYS or CEESECS did not contain a supported Japanese or Republic of China Era name.

Programmer Response: Verify that the format of the input data matches the picture string specification and that the spelling of the Japanese or ROC Era name is correct. Note that the era name must be a proper DBCS string, that is, the '<' position must contain a shift-out character (X'0E') and the '>' position must contain a shift-in character (X'0F').

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2ED

CEE2510S The hours value in a call to CEEISEC or CEESECS was not recognized.

Explanation: (1) In a CEEISEC call, the hours parameter did not contain a number between 0 and 23, or (2) in a CEESECS call, the value in the HH (hours) field did not contain a number between 0 and 23, or the AP (a.m./p.m.) field was present and the HH field did not contain a number between 1 and 12.

Programmer Response: For CEEISEC, verify that the hours parameter contains an integer between 0 and 23. For CEESECS, verify that the format of the input data matches the picture string specification, and that the hours field contains a value between 0 and 23, (or 1 and 12 if the AP field is used).

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EE

CEE2511S The day parameter passed in a CEEISEC call was invalid for year and month specified.

Explanation: The day parameter passed in a CEEISEC call did not contain a valid day number. The combination of year, month, and day formed an invalid date value. Examples: year=1990, month=2, day=29; or month=6, day=31; or day=0.

Programmer Response: Verify that the day parameter contains an integer between 1 and 31, and that the combination of year, month, and day represents a valid date.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EF

CEE2512S The Lilian date value passed in a call to CEEDATE or CEEDYWK was not within the supported range.

Explanation: The Lilian day number passed in a call to CEEDATE or CEEDYWK was not a number between 1 and 3,074,324.

Programmer Response: Verify that the input parameter contains an integer between 1 and 3,074,324.

System Action: The output value is set to blanks.

Symbolic Feedback Code: CEE2EG

CEE2513S The input date passed in a CEEISEC, CEEDAYS, or CEESECS call was not within the supported range.

Explanation: The input date passed in a CEEISEC, CEEDAYS, or CEESECS call was earlier than 15 October 1582, or later than 31 December 9999.

Programmer Response: For CEEISEC, verify that the year, month, and day parameters form a date greater than or equal to 15 October 1582. For CEEDAYS and CEESECS, verify that the format of the input date matches the picture string specification, and that the input date is within the supported range.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EH

CEE2514S The year value passed in a CEEISEC call was not within the supported range.

Explanation: The year parameter passed in a CEEISEC call did not contain a number between 1582 and 9999.

Programmer Response: Verify that the year parameter contains valid data, and that the year parameter includes the century. For example, you must specify the year as 1990, not as 90.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EI

CEE2515S The milliseconds value in a CEEISEC call was not recognized.

Explanation: In a CEEISEC call, the milliseconds parameter (*input_milliseconds*) did not contain a number between 0 and 999.

Programmer Response: Verify that the milliseconds parameter contains an integer between 0 and 999.

Symbolic Feedback Code: CEE2EJ

System Action: The output value is set to 0.

CEE2516S The minutes value in a CEEISEC call was not recognized.

Explanation: (1) In a CEEISEC call, the minutes parameter (*input_minutes*) did not contain a number between 0 and 59, or (2) in a CEESECS call, the value in the MI (minutes) field did not contain a number between 0 and 59.

Programmer Response: For CEEISEC, verify that the minutes parameter (*input_minutes*) contains an integer between 0 and 59. For CEESECS, verify that the format of the input data matches the picture string specification, and that the minutes field contains a number between 0 and 59.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EK

CEE2517S The month value in a CEEISEC call was not recognized.

Explanation: (1) In a CEEISEC call, the month parameter (*input_month*) did not contain a number between 1 and 12, or (2) in a CEEDAYS or CEESECS call, the value in the MM field did not contain a number between 1 and 12, or the value in the MMM, MMMM, etc. field did not contain a correctly spelled month name or month abbreviation in the currently active National Language.

Programmer Response: For CEEISEC, verify that the month parameter (*input_month*) contains an integer between 1 and 12. For CEEDAYS and CEESECS, verify that the format of the input data matches the picture string specification. For the MM field, verify that the input value is between 1 and 12. For spelled-out month names (MMM, MMMM, etc.), verify

that the spelling or abbreviation of the month name is correct in the currently active National Language.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EL

CEE2518S An invalid picture string was specified in a call to a date/time service.

Explanation: The picture string supplied in a call to one of the date/time services was invalid. Only one era character string can be specified. The picture string contained an invalid DBCS string or contains more than one era descriptor, such as both Japanese (<JJJJ>) or Republic of China (<CCCC>) Era being specified in the same picture string.

Programmer Response: Verify that the picture string contains valid data. Only one era character string can be specified. If the picture string contains the X'0E' (shift-out) character, this indicates the presence of DBCS data. Therefore, (1) the DBCS data must be terminated by a X'0F' (shift-in) character, (2) there must be an even number of characters between the shift-out and shift-in, and (3) these characters must all be valid DBCS characters.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EM

CEE2519S The seconds value in a CEEISEC call was not recognized.

Explanation: (1) In a CEEISEC call, the seconds parameter (*input_seconds*) did not contain a number between 0 and 59, or (2) in a CEESECS call, the value in the SS (seconds) field did not contain a number between 0 and 59.

Programmer Response: For CEEISEC, verify that the seconds parameter (*input_seconds*) contains an integer between 0 and 59. For CEESECS, verify that the format of the input data matches the picture string specification, and that the seconds field contains a number between 0 and 59.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EN

CEE2520S CEEDAYS detected non-numeric data in a numeric field, or the date string did not match the picture string.

Explanation: The input value passed in a CEEDAYS call did not appear to be in the format described by the picture specification. For example, non-numeric characters appear where only numeric characters are expected.

Programmer Response: Verify that the format of the input data matches the picture string specification and that numeric fields contain only numeric data.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EO

CEE2521S The Japanese (<JJJJ>) or Chinese (<CCCC>) year-within-Era value passed to CEEDAYS or CEESECS was zero.

Explanation: In a CEEDAYS or CEESECS call, if the YY or ZYY picture token was specified, and if the picture string contained one of the era tokens such as <CCCC> or <JJJJ>, then the year value must be greater than or equal to 1. In this context, the YY or ZYY field means year within Era.

Programmer Response: Verify that the format of the input data matches the picture string specification and that the input data is valid.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2EP

CEE2522S Japanese (<JJJJ>) or Republic of China (<CCCC> or <CCCCCCCC>) Era was used in a picture string passed to CEEDATE, but the Lilian date value was not within the supported range. The era could not be determined.

Explanation: In a CEEDATE call, the picture string indicated that the Lilian date was to be converted to a Japanese or Republic of China Era, but the Lilian date lies outside the range of supported eras.

Programmer Response: Verify that the input value contains a valid Lilian day number within the range of supported eras.

System Action: The output value is set to blanks.

Symbolic Feedback Code: CEE2EQ

CEE2523W The system time was not available when CEERAN0 was called. A seed value of 1 was used to generate a random number and a new seed value.

Explanation: A seed value of 0 was specified in a CEERAN0 call, indicating that the current system time should be used as a seed value. Because the system time was not available, a seed value of 1 was used to generate a new seed value.

Programmer Response: If seed=1 is acceptable, no action is required. Otherwise, code an appropriate non-zero seed, or refer to message CEE2502.

System Action: A seed value of 1 is assumed. CEERAN0 returns both a random number and a new seed value.

Symbolic Feedback Code: CEE2ER

CEE2524S An invalid seed value was passed to CEERAN0. The random number was set to -1.

Explanation: CEERAN0 was called with a seed value that was out of range.

Programmer Response: Code a seed value between 0 and 2147483646, inclusive, for the CEERAN0 call.

System Action: The random number output was set to -1, and the seed value input was not changed.

Symbolic Feedback Code: CEE2ES

CEE2525S CEESECS detected non-numeric data in a numeric field, or the timestamp string did not match the picture string.

Explanation: The input value passed in a CEESECS call did not appear to be in the format described by the picture specification. For example, non-numeric characters appear where only numeric characters are expected, or the a.m./p.m. field did not contain the strings AM or PM.

Programmer Response: Verify that the format of the input data matches the picture string specification and that numeric fields contain only numeric data.

System Action: The output value is set to 0.

Symbolic Feedback Code: CEE2ET

CEE2526E The date string returned by CEEDATE was truncated.

Explanation: In a CEEDATE call, the output string was not large enough to contain the formatted date value.

Programmer Response: Verify that the output string variable is large enough to contain the entire formatted date. Ensure that the output parameter is at least as long as the picture string parameter.

System Action: The output value is truncated to the length of the output parameter.

Symbolic Feedback Code: CEE2EU

CEE2527E The timestamp string returned by CEEDATM was truncated.

Explanation: In a CEEDATM call, the output string was not large enough to contain the formatted timestamp value.

Programmer Response: Verify that the output string variable is large enough to contain the entire formatted timestamp. Ensure that the output parameter is at least as long as the picture string parameter.

System Action: The output value is truncated to the length of the output parameter.

Symbolic Feedback Code: CEE2EV

CEE2529S A debug tool has terminated the enclave.

Explanation: The debug tool terminated the enclave at the user's request. Under VM, abend code 4094, reason code X'28' is issued. Under MVS, return code 3000 is issued.

Programmer Response: No programmer response is necessary.

System Action: The enclave is terminated.

Symbolic Feedback Code: CEE2F1

CEE2530S A debug tool was not available.

Explanation: Either the debug environment was corrupted or could not load the debug event handler.

Programmer Response: Make sure the debug tool is installed with the loadable name CEEEVDBG.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE2F2

CEE2531S The local time was not available from the system.

Explanation: A call to CEELOCT failed because the system clock was in an invalid state. The current time could not be determined.

Programmer Response: Notify systems support personnel that the system clock is in an invalid state.

System Action: All output values are set to 0.

Symbolic Feedback Code: CEE2F3

CEE2533S The value passed to CEESCEN was not between 0 and 100.

Explanation: The *century_start* value passed in a CEESCEN call was not between 0 and 100, inclusive.

Programmer Response: Ensure that the input parameter is within range.

System Action: The 100-year window assumed for all 2-digit years is unchanged.

Symbolic Feedback Code: CEE2F5

CEE2534W Insufficient field width was specified for a month or weekday name in a call to CEEDATE or CEEDATM. Output set to blanks.

Explanation: The CEEDATE or CEEDATM callable services issued this message whenever: (1) the picture string contained MMM, MMMMMZ, WWW, Wwww, etc., requesting a spelled out month name or weekday name, (2) the national language currently in effect was a DBCS (Double Byte Character Set) language such as NATLANG(JPN), and (3) the month name currently being formatted contained more characters than can fit in the indicated field.

Programmer Response: Increase the field width to contain the longest month or weekday name being formatted, including two bytes for the SO/SI characters. For Japanese, eight characters are sufficient (3 DBCS + SO/SI), so one should specify MMMMMMMM or MMMMMMMZ, WWWWWWWW or WWWWWWWWZ in the picture string.

System Action: The month name and weekday name fields that are of insufficient width are set to blanks. The rest of the output string is unaffected. Processing continues.

Symbolic Feedback Code: CEE2F6

CEE2535S Profiler loaded, Debug Tool unavailable.

Explanation: Profiler and Debug Tool cannot run concurrently.

Programmer Response: To dynamically invoke Debug Tool, set PROFILE run-time option OFF.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE2F7

CEE2600I Success with zero result.

Explanation: The floating-point input value was a true zero, and the caller is to provide the appropriate formatting.

Programmer Response: No programmer response is required.

System Action: Program continues.

Symbolic Feedback Code: CEE2H8

CEE2601I Success with positive result.

Explanation: The conversion has been completed successfully, and the result is strictly greater than zero.

Programmer Response: No programmer response is required.

System Action: Program continues.

Symbolic Feedback Code: CEE2H9

CEE2602I Success with negative result.

Explanation: The conversion has been completed successfully, and the result is strictly less than zero.

Programmer Response: No programmer response is required.

System Action: Program continues.

Symbolic Feedback Code: CEE2HA

CEE2603I Success with plus-rounded-to-zero result.

Explanation: The conversion has been completed successfully, and the result contains a zero result that was created by a strictly positive input value that rounded to zero.

Programmer Response: No programmer response is required.

System Action: Program continues.

Symbolic Feedback Code: CEE2HB

CEE2604I Success with minus-rounded-to-zero result.

Explanation: The conversion has been completed successfully, and the result contains a zero result that was created by a strictly negative input value that rounded to zero.

Programmer Response: No programmer response is required.

System Action: Program continues.

Symbolic Feedback Code: CEE2HC

CEE2606E Result overflows output field.

Explanation: The floating-point input value is too large or the output character string is too small to contain the fixed-point representation of the input argument.

Programmer Response: Ensure the input floating-point value is properly specified and the length of the output character string is big enough to contain the fixed-point representation of the input argument.

System Action: The result value is undefined.

Symbolic Feedback Code: CEE2HE

CEE2607E Result has underflowed.

Explanation: The conversion would have resulted in a number smaller than the underflow threshold for the floating point representation.

Programmer Response: Ensure the input character value to be converted is specified correctly. If the feedback token was omitted on the call to the conversion routine, then the condition is signaled. Otherwise, examine the feedback token upon return and take appropriate action.

System Action: A true floating point zero result has been returned.

Symbolic Feedback Code: CEE2HF

CEE2608E Result has overflowed.

Explanation: The conversion would have resulted in a number larger than the overflow threshold for the floating point representation.

Programmer Response: Ensure the input character value to be converted is specified correctly. If the feedback token was omitted on the call to the conversion routine, then the condition is signaled. Otherwise, examine the feedback token upon return and take appropriate action.

System Action: The maximum positive floating point magnitude has been returned.

Symbolic Feedback Code: CEE2HG

CEE2701S An invalid category parameter was passed to a locale function.

Explanation: An invalid category parameter was passed to a locale function. Valid categories are: LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, LC_NUMERIC, and LC_TIME.

Programmer Response: Supply a valid category to the function.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE2KD

CEE2702S An invalid locale name parameter was passed to a locale function.

Explanation: An invalid locale name parameter was passed to a locale function. Locale name must be one provided with the product or constructed using the LOCALEDEF utility.

Programmer Response: Supply a valid locale name to the function.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE2KE

CEE2999C An internal logic error was detected in a date/time routine.

Explanation: An internal logic error was detected in one of the date/time services. Internal date/time control blocks might have been damaged.

Programmer Response: Verify that the program doesn't inadvertently overlay areas of storage reserved for library use.

System Action: The requested action is not completed. The application is terminated.

Symbolic Feedback Code: CEE2TN

CEE3098S The user routine traceback could not be completed.

Explanation: The user routine traceback could not be completed due to an error detected in tracing back through the DSA chain.

Programmer Response: Attempt to perform problem determination through the use of a dump.

System Action: The user routine traceback is not completed.

Symbolic Feedback Code: CEE30Q

CEE3101E The title or option string passed to CEE3DMP was longer than 80 bytes.

Explanation: The maximum character string length for a dump title was 80 bytes.

Programmer Response: Specify dump title string with 80 characters or less.

System Action: Title string is truncated to 80 bytes.

Symbolic Feedback Code: CEE30T

CEE3102E Invalid CEE3DMP options or suboptions were found and ignored.

Explanation: Invalid options or suboptions were found in the options parameter to CEE3DMP.

Programmer Response: Check the options string passed to CEE3DMP. Make sure it has correct syntax and values for options and suboptions as specified in the *OS/390 Language Environment Programming Reference*. Also, make sure the options string is 255 characters long.

System Action: The invalid options or suboptions are ignored, valid options and suboptions are processed, and a dump is performed.

Symbolic Feedback Code: CEE30U

CEE3103S An error occurred in writing messages to the dump file.

Explanation: An error occurred in trying to write information to the dump file, whose file name was specified with the FNAME option to CEE3DMP. The default file name was CEEDUMP, or CESE transient data queue under CICS.

Programmer Response: Make sure the file name is correct as specified in the options to CEE3DMP. Also, make sure there is enough room in the file to contain the dump.

System Action: Dump processing is terminated at the point where the file error is detected.

Symbolic Feedback Code: CEE30V

CEE3104S Information could not be successfully extracted for this DSA.

Explanation: Some information associated with the DSA or save area passed to CEETRCB could not be determined.

Programmer Response: If no information could be extracted by CEETRCB, it is likely that the DSAPTR parameter does not point to an actual DSA or save area.

System Action: All information that could be extracted is returned by CEETRCB. Any information that could not be extracted is zero or blank (depending on parameter type).

Symbolic Feedback Code: CEE310

CEE3105S The language dump exit was unsuccessful.

Explanation: A language component of Language Environment returned this condition to the common component of Language Environment when an error had occurred in the language component's dump event handler that was not covered in the conditions returned by the dump CWI services.

Programmer Response: Not applicable. This is an internal condition within Language Environment, and is never seen by the application programmer.

System Action: The common component of Language Environment ignores this condition and continues dump processing.

Symbolic Feedback Code: CEE311

CEE3106S An invalid parameter value was specified in a call to the CEEVDMP CWI service.

Explanation: The CEEVDMP CWI service was called with an invalid value for one of the parameters.

Programmer Response: Check to make sure the parameters on the call to CEEVDMP are correct. In particular, check the lengths of the strings passed as parameters.

System Action: The CEEVDMP service returns to the caller without adding any information to the dump.

Symbolic Feedback Code: CEE312

CEE3107E The CEEHDMP or CEEBDMP CWI service encountered inaccessible storage during dump processing.

Explanation: The CEEHDMP CWI service encountered inaccessible storage while dumping a storage area, or the CEEBDMP CWI service encountered inaccessible storage while dumping a control block.

Programmer Response: Make sure the address and length of the storage area are correct for CEEHDMP. Make sure the address and offset are correct for CEEBDMP, and that CEEBDMP is dumping the control block with a correct mapping for the control block.

System Action: The message `Inaccessible storage` is printed in the dump at the point of the encounter. The storage or control block dumping terminates, and CEEHDMP or CEEBDMP returns to the calling routine.

Symbolic Feedback Code: CEE313

CEE3108E An invalid option, suboption, or delimiter was found in the dump option string.

Explanation: An invalid option, suboption, or delimiter was found in the dump option string.

Programmer Response: Correct the error location as indicated in the position parameter.

System Action: No system action is taken.

Symbolic Feedback Code: CEE314

CEE3186E A field type parameter of the CEEBDMP CWI service contained an invalid value.

Explanation: The *field_ids*, *field_length*, or *field_types* parameter of the CEEBDMP CWI service contained an invalid value.

Programmer Response: Check to make sure the mapping of the control block specified to CEEBDMP through these three parameters is correct.

System Action: CEEBDMP returns to its caller. Information might have been written to the dump.

Symbolic Feedback Code: CEE33I

CEE3191E An attempt was made to initialize an AMODE24 application without using the ALL31(OFF) and STACK(,,BELOW) run-time options.

Explanation: During initialization it was detected that a program began in AMODE 24, yet the options required for completely safe execution in AMODE 24 were not fully specified.

Programmer Response: Specify run-time options ALL31(OFF) and STACK(,,BELOW) for AMODE 24 operation.

System Action: Program initialization continues.

Symbolic Feedback Code: CEE33N

CEE3192C The Language Environment anchor support was not installed or was not supported on the operating system.

Explanation: The Language Environment anchor was the address of the Language Environment main control block, the CAA. The underlying operating system must provide the Language Environment anchor support for Language Environment to get its main control block, the CAA. Because the anchor was not installed, the application was not able to run properly.

Programmer Response: Report the error to your systems programmer. Check whether Language Environment anchor support is installed properly on the underlying operating system.

System Action: The application is terminated.

Symbolic Feedback Code: CEE33O

CEE3193I The invocation command parameter string contained an unmatched quote character.

Explanation: The invocation command parameter string contained a beginning quote (either single quote or double quote) but a matching end quote was not found.

Programmer Response: Correct the string.

System Action: The entire string is treated as user parameters.

Symbolic Feedback Code: CEE33P

CEE3195W The SNAP dump file could not be opened.

Explanation: The SNAP dump file could not be opened.

Programmer Response: If a SNAP dump was desired, determine the reason the file could not be opened and correct the problem.

System Action: No SNAP dump was taken.

Symbolic Feedback Code: CEE33R

CEE3196W The id number was not in the allowed range.

Explanation: The id number was not in the required range of 0 to 255.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The id number MOD 256 was used.

Symbolic Feedback Code: CEE33S

CEE3197W An invalid value for reserved was passed.

Explanation: An invalid value for the reserved parameter was passed to the SNAP dump service.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The invalid value is ignored.

Symbolic Feedback Code: CEE33T

CEE3198S A SNAP dump was requested on an unsupported system.

Explanation: The SNAP dump service was called to produce a SNAP dump on an unsupported system.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The SNAP dump was not produced.

Symbolic Feedback Code: CEE33U

CEE3199S An error was returned from the SNAP system function.

Explanation: The SNAP dump service was called. It invoked the SNAP system service that failed.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The SNAP dump was not produced.

Symbolic Feedback Code: CEE33V

CEE3201S The system detected an operation exception (System Completion Code=0C1).

Explanation: The program attempted to execute an instruction with an invalid operation code. The operation code may be unassigned or the instruction with that operation code cannot be installed on this platform. See a Principles of Operation manual for a full list of operation exceptions.

Programmer Response: Examine the contents of registers 14 and 15. If register 15 has a value of 0, then the cause was probably a routine didn't exist and a branch was made to location 0. This would indicate a link-edit failure. Examine the contents of register 14 to determine the point at which the branch was made. Also examine the linkage editor map for any unresolved references reported by the linkage editor.

Another possible cause is a routine branched to some unintended location, such as a conflict in addressing mode between the calling and the called routine, or any other program error that branched to the wrong location.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE341

CEE3202S The system detected a privileged-operation exception (System Completion Code=0C2).

Explanation: Attempted to execute a privileged operation code while the machine was in a problem state. See a Principles of Operation manual for a full list of privileged-operation exceptions.

Programmer Response: Examine the contents of registers 14 and 15. If register 15 has a value of 0, then the probable cause is that a routine doesn't exist and a branch was made to location 0. This would indicate a link-edit failure. Examine the contents of register 14 to determine the point at which the branch was made. Also examine the linkage editor map for any unresolved references reported by the linkage editor.

Another possible cause is a routine branched to some unintended location, such as a conflict in addressing mode between the calling and the called routine, or any other program error that branched to the wrong location.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE342

CEE3203S The system detected an execute exception (System Completion Code=0C3).

Explanation: Your program attempted to execute an EXECUTE instruction where the target of the first EXECUTE instruction was another EXECUTE instruction. See a Principles of Operation manual for a full list of execute exceptions.

Programmer Response: Check your application for errors in the EXECUTE instructions. See a Principles of Operation manual for a full list of execute exceptions.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE343

CEE3204S The system detected a protection exception (System Completion Code=0C4).

Explanation: your program attempted to access a storage location to which it was not authorized.

Programmer Response: Check your application for these common errors:

- Using the wrong AMODE to reference storage
- Trying to use a pointer that has not been set

- Trying to store data into storage reserved for the system
- Using an invalid index to an array

See a Principles of Operation manual for a full list of protection exceptions.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE344

CEE3205S The system detected an addressing exception (System Completion Code=0C5).

Explanation: Your program attempted to reference a main-storage location that was not available in the configuration. See a Principles of Operation manual for a full list of addressing exceptions.

Programmer Response: Check your application for these common errors:

- Using the wrong AMODE to reference storage
- Trying to use a pointer that has not been set
- Trying to store data into storage reserved for the system
- Using an invalid index to an array

See a Principles of Operation manual for a full list of addressing exceptions.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE345

CEE3206S The system detected a specification exception (System Completion Code=0C6).

Explanation: Your program attempted an invalid operation such as incorrect use of registers. The register used for an operation was invalid. Examples include using an odd register number when an even register number was required, using a bad number for floating point registers, or having data that was not correctly aligned.

Programmer Response: If the program is being produced by a compiler, then you might be able to specify a different optimization level to by-pass the problem. See a Principles of Operation manual for a full list of specification exceptions.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE346

CEE3207S The system detected a data exception (System Completion Code=0C7).

Explanation: Your program attempted to use a decimal instruction incorrectly. See a Principles of Operation manual for a full list of data exceptions.

Programmer Response: Check the variables associated with the failing statement to make sure that they have been initialized correctly.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE347

CEE3208S The system detected a fixed-point overflow exception (System Completion Code=0C8).

Explanation: Your program attempted to use signed binary arithmetic or signed left-shift operations and an overflow occurred. See a Principles of Operation manual for a full list of fixed-point overflow exceptions.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE348

CEE3209S The system detected a fixed-point divide exception (System Completion Code=0C9).

Explanation: Your program attempted to perform a signed binary division and the divisor is zero. See a Principles of Operation manual for a full list of fixed-point divide exceptions.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE349

CEE3210S The system detected a decimal-overflow exception (System Completion Code=0CA).

Explanation: Your program attempted to perform a mathematical operation and one or more nonzero digits were lost because the destination field in a decimal operation was too short to contain the results. See a Principles of Operation manual for a full list of decimal-overflow exceptions.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE34A

CEE3211S The system detected a decimal-divide exception (System Completion Code=0CB).

Explanation: Your program attempted to perform a mathematical operation where, in decimal division, the divisor is zero or the quotient exceeds the specified data-field size. See a Principles of Operation manual for a full list of decimal-divide exceptions.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE34B

CEE3212S The system detected an exponent-overflow exception (System Completion Code=0CC).

Explanation: Your program attempted a floating-point operation and the result characteristic exceeded 127 and the result fraction was not zero. See a Principles of Operation manual for a full list of exponent-overflow exceptions.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE34C

CEE3213S The system detected an exponent-underflow exception (System Completion Code=0CD).

Explanation: Your program attempted a floating-point operation and the result characteristic is less than zero and the result fraction was not zero. See a Principles of Operation manual for a full list of exponent-underflow exceptions.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE34D

CEE3214S The system detected a significance exception (System Completion Code=0CE).

Explanation: Your program attempted a floating-point addition or subtraction and the resulting fraction was zero. See a Principles of Operation manual for a full list of significance exceptions.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE34E

CEE3215S The system detected a floating-point divide exception (System Completion Code=0CF).

Explanation: Your program attempted a do a floating-point divide and the divisor had a zero fraction. See a Principles of Operation manual for a full list of floating-point divide exceptions.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE34F

CEE3216S The system detected an IEEE inexact exception. The result was truncated.

Explanation: An IEEE-inexact condition is recognized when the rounded result of an operation differs in value from the intermediate result computed as if exponent range and precision were unbounded.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34G

CEE3217S The system detected an IEEE inexact exception. The result was truncated.

Explanation: An IEEE-inexact condition is recognized when the rounded result of an operation differs in value from the intermediate result computed as if exponent range and precision were unbounded.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34H

CEE3218S The system detected an IEEE exponent-underflow exception. The result was truncated.

Explanation: An IEEE-underflow condition is recognized when the exponent of the exact result of an operation would be less than the minimum exponent of the target format.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34I

CEE3219S The system detected an IEEE exponent-underflow exception. The result was inexact and truncated.

Explanation: An IEEE-underflow condition is recognized when the exponent of the exact result of an operation would be less than the minimum exponent of the target format.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34J

CEE3220S The system detected an IEEE exponent-underflow exception. The result was inexact and incremented.

Explanation: An IEEE-underflow condition is recognized when the exponent of the exact result of an operation would be less than the minimum exponent of the target format.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34K

CEE3221S The system detected an IEEE exponent-underflow exception.

Explanation: An IEEE-underflow condition is recognized when the exponent of the rounded result of an operation would be greater than the maximum exponent of the target format if the exponent range were unbounded.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34L

CEE3222S The system detected an IEEE exponent-underflow exception. The result was inexact and truncated.

Explanation: An IEEE-underflow condition is recognized when the exponent of the rounded result of an operation would be greater than the maximum exponent of the target format if the exponent range were unbounded.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34M

CEE3223S The system detected an IEEE exponent-underflow exception. The result was inexact and incremented.

Explanation: An IEEE-underflow condition is recognized when the exponent of the rounded result of an operation would be greater than the maximum exponent of the target format if the exponent range were unbounded.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34N

CEE3224S The system detected an IEEE division—by—zero exception.

Explanation: An IEEE-division—by—zero condition is recognized when in BFP division the divisor is zero and the dividend is a finite nonzero number.

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34O

CEE3225S The system detected an IEEE invalid operation exception.

Explanation: An IEEE-invalid-operation condition is recognized when any of the following occur:

1. An SNaN is encountered in any arithmetic or comparison operation.
2. A QNaN is encountered in a comparison by COMPARE AND SIGNAL.
3. A difference is undefined (addition of infinities of opposite sign, or subtraction of infinities of like sign).
4. A product is undefined (zero times infinity).
5. A quotient is undefined (DIVIDE instruction with both operands zero or both operands infinity).
6. A remainder is undefined (DIVIDE TO INTEGER with a dividend of infinity or a divisor of zero).
7. A square root is undefined (negative nonzero operand).

Programmer Response: You can use a condition handling routine to correct the data values and resume the application.

System Action: The process is terminated.

Symbolic Feedback Code: CEE34P

CEE3230E Vector unnormalized operand exception occurred.

Explanation: The parameters to the vector instruction were floating-point numbers that are unnormalized.

Programmer Response: The data to be processed by the vector instructions must be normalized before it is to be handled in a vector instruction. Normalize the input value by adding floating-point zero (0.0) to the qdata item.

System Action: The user program is terminated unless the condition is handled.

Symbolic Feedback Code: CEE34U

CEE3250C The system or user abend *abend-code* **was issued.**

Explanation: A system or user abend has occurred.

Programmer Response: Look in the messages and codes or system codes manual for the particular platform to resolve the system-described problem.

System Action: The program is terminated abnormally.

Symbolic Feedback Code: CEE35I

CEE3251I An ATTENTION condition occurred.

Explanation: An ATTENTION condition was signaled after polling code was invoked.

Programmer Response: Do whatever is appropriate for the user to do, after the user hits the "attention" key.

System Action: The program is resumed after the point where the condition was signaled.

Symbolic Feedback Code: CEE35J

CEE3253C A critical condition occurred during the sort operation.

Explanation: An unrecoverable error prevented SORT from completing.

Programmer Response: Take the appropriate action defined by the SORT messages.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE35L

CEE3254C An incorrect DFSORT Plist was passed to CEE3SRT.

Explanation: The parameter list for CEE3SRT must be the 31 bit list specified by DFSORT.

Programmer Response: Correct the parameter list for CEE3SRT.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE35M

CEE3255C An attempt to call CEE3SRT was made from within a DFSORT exit routine.

Explanation: Only one sort can be active at a time. A program called during the execution of SORT must have attempted to invoke sort again.

Programmer Response: Do not attempt a sort from within a sort exit.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE35N

CEE3260W No condition was active when a call to a condition management routine was made.

Explanation: The condition manager had no record of an active condition.

Programmer Response: No response is required. Calls to condition management routines should only be made within the handler routine.

System Action: No system action is performed.

Symbolic Feedback Code: CEE35S

CEE3261W *service-name* **is not supported.**

Explanation: The service was no longer supported. It was provided for migration and compatibility with previous releases of Language Environment.

Programmer Response: Migrate an application to a supported function.

System Action: The service did not take any action.

Symbolic Feedback Code: CEE35T

CEE3262W An invalid condition token was passed. The condition token did not represent an active condition.

Explanation: The condition token passed to CEE3CIB did not represent a condition that is currently active.

Programmer Response: No programmer response required.

System Action: No system action is taken.

Symbolic Feedback Code: CEE35U

CEE3263C The condition handler's condition information block was damaged. The requested function was not performed.

Explanation: The condition manager did not have a valid CIB chain.

Programmer Response: This is an internal problem. Contact you service representative.

System Action: The requested function is not performed.

Symbolic Feedback Code: CEE35V

CEE3264S No machine state block found in association with the current stack frame.

Explanation: Your program has not established a valid machine state block (via CEE3SRP) associated with the current stack frame.

Programmer Response: Make sure CEE3SRP is issued before calling CEE3GMB.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE360

CEE3292W The language run-time component id was already registered. No action was taken.

Explanation: The CEE3DHDL CWI was invoked previously with the same language run-time component id.

Programmer Response: No programmer response required.

System Action: If this condition is not handled, execution continues at the instruction after the CEE3DHDL invocation.

Symbolic Feedback Code: CEE36S

CEE3293C The language environment was corrupted. The save area chain was broken.

Explanation: The save area chain was not intact.

Programmer Response: Language Environment always expects the save area to be valid, and usually abends when it is not. Ensure that the save chain is valid.

System Action: The function was not completed, and did not schedule the routine.

Symbolic Feedback Code: CEE36T

CEE3294E The cancel request could not be performed, since the routine was not previously scheduled.

Explanation: A request was made to cancel a routine, but that routine could not be found on the active chain. The routine that was requested to cancel either was never scheduled or was previously deleted.

Programmer Response: Ensure that routines are scheduled via CEEHDLR before an attempt is made to delete them.

System Action: No routine is released.

Symbolic Feedback Code: CEE36U

CEE3295E The condition string from CEE3SPM did not contain all of the settings, because the returned string was truncated.

Explanation: The QUERY option of the CEE3SPM service needed a larger character string to represent the conditions.

Programmer Response: Try increasing the character string length.

System Action: Some items might have been filled in.

Symbolic Feedback Code: CEE36V

CEE3296E Some of the data in the condition string from CEE3SPM could not be recognized.

Explanation: The data encountered in the string could not be interpreted.

Programmer Response: Correct the character representation for the condition(s) and ensure that the string is padded with blanks.

System Action: Only conditions that could be recognized were set.

Symbolic Feedback Code: CEE370

CEE3297E The service completed successfully for recognized condition(s), unsuccessfully for unrecognized (invalid) condition(s).

Explanation: The data encountered in the string could not be interpreted.

Programmer Response: Correct the character representation for the conditions.

System Action: Only conditions that could be recognized were set.

Symbolic Feedback Code: CEE371

CEE3298E CEE3SPM attempted to PUSH settings onto a full stack.

Explanation: There was not enough storage for the CEE3SPM PUSH service to save all of the conditions.

Programmer Response: Increase the size of the storage.

System Action: No settings were changed.

Symbolic Feedback Code: CEE372

CEE3299E CEE3SPM attempted to POP settings off an empty stack.

Explanation: A call to CEE3SPM was made to POP the stack. There were no elements on the stack to POP.

Programmer Response: Ensure that something is on the stack before you attempt to POP it.

System Action: No settings are changed.

Symbolic Feedback Code: CEE373

CEE3300E The action parameter in CEE3SPM was not one of the digits 1 to 5.

Explanation: A call to CEE3SPM was made with an invalid action.

Programmer Response: Use an action value parameter between 1 and 5 when invoking CEE3SPM.

Symbolic Feedback Code: CEE374

System Action: No settings were changed.

CEE3301E The first parameter was not one of the digits expected.

Explanation: A call was made to a condition management subroutine that did not have a valid parameter for the action parameter.

Programmer Response: This is an internal error. The internal routine was called with an improper parameter. Contact your service representative.

System Action: No system action is performed.

Symbolic Feedback Code: CEE375

CEE3350S Unable to find the event handler.

Explanation: An internal error occurred when Language Environment attempted to load a required language run-time component module.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE38M

CEE3351S Unable to properly initialize the event handler.

Explanation: An internal error occurred when Language Environment attempted to initialize a required language run-time component module.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE38N

CEE3352E The enclave terminated with a non-zero return code.

Explanation: An internal error occurred while attempting to terminate an enclave.

Programmer Response: Contact your service representative.

System Action: No system action is performed.

Symbolic Feedback Code: CEE38O

CEE3353S The parameter manipulation service was called, but not during the create enclave event, or not by a language run-time component corresponding to the MAIN program.

Explanation: The parameter manipulation service was used during enclave initialization by the language in which the main program was written. It was used in an illegal manner.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The requested parameter manipulation is not performed and the main parameter list might not be correct.

Symbolic Feedback Code: CEE38P

CEE3354S The parameter list manipulation service was called in a CICS environment.

Explanation: The parameter manipulation service was used during enclave initialization by the language in which the main program was written. It cannot be used in a CICS environment.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The requested parameter manipulation is not performed and the main parameter list might not be correct.

Symbolic Feedback Code: CEE38Q

CEE3355S A language run-time component initialization has failed.

Explanation: An internal error occurred while attempting to establish a minimum environment for a language run-time component.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE38R

CEE3356S The rc_modifier must be in the range of 1 through 4. The return code modifier was not changed.

Explanation: The rc_modifier was not in the range of 1 through 4. The return code modifier that was first established by the enclave termination services or by the condition handling was kept.

Programmer Response: Provide a valid rc_modifier.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE38S

CEE3357S The service was invoked outside of the language run-time component enclave termination. No action was taken.

Explanation: CEESRCM was to be called during the language run-time component enclave termination. It was invoked outside of the language run-time component enclave termination.

Programmer Response: Ensure that the routine is called during the enclave termination.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE38T

CEE3358E The service was invoked outside of the member enclave initialization. No action was taken.

Explanation: This CWI service can only be invoked from within member language enclave initialization.

Programmer Response: Move the use of this service to within enclave initialization event handling, or, determine the proper event to be using at the point where you are trying to invoke this event.

System Action: The service returns, without performing the function of the service.

Symbolic Feedback Code: CEE38U

CEE3360S The stack frame was not found on the call chain.

Explanation: The stack frame parameter passed to the CEE3SMS CWI did not point to a valid stack frame on the call chain.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The CEE3SMS CWI returns without allocating a machine state control block.

Symbolic Feedback Code: CEE390

CEE3361W A nested enclave completed with an unhandled condition of severity two or greater.

Explanation: If a nested enclave is created due to an SVC-assisted linkage (LINK on VM or MVS, CMSCALL on VM), and it subsequently abends or program checks, or it software-signals a condition of severity two or greater, then condition token CEE391 was signaled in the creator of the nested enclave.

Programmer Response: Check condition token CEE391.

System Action: If the signal of the CEE391 condition is not handled, execution continues at the instruction after the LINK or CMSCALL.

Symbolic Feedback Code: CEE391

CEE3362S No main or fetchable procedure or function was present within the load module.

Explanation: The load module contained neither a main procedure/function nor a fetchable procedure/function.

Programmer Response: Correct the load module.

System Action: The application is terminated.

Symbolic Feedback Code: CEE392

CEE3363S A second main procedure or function was entered without crossing a nested enclave boundary.

Explanation: A direct call was made to a main procedure. The program should have been loaded and/or called using a defined language construct like `fetch()` or `system()`.

Programmer Response: Correct the load module.

System Action: The application is terminated.

Symbolic Feedback Code: CEE393

CEE3364W The enclave name was truncated by the enclave naming service during initialization.

Explanation: The enclave naming service was used by the language in which the main program was written during enclave initialization. It was passed a name longer than 32 characters.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The truncated name is used as the enclave name.

Symbolic Feedback Code: CEE394

CEE3365S The enclave naming service was called, but not during enclave initialization, or not by a language run-time component corresponding to the MAIN program.

Explanation: The enclave naming service was used by the language in which the main program was written during enclave initialization. It was used in an illegal manner.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: The truncated name is used as the enclave name.

Symbolic Feedback Code: CEE395

CEE3370W The program invocation name could not be found, and the returned name was blank.

Explanation: CEEBGIN could not determine the name under which the program was invoked.

Programmer Response: No response is required.

System Action: No system action is performed.

Symbolic Feedback Code: CEE39A

CEE3380W The target load module was not recognized by Language Environment.

Explanation: The language list could not be returned because the target load module was not recognized. A value of zero was returned.

Programmer Response: No response is required.

System Action: Processing continues. No system action is performed.

Symbolic Feedback Code: CEE39K

CEE3400W The condition name was not recognized and the value of the condition token was undefined.

Explanation: CEEQFBC was passed a condition name that could not be translated into a corresponding Language Environment condition token.

Programmer Response: No programmer action is required.

System Action: No system action is taken.

Symbolic Feedback Code: CEE3A8

CEE3401W The condition token was not recognized and the value of the condition name was undefined.

Explanation: CEEBFBC was passed a condition token that could not be translated into a corresponding condition name.

Programmer Response: No programmer action is required.

System Action: No system action is taken.

Symbolic Feedback Code: CEE3A9

CEE3402E The condition token passed was invalid and the value of the condition name was undefined.

Explanation: CEEBFBC was passed a condition token that was determined to be invalid and could not to be translated into a corresponding condition name.

Programmer Response: No programmer action is required.

System Action: No system action is taken.

Symbolic Feedback Code: CEE3AA

CEE3424S CEE3SMO was called from outside a user-written condition handler.

Explanation: CEE3SMO can only be called from within a user-written condition handler.

Programmer Response: Only code calls to CEE3SMO from within user-written condition handlers.

System Action: The application is terminated.

Symbolic Feedback Code: CEE3B0

CEE3425S Severity 0 or 1 condition was signaled with CEESGLN.

Explanation: The caller of CEESGLN signaled a severity 0 or 1 condition; however, resumption is never allowed for a condition signaled from CEESGLN.

Programmer Response: Do not signal severity 0 and 1 conditions from CEESGLN. Use CEESGL when signaling a severity 0 and 1 conditions.

System Action: The condition is changed to CEE3B1 and, if unhandled, the enclave is terminated.

Symbolic Feedback Code: CEE3B1

CEE3426S There was an invalid request to fix-up and resume a condition.

Explanation: There was a request to fix-up and resume from a user-written condition handler and either (1) the resume cursor was moved, or (2) the condition was signaled from CEESGLN or from CEESGL without a feedback code. The resume cursor can not be moved by a user-written condition handler if fix-up and resume behavior is desired. Conditions signaled from CEESGLN or from CEESGL without a feedback code can not be resumed without moving the resume cursor. The original condition is indicated in the next message in the message file.

Programmer Response: A user-written condition handler must move the resume cursor and return a result code of 10 (Resume) in order to resume a condition signaled by CEESGLN or by CEESGL without a feedback code.

System Action: The condition is promoted to CEE3B2 and, if unhandled, the enclave is terminated.

Symbolic Feedback Code: CEE3B2

CEE3427S A user-written condition handler promoted a condition signaled by CEESGLN to severity 0 or 1.

Explanation: The condition handling mechanism allows condition handlers to promote their current condition and then handle new ones. If a severity 2 or above condition signaled by CEESGLN was promoted to a 0 or 1 condition, the purpose of CEESGLN would be violated - programs can never resume following a call to CEESGLN. (Language Environment allows severity 0 or 1 conditions to resume.) Note that the original condition is indicated in the next message in the message file.

Programmer Response: User-written condition handlers must not promote conditions that are not allowed to resume to severity 0 or 1.

System Action: The condition is promoted to CEE3B3 and if unhandled the enclave is terminated.

Symbolic Feedback Code: CEE3B3

CEE3428S Condition signaled by CEESGLN is not enabled by a language run-time component.

Explanation: Some conditions are disabled by a language run-time component. For example Fixed Point Overflow conditions in COBOL are ignored and the application is resumed. Such a condition must not be signaled by CEESGLN. Note that the original condition is indicated in the next message in the message file.

Programmer Response: Do not use CEESGLN to signal a condition from a language that does not enable the condition.

System Action: The condition is promoted to CEE3B4 and if unhandled the enclave is terminated.

Symbolic Feedback Code: CEE3B4

CEE3429S Move resume cursor relative is not permitted in a user-written condition handler registered with the USRHDLR run-time option.

Explanation: You can register a user-written condition handler at stack frame 0 with the USRHDLR run-time option. The move resume cursor relative (CEEMRCR) service was not permitted at stack frame 0.

Programmer Response: Remove all references to CEEMRCR in user-written condition handlers registered with the USRHDLR run-time option.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3B5

CEE3449S An internal message services error occurred during termination.

Explanation: A message service was called to perform a service during termination, but the service could not be completed because certain resources were no longer available.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3BP

CEE3450E Only one language was on the stack when a POP request was made to CEE3LNG. The current language was returned in the desired language parameter.

Explanation: CEE3LNG cannot POP since the resulting stack was empty.

Programmer Response: No programmer action is required.

System Action: The current language is returned in the *desired_language* parameter and the stack remains unchanged.

Symbolic Feedback Code: CEE3BQ

CEE3451S The desired language *desired-language* **for the PUSH or SET function for CEE3LNG was invalid. No operation was performed.**

Explanation: The *desired_language* parameter was not a valid 3-character national language id.

Programmer Response: Provide a valid *desired_language* parameter. A list of the valid national languages is provided in *OS/390 Language Environment Programming Reference*.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3BR

CEE3452S The function *function* **specified for CEE3LNG was not recognized. No operation was performed.**

Explanation: The function parameter must be a fullword binary 1, 2, 3, or 4.

Programmer Response: Provide a fullword binary 1, 2, 3, or 4 in the function parameter.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3BS

CEE3454S The *function* requested in CEE3LNG failed because at least one of the high-level languages did not accept the change from the *function*.

Explanation: An internal error prevented the requested change from being made.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3BU

CEE3455E Only one country code was on the stack when a POP request was made to CEE3CTY. The current country code was returned in the country code parameter.

Explanation: CEE3CTY cannot POP the stack since the resulting stack was empty.

Programmer Response: No programmer action is required.

System Action: The current country code is returned in the *country_code* parameter and the stack remains unchanged.

Symbolic Feedback Code: CEE3BV

CEE3456S The country code *country-code* for the PUSH or SET function for CEE3CTY was invalid. No operation was performed.

Explanation: The *country_code* parameter was not a valid 2-character country code.

Programmer Response: Provide a valid *country_code* parameter. A list of the valid country codes is provided in *OS/390 Language Environment Programming Reference*.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3C0

CEE3457S The function *function* specified for CEE3CTY was not recognized. No operation was performed.

Explanation: The *function* parameter must be a fullword binary 1, 2, 3, or 4.

Programmer Response: Provide a fullword binary 1, 2, 3, or 4 in the *function* parameter.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3C1

CEE3459S The *function* requested in CEE3CTY failed because at least one of the high-level languages did not accept the change from the *function*.

Explanation: The function requested failed because one of the high-level languages did not accept the change.

Programmer Response: An internal error prevented the requested change from being made. Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3C3

CEE3460E The decimal separator '*decimal_separator***' was truncated and was not defined in CEE3MDS.**

Explanation: The *decimal_separator* parameter must be a 2-character field. The resulting decimal separator might not be valid. The decimal separator was left-justified and padded on the right with a blank if necessary.

Programmer Response: Provide a 2-character *decimal_separator* parameter.

System Action: The decimal separator is truncated and placed into the given parameter.

Symbolic Feedback Code: CEE3C4

CEE3461E The country code *country_code* was invalid for CEE3MDS. The default decimal separator '*decimal_separator***' was returned.**

Explanation: The *country_code* parameter was not a valid 2-character country code. The default decimal separator was returned.

Programmer Response: Provide a valid *country_code* parameter. A list of the valid country codes is provided in *OS/390 Language Environment Programming Reference*.

System Action: The default decimal separator is returned.

Symbolic Feedback Code: CEE3C5

CEE3462E The currency symbol '*currency_symbol***' was truncated and was not defined in CEE3MCS.**

Explanation: The *currency_symbol* parameter must be a 2-character field. The resulting currency symbol might not be valid. The currency symbol was left-justified and padded on the right with a blank if necessary.

Programmer Response: Provide a 2-character *currency_symbol* parameter.

System Action: The currency symbol is truncated and placed into the given parameter.

Symbolic Feedback Code: CEE3C6

CEE3463E The country code *country_code* was invalid for CEE3MCS. The default currency symbol '*currency_symbol***' was returned.**

Explanation: The *country_code* parameter was not a valid 2-character country code. The default currency symbol was returned.

Programmer Response: Provide a valid *country_code* parameter. A list of the valid country codes is provided in *OS/390 Language Environment Programming Reference*.

System Action: The default currency symbol is returned.

Symbolic Feedback Code: CEE3C7

CEE3464E The thousands separator '*thousands_separator***' was truncated and was not defined in CEE3MTS.**

Explanation: The *thousands_separator* parameter must be a 2-character field. The resulting thousands separator might not be valid. The thousands separator was left-justified and padded on the right with a blank if necessary.

Programmer Response: Provide a 2-character *thousands_separator* parameter.

System Action: The thousands separator is truncated and placed into the given parameter.

Symbolic Feedback Code: CEE3C8

CEE3465E The country code *country_code* was invalid for CEE3MTS. The default thousands separator '*thousands_separator*' was returned.

Explanation: The *country_code* parameter was not a valid 2-character country code. The default thousands separator was returned.

Programmer Response: Provide a valid *country_code* parameter. A list of the valid country codes is provided in *OS/390 Language Environment Programming Reference*.

System Action: The default thousands separator is returned.

Symbolic Feedback Code: CEE3C9

CEE3466E The date picture string *date_pic_string* was truncated and was not defined in CEEFMDA.

Explanation: The *date_pic_string* parameter must be an 80-character field. The resulting *date_pic_string* might not be valid. The *date_pic_string* was left-justified and padded on the right with a blank if necessary.

Programmer Response: Provide an 80-character *date_pic_string* parameter.

System Action: The *date_pic_string* is truncated and placed into the given parameter.

Symbolic Feedback Code: CEE3CA

CEE3467E The country code *country_code* was invalid for CEEFMDA. The default date picture string *date_pic_string* was returned.

Explanation: The *country_code* parameter was not a valid 2-character country code. The default date picture string was returned.

Programmer Response: Provide a valid *country_code* parameter. A list of the valid country codes is provided in *OS/390 Language Environment Programming Reference*.

System Action: The default date picture string is returned.

Symbolic Feedback Code: CEE3CB

CEE3468E The time picture string *time_pic_string* was truncated and was not defined in CEEFMTM.

Explanation: The *time_pic_string* parameter must be an 80-character field. The resulting *time_pic_string* might not be valid. The *time_pic_string* was left-justified and padded on the right with a blank if necessary.

Programmer Response: Provide an 80-character *time_pic_string* parameter.

System Action: The *time_pic_string* is truncated and placed into the given parameter.

Symbolic Feedback Code: CEE3CC

CEE3469E The country code *country_code* was invalid for CEEFMTM. The default time picture string *time_pic_string* was returned.

Explanation: The *country_code* parameter was not a valid 2-character country code. The default time picture string was returned.

Programmer Response: Provide a valid *country_code* parameter. A list of the valid country codes is provided in *OS/390 Language Environment Programming Reference*.

System Action: The default time picture string is returned.

Symbolic Feedback Code: CEE3CD

CEE3470E The date and time string *datetime_str* was truncated and was not defined in CEEFMDT.

Explanation: The *datetime_str* parameter must be an 80-character field. The resulting *datetime_str* might not be valid. The *datetime_str* was left-justified and padded on the right with a blank if necessary.

Programmer Response: Provide an 80-character *datetime_str* parameter.

System Action: The *datetime_str* is truncated and placed into the given parameter.

Symbolic Feedback Code: CEE3CE

CEE3471E The country code *country_code* was invalid for CEEFMDT. The default date and time picture string *datetime_str* was returned.

Explanation: The *country_code* parameter was not a valid 2-character country code. The default date and time string was returned.

Programmer Response: Provide a valid *country_code* parameter. A list of the valid country codes is provided in *OS/390 Language Environment Programming Reference*.

System Action: The default date and time string is returned.

Symbolic Feedback Code: CEE3CF

CEE3472S An internal message services error occurred while getting storage for the message inserts.

Explanation: Insufficient heap storage was available to complete message services.

Programmer Response: If possible, free unneeded heap storage or contact your service representative.

System Action: No message insert area is created.

Symbolic Feedback Code: CEE3CG

CEE3473S An internal message services error occurred while processing the inserts for this message.

Explanation: Corrupted storage was encountered when attempting to initialize a message insert block.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3CH

CEE3475S An internal message services error occurred while freeing the insert area.

Explanation: Corrupted storage was encountered when attempting to free a message insert block.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3CJ

CEE3476S An internal message services error occurred while freeing storage for the message inserts.

Explanation: Message services detected a heap storage freeing failure.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3CK

CEE3480S An internal message services error occurred while processing the inserts for a message.

Explanation: Message services detected an insert error while formatting a message.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3CO

CEE3481S An internal message services error occurred while processing the inserts for a message.

Explanation: Corrupted storage was encountered when attempting to process a message insert block.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3CP

CEE3482S An internal message services error occurred while processing the inserts for a message.

Explanation: An invalid insert was encountered when attempting to process a message insert block.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3CQ

CEE3484E A message could not be written to *ddname* **because the message length of** *message_length* **exceeded the allowable maximum of** *max-message-length***.**

Explanation: The message could not be written to *ddname* data set because message services will not process a message whose length is greater than *max-message-length*.

Programmer Response: Reduce the size of the message or divide it into sections of acceptable length.

System Action: The message is not written.

Symbolic Feedback Code: CEE3CS

CEE3485S An internal message services error occurred while locating the message number within a message file.

Explanation: The message library for the given message number was located and loaded, but the message number could not be found within the library.

Programmer Response: Contact your service representative.

System Action: The given message library is loaded, but no other action is performed.

Symbolic Feedback Code: CEE3CT

CEE3486S An internal message services error occurred while formatting a message.

Explanation: Corrupted storage was encountered when attempting to process a message insert block.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3CU

CEE3487S An internal message services error occurred while locating a message number within the ranges specified in the repository.

Explanation: The message number could not be found within the ranges in the message_library_table.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3CV

CEE3488S An internal message services error occurred while formatting a message.

Explanation: An invalid internal message buffer length was detected while formatting a message.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3D0

CEE3489S An internal message services error occurred while getting storage necessary to format a message.

Explanation: No heap storage was available to get storage needed to complete the formatting of a message.

Programmer Response: If possible, free unneeded heap storage or contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3D1

CEE3490S An internal message services error occurred while attempting to write a message.

Explanation: The given ddname or destination was not valid or was not available.

Programmer Response: Contact your service representative.

System Action: The message is not written.

Symbolic Feedback Code: CEE3D2

CEE3491S An internal message services error occurred while getting storage.

Explanation: No heap storage was available to get storage needed to write out a message.

Programmer Response: If possible, free unneeded heap storage or contact your service representative.

System Action: The message is not written.

Symbolic Feedback Code: CEE3D3

CEE3492S An internal message services error occurred while attempting to write a message.

Explanation: An error was detected while trying to OPEN, WRITE, or CLOSE a given ddname or destination.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3D4

CEE3493W An internal message services error occurred while attempting to close the message file.

Explanation: Language Environment could not close the specified ddname, because Language Environment either did not own it, or the file was not currently open.

Programmer Response: Contact your service representative.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3D5

CEE3494S An internal message services error occurred while attempting to close the message file.

Explanation: An error was detected while trying to CLOSE the given ddname.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3D6

CEE3495S An internal message services error occurred while formatting a message.

Explanation: An error preventing the completion of message formatting was detected.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3D7

CEE3496I An internal message services error occurred while formatting a message.

Explanation: An internal error was detected while locating the inserts for a message.

Programmer Response: Contact your service representative.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3D8

CEE3497E The message file was discovered to have an insufficient LRECL of *too-small***.**

Explanation: The message file cannot have an LRECL less than 14. This was to allow for the message number and 4 characters of text per line.

Programmer Response: Specify an LRECL of 14 or greater.

System Action: The message file LRECL is forced to the default LRECL value.

Symbolic Feedback Code: CEE3D9

CEE3498I The message file was already open.

Explanation: A request to open the message file via CEEOPMF could not be completed because it was already open.

Programmer Response: No programmer response is necessary.

System Action: No system action is taken.

Symbolic Feedback Code: CEE3DA

CEE3499E The message file was unable to be opened.

Explanation: A request to open the message file via CEEOPMF could not be completed.

Programmer Response: Ensure that the ddname to used for the message file is a valid name, and the data set is usable.

System Action: No system action is taken.

Symbolic Feedback Code: CEE3DB

CEE3500S Not enough storage was available to load *module-name***.**

Explanation: Not enough storage was available to load the requested module into virtual memory.

Programmer Response: Ensure that the region size is sufficient to run the application. If necessary, delete modules not currently needed by the application or free unused storage and retry the load request.

System Action: Module is not loaded. The application might abend.

Symbolic Feedback Code: CEE3DC

CEE3501S The module *module-name* **was not found.**

Explanation: The system could not find the load module whose name was specified on the parameter list to the Language Environment load service, in the indicated library (job library or link library).

Programmer Response: Make sure the requesting program name was not incorrectly modified. Make sure that the indicated library is correct in the job step. Correct the error, and execute the job step again.

System Action: Module is not loaded. The application might abend.

Symbolic Feedback Code: CEE3DD

CEE3502S The module name *module-name* was too long.

Explanation: The module name length was greater than the name length supported by the underlying operating system.

Programmer Response: Correct the module name length and execute the job step again.

System Action: Name length is truncated to the name length supported by the underlying operating system. The requested module might or might not be loaded.

Symbolic Feedback Code: CEE3DE

CEE3503S The load request for module *module-name* was unsuccessful.

Explanation: The system could not load the load module.

Programmer Response: Check the original abend from the operating system and refer to the underlying operating system message manual for explanation and programmer's response.

System Action: Module was not loaded. The application might abend.

Symbolic Feedback Code: CEE3DF

CEE3504S The delete request for module *module-name* was unsuccessful.

Explanation: The load module might already have been deleted or was never loaded.

Programmer Response: Make sure the requesting module name is not incorrectly modified.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3DG

CEE3505S The library vector table (LIBVEC) descriptor module *module-name* could not be loaded.

Explanation: During LIBVEC initialization the library vector table descriptor module could not be found.

Programmer Response: Make sure you passed the name of the library vector table (LIBVEC) descriptor rather than the entry address. Make sure the name was not incorrectly modified and the indicated library (job library or link library) is correct.

System Action: LIBVEC initialization is not performed.

Symbolic Feedback Code: CEE3DH

CEE3506S The library packaged subroutine module *module-name* could not be loaded.

Explanation: The system could not find the load module whose name was specified in the library vector table (LIBVEC) descriptor module in the indicated library (job library or link library).

Programmer Response: Make sure the requesting program name was not incorrectly modified. Make sure that the indicated library is correct in the job step. Correct the error, and execute the job step again.

System Action: Module is not loaded and LIBVEC initialization is not performed.

Symbolic Feedback Code: CEE3DI

CEE3507S Not enough storage was available for the library vector table (LIBVEC) *table-name***.**

Explanation: Insufficient storage was available to build the LIBVEC.

Programmer Response: If necessary, free available storage and retry LIBVEC initialization.

System Action: No storage is allocated for the LIBVEC. LIBVEC initialization did not complete.

Symbolic Feedback Code: CEE3DJ

CEE3508S The number of library packaged subroutines specified in the descriptor module *module-name* **exceeded the maximum of 256 library packages. No library packages were loaded.**

Explanation: The maximum number of library packages supported is 256.

Programmer Response: Repackage the library routines so that the number of library packages does not exceed the maximum supported.

System Action: LIBVEC initialization did not complete.

Symbolic Feedback Code: CEE3DK

CEE3509S The number of library vector slots specified in the descriptor module *module-name* **either exceeded 1024 or was less than 1.**

Explanation: A minimum of 1 library routine entry name was required to build the library vector table. A maximum of 1024 library routines entry names is allowed in a LIBVEC.

Programmer Response: If library vector slots exceed the maximum, you might have to build more than one LIBVEC.

System Action: LIBVEC initialization did not complete.

Symbolic Feedback Code: CEE3DL

CEE3510S The module *module-name* **is a member of the library packaged subroutine** *module-name* **and could not be deleted.**

Explanation: Library package subroutines are not allowed to be deleted.

Programmer Response: Correct your program so that it does not request a library package subroutine be deleted.

System Action: Module not deleted.

Symbolic Feedback Code: CEE3DM

CEE3511S The function code *function-code* **was invalid.**

Explanation: Valid functions codes for the verify library vector subroutine are delete and load.

Programmer Response: Make sure the function code passed to the verify library vector subroutine is delete/load. Correct the program and execute job step again.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3DN

CEE3512S An HFS load of module *module-name* **failed. The system return code was** *return-code***; the reason code was** *reason-code***.**

Explanation: The callable service BPX1LOD failed while attempting to load module *module-name* from the HFS. The system return and reason codes were returned.

Programmer Response: See *OS/390 UNIX System Services Messages and Codes* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3DO

CEE3513S The library vector table (LIBVEC) *table-name* **could not be terminated.**

Explanation: LIBVEC termination failed due to an inability to delete library subroutines or free the storage obtained for the LIBVEC.

Programmer Response: Contact your service representative.

System Action: LIBVEC termination did not complete.

Symbolic Feedback Code: CEE3DP

CEE3514C An internal error, Unknown Operating System, was detected.

Explanation: The underlying operating system was unsupported in Language Environment.

Programmer Response: Language Environment runs under the control of, or in conjunction with, the following operating systems/subsystems: MVS/ESA, VM/ESA, CICS/ESA, IMS/ESA, DB2, SQL/DS, DFSORT, ISPF, and TSO/E.

System Action: The application is terminated.

Symbolic Feedback Code: CEE3DQ

CEE3515I No modules were loaded.

Explanation: No application load modules have been loaded via Language Environment load service in the current application.

Programmer Response: No programmer response is necessary.

System Action: No system action is taken.

Symbolic Feedback Code: CEE3DR

CEE3530S The service was invoked for a load module.

Explanation: The CEEPPOS service was invoked for a load module. Only program objects are supported. No action was taken.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EA

CEE3531S The entry point was not recognized by Language Environment.

Explanation: The CEEPPOS service was invoked and Language Environment was not able to recognize the entry point style. Only Language Environment enabled entry point styles are supported for program objects. No action was taken.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EB

CEE3532S The requested class does not exist in the program object.

Explanation: The CEEPPOS service was invoked. If this is an OBTAIN for class C_WSA then this indicates that the program object does not have writable static. If this is a LOCATE for class C_@@DLLI, C_@@STINIT or C_@@PPA2 then this indicates that the program object does not contain the class. No action was taken.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EC

CEE3533S The service invoked a system function which was unsuccessful. The system return code was *return_code* **and the system reason code was** *reason_code***.**

Explanation: The CEEPPOS service invoked program management system service for a program object. The system return code and reason code were returned.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3ED

CEE3534S The requested function is not supported.

Explanation: The CEEPPOS service was invoked with a function that is not recognized. No action was taken.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EE

CEE3535S The requested class_name is not supported, or a required input value for the specified class_name was not correctly specified.

Explanation: The CEEPPOS service was invoked with class_name that is not recognized, or the required input for the function with class_name CEE_ALL is incorrect. No action was taken.

Programmer Response: If your application is involing CEEPPOS, then check that the class_name specified is correct for the function being used. If you are using a function that accepts the class_name CEE_ALL, make sure you specify the class_address and class_size correctly. Otherwise, contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EF

CEE3536S Not enough storage was available for the WSA.

Explanation: The CEEPPOS service was invoked to OBTAIN the WSA and storage was not available to load the WSA into virtual memory. No action was taken.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EG

CEE3537S The request to release the WSA was unsuccessful.

Explanation: The CEEPPOS service was invoked to RELEASE the WSA and the system could not release the WSA because the class_address was not valid.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EH

CEE3538S The request to refresh the WSA was unsuccessful.

Explanation: The CEEPPOS service was invoked to REFRESH the WSA and the system could not refresh the WSA because the class_address was not valid.

Programmer Response: Contact your service representative.

System Action: Unless the condition is handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EI

CEE3539S The load request for program object *module-name* **was unsuccessful for the current level of CICS.**

Explanation: The load request for module, *module-name* resulted in loading a program object. The load service does not support loading a program object for the current level of CICS.

Programmer Response: Rebuild the module using the Language Environment Prelinker Utility and reexecute.

System Action: The module is not loaded. Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EJ

CEE3540S The load request for program object *module-name* **was unsuccessful.**

Explanation: The load request for module, *module-name* resulted in loading a program object. The load service does not support loading a program object.

Programmer Response: Rebuild the module using the Language Environment Prelinker Utility and reexecute.

System Action: The module is not loaded. Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EK

CEE3541S A Writeable Static Area (WSA) associated with the entry point was not found.

Explanation: The CEEPFWSA service was invoked and Language Environment was not able to find an executable module containing the specified entry point. A serach is made of the executable module containing main (if present), any fetched, dynamically-called, PIPI-loaded modules, CEEFETCHed modules and any loaded DLLs.

Programmer Response: Verify that the entry point passed to CEEPFWSA is a valid C/370 or LE style entry point. Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EL

CEE3550S DLL *dll-name* does not contain a CEESTART CSECT.

Explanation: The application is attempting to load DLL *dll-name* implicitly or explicitly, but the CEESTART csect cannot be located within it.

Programmer Response: Make sure that when you generate the DLL, it contains a CEESTART CSECT.

System Action: If this was an implicit DLL reference, the condition is signaled. If the condition is not handled, the default action is to terminate the enclave. If this was an explicit DLL Load request, the feedback code is returned to the caller.

Symbolic Feedback Code: CEE3EU

CEE3551S DLL *dll-name* does not contain any C functions.

Explanation: DLL *dll-name* does not contain any C functions.

Programmer Response: Make sure that you are loading the correct module, and that the DLL is built correctly.

System Action: The condition is signaled. If the condition is not handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EV

CEE3552S DLL *dll-name* does not export any variables or functions.

Explanation: DLL *dll-name* does not export any variables or functions. Either the definition side-deck supplied to your application is incorrect, or the DLL is generated incorrectly.

Programmer Response: Ensure that the DLL was built properly.

1. Specify #pragma export in your source or compile with EXPORTALL compiler option.
2. Compile with DLL, RENT, and LONGNAME compiler options.
3. Ensure that the DLL was built properly.

System Action: The condition is signaled. If the condition is not handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3F0

CEE3553S DLL *dll-name* is part of a circular list.

Explanation: A deadlock condition was discovered while processing a DLL load request for DLL *dll-name.* The deadlock condition exists because the DLLs that are being loaded depend on each other. The following situation illustrates a deadlock condition. DLL A has static constructors that require objects from DLL B. DLL B has static constructors that require objects from DLL A. When DLL A is loaded, its static constructors require objects from DLL B. This forces DLL B to be loaded, requiring objects from DLL A. Since the loading of DLL A has not completed, a deadlock condition exists.

Programmer Response: Remove the circular list dependency from the DLLs.

System Action: The condition is signaled. If the condition is not handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3F1

CEE3554S There is not enough storage to load DLL *dll-name***.**

Explanation: There is insufficient storage to satisfy DLL load request for DLL *dll-name*..

Programmer Response: Increase the region size.

System Action: If this was an implicit DLL reference, the condition is signaled. If the condition is not handled, the default action is to terminate the enclave. If this was an explicit DLL Load request, the feedback code is returned to the caller.

Symbolic Feedback Code: CEE3F2

CEE3558S DLL *dll-name* **does not export any variables.**

Explanation: The application made an implicit reference to DLL, *dll-name*. During the load of the DLL it was determined that the application references external variables from the DLL. However, the DLL that was loaded does not contain any exported variables.

Programmer Response: Ensure that the DLL indicated in the job library or link library is the correct version, and that it contains the external variable.

System Action: The condition is signaled. If the condition is not handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3F6

CEE3559S External variable *variable-name* **was not found in DLL** *dll-name***.**

Explanation: The application is attempting to refer to external variable, *variable-name*. However, this variable is not defined in DLL, *dll-name*.

Programmer Response: Ensure that the DLL indicated in the job library or link library is the correct version, and that it contains the external variable.

System Action: The condition is signaled. If the condition is not handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3F7

CEE3560S DLL *dll-name* **does not export any functions.**

Explanation: The application made an implicit reference to DLL, *dll-name*. During the load of the DLL it was determined that the application references functions from the DLL. However, the DLL that was loaded does not contain any exported functions.

Programmer Response: Ensure that the DLL indicated in the job library or link library is the correct version, and that it contains the external function.

System Action: The condition is signaled. If the condition is not handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3F8

CEE3561S External function *function-name* **was not found in DLL** *dll-name***.**

Explanation: The application is attempting to refer to an external function, *function-name* that is not defined in the DLL, *dll-name*.

Programmer Response: Ensure that the DLL indicated in the job library or link library is the correct version, and that it contains the external function.

System Action: The condition is signaled. If the condition is not handled the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3F9

CEE3562S There is not enough storage to obtain a function pointer for external function *function-name* **in DLL** *dll-name***.**

Explanation: There is insufficient heap storage to satisfy a Query DLL Function request for function *function-name* in DLL *dll-name*.

Programmer Response: Increase the region size.

System Action: The feedback code is returned to the caller.

Symbolic Feedback Code: CEE3FA

CEE3563S Attempted to load DLL *dll-name* **while running C++ destructors.**

Explanation: The application is attempting to load DLL *dll-name* while running C++ destructors.

Programmer Response: Make sure that you are not referring to DLL variables or functions from your C++ destructors.

System Action: If this was an implicit DLL reference, the condition is signaled. If the condition is not handled, the default action is to terminate the enclave. If this was an explicit DLL Load request, the feedback code is returned to the caller.

Symbolic Feedback Code: CEE3FB

CEE3564S DLL constructors or destructors did not complete, so DLL *dll-name* **cannot be used.**

Explanation: DLL *dll-name*, which was being loaded or freed, was in the process of running static constructors or destructors. However, the process did not complete (probably because the thread was abnormally terminated). The DLL is left in an indeterminate state. This error was detected by a thread that was attempting to load or free the same DLL, and was waiting for the constructors or destructors to complete.

Programmer Response: Determine the cause of the incomplete constructor or destructor process. Ensure that the constructors or destructors are not the cause of the thread termination that lead to this condition.

System Action: The condition is signaled. If the condition is not handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3FC

CEE3565I The input dll-token was NULL.

Explanation: The dll-token supplied to the DLL Free request is not valid.

Programmer Response: You must request a DLL Load to initialize a dll-token properly before attempting to free a DLL.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FD

CEE3566I There are no DLLs to be freed.

Explanation: An attempt was made to free a DLL, but all DLLs are freed already, or the dll-token passed is inactive.

Programmer Response: Ensure that the DLL Free request is invoked after the DLL Load request has completed successfully, and that you have no extra DLL Free requests using this dll-token in your application.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FE

CEE3567I A logical delete was performed for DLL *dll-name*, but the DLL was not physically deleted.

Explanation: The DLL Free request completed successfully. DLL *dll-name* is not physically deleted because either there was an implicit DLL Load performed against this DLL by the application, or multiple DLL Load requests were made for the DLL.

Programmer Response: If the DLL was loaded implicitly by referring to an external variable or an external function, it will be physically deleted by Language Environment at enclave termination. Otherwise, to free the DLL, issue a DLL Free request using the proper dll-token.

System Action: Execution continues.

Symbolic Feedback Code: CEE3FF

CEE3568I No DLL could be found which matched the input dll-token.

Explanation: The dll-token supplied to the DLL Free request could not be matched to a DLL loaded by this application.

Programmer Response: Ensure that the dll-token supplied to the DLL Free request is the same as the one returned from the DLL Load request, and that it has not been overwritten.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FG

CEE3569E The DLL function was not allowed because destructors are running for the DLL.

Explanation: A DLL Free, Query Variable, or Query Function request was made for a DLL that is currently running destructors. Since destructors are running, the DLL is about to be freed. Further function requests using this DLL are not allowed.

Programmer Response: Do not issue DLL function requests from one thread while the DLL is being freed from another thread.

System Action: The feedback code is returned to the caller.

Symbolic Feedback Code: CEE3FH

CEE3570S DLL name *dll-name* was not valid.

Explanation: Either the DLL name provided as input was null, or the length of the DLL name was negative.

Programmer Response: If this was an implicit DLL reference, make sure that the DLL was built correctly. If this was an explicit DLL Load request, verify that the DLL name was specified correctly.

System Action: If this was an implicit DLL reference, the condition is signaled. If the condition is not handled, the default action is to terminate the enclave. If this was an explicit DLL Load request, the feedback code is returned to the caller.

Symbolic Feedback Code: CEE3FI

CEE3571S Storage for writeable static was not available for DLL *dll-name.*

Explanation: Not enough storage was available for allocation of writeable static for DLL *dll-name*.

Programmer Response: Increase the region size.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FJ

CEE3572I The input dll-token was not available for use.

Explanation: The dll-token supplied to a DLL Query Function or Query Variable request could not be used because:

- the dll-token was null;
- the dll-token was not valid; or
- the dll-token had been marked inactive as a result of an explicit DLL Free request.

Programmer Response: Ensure that the proper dll-token is supplied to the DLL request, and that the subject DLL is not freed prematurely.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FK

CEE3573I Dll *dll-name* **does not export any functions.**

Explanation: An attempt was made to query an external function, but DLL *dll-name* does not contain any exported functions.

Programmer Response: Ensure that the DLL indicated in the job library or link library is the correct version, and that it contains the external function.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FL

CEE3574I External function *function-name* **was not found in DLL** *dll-name.*

Explanation: An attempt was made to query an external function, but function *function-name* was not found in the export section of the DLL *dll-name*.

Programmer Response: Ensure that the function name specified on the DLL Query Function request is correct, that the DLL indicated in the job library or link library is the correct version, and that it contains the external function.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FM

CEE3575I DLL *dll-name* **does not export any variables.**

Explanation: An attempt was made to query an external variable, but DLL *dll-name* does not contain any exported variables.

Programmer Response: Ensure that the DLL indicated in the job library or link library is the correct version, and that it contains the external variable.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FN

CEE3576I External variable *variable-name* **was not found in DLL** *dll-name.*

Explanation: An attempt was made to query an external variable, but *variable-name* was not found in the export section of DLL *dll-name*.

Programmer Response: Ensure that the variable name specified on the DLL Query Variable request is correct, that the DLL indicated in the job library or link library is the correct version, and that it contains the external variable.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FO

CEE3577I The external function was not found in DLL *dll-name.*

Explanation: An attempt was made to query an external function in DLL *dll-name*, but either the function name was null, or the length of the function name was negative.

Programmer Response: Ensure that the function name and length are specified correctly on the DLL Query Function request.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FP

CEE3578I The external variable was not found in DLL *dll-name.*

Explanation: An attempt was made to query an external variable in DLL *dll-name*, but either the variable name was null, or the length of the variable name was negative.

Programmer Response: Ensure that the variable name and length are specified correctly on the DLL Query Variable request.

System Action: The request is ignored.

Symbolic Feedback Code: CEE3FQ

CEE3579S Attempted to free DLL *dll-name* **while running C++ destructors.**

Explanation: The application is attempting to free DLL *dll-name* while running C++ destructors.

Programmer Response: Make sure that you are not freeing this DLL from your C++ destructors.

System Action: The feedback code is returned to the caller.

Symbolic Feedback Code: CEE3FR

CEE3601I The string '*string***' was found where a delimiter was expected following a quoted suboption for the run-time option** *option***.**

Explanation: A quoted suboption must be followed by either a comma, right parenthesis, or space.

Programmer Response: Correct the run-time options string.

System Action: The characters following *suboption* up to the next comma, space, or parenthesis are ignored.

Symbolic Feedback Code: CEE3GH

CEE3602I An end quote delimiter did not occur before the end of the run-time option string.

Explanation: Quotes, either single or double, must be in pairs.

Programmer Response: Correct the run-time options string.

System Action: The end quote is assumed.

Symbolic Feedback Code: CEE3GI

CEE3603I The character '*character*' is not a valid run-time option delimiter.

Explanation: Options must be separated by either a space or a comma.

Programmer Response: Correct the run-time options string.

System Action: *character* is ignored.

Symbolic Feedback Code: CEE3GJ

CEE3604I The character '*character*' is not a valid suboption delimiter for run-time options.

Explanation: Suboptions must be separated by a comma.

Programmer Response: Correct the run-time options string.

System Action: The separator is assumed to be a comma.

Symbolic Feedback Code: CEE3GK

CEE3605I The string '*string*' was found where a delimiter was expected following the suboptions for the run-time option *option*.

Explanation: Suboptions that are enclosed within parentheses must be followed by either a space or a comma.

Programmer Response: Correct the run-time options string.

System Action: The characters following the right parenthesis up to the next comma or space are ignored.

Symbolic Feedback Code: CEE3GL

CEE3606I The string '*string*' was too long and was ignored.

Explanation: The maximum string length for an option or suboption was exceeded.

Programmer Response: Correct the run-time options string.

System Action: *string* is ignored.

Symbolic Feedback Code: CEE3GM

CEE3607I The end of the suboption string did not contain a right parenthesis.

Explanation: A left parenthesis did not have a matching right parenthesis.

Programmer Response: Correct the run-time options string.

System Action: The right parenthesis is assumed.

Symbolic Feedback Code: CEE3GN

CEE3608I The following messages pertain to the invocation command run-time options.

Explanation: The messages after this one up to the next message of this type with a different source, pertain to the invocation command.

Programmer Response: No programmer response is required.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3GO

CEE3609I The run-time option *option* is not supported.

Explanation: *option* was an option from a previous release that was not supported or mapped by Language Environment.

Programmer Response: Consult the appropriate migration guide for a list of options supported for the language. Correct the run-time options string.

System Action: *option* is ignored.

Symbolic Feedback Code: CEE3GP

CEE3610I The run-time option *old-option* was mapped to the run-time option *le-option*.

Explanation: *old-option* was an option from a previous release that was supported by Language Environment for compatibility.

Programmer Response: Consult the appropriate migration guide for a list of options supported for the language. Change the run-time options string to use the *le-option* instead.

System Action: *old-option* is mapped to *le-option*.

Symbolic Feedback Code: CEE3GQ

CEE3611I The run-time option *option* was an invalid run-time option.

Explanation: *option* was not a valid option or was an option that was recognized by Language Environment for previous release language compatibility.

Programmer Response: Consult the appropriate migration guide for a list of options supported for the language. Correct the run-time options string.

System Action: *option* is ignored.

Symbolic Feedback Code: CEE3GR

CEE3612I Too many suboptions were specified for the run-time option *option*.

Explanation: The number of suboptions specified for *option* exceeded that defined for the option.

Programmer Response: A list of valid run-time options is provided in *OS/390 Language Environment Programming Reference*. Correct the run-time options string.

System Action: The extra suboptions are ignored.

Symbolic Feedback Code: CEE3GS

CEE3613I The run-time option *old-option* appeared in the options string.

Explanation: *old-option* (SPIE, NOSPIE, STAE, or NOSTAE) was an option from a previous release that was supported by Language Environment for compatibility, but ignored if TRAP was specified. See *OS/390 Language Environment Programming Reference* for the interactions between TRAP and SPIE, NOSPIE, STAE, or NOSTAE.

Programmer Response: Change the run-time options string to use the TRAP option instead of SPIE, NOSPIE, STAE, or NOSTAE.

System Action: *old-option* is ignored if TRAP is specified, otherwise it is mapped to TRAP.

Symbolic Feedback Code: CEE3GT

CEE3614I An invalid character occurred in the numeric string '*string***' of the run-time option** *option***.**

Explanation: *string* did not contain all decimal numeric characters.

Programmer Response: Correct the run-time options string to contain all numeric characters.

System Action: The *string* is ignored.

Symbolic Feedback Code: CEE3GU

CEE3615I The installation default for the run-time option *option* **could not be overridden.**

Explanation: *option* was defined as non-overridable at installation time.

Programmer Response: Correct the run-time options to not specify this *option*.

System Action: The option is ignored.

Symbolic Feedback Code: CEE3GV

CEE3616I The string '*string***' was not a valid suboption of the run-time option** *option***.**

Explanation: *string* was not in the set of recognized values.

Programmer Response: Remove the invalid suboption *string* from the run-time option *option*.

System Action: The suboption is ignored.

Symbolic Feedback Code: CEE3H0

CEE3617I The number *number* **of the run-time option** *option* **exceeded the range of -2147483648 to 2147483647.**

Explanation: *number* exceeded the range of -2147483648 to 2147483647.

Programmer Response: Correct the run-time options string to be within the acceptable range of -2147483647 to 2147483647.

System Action: The *number* is ignored.

Symbolic Feedback Code: CEE3H1

CEE3618I The run-time option *option* **was not valid from the invocation command.**

Explanation: *option* was not valid from the invocation command.

Programmer Response: Remove the *option* run-time option from the invocation command.

System Action: *option* is ignored.

Symbolic Feedback Code: CEE3H2

CEE3619I The value *value* **was not a valid MSGQ number.**

Explanation: *value* must be greater than zero.

Programmer Response: Correct the value in the run-time options string to be greater than zero.

System Action: *value* is ignored.

Symbolic Feedback Code: CEE3H3

CEE3620I The following messages pertain to the assembler user exit run-time options.

Explanation: The messages after this one up to the next message of this type with a different source pertain to the assembler user exit.

Programmer Response: No response is required.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3H4

CEE3621I The run-time option *option* was not valid from the assembler user exit.

Explanation: *option* was not valid from the assembler user exit.

Programmer Response: Remove the *option* from the run-time options specified in the assembler user exit.

System Action: *option* is ignored.

Symbolic Feedback Code: CEE3H5

CEE3622I The STORAGE option quoted suboption string '*string*' was not one character long.

Explanation: The only acceptable length for STORAGE suboptions within quotes is one.

Programmer Response: Correct the STORAGE run-time option quoted suboption string to be one character long.

System Action: The suboption is ignored.

Symbolic Feedback Code: CEE3H6

CEE3623I The UPSI option suboption string '*string*' was not eight characters long.

Explanation: The only acceptable length for the UPSI suboption is eight.

Programmer Response: Correct the UPSI run-time option suboption string to be eight characters long.

System Action: The suboption is ignored.

Symbolic Feedback Code: CEE3H7

CEE3624I One or more error messages pertaining to the run-time options included in the invocation command were lost.

Explanation: The run-time options error table (ROET) overflowed.

Programmer Response: Correct the reported errors so the discarded errors fit into the error table.

System Action: The errors that are detected after the table overflowed are discarded.

Symbolic Feedback Code: CEE3H8

CEE3625I One or more error messages pertaining to the run-time options returned by the assembler user exit were lost.

Explanation: The run-time options error table (ROET) overflowed.

Programmer Response: Correct the reported errors so the discarded errors fit into the error table.

System Action: The errors that are detected after the table overflowed are discarded.

Symbolic Feedback Code: CEE3H9

CEE3626I One or more error messages pertaining to the run-time options contained within the programmer defaults were lost.

Explanation: The run-time options error table (ROET) overflowed.

Programmer Response: Correct the reported errors so the discarded errors fit into the error table.

System Action: The errors that are detected after the table overflowed are discarded.

Symbolic Feedback Code: CEE3HA

CEE3627I The following messages pertain to the programmer default run-time options.

Explanation: The messages after this one up to the next message of this type with a different source, pertain to the programmer default options.

Programmer Response: No response is required.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3HB

CEE3628I The run-time option *option* **was not valid from the programmer defaults.**

Explanation: *option* was not valid from the programmer defaults.

Programmer Response: Correct the run-time options string by removing the *option* run-time option.

System Action: The option is ignored.

Symbolic Feedback Code: CEE3HC

CEE3629I The run-time option *old-option* **was partially mapped to the run-time option** *le-option***.**

Explanation: *old-option* was an old language option that was being supported by Language Environment for compatibility. The user should use the Language Environment option *le-option* instead.

Programmer Response: Change the run-time options string to use the Language Environment option instead.

System Action: *old-option* is partially mapped to its Language Environment equivalent.

Symbolic Feedback Code: CEE3HD

CEE3630I One or more settings of the run-time options STAE or SPIE were ignored.

Explanation: STAE, SPIE, NOSTAE, and NOSPIE (options from a previous release) were ignored when the TRAP option was specified. See *OS/390 Language Environment Programming Reference* for the interactions between TRAP and SPIE, NOSPIE, STAE, or NOSTAE.

Programmer Response: Remove the STAE, SPIE, NOSTAE, or NOSPIE run-time options if the TRAP run-time option is specified.

System Action: STAE, SPIE, NOSTAE, or NOSPIE are ignored.

Symbolic Feedback Code: CEE3HE

CEE3631I One or more settings of the run-time options STAE or SPIE were mapped to TRAP.

Explanation: STAE, SPIE, NOSTAE, and NOSPIE are options from a previous release that are supported by Language Environment for compatibility. See *OS/390 Language Environment Programming Reference* for the interactions between TRAP and SPIE, NOSPIE, STAE, or NOSTAE.

Programmer Response: Change the run-time options string to use the TRAP option instead of SPIE, STAE, NOSPIE, or NOSTAE.

System Action: STAE, SPIE, NOSTAE, or NOSPIE are mapped to TRAP.

Symbolic Feedback Code: CEE3HF

CEE3632I POSIX(ON) run-time option specified and the OpenEdition feature is not available on the underlying operating system.

Explanation: The POSIX(ON) option was specified but the OpenEdition feature was not available on the underlying operating system.

Programmer Response: Check with your system programmer to ensure that OpenEdition feature is available. Remove the POSIX(ON) run-time option if the OpenEdition feature is not available.

System Action: POSIX(ON) is ignored.

Symbolic Feedback Code: CEE3HG

CEE3633W The total length of the combined ENVAR strings exceeded 250 characters.

Explanation: The total length of the combined ENVAR strings exceeded the maximum limit of 250 characters.

Programmer Response: Reduce the total length of the ENVAR strings to less than the 250 character maximum.

System Action: The ENVAR string is ignored.

Symbolic Feedback Code: CEE3HH

CEE3634I The number *number* **of the run-time option** *option* **exceeded the range of -32768 to 32767.**

Explanation: *number* exceeded the range of -32768 to 32767.

Programmer Response: Correct the run-time options string to be within the range of -32768 to 32767.

System Action: The *number* is ignored.

Symbolic Feedback Code: CEE3HI

CEE3635I The string *string* **was not a valid RECFM suboption specification for run-time option MSGFILE.**

Explanation: *string* for RECFM suboption must be one of the following: F, FA, FB, FBA, FBS, FBSA, U, UA, V, VA, VB, or VBA.

Programmer Response: Specify a valid RECFM suboption string of F, FA, FB, FBA, FBS, FBSA, U, UA, V, VA, VB, or VBA.

System Action: *string* is ignored.

Symbolic Feedback Code: CEE3HJ

CEE3636I The value *value* exceeded the maximum allowable LRECL or BLKSIZE of 32760 bytes.

Explanation: *value* cannot be greater than 32760.

Programmer Response: Correct the LRECL or BLKSIZE suboption value to be less than or equal to 32760 bytes.

System Action: *value* is ignored.

Symbolic Feedback Code: CEE3HK

CEE3637I The number *number* specified in the *suboption* suboption of the run-time option *option* is not a valid hexadecimal number in the range 0 to FFFFFFFF.

Explanation: An invalid hexadecimal numeral was specified or the range of the *number* exceeds 0 to FFFFFFFF.

Programmer Response: Correct the run-time options string to be a valid hexadecimal number in the range of 0 to FFFFFFFF.

System Action: The *number* is ignored.

Symbolic Feedback Code: CEE3HL

CEE3638I The table size of *size*, specified in the TRACE run-time option, exceeds the maximum allowed value of 16777215.

Explanation: *size* exceeded the maximum allowed value of 16777215.

Programmer Response: Correct the TRACE run-time options to not exceed the maximum of 16777215.

System Action: The *size* is ignored.

Symbolic Feedback Code: CEE3HM

CEE3639I The ID suboption *suboption* of the TRACE run-time option must consist of the keyword 'ID' followed by a one or two digit number in the range 0 to *number*

Explanation: The format of the ID suboption of the TRACE run-time option is *IDxx=nnnnnnnn* where *xx* is a one or two digit decimal number with no blanks between it and either the ID or the equal-sign.

Programmer Response: Correct the ID suboption of the TRACE run-time option to be the correct format where *xx* is a one or two digit decimal number with no blanks between it and either the ID or the equal-sign.

System Action: The *suboption* is ignored.

Symbolic Feedback Code: CEE3HN

CEE3640W Multithreading function is being used in your application but the OpenEdition feature is not available on the underlying operating system.

Explanation: Multithreading function is being used in your application and that function is not supported. The underlying operating system must have the OpenEdition feature installed and active when you run this application.

Programmer Response: If your application uses multithreading ensure that the underlying operating system has the OpenEdition option installed and that it is active when your application is running.

System Action: Execution continues.

Symbolic Feedback Code: CEE3HO

CEE3641I The *number* of the run-time option *option* exceeded the range of 0 to 2147483647.

Explanation: *number* exceeded the range of 0 to 2147483647.

Programmer Response: Correct the run-time option string to be within the range of 0 to 2147483647.

System Action: The *number* is ignored.

Symbolic Feedback Code: CEE3HP

CEE3642I The cell pool size *number* of the run-time option *option* is not valid.

Explanation: *number* is either not a multiple of 8 or not in the range from 8 to 2048.

Programmer Response: Correct the run-time options string so that the *number* is in the range from 8 to 2048.

System Action: The *number* is ignored.

Symbolic Feedback Code: CEE3HQ

CEE3643I The cell pool percentage *number* of the run-time option *option* exceeded the range of 1 to 90.

Explanation: *number* exceeded the range of 1 to 90.

Programmer Response: Correct the run-time options string so that the *number* is in the range from 1 to 90.

System Action: The *number* is ignored.

Symbolic Feedback Code: CEE3HR

CEE3644I TEST option negates PROFILE option setting.

Explanation: The TEST and PROFILE run-time options cannot be active at the same time. If TEST and PROFILE ON are specified together, Language Environment will not load the profiler tool.

Programmer Response: To specify a PROFILE option, ensure the NOTEST run-time option is specified for your application or as your system default. The NOTEST option should be first when specifying NOTEST and PROFILE together via a compiler directive or on application invocation.

System Action: The PROFILE option is ignored.

Symbolic Feedback Code: CEE3HS

CEE3645I Profiler not loaded; module CEEEVPRF not accessible.

Explanation: The PROFILE ON run-time option has been specified but Language Environment has not loaded the profiler tool.

Programmer Response: Ensure that the profile module CEEEVPRF exists and is accessible to Language Environment. When calling the profiler application, Language Environment must be able to locate and access the CEEEVPRF module.

System Action: The PROFILE option is ignored.

Symbolic Feedback Code: CEE3HT

CEE3646I The following messages pertain to the region default run-time options.

Explanation: The messages after this one, and up to the next message of this type with a different source, pertain to the region default options.

Programmer Response: No response is required.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3HU

CEE3647I The region default for the run-time option *option* could not be overridden.

Explanation: *option* was defined as non-overridable at region initialization time.

Programmer Response: Correct the run-time options to not specify this *option*.

System Action: The option is ignored.

Symbolic Feedback Code: CEE3HV

CEE3648S POSIX(ON) run-time option in a nested enclave *enclave-name* is not supported.

Explanation: In Language Environment, a process can have only one enclave that is running with POSIX(ON), and that enclave must be the first enclave. All nested enclaves must be running with POSIX(OFF).

Programmer Response: Specify the POSIX(ON) run-time option for only the first enclave. Make sure all nested enclaves specify POSIX(OFF).

System Action: The application will be terminated.

Symbolic Feedback Code: CEE3I0

CEE3649W The parameter string returned from CEE3PRM exceeded the maximum length of 80 bytes and was truncated.

Explanation: The user parameters exceed 80 characters. The first 80 bytes are returned and the remainder of the user parameters are truncated.

Programmer Response: Reduce the user parameter string to less than 80 bytes.

System Action: The user parameter string is truncated to 80 bytes. The truncated value is returned to the caller in the character string parameter.

Symbolic Feedback Code: CEE3I1

CEE3700I The storage and options report heading replaced a previous heading.

Explanation: The specified report heading has replaced a heading set by an earlier call to CEERPTH.

Programmer Response: None required.

System Action: The report heading is replaced by the new heading.

Symbolic Feedback Code: CEE3JK

CEE3701W Heap damage found by HEAPCHK run-time option.

Explanation: This is a title message for the heap check section of the message file.

Programmer Response: View the messages following this one to see where damage was found.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JL

CEE3702S Program terminating due to heap damage.

Explanation: This is the last message in the heap check section of the message file.

Programmer Response: The message file will contain the address, expected and actual data for each damaged area found.

System Action: The application is terminated.

Symbolic Feedback Code: CEE3JM

CEE3703I In *controlblock* **Control Block, the** *fieldname* **is damaged.**

Explanation: A Language Environment control block *controlblock* has damage in the *fieldname* area.

Programmer Response: The message following this one in the message file will identify the address of the damage and the expected data. If you did not use the HEAPCHK run-time option, re-run the application with HEAPCHK(ON) to help locate the cause of the problem. If you used the HEAPCHK run-time option and are unable to locate the cause of the problem, contact your service representative.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JN

CEE3704I Expected data at address *address***:***data***.**

Explanation: Provides the address *address* and expected data *data* when heap damage is found.

Programmer Response: The data area following this message provides the actual data found at the damaged location.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JO

CEE3705I Pointer at *address* **should point to a valid** *controlblock***.**

Explanation: The pointer at location *address* should point to a Language Environment control block with a *controlblock* eye catcher.

Programmer Response: The data area following this message provides the actual data found at the damaged location.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JP

CEE3706I The contents of the free tree node at *address1* **in the heap segment beginning at** *address2* **do not match the STORAGE run-time option heap_free_value.**

Explanation: The contents of storage at *address1* should match the heap_free_value specified with the STORAGE run-time option. The first 16 bytes at *address1* provide header information and are not expected to match the heap_free_value.

Programmer Response: The data area following this message provides the actual data found at the damaged location.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JQ

CEE3707I *branch* **pointer is bad in the free tree at** *address1* **in the heap segment beginning at** *address2***.**

Explanation: The pointer to the *branch* branch of the free tree node at address *address1* does not point to another free tree node.

Programmer Response: The data area following this message provides the actual data found at the damaged location.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JR

CEE3708I *branch* **length is bad in the free tree at** *address1* **in the heap segment beginning at** *address2***.**

Explanation: The length of the *branch* branch of the free tree node at address *address1* is damaged.

Programmer Response: The data area following this message provides the actual data found at the damaged location.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JS

CEE3709I Either the *branch* **pointer or length is damaged in the free tree at** *address1* **in the heap segment beginning at** *address2***.**

Explanation: The pointer to the *branch* branch of the free tree node at address *address1* plus it's length does not match a heap storage element.

Programmer Response: The data area following this message provides the actual data found at the damaged location.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JT

CEE3710I Heap element at *address* **is damaged; expected data is** *word1***:***word2***.**

Explanation: The header of the heap storage element at *address* does not match the expected data *word1* and *word2*.

Programmer Response: The data area following this message provides the actual data found at the damaged location.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JU

CEE3711I Processing of the HEAPCHK run-time option has been terminated due to a previous error. Heaps are no longer being checked for damage.

Explanation: A message preceding this one in the message file will provide the actual error which caused the HEAPCHK processing to be terminated.

Programmer Response: Locate the message that describes the actual error and take appropriate action to correct the problem. If you are unable to locate the cause of the problem, contact your service representative.

System Action: No system action is performed.

Symbolic Feedback Code: CEE3JV

CEE3800S The address passed to the stack segment routine was not within any Language Environment stack segment.

Explanation: The address passed to the stack segment routine was not within any currently allocated Language Environment stack segment.

Programmer Response: Contact your service representative. This is an internal error.

System Action: The bounds, segment type, and chain are undefined.

Symbolic Feedback Code: CEE3MO

CEE3817E The member event handler did not return a useable function pointer.

Explanation: The member language which compiled the input load module either does not support the CEEPGFD CWI, or encountered an unrecoverable error.

Programmer Response: Ensure that the input load module is compiled from a language which supports the CEEPGFD CWI.

System Action: CEEPGFD returns an unuseable function pointer.

Symbolic Feedback Code: CEE3N9

CEE3818E The member event handler encountered an error.

Explanation: The member language which compiled the input load module either does not support the CEEPRFD CWI, or encountered an unrecoverable error.

Programmer Response: Ensure that the input load module is compiled from a language which supports the CEEPRFD CWI, and that the function pointer is a valid pointer obtained from the CEEPGFD CWI.

System Action: No function pointer is released.

Symbolic Feedback Code: CEE3NA

CEE3819I An invalid string *string* was found in the run-time option ENVAR.

Explanation: The string does not contain an equal sign. The input beginning at the string will be ignored.

Programmer Response: ENVAR strings must be in the form of 'name=value'. The string may be missing or have misplaced quotation marks. You can specify multople environment variables, separating the name=value pairs with commas. Quotation marks are required when specifying multiple variables.

System Action: The invalid ENVAR string is ignored.

Symbolic Feedback Code: CEE3NB

CEE3900S The function code passed to CEE3USR was not 1 or 2.

Explanation: The *function_code* specified in a CEE3USR call was invalid

Programmer Response: Invoke CEE3USR with *function_code* 1 (for SET) or 2 (for QUERY).

System Action: Neither SET nor QUERY is performed.

Symbolic Feedback Code: CEE3PS

CEE3901S The field number passed to CEE3USR was not 1 or 2.

Explanation: The field number specified in a CEE3USR call was invalid.

Programmer Response: Invoke CEE3USR with *field_number* 1 or 2.

System Action: Neither SET nor QUERY is performed.

Symbolic Feedback Code: CEE3PT

CEE3nnnS A Writeable Static Area (WSA) associated with the entry point was not found.

Explanation: The CEEPFWSA service was invoked and Language Environment was not able to find an executable module containing the specified entry point. A search is made of the executable module containing main (if present), any fetched, dynamically-called, PIPI-loaded modules, CEEFETCHed modules, and any loaded DLLs.

Programmer Response: Verify that the entry point point passed to CEEPFWSA is a valid C/370 or LE style entry point. Contact your service representative.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE3EB

CEE4001S General Failure: Service could not be completed.

Explanation: An error was encountered attempting to complete a C/370 locale function.

Programmer Response: Contact your service representative.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE3T1

CEE4015S Input Error: The number of characters to be transformed must be greater than zero.

Explanation: An error was encountered attempting to complete a C/370 locale function. The CEESTXF callable service was called with a number parameter that was non-positive.

Programmer Response: Make sure the parameter is positive.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE3TF

CEE4086S Input Error: The number of characters to be formatted must be greater than zero.

Explanation: An error was encountered attempting to complete a C/370 locale function. The CEEFMON or CEEFTDS callable service was called with a maxsize parameter that was non-positive.

Programmer Response: Make sure the parameter is positive.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE3VM

CEE5001S POSIX function was not available. POSIX(ON) run-time option must be in effect and OpenEdition system services started.

Explanation: The requested POSIX service failed because the POSIX(ON) run-time option was not in effect and/or OpenEdition system services were not started.

Programmer Response: Specify the POSIX(ON) run-time option and/or contact your system programmer to start the OpenEdition system services.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE4S9

CEE5002S POSIX function was not available. OpenEdition system services were not started.

Explanation: The requested POSIX service failed because the OpenEdition system services were not started.

Programmer Response: Contact your system programmer to start the OpenEdition system services.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE4SA

CEE5101C During initialization, the OpenEdition callable service BPX1MSS failed. The system return code was *return_code***; the reason code was** *reason_code***. The application will be terminated.**

Explanation: The OpenEdition callable service BPX1MSS failed with return code *return_code* and reason code *reason_code* because the id was not registered with OpenEdition. The *return_code* is a decimal number and the *reason_code* is hexadecimal.

Programmer Response: Contact your system administrator to have the id registered with OpenEdition to use the OpenEdition services. See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your OpenEdition system support personnel if necessary.

System Action: The application is terminated.

Symbolic Feedback Code: CEE4VD

CEE5102E A request to dump process and enclave information could not be guaranteed to be consistent due to system constraints.

Explanation: A call to dump services was made in a multithread environment, but the *QUIESCE_FREEZE* feature of the callable service BPX1PTQ was not available on the release that was running.

Programmer Response: Check that the level of OpenEdition you are running supports the *QUIESCE_FREEZE* feature of the OpenEdition callable service BPX1PTQ. *QUIESCE_FREEZE* is an OpenEdition Release 2 feature.

System Action: A dump is taken with unpredictable results.

Symbolic Feedback Code: CEE4VE

CEE5103W The dump service was busy.

Explanation: A call to dump services was made in a multithread environment while another thread had requested that all threads be frozen.

Programmer Response: To dump your active thread, put the call to the dump service in a loop that iterates until the dump is successful. However, dump information for your thread might already be in the dump report due to another thread requesting a dump of all threads in the process.

System Action: No dump is taken. The thread is not terminated.

Symbolic Feedback Code: CEE4VF

CEE5104S The callable service BPX1PTQ failed. The system return code was *return_code***, the reason code was** *reason_code***.**

Explanation: The callable service, BPX1PTQ, is called by LE/370 to freeze and unfreeze threads. If this service fails, LE/370 will return the *return_code* and *reason_code*.

Programmer Response: Look up the return code and reason code in *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* and take the appropriate action. It is possible that the service failed due to the fact that another thread had already given a freeze request. Consult with your system support personnel if necessary.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE4VG

CEE5105S A call was made to *callable_service_name* **without the thread being frozen.**

Explanation: A call was made to the CWI *callable_service_name* with a caaptr parameter which pointed to a CAA pointer of a thread that was not frozen.

Programmer Response: Consult with your system support personnel.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE4VH

CEE5106S A call was made to *callable_service_name* **with an invalid caaptr parameter.**

Explanation: A call was made to the CWI *callable_service_name* with a caaptr parameter which didn't point to a valid CAA.

Programmer Response: Consult with your system support personnel.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE4VI

CEE5151S The POSIX fork() function could not operate on the Language Environment member ID number *member_id***.**

Explanation: The Language Environment member cannot be the object of a `fork() or vfork()` function.

Programmer Response: Make sure that the member can be the object of a `fork() or a vfork()` function before issuing the function.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE50V

CEE5152S The callable service BPX1FRK for the *fork* function was unsuccessful. The system return code was *return_code*, the reason code was *reason_code*.

Explanation: The callable service BPX1FRK for the *fork() or vfork()* function failed. The system return code and reason code were returned. The *return_code* and *reason_code* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE510

CEE5154S The requested *fork* () service failed because it was invoked from a multi-thread environment.

Explanation: The `fork()` and `exec()` services can be invoked only from a single-thread environment.

Programmer Response: Try the requested service in a single-thread environment.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE512

CEE5155S The callable service BPX1SPN for the *spawn* function was unsuccessful. The system return code was *return_code*, the reason code was *reason_code*.

Explanation: The callable service BPX1SPN for the *spawn() or spawnp()* function failed. The system return code and reason code were returned. The *return_code* and *reason_code* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE513

CEE5161S The callable service BPX1EXC for the exec() family function was unsuccessful. The system return code was *return_code*, the reason code was *reason_code*.

Explanation: The callable service BPX1EXC for the *exec()* family function failed. The system return code and reason code were returned.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE519

CEE5162S The environment variable, _CEE_RUNOPTS, was too long.

Explanation: During *exec()* processing, Language Environment propagated run-time options from the program issuing the *exec()* by concatenating all run-time options that were specified on invocation of this program with those specified in the environment variable *_CEE_RUNOPTS*. The size of the work area used to perform this concatenation was insufficient.

Programmer Response: Verify that the value of the *_CEE_RUNOPTS* environment variable does not contain superfluous blanks or invalid run-time options.

System Action: *exec()* family function failed.

Symbolic Feedback Code: CEE51A

CEE5176S There was insufficient storage to process an environment variable.

Explanation: The environment variable processing service CEEBENV was called to get, set, or clear environment variable(s). However, there was insufficient system storage available to do so.

Programmer Response: Additional system storage is required before more environment variables can be processed. Either free some heap storage or rerun the application with a larger region size.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE51O

CEE5177S A bad input character was detected for the environment variable name.

Explanation: The internal environment variable processing service CEEBENV was called to get or set an environment variable. However, the name specified contained an invalid = character.

Programmer Response: Correct the environment variable name and retry.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE51P

CEE5178S The environment variable anchor or array contained an invalid address.

Explanation: The internal environment variable processing service CEEBENV was called to get, set, or clear environment variable(s). However, it encountered an invalid anchor or array address.

Programmer Response: If `**environ` is used to set or clear an environment variable, make sure that the address is correct.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE51Q

CEE5179S A parameter to the internal environment variable processing routine contained an invalid value.

Explanation: The internal environment variable processing service CEEBENV was called to get or set an environment variable. However, one of the parameters specified contained an invalid value. For instance, the name length or value length was negative, or the function code was invalid.

Programmer Response: Correct the parameter and retry.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE51R

CEE5180I The specified environment variable name already exists.

Explanation: An attempt was made to set an environment variable whose name already exists, but the 'overwrite' option was not set.

Programmer Response: If you want to modify the variable, specify the 'overwrite' option.

System Action: The operation returns a qualified success. The original variable is not modified.

Symbolic Feedback Code: CEE51S

CEE5201S The signal SIGFPE was received.

Explanation: A signal indicating an erroneous arithmetic operation was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 8.

Symbolic Feedback Code: CEE52H

CEE5202S The signal SIGILL was received.

Explanation: A signal indicating an invalid hardware instruction was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 4.

Symbolic Feedback Code: CEE52I

CEE5203S The signal SIGSEGV was received.

Explanation: A signal indicating an invalid memory reference was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 11.

Symbolic Feedback Code: CEE52J

CEE5204S The signal SIGABND was received.

Explanation: A signal indicating a user or system initiated abend was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 18.

Symbolic Feedback Code: CEE52K

CEE5205S The signal SIGTERM was received.

Explanation: A signal indicating a termination signal was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 15.

Symbolic Feedback Code: CEE52L

CEE5206S The signal SIGINT was received.

Explanation: A signal indicating an interruptive attention signal was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 2.

Symbolic Feedback Code: CEE52M

CEE5207E The signal SIGABRT was received.

Explanation: A signal indicating an abnormal termination signal was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 3.

Symbolic Feedback Code: CEE52N

CEE5208S The signal SIGUSR1 was received.

Explanation: A signal indicating an application-defined signal 1 was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 16.

Symbolic Feedback Code: CEE52O

CEE5209S The signal SIGUSR2 was received.

Explanation: A signal indicating an application-defined signal 2 was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 17.

Symbolic Feedback Code: CEE52P

CEE5210S The signal SIGHUP was received.

Explanation: A signal indicating a hangup on the controlling terminal or the termination of the controlling process was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 1.

Symbolic Feedback Code: CEE52Q

CEE5211S The signal SIGSTOP was received.

Explanation: A signal indicating a 'STOP' was raised. This signal cannot be caught or ignored.

Programmer Response: None.

System Action: The process is stopped.

Symbolic Feedback Code: CEE52R

CEE5212C The signal SIGKILL was received.

Explanation: A signal indicating a termination signal was raised. This signal cannot be caught or ignored.

Programmer Response: None.

System Action: The system abnormally terminates the process.

Symbolic Feedback Code: CEE52S

CEE5213S The signal SIGPIPE was received.

Explanation: A signal indicating a write to a pipe with no readers was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 13.

Symbolic Feedback Code: CEE52T

CEE5214S The signal SIGALRM was received.

Explanation: A signal was raised, indicating a timeout condition such as initiated by the *alarm()* function.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the POSIX process and produce a traceback or dump, depending on how the TERMTHDACT run-time option is set. The return code is set to 3000 and the signal number for the process termination is set to 14.

Symbolic Feedback Code: CEE52U

CEE5215W The signal SIGCONT was received.

Explanation: A signal indicating a 'continue if stopped' signal was raised.

Programmer Response: None.

System Action: If the default action is SIG_DFL, all stopped threads in the process are continued.

Symbolic Feedback Code: CEE52V

CEE5216W The signal SIGCHLD was received.

Explanation: A signal indicating a terminated child process or stopped condition was raised.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE530

CEE5217S The signal SIGTTIN was received.

Explanation: A signal was raised, indicating a read from a control terminal attempted by a language run-time component of a background process group condition.

Programmer Response: None.

System Action: If the default action is SIG_DFL, all threads in the process are stopped.

Symbolic Feedback Code: CEE531

CEE5218S The signal SIGTTOU was received.

Explanation: A signal was raised, indicating a write to a control terminal attempted by a language run-time component of a background process group condition.

Programmer Response: None.

System Action: If the default action is SIG_DFL, all threads in the process are stopped.

Symbolic Feedback Code: CEE532

CEE5219W The signal SIGIO was received.

Explanation: A signal indicating the completion of an input or output operation was raised.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE533

CEE5220S The signal SIGQUIT was received.

Explanation: A signal indicating an interruptive terminal signal requesting the process termination was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the enclave with a return code of 3000 and the signal number for the process termination set to 24.

Symbolic Feedback Code: CEE534

CEE5221S The signal SIGTSTP was received.

Explanation: A signal was raised, indicating an interruptive stop signal by a language run-time component of a background process group condition.

Programmer Response: None.

System Action: If the default action is SIG_DFL, all threads in the process are stopped.

Symbolic Feedback Code: CEE535

CEE5222S The signal SIGTRAP was received.

Explanation: A signal indicating a trap condition was raised.

Programmer Response: None.

System Action: If the signal is unhandled, the default action is to terminate the enclave with a return code of 3000 and the signal number for the process termination set to 26.

Symbolic Feedback Code: CEE536

CEE5223W The signal SIGIOERR was received.

Explanation: A signal indicating an I/O error was raised.

Programmer Response: See *OS/390 C/C++ Programming Guide* for information on SIGIOERR and how to respond to this error.

System Action: No system action is taken.

Symbolic Feedback Code: CEE537

CEE5224W The signal SIGDCE was received.

Explanation: The SIGDCE signal was generated as a result of a `MODIFY DCEKERN,DEBUG pid=` command. It communicates to a DCE-enabled process a desire to enable DCE run-time debug messages. If the target process is not a DCE process, the target process does not know how to handle SIGDCE.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE538

CEE5225S The signal SIGPOLL was received.

Explanation: This signal indicates that a pollable event has occurred. If the signal is unhandled, the following default action will be applied: The program (enclave) is terminated and a traceback or dump is issued depending on the TERMTHDACT run-time option. The return code is set to 3000 and the signal number for the process termination is set to 5.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE539

CEE5226W The signal SIGURG was received.

Explanation: This signal indicates that high bandwidth data is available at a socket.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE53A

CEE5227S The signal SIGBUS was received.

Explanation: This signal indicates that a bus error has occurred. If the signal is unhandled, the following default action will be applied: The program (enclave) is terminated and a traceback or dump is issued depending on the TERMTHDACT run-time option. The return code is set to 3000 and the signal number for the process termination is set to 10.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE53B

CEE5228S The signal SIGSYS was received.

Explanation: This signal indicates that a bad system call was detected. If the signal is unhandled, the following default action will be applied: The program (enclave) is terminated and a traceback or dump is issued depending on the TERMTHDACT run-time option. The return code is set to 3000 and the signal number for the process termination is set to 12.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE53C

CEE5229W The signal SIGWINCH was received.

Explanation: This signal indicates that the window size has changed.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE53D

CEE5230S The signal SIGXCPU was received.

Explanation: This signal indicates that the CPU time limit has been exceeded. If the signal is unhandled, the following default action will be applied: The program (enclave) is terminated and a traceback or dump is issued depending on the TERMTHDACT run-time option. The return code is set to 3000 and the signal number for the process termination is set to 29.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE53E

CEE5231S The signal SIGXFSZ was received.

Explanation: This signal indicates that the file size limit has been exceeded. If the signal is unhandled, the following default action will be applied: The program (enclave) is terminated and a traceback or dump is issued depending on the TERMTHDACT run-time option. The return code is set to 3000 and the signal number for the process termination is set to 30.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE53F

CEE5232S The signal SIGVTALRM was received.

Explanation: This signal indicates that a virtual timer has expired. If the signal is unhandled, the following default action will be applied: The program (enclave) is terminated and a traceback or dump is issued depending on the TERMTHDACT run-time option. The return code is set to 3000 and the signal number for the process termination is set to 31.

Programmer Response: None.

System Action: No system action taken.

Symbolic Feedback Code: CEE53G

CEE5233S The signal SIGPROF was received.

Explanation: This signal indicates that a profiling timer has expired. If the signal is unhandled, the following default action will be applied: The program (enclave) is terminated and a traceback or dump is issued depending on the TERMTHDACT run-time option. The return code is set to 3000 and the signal number for the process termination is set to 32.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE53H

CEE5234I The signal SIGDUMP was received.

Explanation: A signal indicating a dump signal was raised. This signal cannot be caught or ignored.

Programmer Response: None.

System Action: The system will obtain a user address space dump.

Symbolic Feedback Code: CEE53I

CEE5301S An invalid message number was received by the internal signal handling routine.

Explanation: The message number specified in the condition token passed to CEEOKILL was invalid. Only those message numbers that correspond to valid POSIX signals (5201 through 5224) are allowed.

Programmer Response: None.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE55L

CEE5302S A signal could not be raised due to a system-detected error, with return code *error-code* **and reason code** *reason-code***.**

Explanation: The Language Environment library routine called the callable services BPX1KIL (for kill or raise) or BPX1PTK (all others including *pthread_kill* and CEESGL) and the call was not successful. The system return code and reason code were returned. The *error-code* is a decimal number, and the *reason-code* is hexadecimal.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE55M

CEE5401S The function code *func_code* to CEEMPMSG was invalid.

Explanation: A call to CEEMPMSG, the message handler, had an invalid function code.

Programmer Response: Report the error to your system support personnel.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE58P

CEE5402I The callable service BPX1OPN, when invoked to open the message file, was unsuccessful. The system return code was *posix_rc*, the reason code was *posix_rsn*.

Explanation: The callable service BPX1OPN, when invoked to open the message file, failed. The system return code and reason code were returned. The *posix_rc* and *posix_rsn* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: No system action is taken.

Symbolic Feedback Code: CEE58Q

CEE5403I The callable service BPX1WRT, when invoked to write to the message file, was unsuccessful. The system return code was *posix_rc*; the reason code was *posix_rsn*.

Explanation: The callable service BPX1WRT, when invoked to write to the message file, failed. The system return code and reason code were returned. The *posix_rc* and *posix_rsn* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: No system action is taken.

Symbolic Feedback Code: CEE58R

CEE5404I The callable service BPX1CLO, when invoked to close the message file, was unsuccessful. The system return code was *posix_rc*; the reason code was *posix_rsn*.

Explanation: The callable service BPX1CLO, when invoked to close the message file, failed. The system return code and reason code were returned. The *posix_rc* and *posix_rsn* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: No system action is taken.

Symbolic Feedback Code: CEE58S

CEE5405I The callable service BPX1GCW, when invoked to determine the current working directory, was unsuccessful. The system return code was *posix_rc*; the reason code was *posix_rsn*.

Explanation: The callable service BPX1GCW, when invoked to determine the current working directory, failed. The system return code and reason code were returned. The *posix_rc* and *posix_rsn* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler*

Callable Services Reference for the appropriate action to take for this return code and reason code.

System Action: No Language Environment dump taken.

Symbolic Feedback Code: CEE58T

CEE5526S There was not enough storage to create the new key.

Explanation: There was not enough storage to create the new key. Keys are allocated in heap storage.

Programmer Response: Increase the storage allocation available to the execution of the program by either freeing some heap storage or rerunning the application with a larger region size.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5CM

CEE5527S The key namespace was exhausted.

Explanation: The maximum number of keys allowed have been created.

Programmer Response: Use the `sysconf()` function to determine the maximum number of keys that can be created within an enclave. Do not exceed this limit.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5CN

CEE5528S Termination was in progress. Key creates were not allowed.

Explanation: Key creates (CEEOPKC) calls were not allowed during thread termination after all destructor routines have been executed.

Programmer Response: None.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5CO

CEE5529S There was no storage to bind value to the key.

Explanation: There was not enough storage available in the address space to acquire sufficient heap storage to satisfy the CEEOPSS call.

Programmer Response: Either free some heap storage or rerun the application with a larger region size.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5CP

CEE5530S The specified key ID was invalid.

Explanation: The key identifier passed on the call to internal services CEEOPSS or CEEOPGS did not refer to a valid key.

Programmer Response: Before setting or getting the value associated with a key, the key must be created using the internal CEEOPKC service.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5CQ

CEE5531S The key set was not allowed.

Explanation: Key set operation (CEEOPSS) calls were not allowed during thread termination after all destructor routines had been executed.

Programmer Response: None.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5CR

CEE5532S The key get was not allowed.

Explanation: Key gets (CEEOPGS) calls were not allowed during thread termination after all destructor routines had been executed.

Programmer Response: None.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5CS

CEE5533S An invalid key pointer was passed in key create operation.

Explanation: The pointer to the storage location for which the newly created key was to be placed was invalid.

Programmer Response: None.

System Action: The key create is not performed.

Symbolic Feedback Code: CEE5CT

CEE5551S The array entry described by the slot parameter was already set.

Explanation: Conditional invocation of CEEOSETE internal service failed because the array entry described by the slot parameter was already set. The *slot* parameter described an array entry that was already in use. The entry can be set by using UNCONDITIONAL form of this CWI.

Programmer Response: None.

System Action: The entry is not set.

Symbolic Feedback Code: CEE5DF

CEE5552S The array entry described by the slot parameter was invalid or was reserved.

Explanation: Invocation of the CEESETE internal service failed because the array entry described by the slot parameter was invalid or was reserved. The *slot* parameter described an array entry that was unavailable for use. The value of *slot* was invalid.

Programmer Response: Choose a value for *slot* that is not reserved.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5DG

CEE5553S The callable service BPX1IPT (run a program on the IPT task) was unsuccessful. The system return code was *return_code*; the reason code was *reason_code*.

Explanation: The callable service BPX1IPT (run a program on the IPT task) failed. The system return code and reason code were returned. The *return_code* and *reason_code* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5DH

CEE5601S The attributes object parameter did not contain a valid initialized attributes object (POSIX PTAT).

Explanation: Each routine for which the thread attributes object was a parameter checks certain fields in that object to verify that they contain valid values. If any of the fields that were checked by the routine contained an invalid value, this condition was raised.

Programmer Response: Modify the calling program to pass a valid parameter object.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F1

CEE5602S The detachstate parameter did not contain a valid value.

Explanation: The *detachstate* parameter must be a fullword containing binary 0 for undetached or 1 for detached.

Programmer Response: Modify the calling program to pass a valid parameter value.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F2

CEE5603S The threadweight parameter did not contain a valid value.

Explanation: The *threadweight* parameter must be a fullword containing binary 0 for heavyweight, or 1 for medium-weight.

Programmer Response: Modify the calling program to pass a valid parameter value.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F3

CEE5604S A new thread could not be created due to a system-detected error, with error code *error-code* and reason code *reason-code*.

Explanation: The Language Environment library routine called OpenEdition and failed. The error code and reason code were returned. The *error-code* and *reason-code* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* or *OpenEdition for VM/ESA: Callable Services Reference* for the appropriate action to take for this error code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F4

CEE5605S A new thread could not be created due to an insufficient storage condition.

Explanation: Storage resource was insufficient for a new thread to be created.

Programmer Response: Use a larger region size or release some heap storage, and retry the application.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F5

CEE5606S The callable service BPX1PTJ failed due to an invalid thread ID on a join request. The system return code was *return_code***; the reason code was** *reason_code***.**

Explanation: The callable service BPX1PTJ was called by the Language Environment internal join service CEEOPJ to wait for a thread to terminate. However, BPX1PTJ returned without waiting because the ID of the target thread specified on the join request was invalid. The *return_code* and *reason_code* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* or *OpenEdition for VM/ESA: Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F6

CEE5607S The callable service BPX1PTJ failed due to an invalid thread ID on a join request. The system return code was *return_code***; the reason code was** *reason_code***.**

Explanation: The callable service BPX1PTJ was called by the Language Environment internal join service CEEOPJ to wait for a thread to terminate. However, BPX1PTJ returned without waiting because the ID of the target thread specified on the join request was the same as the ID of the calling thread that would result in a deadlock condition. The *return_code* and *reason_code* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* or *OpenEdition for VM/ESA: Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F7

CEE5608S The callable service BPX1PTJ failed during a thread join request. The system return code was *return_code***; the reason code was** *reason_code***.**

Explanation: The callable service BPX1PTJ was called by the Language Environment internal join service CEEOPJ to wait for a thread to terminate. However, BPX1PTJ returned without waiting. The *return_code* and *reason_code* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* or *OpenEdition for VM/ESA: Callable Services Reference* for

the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F8

CEE5609S The callable service BPX1PTJ failed during a thread join request. The system return code was *return_code***; the reason code was** *reason_code***.**

Explanation: The callable service BPX1PTJ was called by the Language Environment internal join service CEEOPJ to wait for a thread to terminate. However, BPX1PTJ returned without waiting indicating the target thread was not in an undetached state and could not be joined. The *return_code* and *reason_code* fields are decimal numbers.

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* or *OpenEdition for VM/ESA: Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5F9

CEE5612S The stacksize parameter did not contain a valid value.

Explanation: The *stacksize* parameter must be a fullword containing a binary number that is greater than or equal to zero. If positive, it specifies the number of bytes to be used for the stack. If 0, it specifies that 1/2 of all available storage should be used for the stack.

Programmer Response: Modify the calling program to pass a valid parameter value.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5FC

CEE5613S The synctype parameter did not contain a valid value.

Explanation: The *synctype* parameter must be a fullword containing binary 0 for synchronous.

Programmer Response: Modify the calling program to pass a valid parameter value.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5FD

CEE5626S There was insufficient storage for cleanup push operation.

Explanation: The internal service CEEOPCPU failed while trying to acquire heap storage for the cleanup routine registration.

Programmer Response: Either free some heap storage or rerun the application with a larger region size.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5FQ

CEE5627S Cleanup push was not allowed during thread termination.

Explanation: Cleanup routine push operations (CEEOPCPU) were not allowed during thread termination after all cleanup routines have been executed.

Programmer Response: None.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5FR

CEE5628S The cleanup pop was not allowed during thread termination.

Explanation: Cleanup routine pop operations (CEEOPCPO) were not allowed during thread termination after all cleanup routines have been executed.

Programmer Response: None.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5FS

CEE5629S The cleanup stack was empty.

Explanation: The internal service CEEOPCPO failed because there were no cleanup routines available. The cleanup stack was empty.

Programmer Response: None.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5FT

CEE5651S The oncecontrol parameter did not contain a valid value.

Explanation: The *oncecontrol* parameter must be a fullword containing binary 0 for initial value, or one of the other defined but not externalized values set by the *pthread_once* routine.

Programmer Response: Modify the calling program to pass a valid parameter value. *oncecontrol* should be initialized by the caller to *PTHREAD_ONCE_INIT(0)*. After initialization, it should not be modified directly but only by calling the *pthread_once* routine. It should not be tested directly by the caller, but only implicitly by calling the *pthread_once* routine.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5GJ

CEE5701S The mutex object was not initialized.

Explanation: The mutex-related service that was invoked requires the mutex object specified as a parameter be initialized.

Programmer Response: Use the internal service CEEOPMI to initialize the mutex object before invoking the service that failed.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5I5

CEE5702S The mutex was already owned.

Explanation: A thread invoked the mutex lock internal service CEEOPML specifying a nonrecursive mutex that had already been locked by the thread. Only a mutex that had been given the attribute RECURSIVE can be locked multiple times by the same thread.

Programmer Response: None.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5I6

CEE5703S An addressing exception occurred referencing a mutex object or mutex attribute object.

Explanation: The address of a mutex object or mutex attribute object passed as an parameter on a mutex related service call was invalid. An addressing exception program interrupt occurred when the called service referenced this address.

Programmer Response: Specify the correct mutex object or mutex attribute object when passing parameters to the mutex-related service call.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5I7

CEE5704C An addressing exception occurred referencing system storage allocated for mutexes.

Explanation: An addressing exception program interrupt occurred when a mutex-related service referenced system storage allocated for mutexes.

Programmer Response: Make sure that the application has not written over system storage prior to issuing the service call.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE5I8

CEE5705S A mutex object has been changed since it was initialized.

Explanation: The mutex destroy internal service CEEOPMD detected that a mutex object (specified as a parameter) had changed since it was initialized by the mutex initialization internal service CEEOPMI. The mutex was destroyed, but internal service CEEOPMD did not alter the storage associated with the mutex object. However, if internal service CEEOPMI was invoked, the storage was altered.

Programmer Response: Make sure the application is not incorrectly reusing storage associated with the mutex object after initializing it.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5I9

CEE5706S The mutex was not owned by thread.

Explanation: A thread called the mutex unlock internal service CEEOPMU to unlock the mutex but the mutex was not owned by the thread. A thread acquired a mutex with the mutex lock internal service CEEOPML or mutex trylock internal service CEEOPMT and was said to own the lock.

Programmer Response: Structure the application so that the thread that locks the mutex also unlocks the mutex.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5IA

CEE5707I The mutex was busy.

Explanation: The mutex trylock internal service CEEOPMT was invoked to lock a nonrecursive mutex that was already locked.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5IB

CEE5708S The mutex object was already initialized.

Explanation: The mutex initialization internal service CEEOPMI was called to initialize a mutex object that had already been initialized.

Programmer Response: Call the mutex destroy internal service CEEOPMD to destroy an initialized mutex object before initializing it again.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5IC

CEE5709S The mutex attribute object was not initialized.

Explanation: The mutex attribute-related services required that the mutex attribute object specified as an parameter be initialized.

Programmer Response: Use internal service CEEOPXI to initialize the mutex attribute object before invoking the service that failed.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5ID

CEE5710S There was insufficient storage to initialize a mutex object.

Explanation: The mutex initialization internal service CEEOPMI was called to initialize a mutex object. However, there was insufficient system storage available.

Programmer Response: Get additional system storage before initializing more mutex objects.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5IE

CEE5711S A mutex attribute object has been changed since it was initialized.

Explanation: The mutex attribute destroy internal service CEEOPXD detected that a mutex attribute object specified as a parameter was changed since it was initialized by the mutex attribute initialization internal service CEEOPXI. The mutex attribute object was destroyed, but internal service CEEOPXD did not alter the storage associated with the mutex attribute object. However, if internal service CEEOPXI was invoked, the storage was altered.

Programmer Response: Make sure the application is not incorrectly reusing storage associated with the mutex attribute object after initializing it.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5IF

CEE5712S The mutex attribute object was already initialized.

Explanation: The mutex attribute initialization internal service CEEOPXI was called to initialize a mutex attribute object that had already been initialized.

Programmer Response: Call the mutex attribute destroy internal service CEEOPXD to destroy an initialized mutex attribute object before initialized it again.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5IG

CEE5713S There was insufficient storage to initialize a mutex attribute object.

Explanation: The mutex attribute initialization internal service CEEOPXI was called to initialize a mutex attribute object. However, there was insufficient system storage available.

Programmer Response: Acquire additional system storage before initializing more mutex attribute objects.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5IH

CEE5714S The mutex was busy.

Explanation: The mutex destroy internal service CEEOPMD was invoked to destroy a mutex that was in use. A mutex that was locked or associated with a condition wait or timed wait cannot be destroyed.

Programmer Response: Verify that your applications owns the mutex before calling CEEOPMD to destroy the mutex.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5II

CEE5715S An addressing exception occurred while referencing attribute kind storage.

Explanation: The address where to return attribute kind that was passed as an parameter on a *getkind_np* service request, was invalid. An addressing exception occurred when the *getkind_np* service CEEOPX attempted to store the attribute kind value at this address.

Programmer Response: Specify the correct attribute kind address parameter on the *getkind_np* service call.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5IJ

CEE5716C System mutex storage could not be freed.

Explanation: The destroy mutex internal service CEEOPMD was unable to free storage allocated for a mutex by the mutex initialization service CEEOPMI.

Programmer Response: Check if the application might have written over system storage. Report this problem to the storage administrator.

System Action: Thread is terminated.

Symbolic Feedback Code: CEE5IK

CEE5717C System mutex attribute storage could not be freed.

Explanation: The destroy mutex attribute internal service CEEOPXD was unable to free storage allocated for a mutex attribute by the mutex attribute initialization service CEEOPXI.

Programmer Response: Check if the application might have written over system storage. Report this problem to the system administrator.

System Action: Thread is terminated.

Symbolic Feedback Code: CEE5IL

CEE5718C There was invalid mutex attribute storage.

Explanation: The mutex attribute *getkind_np* internal service CEEOPXG found an invalid value in system storage for mutex attributes.

Programmer Response: Check if the application might have written over system storage. Report this problem to the system administrator.

System Action: Thread is terminated.

Symbolic Feedback Code: CEE5IM

CEE5719S There was an invalid attribute value.

Explanation: The attribute kind parameter in a call to internal service CEEOPXS specified an invalid attribute kind value. Valid values for *setkind_np* are NONRECURSIVE (0), RECURSIVE (1), NONRECURSIVE + NODEBUG (2), and RECURSIVE + NODEBUG (3).

Programmer Response: Specify a correct attribute kind value.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5IN

CEE5720C A thread waiting for a mutex was forced to terminate.

Explanation: An event, such as the initial thread terminating, forced all threads to terminate including threads waiting for a mutex.

Programmer Response: Check that all threads exit correctly.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE5IO

CEE5721C There was insufficient resource to initialize another mutex.

Explanation: The mutex init internal service, CEEOPMI, was invoked to initialize a mutex, but not enough resource was available to initialize another mutex.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5IP

CEE5722I There was insufficient privilege to initialize the mutex.

Explanation: The mutex init internal service, CEEOPMI, was invoked to initialize a mutex, but not enough resource was available to initialize another mutex.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5IP

CEE5724I There was insufficient resource to obtain the mutex.

Explanation: The mutex lock or trylock internal services CEEOPML or CEEOPMT was invoked to lock a recursive mutex, but not enough resource was available to obtain this recursive mutex another time.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5IS

CEE5726S The condition object was not initialized.

Explanation: The condition-related service required that the condition object (specified as an parameter) be initialized.

Programmer Response: Use internal service CEEOPCI to initialize the condition object before invoking the service that failed.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5IU

CEE5727S The condition signal service (CEEOPCS) failed due to a system detected error with error code *return-code* **and reason code** *reason-code***.**

Explanation: The condition signal internal service CEEOPCS called the callable service BPX1CPO to signal another thread waiting on the condition. BPX1CPO returned an unexpected error code and reason code.

Programmer Response: Report this failure to your system administrator.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5IV

CEE5728C An addressing exception occurred referencing system storage related to conditions variables.

Explanation: An addressing exception program interrupt occurred when a condition variable related service referenced system storage allocated for a condition variable.

Programmer Response: Make sure that the application has not written over system storage prior to issuing the service call.

System Action: The thread on which the addressing exception occurred is terminated.

Symbolic Feedback Code: CEE5J0

CEE5729S The mutex specified on a condition wait or timed wait request was a recursive mutex. The request was rejected.

Explanation: The condition wait internal service CEEOPCW and condition timed wait internal service CEEOPCT did not accept a request since the mutex associated with the request was recursive.

Programmer Response: Do not specify a mutex with the recursive attribute on a condition wait or timed wait request.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5J1

CEE5730S The mutex specified on a condition wait or timed wait request was a different mutex than the one already associated with the condition variable. The request was rejected.

Explanation: Different threads called the condition wait internal service CEEOPCW or condition timed wait internal service CEEOPCT and specified the same condition object but different mutexes on the requests.

Programmer Response: Make sure that all threads waiting on a particular condition variable specify the same mutex in their condition wait or timed wait requests.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5J2

CEE5731S The condition wait service or timed wait service failed due to a system detected error with error code *return-code* **and reason code** *reason-code***.**

Explanation: The condition wait internal service CEEOPCW or timed wait internal service CEEOPCT called the callable service BPX1CSE to set up for a condition wait. BPX1CSE returned an unexpected error code and reason code.

Programmer Response: Report this failure to your system administrator.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5J3

CEE5732S The condition wait service failed due to a system detected error with error code *return-code* **and reason code** *reason-code***.**

Explanation: The condition wait internal service CEEOPCW called the callable service BPX1CWA to block a thread. BPX1CWA returned an unexpected error code and reason code.

Programmer Response: Report this failure to your system administrator.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5J4

CEE5733S The value specified for number of seconds to wait was invalid. The condition wait request was rejected.

Explanation: The value for number of seconds to wait that was passed to the condition timed wait internal service CEEOPCT must be a non-negative number of seconds since midnight, January 1, 1970. This value cannot exceed 2,147,483,647 seconds.

Programmer Response: Time to wait should be specified as current calendar in seconds since midnight, January 1, 1970. Be sure the service you are using to get current calendar time returns seconds since midnight, January 1, 1970, or that your program is correctly converting the value obtained.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5J5

CEE5734S The value specified for number of nanoseconds to wait was invalid. The condition wait request was rejected.

Explanation: The value for number of nanoseconds to wait that was passed to the condition timed wait internal service CEEOPCT must be a non-negative number that does not exceed 1,000,000,000 (1,000 million).

Programmer Response: Be sure to initialize the nanosecond parameter to a value in the range 0 to 1,000,000,000 before invoking the condition wait service.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5J6

CEE5735S The value for current calendar time was invalid. The condition wait request was rejected.

Explanation: The system time of day (TOD) clock was not properly initialized or had overflowed. The value for current calendar time returned to the condition timed wait internal service CEEOPCT by the store clock (STCK) instruction was invalid.

Programmer Response: Report this problem to your system administrator.

System Action: The condition wait is rejected.

Symbolic Feedback Code: CEE5J7

CEE5736I The time to wait specified on a condition timed wait request has elapsed.

Explanation: Current calendar time in seconds since midnight, January 1, 1970, was equal to or greater than the time to wait. The time to wait was specified to the condition timed wait internal service CEEOPCT in seconds plus nanoseconds. Internal service CEEOPCT returned to allow the thread to continue processing.

Programmer Response: Be sure you are specifying seconds to wait as current calendar time in seconds since midnight, January 1, 1970, plus some additional number of seconds.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5J8

CEE5737S The condition timed wait service failed due to a system error with error code *return-code* **and reason code** *reason-code***.**

Explanation: The condition timed wait internal service CEEOPCT called the callable service CPX1CTW to block a thread. CPX1CTW returned an unexpected error code and reason code.

Programmer Response: Report this failure to your system administrator.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5J9

CEE5738S The condition attribute object was already initialized.

Explanation: The condition attribute initialization internal service CEEOPDI was called to initialize a condition attribute object that had already been initialized.

Programmer Response: Call the condition attribute destroy internal service CEEOPDD to destroy an initialized condition attribute object before calling internal service CEEOPDI to initializing it.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5JA

CEE5739S There was insufficient storage to initialize a condition attribute object.

Explanation: The condition attribute initialization internal service CEEOPDI was called to initialize a condition attribute object. However, there was insufficient system storage available to do so.

Programmer Response: Additional system storage is required before attempting to initialize more condition attribute objects.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5JB

CEE5740S An addressing exception occurred referencing condition object or condition attribute object.

Explanation: The address of a condition object or condition attribute object passed as an parameter on a condition variable related service call was invalid. An addressing exception program interrupt occurred when the called service referenced this address.

Programmer Response: Make sure the application correctly specifies the condition object or condition attribute object parameter in the service call.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5JC

CEE5741C The system condition attribute storage could not be freed.

Explanation: The destroy condition attribute internal service CEEOPDD was unable to free storage allocated for a condition attribute by the condition attribute initialization internal service CEEOPDI.

Programmer Response: Check if the application might have written over system storage. Report this problem to your system administrator.

System Action: Thread is terminated.

Symbolic Feedback Code: CEE5JD

CEE5742S The condition object was already initialized.

Explanation: The condition initialization internal service CEEOPCI was called to initialize a condition object that had already been initialized.

Programmer Response: Call the condition destroy internal service CEEOPCD to destroy an initialized condition object before initializing it again.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5JE

CEE5743S The condition attribute object was not initialized.

Explanation: An uninitialized condition attribute object was specified as an parameter on a call to the condition initialization internal service CEEOPCI.

Programmer Response: Call internal service CEEOPDI to initialize the condition attribute object before invoking internal service CEEOPCI.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5JF

CEE5744S There was insufficient storage to initialize a condition object.

Explanation: The condition initialization internal service CEEOPCI was called to initialize a condition object. However, there was insufficient system storage available to do so.

Programmer Response: Get additional system storage before initializing more condition objects.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5JG

CEE5745C The system condition variable storage could not be freed.

Explanation: The destroy condition internal service CEEOPCD was unable to free storage allocated for a condition variable by the condition initialization internal service CEEOPCI.

Programmer Response: Check if the application might have written over system storage. Report this problem to your system administrator.

System Action: Thread is terminated.

Symbolic Feedback Code: CEE5JH

CEE5746S A condition attribute object had been changed since it was initialized.

Explanation: The condition attribute destroy internal service CEEOPDD detected that a condition attribute object (specified as a parameter) had changed since it was initialized by the condition attribute initialization internal service CEEOPDI. The condition attribute object was destroyed, but internal service CEEOPDD did not alter the storage associated with the condition attribute object. However, if internal service CEEOPDI was invoked, the storage was altered.

Programmer Response: Check that the application is correctly reusing storage associated with the condition attribute object after initializing it.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5JI

CEE5747S The condition variable was busy.

Explanation: The condition destroy internal service CEEOPDD was invoked to destroy a condition variable that was in use. A condition variable that was in use by one or more threads for a condition wait or timed wait cannot be destroyed.

Programmer Response: Retry the request or determine why the condition variable is in use.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5JJ

CEE5748S A condition object had been changed since it was initialized.

Explanation: The condition destroy service CEEOPCD detected that a condition object (specified as a parameter) was changed since it was initialized by the condition initialization internal service CEEOPCI. The condition variable was destroyed, but internal service CEEOPDD did not alter the storage associated with the condition object. However, if internal service CEEOPCI was invoked, the storage was altered.

Programmer Response: Check that the application is correctly reusing storage associated with the condition object after initializing it.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5JK

CEE5749S An invalid attribute kind value was passed.

Explanation: The attribute kind parameter *setkind_np* that was passed to internal service CEEOPDS specified an invalid value. Valid values for *setkind_np* are NODEBUG (2).

Programmer Response: Specify a valid attribute kind value.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5JL

CEE5750S An addressing exception occurred referencing attribute kind storage.

Explanation: The address where to return attribute kind that was passed as a parameter on a *getkind_np* service request, was invalid. An addressing exception occurred when the internal service CEEOPDG attempted to store the attribute kind value at this address.

Programmer Response: Check that the application is correctly specifying the attribute kind address parameter on the *getkind_np* service call.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5JM

CEE5751C Invalid condition attribute storage detected.

Explanation: Internal service CEEOPDG found an invalid value in system storage for condition attribute *getkind_np*.

Programmer Response: Check if the application might have written over system storage. Report this problem to your system administrator.

System Action: Thread is terminated.

Symbolic Feedback Code: CEE5JN

CEE5761C Latch services were not available. The application will be terminated.

Explanation: A Language Environment function invoked internal Language Environment latch services when these services were not available. Latch services are initialized only when the POSIX(ON) run-time option was in effect.

Programmer Response: Report problem to your system administrator.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5K1

CEE5762C The latch was already owned. The application will be terminated.

Explanation: A Language Environment function invoked internal Language Environment latch services to request a latch. The thread from which the request was made already holds the latch.

Programmer Response: Report problem to your system administrator.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5K2

CEE5763C The latch was not owned. The application will be terminated.

Explanation: A Language Environment function invoked internal Language Environment latch services to release a latch. The thread from which the request was made did not hold the latch.

Programmer Response: Report problem to your system administrator.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5K3

CEE5764S The lock object was not initialized.

Explanation: The mutex or read-write lock related service that was invoked requires the lock object specified as a parameter be initialized.

Programmer Response: Use the internal service CEEOPMI to initialize the mutex or read-write lock object before invoking the service that failed.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5K4

CEE5765S The read-write lock was already held for writing.

Explanation: A thread invoked the read-write rdlock internal service CEEOPRL specifying a read-write lock that had already been locked by the thread for writing. A read-write lock can only be locked for reading multiple times by the same thread.

Programmer Response: None

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5K5

CEE5766S An addressing exception occurred referencing a lock object or lock attribute object.

Explanation: The address of a mutex or read-write lock object, or mutex or read-write lock attribute object passed as a parameter on a lock related service call was invalid. An addressing exception program interrupt occurred when the called service referenced this address.

Programmer Response: Specify the correct lock object or lock attribute object when passing parameters to the lock related service call.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5K6

CEE5767S An addressing exception occurred referencing system storage allocated for locks.

Explanation: An addressing exception program interrupt occurred when a mutex or read-write lock-related service referenced system storage allocated for locks.

Programmer Response: Make sure that the application has not written over system storage prior to issuing the service call.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE5K7

CEE5768S A lock object has been changed since it was initialized.

Explanation: The mutex or read-write lock destroy internal service CEEOPMD detected that a lock object (specified as a parameter) had changed since it was initialized by the lock initialization internal service CEEOPMI. The lock was destroyed, but internal service CEEOPMD did not alter the storage associated with the read-write lock object. However, if internal service CEEOPMI was invoked, the storage was altered.

Programmer Response: Make sure the application is not incorrectly reusing storage associated with the read-write lock object after initializing it.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5K8

CEE5769S The read-write lock was not held by thread.

Explanation: A thread called the read-write lock unlock internal service CEEOPRU to unlock the read-write lock but the read-write lock was not held by the thread. A thread acquired a read-write lock with one of the following read-write lock internal services:

- rdlock internal service CEEOPRL
- tryrdlock internal service CEEOPRT
- wrlock internal service CEEOPWL
- trywrlock internal service CEEOPWT

and was said to have held the lock.

Programmer Response: Structure the application so that the thread that locks the read lock also unlocks the read lock.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5K9

CEE5770S The read-write lock was already held.

Explanation: A thread invoked the read-write wrlock internal service CEEOPWL specifying a read-write lock that had already been locked by the thread. A read-write lock can only be locked for reading multiple times by the same thread.

Programmer Response: Structure the application so that the thread that locks the read-write lock also unlocks the read-write lock.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5KA

CEE5771S The read-write lock was already initialized.

Explanation: The read-write lock initialization internal service CEEOPMI was called to initialize a read-write lock object that had already been initialized.

Programmer Response: Call the real-write lock destroy internal service CEEOPMD to destroy an initialized read-write lock object before initializing it again.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5KC

CEE5772S The lock attribute object was not initialized.

Explanation: The mutex or read-write lock attribute related services required that the lock attribute object specified as a parameter be initialized.

Programmer Response: Use internal service CEEOPXI to initialize the mutex or read-write lock attribute object before invoking the service that failed.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5KC

CEE5773S There was insufficient storage to initialize a read-write lock object.

Explanation: The read-write lock initialization internal service CEEOPMI was called to initialize a read-write lock object. However, there was insufficient system storage available.

Programmer Response: Get additional system storage before initializing more read-write lock objects.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5KD

CEE5774S A read-write lock attribute object has been changed since it was initialized.

Explanation: The read-write lock attribute destroy internal service, CEEOPXD, detected that a read-write lock attribute object specified as a parameter was changed since it was initialized by the read-write lock attribute initialization internal service, CEEOPXI. The read-write lock attribute object was destroyed, but internal service, CEEOPXD, did not alter the storage associated with the read-write lock attribute object. However, if internal service, CEEOPXI, was invoked, the storage was altered.

Programmer Response: Make sure the application is not incorrectly reusing storage associated with the read-write lock attribute object after initializing it.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5KE

CEE5775S The read-write lock attribute object was already initialized.

Explanation: The read-write lock attribute initialization internal service, CEEOPXI, was called to initialize a read-write lock attribute object that had already been initialized.

Programmer Response: Call the read-write lock attribute destroy internal service, CEEOPXD, to destroy an initialized read-write lock attribute object before initializing it again.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5KF

CEE5776S There was insufficient storage to initialize a read-write lock attribute object.

Explanation: The read-write lock attribute initialization internal service, CEEOPXI, was called to initialize a read-write lock attribute object, however, there was insufficient system storage available.

Programmer Response: Acquire additional system storage before initializing more read-write lock attribute objects.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5KG

CEE5777S The lock was busy.

Explanation: The mutex or read-write lock destroy internal service CEEOPMD was invoked to destroy a lock that was in use. A mutex or read-write lock that is locked, or a mutex that is associated with a condition wait or timed wait, cannot be destroyed.

Programmer Response: Verify that no other thread holds the lock before calling CEEOPMD to destory the lock.

System Action: The request is rejected.

Symbolic Feedback Code: CEE5KH

CEE5778S An addressing exception occurred while referencing attribute return storage.

Explanation: The address where to return attribute information that was passed as a parameter on a call to the mutex and read-write lock attribute internal service, CEEOPXG, was invalid. An addressing exception occurred when the CEEOPXG internal service attempted to store the attribute value at this return address.

Programmer Response: Specify the correct attribute return address parameter on the CEEOPXG internal service call.

System Action: The application is terminated.

Symbolic Feedback Code: CEE5KI

CEE5779S System lock storage could not be freed.

Explanation: The destroy mutex and read-write lock internal service, CEEOPMD, was unable to free storage allocated for a mutex or read-write lock by the lock initialization service, CEEOPMI.

Programmer Response: Check if the application might have written over system storage. Report his problem to the storage administrator.

System Action: The thread is teminated.

Symbolic Feedback Code: CEE5KJ

CEE5780S System lock attribute storage could not be freed.

Explanation: The destroy lock attribute internal service, CEEOPXD, was unable to free storage allocated for a mutex or read-write lock attribute by the lock attribute initialization service, CEEOPXI.

Programmer Response: Check if the application might have written over system storage. Report his problem to the system administrator.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE5KK

CEE5781S There was invalid lock attribute storage.

Explanation: The mutex and read-write lock attribute internal service, CEEOPXG, found an invalid value in system storage for lock attributes of the specified type.

Programmer Response: Check if the application might have written over system storage. Report his problem to the system administrator.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE5KL

CEE5782S There was an invalid lock attribute value.

Explanation: The attribute parameter in a call to internal service, CEEOPXS, specified an invalid attribute value for lock attributes of the specified type. Valid values for type *setkind_np* or *settype are*:

- NONRECURSIVE + DEBUG + ERRORCHECK (0)
- RECURSIVE + DEBUG + ERRORCHECK (1)
- NONRECURSIVE + NODEBUG + ERRORCHECK (2)
- RECURSIVE + NODEBUG + ERRORCHECK (3)
- NONRECURSIVE + DEBUG + NOERRORCHECK (4)
- RECURSIVE + DEBUG + NOERRORCHECK (5)
- NONRECURSIVE + NODEBUG + NOERRORCHECK (6)
- RECURSIVE + NODEBUG + NOERRORCHECK (7)

Valid values for type *setpshared* are:

- PRIVATE (0)
- SHARED (8)

Programmer Response: Specify a correct attribute value.

System Action: Unless the condition is handled, the default action it to terminate the enclave.

Symbolic Feedback Code: CEE5KM

CEE5783C A thread waiting for a read-write lock was forced to terminate.

Explanation: An event, such as the initial thread terminating, forced all threads to terminate including threads waiting for a read-write lock.

Programmer Response: Check that all threads exit correctly.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE5KN

CEE5784I There was insufficient resource to initialize another read-write lock.

Explanation: The read-write lock init internal service, CEEOPMI, was invoked to initialize a read-write lock, but not enough resource was available to initialize another read-write lock.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5KO

CEE5785I There as insufficient privilege to initialize the read-write lock.

Explanation: The read-write lock init internal service, CEEOPMI, was invoked to initialize a read-write lock, but not enough privilege was available to initialize the read-write lock.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5KP

CEE5786S The OS/390 UNIX callable service, BPX1SLK, failed during shared lock processing. The system return code was *return_code***, the reason code was** *reason_code***. X'00'**

Explanation: The OS/390 UNIX callable service, BPX1SLK, was called by a Language Environment internal service for shared mutex or read-write lock processing. BPX1SLK returned without performing the specified shared lock processing (initialize, lock, unlock, or destroy).

Programmer Response: See *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* for the appropriate action to take for this return code and reason code. Consult with your OS/390 UNIX system support personnel if necessary.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5KQ

CEE5787I There as insufficient resource to obtain the read-write lock.

Explanation: The read-write lock rdlock or tryrdlock internal services, CEEOPRL, or CEEOPRT was invoked to lock a read-write lock, but not enough resource was available to obtain this read-write lock another time for read.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5KR

CEE5788I The read-write lock was busy.

Explanation: The read-write lock tryrdlock internal service, CEEOPRT, was invoked to lock a read-write lock for read that was already locked for write or had an outstanding write lock request.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5KS

CEE5789I The read-write lock was busy.

Explanation: The read-write lock trywrlock internal service, CEEOPWT, was invoked to lock a read-write lock for write that was already locked for read or write.

Programmer Response: None.

System Action: No system action is taken.

Symbolic Feedback Code: CEE5KT

CEE5790S There was insufficient storage to lock a read-write lock object.

Explanation: A thread attempted to lock a read-write lock by calling one of the following read-write lock internal services:

- rdlock internal service, CEEOPRL
- tryrdlock internal service, CEEOPRT
- wrlock internal service, CEEOPWL
- trywrlock internal service, CEEOPWT

However, there was insufficient system storage available.

Programmer Response: Acquire additional system storage before attempting to lock more read-write lock objects.

System Action: Unless the condition is handled, the default action is to terminate the enclave.

Symbolic Feedback Code: CEE5KU

CEE5791C System read-write lock storage could not be freed.

Explanation: The read-write lock unlock internal service, CEEOPRU was unable to free storage allocated for a read-write lock by one of the following read-write lock internal services:

- rdlock internal service, CEEOPRL
- tryrdlock internal service, CEEOPRT
- wrlock internal service, CEEOPWL
- trywrlock internal service, CEEOPWT

Programmer Response: Check if the application might have written over system storage. Report this problem to the storage administrator.

System Action: The thread is terminated.

Symbolic Feedback Code: CEE5KV

Chapter 10. C Prelinker and the C Object Library Utility Messages

This chapter provides message information for the prelinker and object library utilities.

A return code is generated to indicate the degree of prelinking success. The return codes are as follows:

0 No error detected; processing completed; successful execution anticipated.

4 Possible error (warning) detected; processing completed; successful execution probable.

8 Error detected; processing might have been completed; successful execution impossible.

12 Severe error detected; processing terminated abnormally; successful execution impossible.

The messages issued by the prelinker and object library utility have the following format:

EDCnnnns text <**&s**>

where

nnnn Error message number

s Error severity

- **I** Informational message
- **W** Warning message
- **E** Error message
- **S** Severe error message

&s Substitution variable, such as &1

Note: For C messages less than 4000, see *OS/390 C/C++ Compiler and Run-Time Migration Guide*.

The prelinker and object library utility can return the following messages:

EDC4000S Unable to open *&1*.

Explanation: An error was encountered during a file open.

Programmer Response: Make sure that the named file has the proper DCB requirements (i.e., RECFM, BLKSIZE, LRECL).

System Action: Processing terminates.

EDC4001S Unable to read *&1*.

Explanation: An error was encountered during a file read.

Programmer Response: Make sure that the named file has the proper DCB requirements (i.e., RECFM, BLKSIZE, LRECL). If the file has been corrupted recreate it, then recompile and run the new file.

System Action: Processing terminates.

EDC4002S Unable to write to *&1*.

Explanation: An error was encountered during a file write.

Programmer Response: Make sure that the named file has the proper DCB requirements (i.e., RECFM, BLKSIZE, LRECL). Also make sure that sufficient write space is available.

Programmer Response: Ensure that sufficient disk space is available.

System Action: Processing terminates.

EDC4004W Invalid options: *&1*.

Explanation: The listed prelinker options were invalid.

Programmer Response: Enter the list of valid options.

System Action: The invalid prelinker options are ignored and processing continues.

EDC4005E No input decks were specified.

Explanation: No input decks were specified for the prelink.

Programmer Response: Input at least one deck.

System Action: The prelinker will process nothing.

EDC4006S Object deck was missing TXT cards.

Explanation: A corrupted input deck was encountered during the prelink.

Programmer Response: Recompile the source routine and run it again. If the problem persists, call your IBM service representative.

System Action: Processing terminates.

EDC4007S Object deck had multiple initialized CSECTs.

Explanation: A corrupted input deck was encountered during the prelink.

Programmer Response: Recompile the source routine and run it again. If the problem persists, call your IBM service representative.

System Action: Processing terminates.

EDC4008S Invalid initialization deck (RLDs span cards).

Explanation: A corrupted input deck was encountered during the prelink.

Programmer Response: Recompile the source routine and run it again. If the problem persists, call your IBM service representative.

System Action: Processing terminates.

EDC4009S Invalid initialization deck (RLDs and TXTs not in sync).

Explanation: A corrupted input deck was encountered during the prelink.

Programmer Response: Recompile the source routine and run it again. If the problem persists, call your IBM service representative.

System Action: Processing terminates.

EDC4010W A zero length static object was found in assembler deck.

Explanation: A zero length static object was encountered in an assembler deck.

Programmer Response: Redefine the object with the appropriate size.

System Action: Incorrect or undefined execution could result.

EDC4011E Unresolved writable static references were detected.

Explanation: Undefined writable static objects were encountered at prelink termination.

Programmer Response: Prelink with the MAP option to find the objects in question and include these objects with the prelink step.

System Action: Prelinker produces object module with unresolved writable static references. Use of this object module could result in incorrect or undefined execution.

EDC4012E No input decks were found.

Explanation: Input decks were not found for the prelink.

System Action: The prelinker will process nothing.

EDC4013I No map displayed as no writable static was found.

Explanation: No writable static objects were found during the prelink.

System Action: If MAP option is specified, no static map is produced because no writable static objects were found.

EDC4014E Undefined writable static objects were detected:

Explanation: The listed writable static objects were undefined at prelink termination.

Programmer Response: Include these objects during the prelink.

System Action: Incorrect or undefined execution could result.

EDC4015W Unresolved references were detected:

Explanation: The listed objects were unresolved at prelink termination. Unresolved C library objects are not required for the prelink step, but should be resolved during the link-edit step. Unresolved writable static objects or unresolved objects referring to writable static objects are required for prelink.

Programmer Response: To correct the latter, include these objects during the prelink.

System Action: Prelinker only resolves writable static objects or unresolved objects referring to writable static objects.

EDC4016W Duplicate objects were detected:

Explanation: The listed objects were defined multiple times.

Programmer Response: Define the objects consistently.

System Action: Incorrect execution could occur unless the objects are defined consistently.

EDC4017W Duplicate object *&1* was defined with different sizes.

Explanation: An object had been defined multiple times with different sizes. The larger of the different sizes was taken. Incorrect execution could occur unless the object is defined consistently.

Programmer Response: Define the object consistently.

System Action: The largest size is used.

EDC4018E No member name specified and NAME card not found.

Explanation: For the ADD function, you must specify a member name, or a NAME card indicating the member name must be present in the object module.

Programmer Response: Repeat the step specifying an appropriate member name.

System Action: Processing terminates.

EDC4019S Invalid or missing XSD cards.

Explanation: A corrupted input deck was encountered during processing.

Programmer Response: Recompile your source routine and repeat the step. If the problem persists, call your IBM service representative.

System Action: Processing terminates.

EDC4020W Continuation card missing for *&1* control card.

Explanation: A control card of type *&1* was encountered with the continuation column set, but there was no next card or the next card was not a valid continuation card.

Programmer Response: Add the appropriate continuation card or set continuation column 72 to blank if no continuation card is required.

System Action: The card is ignored and processing continues.

EDC4021W Invalid syntax specified on *&1* control card.

Explanation: A control card with invalid syntax was encountered during processing.

Programmer Response: If the card is required, correct the syntax errors and repeat the step. If the card is not required, the warning message can be removed by deleting the invalid card.

System Action: If the card was an INCLUDE card, the card is processed up to the syntax error and the remainder of the card is ignored. If the card was not an INCLUDE card, the card is ignored. In either case, processing continues.

EDC4022W More than one *&1* card found in *&2*.

Explanation: More than one control card of type *&1* was encountered during the processing of *&2*.

Programmer Response: No recovery is necessary unless the incorrect card was chosen or incorrect processing was performed. In this case, remove the offending card and repeat the step.

System Action: If the card is a NAME card and this was encountered during the prelink step, the last NAME card is used and processing continues.

If the card is a NAME card and this was encountered during the C370LIB ADD or GEN steps, all NAME cards for *&2* are ignored and processing continues.

EDC4023W Continuation cards not allowed for *&1* card. Card ignored.

Explanation: A control card of type *&1* was found to be expecting a continuation card. Information for a card of this type must be specified on one card.

Programmer Response: Correct the card if necessary, set continuation column 72 to blank, and repeat the step.

System Action: The card is ignored and processing continues.

EDC4024W RENAME card cannot be used for short name *&1*.

Explanation: A RENAME card was encountered that attempted to rename a short name to another name. RENAME cards are valid only for long names for which there is no corresponding short name.

Programmer Response: The warning message can be removed by deleting the invalid RENAME card.

System Action: The card is ignored and processing continues.

EDC4025W Multiple RENAME cards found for *&1*. First valid one taken.

Explanation: More than one RENAME card was encountered for the name *&1*.

Programmer Response: The prelinker map shows which output name was chosen. If this was not the intended name, remove the duplicate RENAME card(s) and repeat the step.

System Action: The first RENAME card with a valid output name is chosen.

EDC4026W May not RENAME long name *&1* to another long name *&2*.

Explanation: A RENAME card had been encountered that attempted to rename a long name to another long name.

Programmer Response: The prelinker map shows which output name was chosen. If this was not the intended name, replace the invalid RENAME card with a valid output name and repeat the step. To remove the warning message, delete the invalid RENAME card.

System Action: The card is ignored and processing continues.

EDC4027W May not RENAME defined long name *&1* to defined name *&2*.

Explanation: A RENAME card had been encountered that attempted to rename the defined long name *&1* to another defined name *&2*.

Programmer Response: The prelinker map shows which output name was chosen. If this was not the intended name, replace the invalid RENAME card with a valid output name and repeat the step. To remove the warning message, delete the invalid RENAME card.

System Action: The card is ignored and processing continues.

EDC4028W RENAME card of *&1* to *&2* ignored since *&2* is target of another RENAME.

Explanation: Multiple RENAME cards had been encountered attempting to rename two different names the same name *&2*.

Programmer Response: The prelinker map shows which name was renamed to *&2*. If the output name for *&2* was not the intended name, change the name and repeat the step. To remove the warning message, delete the extra RENAME card(s).

System Action: The first valid RENAME card for *&2* is chosen.

EDC4029W *&1* and *&2* mapped to same name (*&3*) due to UPCASE option.

Explanation: A name (*&1*) that was made uppercase because of the UPCASE option collided with the output name (*&3*) of another name (*&2*).

Programmer Response: If both names (*&1* and *&2*) correspond to the same object the warning can be ignored. If the names do not correspond to the same object or if the warning is to be removed, do one of the following:

- Use a RENAME card to rename one of the names to something other than *&3*.
- Change one of the names in the source routine.
- Use `#pragma` map in the source routine on one of the names.
- Do not run the step with the UPCASE option.

System Action: Both names (*&1* and *&2*) are mapped to *&3*.

EDC4030E Missing command operands.

Explanation: One or more operands were missing on the invocation of object library utility command.

Programmer Response: Add the proper operands and repeat the step.

System Action: Processing terminates.

EDC4031W File *&1* not found.

Explanation: The specified file could not be located to perform the command.

Programmer Response: Try the command again, specifying the appropriate file.

System Action: If possible, processing continues ignoring the particular file.

EDC4032E Error with *&1* command. Return code=*&2*.

Explanation: In order to perform the library command, the system command *&1* was issued and resulted in a return code of *&2*.

Programmer Response: Diagnose the problem using the return code and any messages generated.

System Action: Processing terminates.

EDC4033E Invalid C370LIB-directory encountered in library *&1*.

Explanation: An invalid or corrupted C370LIB-directory had been encountered.

Programmer Response: Use the C370LIB DIR command to recreate the C370LIB-directory and repeat the step.

System Action: Processing terminates.

EDC4034E Library *&1* did not contain a C370LIB-directory.

Explanation: The library *&1* did not contain a C370LIB-directory necessary to perform the command.

Programmer Response: The library was not created with the C370LIB command. Use the C370LIB DIR command to create the C370LIB-directory and repeat the step.

System Action: Processing terminates.

EDC4035W Member *&1* not found in library *&2*.

Explanation: The specified member *&1* was not found in the library.

Programmer Response: Use the C370LIB MAP command to display the names of library members.

System Action: Processing continues.

EDC4036E Invalid command operands: *&1*.

Explanation: Invalid operands were specified on the invocation of this command.

Programmer Response: Specify the correct operands and repeat the step.

System Action: Processing terminates.

EDC4037E File *&1* had invalid format.

Explanation: The specified file, *&1*, did not have the proper format. The file should be fixed-format with a record length of 80.

Programmer Response: Correct the file or file specification and repeat the step.

System Action: The file is ignored and processing continues.

EDC4038E Library *&1* not found.

Explanation: The library, *&1*, could not be found to perform the command.

Programmer Response: Try the command again, specifying the correct library.

System Action: Processing terminates.

EDC4039E Library *&1* had invalid format.

Explanation: The specified library, *&1*, did not have the proper format. The library must contain object modules as members and be fixed-format with a record length of 80.

Programmer Response: Correct the library or library specification and repeat the step.

System Action: Processing terminates.

EDC4042S Virtual storage exceeded.

Explanation: The utility ran out of memory. This sometimes happens with large files or routines with large functions. Very large routines limit the optimization that can be done.

Programmer Response: Divide the file into several smaller sections or shorten the function.

System Action: Processing terminates.

EDC4043E Invalid symbol table encountered in archive library *&1*.

Explanation: The archive library from the MVS system had invalid information in its symbol table.

Programmer Response: Rebuild the archive library.

System Action: The invalid archive library is ignored and processing continues.

EDC4044E Archive library *&1* did not contain a symbol table.

Explanation: The symbol table for the archive library from the MVS system could not be found.

Programmer Response: Rebuild the archive library.

System Action: The invalid archive library is ignored and processing continues.

EDC4045E Archive library *&1* not found.

Explanation: The archive library could not be found.

Programmer Response: Try the command again specifying the appropriate file.

System Action: The invalid archive library is ignored and processing continues.

EDC4046E Archive library *&1* had invalid format.

Explanation: The file was found but did not have the correct information to be recognized as an archive library.

Programmer Response: Rebuild the archive library.

System Action: The invalid archive library is ignored and processing continues.

EDC4048W Card *&1* of *&2* is invalid.

Explanation: The card shown is not valid.

Programmer Response: Prelink the DLL and generate a new, uncorrupted definition side-deck.

EDC4049E Unresolved references could not be imported.

Explanation: The same symbol was referenced in both DLL and non-DLL code. The DLL reference could have been satisfied by an IMPORT control statement which was processed, but the non-DLL reference could not.

Programmer Response: You must either supply a definition for the referenced symbol during the prelink step or recompile the code containing the non-DLL reference with the `DLL` compiler option so that it becomes a DLL reference.

EDC4050W Card *&1* of *&2* is not the continuation of an IMPORT control statement.

Explanation: The object deck of `IMPORT` control statements is corrupted.

Programmer Response: Prelink the exporting DLL again to generate a new object deck of control statements or get a new copy from the DLL provider.

EDC4051W Duplicate IMPORT definitions are detected.

Explanation: A name referenced in DLL code was not defined within the application but more than one IMPORT control statement was seen with that symbol name. The first one seen by the prelinker was used.

Programmer Response: Check the Import Symbol Map section of the Prelinker Map to see if you are importing the symbol from the correct DLL. If not, change the input order of the IMPORT control statements.

EDC4052W Module name *&1* chosen for generated IMPORT control statements.

Explanation: The prelinker has assigned the default name TEMPNAME to the module in the Definition Side-Deck.

Programmer Response: Include a NAME control statement in the prelinker input or specify the output object module of the prelinker to be a PDS member so that the prelinker will use that as the module name in generated IMPORT control statements.

Severe Error Messages

The following error messages are produced by the prelinker or the Object Library Utility if the message file is itself invalid.

EDC0090 Unable to open message file *&1*.
EDC0091 Invalid offset table in message file *&1*.
EDC0092 Message component *&1* is not found.
EDC0093 Message file *&1* corrupted.
EDC0094 Integrity check failure on msg *&1*.
EDC0095 Bad substitution number in message *&1*.
EDC0096 Virtual storage exceeded.

Chapter 11. C Utility and SPC Messages

This chapter provides message information for the `localedef` utility, the `iconv` utility, the `genxlt` utility, and System Programming C.

localedef Messages

This section contains the `localedef` messages.

Return Codes

The `localedef` utility returns the following return codes:

0 No errors were detected and the locales were generated successfully
.

4 Warning messages were issued and the locales were generated successfully, or error messages were issued but the BLDERR option was specified.

4 Warning or errors were detected and the locale was not generated.

Messages

The messages issued by the `localedef` utility have the following format.

Message Format: EDCnnnn ss text <**%n$x**>

nnnn Error message number

ss Error severity

- **10** Warning message
- **30** Error message
- **40** Severe error

%n$x Substitution variable

- **%** The start of the substitution variable
- **n** The number that represents the line position of the variable
- **$** A delimiter
- **x** The kind of variable (d=decimal, c=character, s=string)

Warning messages will be issued when the FLAG(E) option is not specified. The default FLAG(W), will produce warnings. When warning messages (severity of 10) are issued, the minimum return code from the `localedef` utility is 4.

When error messages (severity of 30) are issued, the locale is built only if the BLDERR option is specified. The default is NOBLDERR. If BLDERR is specified, the return code would be set to a minimum of 4. If error messages are issued and NOBLDERR was specified (or by default), the return code will be set to a minimum of 8.

When severe error messages (severity of 40) are issued, the locale is not built and the return code from the `localedef` utility is 12.

The messages that can be issued are as follows:

EDC4100 40 The symbolic name '%1$s' was not the correct type.

Explanation: This message is issued in the locale definition file when using a symbolic name that was not the expected type. The most common time this error occurs is when the LC_CTYPE keywords are used as character references in any locale definition file category.

Programmer Response: Use a symbolic name instead of a character reference.

System Action: The locale has not been created.

EDC4101 40 Could not open '%1$s' for read.

Explanation: This message is issued if the open for read failed for any file required by the `localedef` utility. The file name passed to `fopen()` is included in the message. The locale is not created.

Programmer Response: Verify the file name is correct and the file/data set exists.

System Action: The locale has not been created.

EDC4102 40 Internal error in file %1$s on line %2$d.

Explanation: An internal error had occurred in the `localedef` utility.

Programmer Response: Examine the locale definition and charmap files for possible errors. Report error to IBM.

System Action: The locale has not been created.

EDC4103 40 Syntax Error: expected %1$d arguments and received %2$d arguments.

Explanation: This message is issued in the locale definition file when a keyword was expecting a fixed number of arguments and not enough arguments were supplied.

Programmer Response: Add the missing arguments to the keyword in the locale definition file.

System Action: The locale has not been created.

EDC4104 40 Illegal limit in range specification.

Explanation: An error had occurred in a range in the LC_CTYPE category of the locale definition file. The locale was not created.

Programmer Response: Examine the locale definition file for possible errors.

System Action: The locale has not been created.

EDC4105 40 Memory allocation failure on line %1$d in module %2$s.

Explanation: The `localedef` utility was unable to allocate memory.

Programmer Response: Under MVS and TSO, increase region size and rerun the `localedef` utility. Under CMS, increase the virtual machine size and rerun the `localedef` utility.

System Action: The locale has not been created.

EDC4106 40 Could not open file '%1$s' for write.

Explanation: This message is issued if the open for write failed when the `localedef` utility attempted to generate the C program. The file name passed to `fopen()` is included in the message.

Programmer Response: Under CMS, verify the A-Disk exists and is in WRITE mode.

System Action: The locale has not been created.

EDC4107 40 The '%1$s' symbol was longer than <mb_cur_max>.

Explanation: The length of value assigned to the specified symbol in the charmap file must not be as big as the value assigned to <mb_cur_max>. <mb_cur_max> defaults to 1 and can only have the values 1 or 4. If multibyte characters are required then the value of <mb_cur_max> must also include the shift_in and shift_out characters even though the shift_in and shift_out characters are not entered into the charmap file as part of a character definition.

Programmer Response: Increase the size of <mb_cur_max> or remove the extra byte in multibyte sequence assigned to the symbol specified.

System Action: The locale has not been created.

EDC4108 10 The '%1$s' symbolic name was undefined and has been ignored.

Explanation: The specified symbolic name used in the locale definition file was not defined in the charmap file. When a symbolic name that is not defined is used in the LC_CTYPE or LC_COLLATE categories, the warning is issued.

Programmer Response: Define the specified symbol name in the charmap file.

System Action: The character has been ignored and the locale has been created.

EDC4109 40 The '%1$s' symbolic name was undefined.

Explanation: The specified symbolic name used in the locale definition file was not defined in the charmap file. When a symbolic name that is not defined is used in categories other than LC_CTYPE or LC_COLLATE, an error message is issued.

Programmer Response: Define the specified symbol name in the charmap file.

System Action: The locale has not been created.

EDC4110 40 The start of the range, '%1$s', must be numerically less than the end of the range, '%2$s'.

Explanation: In the collation section of the locale definition file, the start range codepoint specified must be less than the end range codepoint specified. These codepoints were assigned values in the charmap file where the codepoints can be assigned in any order.

Programmer Response: Change the collation range codepoints in the locale definition file so that the start of the range is less than the end of the range.

System Action: The locale has not been created.

EDC4111 40 The symbol range containing %1$s and %2$s was incorrectly formatted.

Explanation: The symbolic names used in range definition in the charmap file should consist of zero or more nonnumeric characters, followed by an integer formed by one or more decimal digits. The characters preceding the integer should be identical in the two symbolic names, and the integer formed by the digits in the second name should be equal to or greater than the integer formed by the digits in the first name. This is interpreted as a series of symbolic names formed from the common part and each of the integers between the first and second integer, inclusive.

In the following example, the first line is valid as both names have the same prefix, followed by four digits, whereas the second example has a different prefix for the first and second name, and is invalid.

```
<ab0101>...<ab0120>  \x42\xc1
<abc0101>...<ab0120> \x42\xc1
```

Programmer Response: Check the specified symbolic names to ensure compliance to the above rules.

System Action: The locale has not been created.

EDC4112 40 Illegal character reference or escape sequence in '%1$s'.

Explanation: A character reference or escape sequence had been defined that was not legal.

Programmer Response: Make the character reference or escape sequence legal.

System Action: The locale has not been created.

EDC4113 30 The symbolic name '%1$s', had already been specified.

Explanation: The specified symbolic name in the charmap file had already been specified. A symbolic name should only be defined once.

Programmer Response: Remove the duplicate symbolic name from the charmap file.

System Action: The locale has not been created.

EDC4114 10 There are characters in the codeset which were unspecified in the collation order.

Explanation: There were characters defined in the charmap file that were not used in the collation category of the locale definition file. The locale was still created. The characters were added at the end of the collation sequence.

Programmer Response: If required, add the missing characters from the charmap file to the collation category of the locale definition file.

System Action: The locale has been created and the characters were added at the end of the collation sequence.

EDC4115 30 Illegal decimal constant '%1$s'.

Explanation: The decimal constant of type '\dnnn' specified in the charmap file was greater than decimal 255.

Programmer Response: Change the decimal constant in the charmap file to a value less than or equal to 255.

System Action: The locale has not been created.

EDC4116 30 Illegal octal constant '%1$s'.

Explanation: The octal constant of type '\nnn' specified in the charmap file was greater than octal 377.

Programmer Response: Change the octal constant in the charmap file to a value less than or equal to octal 377.

System Action: The locale has not been created.

EDC4117 30 Illegal hexadecimal constant '%1$s'.

Explanation: The hexadecimal constant of type '\xnn' specified in the charmap file was greater than hexadecimal FF.

Programmer Response: Change the hexadecimal constant in the charmap file to a value less than or equal to hexadecimal FF.

System Action: The locale has not been created.

EDC4118 30 Missing closing quote in string '%1$s'.

Explanation: The string specified had a opening double quote but no closing double quote. The closing quote will be added.

Programmer Response: Add the closing double quote after the string.

System Action: The locale has not been created. If BLDERR option is specified, the characters between the opening double quote and the end of line character will be used.

EDC4119 30 Illegal character, '%1$c', in input file.

Explanation: An illegal character had been found in the charmap or locale definition file.

Programmer Response: Remove the character.

System Action: The locale has not been created. If BLDERR option is specified, the character is ignored.

EDC4120 30 The character for '%1$s' statement is missing.

Explanation: When defining the escape character or comment character in the charmap or locale definition file, a character was not supplied.

Programmer Response: Insert a character to be defined as the escape character or comment character in the charmap or locale definition file.

System Action: The statement was ignored and the escape character or comment character was not changed. The locale has not been created. If BLDERR option is specified, the default comment or escape character is used.

EDC4121 30 '%1$c' is not a POSIX Portable Character.

Explanation: When defining escape_char or comment_char in the charmap or locale definition file, the character was less than space.

Programmer Response: Define the escape_char or comment_char in the charmap or locale definition file with a character greater than space.

System Action: The statement was ignored and the escape character or comment character was not changed. The locale has not been created. If BLDERR option is specified, the default comment or escape character is used.

EDC4122 30 The character symbol '%1$s' is missing the closing '>'**.**

Explanation: The character symbol specified had a less than sign at the beginning of the symbol but no closing greater than sign. The symbol was accepted.

Programmer Response: Add the greater than sign after the symbol.

System Action: The locale has not been created. If BLDERR option is specified, the characters between the open '<' and the end of line character is used.

EDC4123 30 Unrecognized keyword, '%1$s'.

Explanation: When a dot is not used in a string or as part as of an ellipses (...), the keyword is unrecognized, the statement is ignored.

Programmer Response: Remove the dot which is part of the unrecognized keyword or add the missing dots to make up ellipses (...).

System Action: The locale has not been created.

EDC4124 40 The encoding specified for the '%1$s' character is unsupported.

Explanation: The multibyte character was not valid, contains a shift out without a corresponding shift in or a shift in character without a corresponding shift out. The locale was not created.

Programmer Response: If the string contains unmatched shift in or shift out characters, remove them.

System Action: The locale has not been created.

EDC4125 30 The character, '%1$s', had already been assigned a weight.

Explanation: The specified character or symbolic name in the collation category of the locale definition file, had already been defined.

Programmer Response: Remove the duplicate character or symbolic name for the collation category.

System Action: The locale has not been created. If BLDERR option is specified, the second definition is ignored.

EDC4126 30 A character in range '%1$s...%2$s' already had a collation weight.

Explanation: A character or symbolic name in the specified range in the collation category of the locale definition file, had already been defined in the collation category.

Programmer Response: Remove the duplicate character or adjust the range so as not to cover duplicate characters.

System Action: The locale has not been created. If BLDERR option is specified, the second definition is ignored.

EDC4127 10 No toupper section defined for this locale source file.

Explanation: The toupper keyword in the LC_CTYPE category in the locale definition file was not specified. The lowercase character 'a' to 'z' are mapped to the characters 'A' to 'Z'.

Programmer Response: Add the lowercase characters 'a' to 'z' and 'A' to 'Z' to the toupper section of the LC_CTYPE category in the locale definition file.

System Action: The locale has been created.

EDC4128 10 The use of the '...' keyword assumed that the codeset was contiguous between the two range endpoints specified.

Explanation: This warning is always produced when ellipses (...) are used in defining collation sequences in the locale definition file because the locale may not be portable whenever ellipses are used.

Programmer Response: Instead of using ellipses, insert all the symbol names between the two range endpoints.

System Action: The locale is still created.

EDC4129 30 The symbolic name, '%1$s', referenced had not yet been specified in the collation order.

Explanation: Collation weights in the locale definition file must use symbolic names that have already been specified in the collation order.

Programmer Response: Remove the reference to the symbolic name from the collation weights that have not yet been specified in the collation order.

System Action: The locale has not been created. If BLDERR option is specified, the unspecified reference to the symbolic name is ignored.

EDC4130 30 Error in file %1$s, on line %2$d, at character %3$d.

Explanation: An error had occurred in the charmap or locale definition file on the line number supplied and at the character position supplied. The line number and character position in the message indicates the position within the file when the error was detected. This may be after the line containing the error.

Programmer Response: See the message following for more information.

EDC4131 10 Warning in file %1$s, on line %2$d, at character %3$d.

Explanation: A warning message had been produced for the line number supplied, at the character position supplied in the charmap or locale definition file name supplied. The line number and character position in the message indicates the position within the file when the error was detected. This may be after the line containing the error.

Programmer Response: See the message following for more information.

EDC4132 30 Syntax error in file %1$s, on line %2$d, at character %3$d.

Explanation: A syntax error had been found in the charmap or local definition file name supplied, on the line number supplied and at the character position supplied. The line number and character position in the message indicates the position within the file when the error was detected. This may be after the line containing the error.

Programmer Response: Change the line in the charmap or locale definition file to conform to the POSIX standard format.

EDC4133 40 Specific collation weight assignment was not valid when no sort keywords have been specified.

Explanation: The number of sort rules, such as forward, backward, no-substitute or position, specified after the order_start keyword must be greater than or equal to the number of weights assigned to any one character in the collation category of the locale definition file. When no sort rules are specified, one forward sort rule is assumed.

Programmer Response: Add additional sort rules to the order_start keyword.

System Action: The locale has not been created.

EDC4134 10 The <mb_cur_min> keyword must be defined as 1, you had defined it as %1$d.

Explanation: The <mb_cur_min> keyword in the charmap file can only be set to 1.

Programmer Response: Change the value of the <mb_cur_min> keyword in the charmap file to 1.

System Action: The Value was ignored and the locale has been created.

EDC4135 30 The <code_set_name> must contain only characters from the POSIX portable character set, '%1$s' is not valid.

Explanation: The <code_set_name> in the charmap file must only use graph characters. It must contain only characters from the portable character set. The character %1$s is not valid.

Programmer Response: Remove the character from the <code_set_name> in the charmap file that is not in the portable character set.

System Action: The locale has not been created. If BLDERR option is specified, the <code_set_name> is used anyway.

EDC4136 30 The sort rules forward and backward are mutually exclusive.

Explanation: Each sort rules of the order_start keyword of the collation category in the locale definition file can consist of one or more sort rules separated by commas. The sort rules forward and backward, cannot be used at the same time.

Programmer Response: Specify only forward or backward but not both.

System Action: The locale has not been created.

EDC4137 30 Received too many arguments, expected %1$d.

Explanation: This message is issued in the locale definition file when a keyword is expecting a fixed number of arguments and too many arguments are supplied.

Programmer Response: Remove the unnecessary argument in the locale definition file.

System Action: The locale has not been created. If BLDERR option is specified, the extra arguments are ignored.

EDC4138 30 The %1$s category had already been defined.

Explanation: The specified category in the locale definition file should only be defined once.

Programmer Response: Remove the specified duplicate category.

System Action: The locale has not been created. If BLDERR option is specified, the second definition of the duplicate category is ignored.

EDC4139 10 The %1$s category was empty.

Explanation: The specified category in the locale definition file did not contain any keywords.

Programmer Response: Remove the empty category or add keywords to the specified category.

System Action: The locale has been created.

EDC4140 30 Unrecognized category %1$s was not processed by localedef.

Explanation: User defined categories in the locale definition file were not supported. That is, categories that are not LC_CTYPE, LC_COLLATE, LC_MONETARY, LC_NUMERIC, LC_TIME, LC_MESSAGES, LC_SYNTAX or LC_TOD were not processed by the `localedef` utility.

Programmer Response: Remove the unrecognized category from the locale definition file.

System Action: The locale has not been created. If BLDERR option is specified, the unsupported categories are ignored.

EDC4141 10 The POSIX defined categories must appear before any unrecognized categories.

Explanation: User defined categories in the locale definition file must appear after the POSIX defined categories LC_CTYPE, LC_COLLATE, LC_MONETARY, LC_NUMERIC, LC_TIME, LC_MESSAGES, LC_SYNTAX and LC_TOD.

Programmer Response: Move the unrecognized category to the end of locale definition file.

System Action: The locale has been created.

EDC4142 30 The file code for the digit %1$s was not one greater than the file code for %2$s.

Explanation: The values assigned to the digit symbolic names <zero> to <nine> in the charmap file must be in sequence and be contiguous.

Programmer Response: Change the value assigned to the specified digit symbolic name in the charmap file so that it is one greater than the value assigned to the preceding digit symbolic name.

System Action: The locale has not been created.

EDC4143 30 The process code for the digit %1$s is not one greater than the process code for %2$s.

Explanation: The wide character values assigned to the digit symbolic names <zero> to <nine> in the charmap file must be in sequence and be contiguous.

Programmer Response: Change the wide character value assigned to the specified digit symbolic name in the charmap file so that it is one greater than the wide character value assigned to the preceding digit symbolic name.

System Action: The locale has not been created. If BLDERR option is specified, the values are forced to be used.

EDC4144 30 The symbol %1$s has already been defined.

Explanation: The collation symbol must be a symbolic name, enclosed between angle brackets (< and >), and should not duplicate any symbolic name in the charmap file or any other name defined in the collation definition.

Programmer Response: Use another symbolic name for the collating symbol.

System Action: The locale has not been created. If BLDERR option is specified, the definition as a collating-symbol is ignored.

EDC4145 10 Locale did not conform to POSIX specifications for the LC_CTYPE '%1$s' keyword.

Explanation: The specified keyword in the LC_CTYPE category in the locale definition contained characters that conflict with the POSIX definition of the category. This may be caused by the following:

- The upper keyword contained characters from the cntrl, digit, punct or space keywords.
- The lower keyword contained characters from the cntrl, digit, punct or space keywords.
- The alpha keyword contained characters from the cntrl, digit, punct or space keywords.
- The space keyword contained characters from the digit, upper, lower, alpha or xdigit keywords.
- The cntrl keyword contained characters from the digit, upper, lower, alpha, graph, punct, print or xdigit keywords.
- The punct keyword contained characters from the digit, upper, lower, alpha, cntrl, space or xdigit keywords.
- The graph keyword contained characters from the cntrl keyword.
- The print keyword contained characters from the cntrl keyword.

Programmer Response: Remove the character from the specified keyword that conflicts with characters from one of the other keywords.

System Action: The locale has been created.

EDC4146 10 Locale did not specify the minimum required for the LC_CTYPE '%1$s' keyword. Setting to POSIX defined defaults.

Explanation: The specified keyword in the LC_CTYPE category in the locale definition file did not contain the minimum characters required by the keyword. The minimum requirements for the keywords are as follows:

- The upper keyword does not contain the required characters 'A' to 'Z'.
- The lower keyword does not contain the required characters 'a' to 'z'.
- The digit keyword does not contain the required digits 0 through 9.
- The xdigit keyword does not contain the required digits 0 through 9,the uppercase letters 'A' through 'F' and the lowercase letters 'a' through 'f'.
- The space keyword does not contain the required characters space, form feed, newline, carriage return, horizontal tab and vertical tab.
- The blank keyword does not contain the required characters space and tab.

Programmer Response: Specify the minimum requirements for the specified keyword.

System Action: The locale has been created.

EDC4147 10 Locale did not specify only '0', '1', - '2', '3', '4', '5', '6', '7', '8', and '9' for LC_CTYPE digit keyword.

Explanation: The digit keyword in the LC_CTYPE category in the locale definition file can only contain the characters required, '0' to '9'.

Programmer Response: Remove the character outside the '0' to '9' range in the digit keyword.

System Action: The locale will still be created.

EDC4148 10 Locale did not specify only '0', '1', '2', '3', '4', '5', '6', '7', '8', '9', 'a' through 'f', and 'A' through 'F' for LC_CTYPE xdigit keyword.

Explanation: The xdigit keyword in the LC_CTYPE category in the locale definition file can only contain the characters required, '0' to '9' and 'A' to 'F' or 'a' to 'f'. The locale will still be created.

Programmer Response: Remove the character outside the range '0' to '9' and 'A' to 'F' or 'a' to 'f' to the xdigit keyword.

System Action: The locale will still be created.

EDC4149 30 The number of operands to LC_COLLATE order exceeded COLL_WEIGHTS_MAX.

Explanation: The number of sort rules, such as forward, backward, no-substitute or position, specified after the order_start keyword must not exceed COLL_WEIGHTS_MAX in the collation category of the locale definition file.

Programmer Response: Reduce the number of sort rules to the order_start keyword.

System Action: The locale has not been created. If BLDERR option is specified, the extra operands are ignored.

EDC4150 30 Both '%1$s' and '%2$s' symbols must be characters and not collation symbols or elements.

Explanation: When defining ranges using ellipses (...) in the collation category of the locale definition file, the endpoints of the range must be characters or symbolic names defined in the charmap file. They should not be collating-symbol operands or collating-element operands.

Programmer Response: Use different characters for the range endpoints.

System Action: The locale has not been created. If the BLDERR option is specified, the defined ranges will not be used.

EDC4151 10 Option %1$s is not valid and was ignored.

Explanation: The option specified in the message is not a valid `localedef` utility option or a valid option has been specified with an invalid value.

Programmer Response: Rerun the `localedef` utility with the correct option.

System Action: The specified option was ignored and the locale has been created.

EDC4152 10 No matching right parenthesis for %1$s option.

Explanation: The option specified had a sub option beginning with a left parenthesis but no right parenthesis was present. The option and suboption were accepted and the locale was still produced.

Programmer Response: Add the right parenthesis after the sub option.

System Action: The option and sub option has been accepted and the locale was still produced.

EDC4153 10 Symbol name %1$s is undefined and was required in the charmap file.

Explanation: The symbolic name specified is not defined in the charmap file and must be specified.

Programmer Response: Define the missing symbol name in the charmap file.

System Action: The locale has been produced.

EDC4154 30 Keyword 'copy' cannot be nested.

Explanation: A locale category specifies the copy keyword, and the locale from which the category is being copied from also includes copy keyword for the same category.

Programmer Response: Change the name of the existing locale to be copied to the name specified in existing locale copy keyword.

System Action: The locale has not been created. If BLDERR option is specified, the default is used for the category.

EDC4155 30 'copy' keyword category '%1$s' not found.

Explanation: The specified category cannot be found in the locale definition file that was included using the copy keyword. The category is not copied.

Programmer Response: Change the name of the existing locale to be copied or add the specified category to the locale definition file.

System Action: The category is not copied and the locale has not been created.

EDC4156 30 LC_SYNTAX '%1$s' character can only be a punctuation character.

Explanation: The specified character defined in the LC_SYNTAX category of the locale definition file, must be a punctuation character. The character was ignored.

Programmer Response: Only use punctuation characters as LC_SYNTAX characters.

System Action: The locale has not been created.

EDC4157 10 LC_SYNTAX '%1$s' character can only have a length of 1. Ignoring additional characters.

Explanation: The specified character defined in the LC_SYNTAX category of the locale definition file contained more than one character, or specified a multibyte character. The LC_SYNTAX characters must only be single-byte characters.

Programmer Response: Only use single-byte characters as LC_SYNTAX characters.

System Action: The locale is created ignoring additional characters.

EDC4158 10 LC_SYNTAX '%1$s' character could not be found in the charmap file. Assigned code page IBM-1047 symbol '%2$s'.

Explanation: The LC_SYNTAX category was omitted, or the character was omitted from the LC_SYNTAX category, and the `localedef` utility attempted to assign the default value. The specified symbolic name was not found in the charmap file, and the character has been assigned the code point value from the IBM-1047 code page.

Programmer Response: Specify the character in the LC_SYNTAX category that exists in charmap file, or change the charmap file to include the specified symbolic name.

System Action: The local is still created.

EDC4159 30 Duplicate characters for '%1$s' and '%2$s' found in LC_SYNTAX.

Explanation: The specified characters from the LC_SYNTAX category have the same code points assigned.

Programmer Response: Change the characters to specify different code points for each of the LC_SYNTAX characters.

System Action: The locale has not been build.

EDC4160 10 The '%1$s' keyword is not supported and was ignored.

Explanation: The specified keyword is not defined in the POSIX standard.

Programmer Response: Remove the specified keyword.

System Action: The undefined keyword is ignored and locale has been created.

EDC4161 10 The <mb_cur_max> keyword must be defined as 1 or 4, you have defined it as %1$d. Value is ignored.

Explanation: The <mb_cur_max> keyword can have the value of 1 for single-byte characters only, or 4 to support DBCS characters. Values of other than 1 or 4 are ignored.

Programmer Response: Specify <mb_cur_max> as either 1 or 4.

System Action: The value is ignored and locale has been created. If BLDERR option is specified, the value of 1 is used.

EDC4162 30 Both <shift_in> and <shift_out> must be specified or neither specified.

Explanation: Either the <shift_in> keyword or the <shift_out> keyword have been specified, but not both.

Programmer Response: Specify either both or neither <shift_in> and <shift_out>.

System Action: The locale has not been created.

EDC4163 30 You have exceeded the maximum number of alternate strings for alt_digits.

Explanation: Up to 100 alternate strings can be specified for the alt_digits keyword for the values from zero to 99.

Programmer Response: Remove the extra alternate strings.

System Action: The locale has not been created. If BLDERR option is specified, the extra strings are ignored.

EDC4164 30 The grouping string '%1$s' is invalid.

Explanation: The string specified for the LC_NUMERIC grouping keyword or LC_MONETARY mon_grouping keyword is not in the correct format. The string should consist of numbers in the range –1 and 254 separated by semicolons.

Programmer Response: Correct the grouping or mon_grouping string to be in the correct format.

System Action: The locale has not been created.

EDC4165 10 The grouping string '%1$s' is invalid and had been truncated to '%2$s'.

Explanation: The string specified for the LC_NUMERIC grouping keyword or LC_MONETARY mon_grouping keyword is not in the correct format. The string should consist of numbers in the range –1 and 254 separated by semicolons, with no other numbers or semicolons following the –1.

Programmer Response: Remove the characters from the grouping or mon_grouping string following the –1.

System Action: The characters following the –1 were ignored and the locale has been created.

EDC4166 30 The value '%1$d' for '%2$s' is invalid.

Explanation: The value %1$d specified is not a value for the specified keyword. For example, the day is not valid for the specified month, or the month is not in the range from 1 to 12.

Programmer Response: Correct the value for the specified keyword to be within the correct range for that keyword.

System Action: The locale has not been created. If BLDERR option is specified, localdef assign 0 to value '%1$d'.

EDC4167 30 '%1$s' specified with no '%2$s'.

Explanation: The keyword specified can only be specified if the other keyword is also specified. Either both or neither should be specified.

Programmer Response: Either remove the first keyword specified, or add the other required keyword.

System Action: The locale has not been created.

EDC4168 10 'daylight_name' must be specified if Daylight Saving Time information is to be used by the mktime and localtime functions.

Explanation: Keywords had been specified in the LC_TOD category, but the 'daylight_time' keyword had not been specified. The other keywords will be ignored.

Programmer Response: Remove the other keywords from the LC_TOD category, or add the 'daylight_time' keyword.

System Action: The locale has been build.

EDC4169 30 One-to-many mappings cannot be specified against a collating-symbol, collating-element or the UNDEFINED symbol.

Explanation: A one-to-many mapping has been specified in the LC_COLLATE category against a collating-symbol, collating-element or the UNDEFINED symbol. For example, all of the following would cause this error message:

```
collating-symbol  <HIGH>
collating-element <ch> from "<c><h>"
<HIGH>    "<A>"
<ch>      "<B>"
UNDEFINED "<C>"
```

Programmer Response: Remove the one-to-many mapping from the collating-symbol, collating-element or the UNDEFINED symbol.

System Action: The locale has not been build.

EDC4170 40 Write failed while writing to file %1$s.

Explanation: The write failed to the specified file.

Programmer Response: Look for a basic problem, such as insufficient disk space or lack of access to the file. If you are still unable to determine the cause of the write failure, contact your system programmer.

System Action: The locale has not been created.

EDC4171 30 The process code of the first character of the collating-element was greater than the maximum process code.

Explanation: The wchar_t value for the first character in a collating-element was greater than the largest character specified in the charmap file. This may occur if the charmap file specifies <mb_cur_max> of 4, but did not specify the DBCS characters, and the collating-element begins with a DBCS character.

Programmer Response: Either use a charmap file that specifies <mb_cur_max> of 1, or change the collating-element to not start with a DBCS character.

System Action: The locale has not been created.

iconv Utility Messages

This section contains the `iconv` return codes and messages.

Return Codes

The `iconv` utility returns the following return codes:

0 No errors were detected and the file was successfully converted from the input codeset to the output codeset.

4 The specified conversions are not supported, the given input file cannot be read, or there is a usage-syntax error.

8 An unusable character was encountered in the input file.

>**8** A severe error occurred.

Messages

The messages issued by the `iconv` utility have the following format:

Message Format: EDCnnnn s text <**%n$x**>

nnnn Error message number

s Error severity

- **10** Warning message
- **30** Error message

%n$x Substitution variable

- **%** The start of the substitution variable
- **n** The number that represents the line position of the variable
- **$** A delimiter
- **x** The kind of variable (d=decimal, c=character, s=string)

The messages that can be issued are as follows:

EDC4151 10 Option *%1$s* is not valid and was ignored.

Explanation: The option specified in the message is not a valid `iconv` utility message, or a valid option had been specified with an invalid value.

System Action: The specified option has been ignored.

Programmer Response: Rerun the `iconv` utility, specifying the correct option.

EDC4152 10 No matching right parenthesis for *%1$s* option.

Explanation: The option specified had a suboption beginning with a left parenthesis, but no right parenthesis was present.

Programmer Response: Add the right parenthesis.

System Action: The option has been accepted as entered.

EDC4180 30 FROMCODE option had not been specified.

Explanation: The FROMCODE option is required, but had not been specified.

Programmer Response: Rerun the `iconv` utility, specifying the FROMCODE option.

System Action: The file has not been converted.

EDC4181 30 TOCODE option has not been specified.

Explanation: The TOCODE option is required, but has not been specified.

Programmer Response: Rerun the `iconv` utility, specifying the TOCODE option.

System Action: The file has not been converted.

EDC4182 30 Cannot open converter from *%1$s* to *%2$s*.

Explanation: The `iconv` utility could not locate the conversion from *%1$s* to *%2$s*.

Programmer Response: Check the *%1$s* and *%2$s* specified to ensure they are correct.

System Action: The file has not been converted.

EDC4183 30 Cannot open input file.

Explanation: The `iconv` utility could not open the input file.

Programmer Response: Verify that the correct file name has been specified and rerun the `iconv` utility.

System Action: The file has not been converted.

EDC4184 30 Cannot open output file.

Explanation: The `iconv` utility could not open the output file.

Programmer Response: Correct the cause of the error and rerun the `iconv` utility.

System Action: The file has not been converted.

EDC4185 30 Invalid character found.

Explanation: An invalid character was detected in the input file and could not be converted.

Programmer Response: Correct the invalid character in the input file, or specify a different FROMCODE and TOCODE.

System Action: The file is converted up to the record in error.

EDC4186 30 Truncated character found.

Explanation: The end of the file has been reached, and a truncated multibyte character was detected.

Programmer Response: Correct the invalid character in the input file, or specify a different FROMCODE and TOCODE.

System Action: The last character has not been converted.

EDC4187 30 Unable to allocate enough memory.

Explanation: The `iconv` utility could not allocate buffers for use when converting the file.

Programmer Response: Rerun the `iconv` utility with more memory.

System Action: The file has not been converted.

EDC4188 30 I/O error on file *filename*.

Explanation: An input or output error was detected with the *filename*.

This message is issued if the record format of the output file was fixed and the output records did not have the same length as the output file, or if the record format of the output file was variable and the output records were longer than the maximum record length.

Programmer Response: Correct the cause of the input/output error and rerun the `iconv` utility.

System Action: The file is converted up to the record in error.

EDC4189 30 Unable to fetch messages file EDCIMSGE.

Explanation: The `iconv` utility could not fetch the message file EDCIMSGE.

Programmer Response: Ensure that the `iconv` utility has sufficient storage to run. Under CMS, ensure that the GLOBAL LOADLIB command has been issued. Under MVS and TSO, ensure that the correct libraries are specified on the STEPLIB DD statement.

System Action: The file has not been converted.

genxlt Utility Messages

The messages issued by the `genxlt` utility have the following format:

Message Format: EDCxxxx nn text <**%n$x**>

xxxx Error message number

nn Error severity

- **10** Warning message
- **30** Error message

%n$x Substitution variable

- **%** The start of the substitution variable
- **n** The number that represents the line position of the variable
- **$** A delimiter
- **x** The kind of variable (d=decimal, s=string)

The messages that can be issued are as follows:

EDC4151 10 Option *%1$s* **is not valid and was ignored.**

Explanation: The option specified in the message is not a valid `genxlt` utility message, or a valid option had been specified with an invalid value.

Programmer Response: Rerun the `genxlt` utility, specifying the correct option.

System Action: The specified option is ignored.

EDC4190 30 Unable to open data file.

Explanation: The `genxlt` utility could not open the input file.

Programmer Response: Check that the correct file name has been specified and rerun the `genxlt` utility.

System Action: The conversion table has not been built.

EDC4191 30 Unable to open target file.

Explanation: The `genxlt` utility could not open the output file.

Programmer Response: Correct the cause of the error, and rerun the `genxlt` utility.

System Action: The conversion table has not been built.

EDC4192 30 There was no assignment for index *%1$d***.**

Explanation: The character *%1$d* had not been assigned a character to which it must be converted.

Programmer Response: Update the input file to specify a conversion value for the character specified.

System Action: The conversion table has not been built.

EDC4193 30 Unable to write for target file.

Explanation: An output error was detected with the output file.

Programmer Response: Correct the cause of the output error and rerun the `genxlt` utility.

EDC4194 30 Invalid format at line *%1$d*.

Explanation: The line *%1$d* is not valid. The conversion table has not been built.

Programmer Response: Correct the line in error and rerun the `genxlt` utility.

System Action: The conversion table has not been built.

EDC4195 30 Unable to fetch messages file EDCGMSGE.

Explanation: The `genxlt` utility could not fetch the message file EDCGMSGE.

Programmer Response: Ensure that the `genxlt` utility has sufficient storage to run. Under CMS, ensure that the GLOBAL LOADLIB command has been issued. Under MVS and TSO, ensure that the correct libraries are specified on the STEPLIB DD statement.

System Action: The file has not been converted.

System Programming C Messages

The System Programming C (SPC) messages have the following format:

Message Format: EDCKxxx text

EDCK Indicates message is generated by the C library when running under CICS

xxx Error message number

The messages that can be issued are as follows:

EDCK001 ABEND=8091 operation exception.

Explanation: An attempt has been made to execute an instruction with an invalid operation code. The operation code could be unassigned, or the instruction with that operation code might not be installed on the CPU.

Programmer Response: Determine the reason for the operation exception in the user code and correct.

System Action: The program terminates.

EDCK002 ABEND=8092 privileged operation exception.

Explanation: An attempt had been made to execute a privileged instruction in the problem state.

Programmer Response: Determine the reason for the privileged operation exception in the user code and correct.

System Action: The program terminates.

EDCK003 ABEND=8093 execute exception.

Explanation: An attempt had been made to execute an `EXECUTE` instruction.

Programmer Response: Determine the reason for the execute exception in the user code and correct.

System Action: The program terminates.

EDCK004 ABEND=8094 protection exception.

Explanation: An attempt had been made to access data that was protected against this type of reference or to store data in protected storage, such as a low address `0 - 511`.

Programmer Response: Determine the reason for the protection exception in the user code and correct.

System Action: The program terminates.

EDCK005 ABEND=8095 addressing exception.

Explanation: An attempt was made to reference a main storage location that is not available in the configuration.

Programmer Response: Determine the reason for the addressing exception in the user code and correct.

System Action: The program terminates.

EDCK006 ABEND=8096 specification exception.

Explanation: An alignment error in the operands of an instruction or an error in the specification of the operands has occurred (that is, an odd-numbered register was specified when an even-numbered register was expected).

Programmer Response: Determine the reason for the specification exception in the user code and correct.

System Action: The program terminates.

EDCK007 ABEND=8097 data exception.

Explanation: An attempt had been made to process packed decimal data that is not in the correct format.

Programmer Response: Determine the reason for the data exception in the user code and correct.

System Action: The program terminates.

EDCK008 ABEND=0220 zero divide.

Explanation: An attempt had been made to execute an instruction in which the value of zero has been used as the divisor of a division operation, or an overflow condition has occurred during a conversion to binary.

Programmer Response: Determine the reason for the zero divide in the user code and correct.

System Action: The program terminates.

EDCK009 ABEND=0620 overflow.

Explanation: The OVERFLOW condition occurred when the magnitude of a floating-point number exceeded the supported maximum.

Programmer Response: Determine the reason for the overflow in the user code and correct.

System Action: The program terminates.

EDCK010 The signal SIGFPE has been raised.

Explanation: The routine issued a `raise(SIGFPE)` under default conditions.

Programmer Response: None.

System Action: The program terminates.

EDCK011 The signal SIGILL has been raised.

Explanation: The routine issued a `raise(SIGILL)` under default conditions.

Programmer Response: None.

System Action: The program terminates.

EDCK012 The signal SIGSEGV has been raised.

Explanation: The routine issued a `raise(SIGSEGV)` under default conditions.

Programmer Response: None.

System Action: The program terminates.

EDCK017 ABEND=0320 fixed or decimal overflow.

Explanation: The overflow condition occurred when the magnitude of a fixed or decimal number exceeds the supported maximum.

Programmer Response: Determine the reason for the fixed or decimal overflow in the user code and correct.

System Action: The program terminates.

Chapter 12. C Run-Time Messages

The following run-time messages pertain to C. Each message is followed by an explanation describing the condition that caused the message, a programmer response suggesting how you might prevent the message from occurring again, and a system action indicating how the system responds to the condition that caused the message.

The messages also contain a symbolic feedback code, which represents the first 8 bytes of a 12-byte condition token. You can think of the symbolic feedback code as the nickname for a condition. As such, the symbolic feedback code can be used in user-written condition handlers to screen for a given condition, even if it occurs at different locations in an application.

The messages in this section contain alphabetic suffixes that have the following meaning:

I Informational message
W Warning message
E Error message
S Severe error message
C Critical error message

EDC5000I No error occurred.

Explanation: The value of errno is zero.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: EDC4S8

EDC5001I A domain error occurred.

Explanation: An input argument to one of the math functions was outside the domain over which the mathematical function is defined.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the math functions that produced this error.

System Action: The math function fails.

Symbolic Feedback Code: EDC4S9

EDC5002I A range error occurred.

Explanation: The result of the math function could not be represented as a double value.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the math functions that produced this error.

System Action: The math function fails.

Symbolic Feedback Code: EDC4SA

EDC5003I Truncation of a record occurred during an I/O operation.

Explanation: Truncation occurred because: 1) the specified record length on the write operation was larger than the record buffer size; 2) an attempt to extend the record buffer for a CMS variable length file failed which caused record truncation; or 3) the record read in was larger than the record buffer size.

Programmer Response: For a text stream, place the newline character earlier in the record to shorten the record size. For a file opened for record I/O, specify a smaller number of bytes for `fread()`, `fwrite()`, or `fupdate()`.

System Action: The return value depends on the operation attempted. In all cases, the buffer will be read or written up to the point where truncation occurred.

Symbolic Feedback Code: EDC4SB

EDC5004I The size of the specified record was too small.

Explanation: The record length was too small because the specified record size for an `fwrite()` or `fupdate()` function was smaller than the minimum record length allowed for the file.

Programmer Response: Increase the size or count parameter on the `fwrite()` or `fupdate()` function.

System Action: In all cases, the write or update operation fails.

Symbolic Feedback Code: EDC4SC

EDC5005I A write operation may not immediately follow a read operation.

Explanation: If the last operation on a non-VSAM file opened for record I/O was a read, a write operation may not directly follow.

Programmer Response: Invoke `fflush()`, `rewind()`, `fseek()`, or `fsetpos()` between the read and write operations on the file stream.

System Action: The write operation fails.

Symbolic Feedback Code: EDC4SD

EDC5006I A read operation may not immediately follow a write operation.

Explanation: If the last operation on a file was a write, a read operation may not directly follow.

Programmer Response: Invoke `fflush()`, `rewind()`, `fseek()`, or `fsetpos()` between the write and read operations on the file stream.

System Action: The read operation fails.

Symbolic Feedback Code: EDC4SE

EDC5007I The I/O buffer could not be allocated.

Explanation: Memory was not available for the allocation of various buffers when invoking any of the I/O functions.

Programmer Response: Run the program in a larger region.

System Action: The I/O function returns NULL or EOF.

Symbolic Feedback Code: EDC4SF

EDC5008I The LRECL or BLKSIZE exceeded the maximum allowable value.

Explanation: On CMS, the resultant CMS LRECL was greater than 65535. On MVS, the specified LRECL or BLKSIZE was greater than 32760.

Programmer Response: Change the open attributes specified to be within the valid limits.

System Action: The `fopen()/freopen()` function returns NULL.

Symbolic Feedback Code: EDC4SG

EDC5009I An I/O operation was attempted using an invalid FILE pointer.

Explanation: The FILE pointer that was input to the I/O function was not an active FILE pointer created by `fopen()/freopen()`.

Programmer Response: Ensure that the FILE pointer was created by `fopen()/freopen()`, and that no I/O operation is attempted after `fclose()`.

System Action: The specified I/O operation fails.

Symbolic Feedback Code: EDC4SH

EDC5010I A read operation was attempted on a file that was not opened for reading.

Explanation: When a read operation (for example, `fgetc()`, `fread()`) is invoked, the file specified must be opened in a mode that supports reading.

Programmer Response: Open the file with a mode that supports reading. The following modes do NOT support reading: `'w'`, `'wb'`, `'a'`, or `'ab'`.

System Action: The read operation fails.

Symbolic Feedback Code: EDC4SI

EDC5011I The number of ungetc() push-back characters has exceeded the maximum allowed.

Explanation: An `ungetc()` was attempted but could not be honored because there were already pushed-back characters waiting to be read, and the number of pushed-back characters already equalled the maximum allowed.

Programmer Response: Either read a pushed-back character, or reposition the file before attempting to push back another character.

System Action: The `ungetc()` function returns EOF.

Symbolic Feedback Code: EDC4SJ

EDC5012I File positioning is not allowed for this data set.

Explanation: An attempt was made to either acquire the file position or reposition the file using an I/O function that is not supported by the file.

Programmer Response: For non-VSAM files, do not open the file with the NOSEEK option. For VSAM PATH data sets, position the FILE pointer to the beginning of the data set, or do not issue the `ftell()` or `fseek()` functions. If the data set resides on a device that does not support repositioning, either move the data set or do not use the positioning functions.

System Action: The function fails.

Symbolic Feedback Code: EDC4SK

EDC5013I No hiperspace blocks are available for expansion.

Explanation: A hiperspace has been filled to its maximum allowed size. An attempt has been made to add more data to the hiperspace.

Programmer Response: Check with your system programmer to see if there is currently a shortage of resources for hiperspaces.

System Action: The write operation fails.

Symbolic Feedback Code: EDC4SL

EDC5014I An attempt was made to acquire a position that is before the start of the file.

Explanation: The `ftell()` and `fgetpos()` functions cannot return a file position when characters are pushed back using `ungetc()` at the start of the file. This is because the resultant position ends up being before the start of the file, and this is not a valid position.

Programmer Response: Do not call `ftell()` or `fgetpos()` if you push back characters before the start of the file, unless you either read them or discard them using a reposition first.

System Action: Function `ftell()` or `fgetpos()` fails.

Symbolic Feedback Code: EDC4SM

EDC5015I The file position value was beyond the limits that ftell() can represent in a long integer value.

Explanation: The current position lies outside the bounds that can be represented by the `ftell()` encoding scheme. For fixed format binary streams, this is a file position beyond relative byte number 2147483647. For other files, the limit is based on the relative block or record number. For CMS files with LRECL between 32KB and 64KB, this limit is 65536 records. For all other files, the maximum depends on the block size. Smaller block sizes allow more records to be encoded. The maximum is at least 131072 records.

Programmer Response: The `fgetpos()` function can be used to report file positions that `ftell()` cannot. The `fsetpos()` function must then be used to perform the repositioning at a later time.

System Action: The `ftell()` function fails (return -1 (EOF)).

Symbolic Feedback Code: EDC4SN

EDC5016I Byte I/O was attempted on a file that was opened for record I/O.

Explanation: One of the byte I/O functions was invoked with a file that was opened using `'type=record'`.

Programmer Response: Only the `fread()`, `fwrite()`, and `fupdate()` functions may be used to read, write, or update a file opened for record I/O.

System Action: The requested function fails.

Symbolic Feedback Code: EDC4SO

EDC5017I A write operation was attempted on a file that was not opened for writing.

Explanation: When a write operation (for example, `fputc()`, `fwrite()`) is invoked, the file specified must have been opened for writing.

Programmer Response: Open the file with a mode that supports writing. The following modes do not support writing: `'r'`, `'rb'`.

System Action: The write operation fails.

Symbolic Feedback Code: EDC4SP

EDC5018I An ungetc() function call cannot immediately follow a write operation.

Explanation: A reposition function or flush must occur between a write operation and `ungetc()`.

Programmer Response: Invoke either `fflush()`, `rewind()`, `fseek()`, or `fsetpos()` before calling `ungetc()`.

System Action: The `ungetc()` function returns EOF.

Symbolic Feedback Code: EDC4SQ

EDC5019I An unrecoverable error has permanently marked the file in error.

Explanation: A previous I/O operation has failed such that the current file pointer is no longer valid. Only the `fclose()` and `freopen()` functions are permitted.

Programmer Response: Check the return codes of previous I/O operations, or set up a SIGIOERR handler to determine the source of the error. When you have determined which C function has generated the error, issue `perror()` to get the original error message.

System Action: The operation fails.

Symbolic Feedback Code: EDC4SR

EDC5020I An attempt to allocate memory in the Language Environment has failed.

Explanation: The Language Environment's attempt to obtain memory in order to satisfy the current library request has failed.

Programmer Response: Run the program in a larger region, or use the HEAP(,,FREE) run-time option instead of the HEAP(,,KEEP) option.

System Action: The requested function fails.

Symbolic Feedback Code: EDC4SS

EDC5021I The file attributes for open create an invalid combination.

Explanation: An invalid combination was caused by merging the characteristics specified on the `fopen()`/`freopen()` call, the ddname declaration, or the existing file attributes.

Programmer Response: Adjust the LRECL and BLKSIZE parameters on the `fopen()`/`freopen()` call, or adjust the attributes specified with the ddname so a valid combination will be created. See *OS/390 C/C++ Programming Guide* for details on attribute merging and valid combinations.

System Action: The `fopen()`/`freopen()` function returns NULL.

Symbolic Feedback Code: EDC4ST

EDC5022I An error occurred while generating a temporary name.

Explanation: The `tmpnam()` function was called to generate a temporary file name. However, a name, which did not already exist, could not be generated within the maximum number of attempts.

Programmer Response: Verify that the `time()` and `clock()` functions are working correctly on your system. If so, try erasing all unused files that were created by the `tmpnam()` function, and retry the function. Contact your IBM Support Center if error still occurs.

System Action: The `tmpnam()` function fails and returns NULL.

Symbolic Feedback Code: EDC4SU

EDC5023I An attempt to back up position has failed.

Explanation: One or more `ungetc()` calls are outstanding when an `fgetpos()` or `ftell()` is called such that the file position is really in the previous physical block. An attempt by the Language Environment to back up the file to acquire the position has failed.

Programmer Response: Check the __amrc structure for more information. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The `ftell()`/`fgetpos()` function fails.

Symbolic Feedback Code: EDC4SV

EDC5024I An attempt was made to close a file that had been opened on another thread.

Explanation: A file that was opened on one thread was closed on another.

Programmer Response: All files must be closed on the same thread on which they were opened.

System Action: The close operation fails.

Symbolic Feedback Code: EDC4T0

EDC5025I An I/O function was invoked when a read was pending for a file that had been intercepted.

Explanation: A file that was intercepted under the debugging tool was expecting input when an I/O function for that file was invoked from the debugging session.

Programmer Response: Do not recursively invoke library I/O functions when a read is pending. Supply the expected data and then invoke the I/O function.

System Action: The I/O function fails.

Symbolic Feedback Code: EDC4T1

EDC5026I An error occurred when expanding hiperspace.

Explanation: An error occurred trying to expand a hiperspace to more than its current size, but less than equal to its maximum allowable size.

Programmer Response: Check the __amrc structure for the return code from HSPSERV. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The write operation fails.

Symbolic Feedback Code: EDC4T2

EDC5027I The position specified to fseek() was invalid.

Explanation: One of the following occurred: 1) a whence value other than SEEK_SET, SEEK_CUR, or SEEK_END was specified; 2) the specified position was before the start of the stream; or 3) the specified position was beyond the end of the stream and the stream was not a binary file.

Programmer Response: Correct the offset/whence parameters on the `fseek()` function to be a valid position, or open the file in binary mode if the user wants file positions beyond EOF to result in null extension to the file.

System Action: The `fseek()` function fails.

Symbolic Feedback Code: EDC4T3

EDC5028I A previous I/O error has marked the stream invalid for further I/O processing.

Explanation: A serious error has occurred in a previous I/O operation such that further I/O cannot be continued. The routine that caused the original error had set errno previously, but it will have changed because of this errno value. The `clearerr()` function will not clear this type of error.

Programmer Response: Check the return code values of previous I/O operations to detect which operation originated the system I/O failure and get the errno value. Use this list to find a prescribed action, or attempt a `rewind()` or `fsetpos()` to clear the internal error marker and reestablish the file position.

System Action: The current I/O operation fails.

Symbolic Feedback Code: EDC4T4

EDC5029I An unrecognized signal value was passed to the signal() or raise() function.

Explanation: The signal value passed into the `signal()` or `raise()` function was not one of the valid signals as defined in signal.h.

Programmer Response: Pass either SIGIOERR, SIGFPE, SIGSEGV, SIGILL, SIGABRT, SIGTERM, SIGINT, SIGTERM, SIGUSR1, SIGUSR2, or SIGABND to the `signal()` or `raise()` function.

System Action: The `signal()` or `raise()` function returns SIG_ERR.

Symbolic Feedback Code: EDC4T5

EDC5030I An invalid argument was passed.

Explanation: The `setenv()` function has been called with a `'='` sign in the environment variable name. This is an invalid argument.

Programmer Response: Remove the `'='` sign from the environment variable name.

System Action: The `setenv()` function fails.

Symbolic Feedback Code: EDC4T6

EDC5031I An attempt was made to close a stream not belonging to the current main program.

Explanation: The user has passed a file pointer across a system call boundary and has attempted to close or reopen the file in the child program.

Programmer Response: The program is invalid and must be changed. The suggested change is to close the file in the parent program before the `system()` call. The file can then be reopened in the child program, if required. Upon returning to the parent program, the file can again be reopened.

System Action: The `fclose()`/`freopen()` function fails.

Symbolic Feedback Code: EDC4T7

EDC5032I An error was detected in the input string passed to the system() function.

Explanation: When the `system()` function was invoked and `'PGM='` was specified for an MVS-style parameter list, either the `'PARM='` string was not specified or invalid characters were found on the `'PARM='` string.

Programmer Response: Correct the parameter string passed to the `system()` function, or use a VM-style parameter list.

System Action: The `system()` function fails.

Symbolic Feedback Code: EDC4T8

EDC5033I An attempt was made to extend a non-extendable file.

Explanation: While updating a partitioned data set member or a concatenated dataset, an attempt was made to extend the file.

Programmer Response: If extension is required to a member, open the old member in read mode and copy the contents to a new member that is opened for write. Because the new member is opened in write mode, it can be extended. Close both the old and new members, and then delete the old member with the `remove()` function. Rename the new member using the `rename()` function so that it appears to be the old member, now extended. You cannot extend the concatenation for a concatenated data set.

System Action: The I/O write operation fails.

Symbolic Feedback Code: EDC4T9

EDC5034I An unsupported buffering mode was specified for the setvbuf() function.

Explanation: The buffer type specified as a parameter for the `setvbuf()` function was unsupported, or a buffer mode other than line buffered (_IOLBF) was specified for a terminal device type.

Programmer Response: Specify one of the following supported buffer types: _IOFBF (full buffering) or _IOLBF (line buffering).

System Action: The `setvbuf()` function fails.

Symbolic Feedback Code: EDC4TA

EDC5035I An attempt was made to change the buffering mode after an operation on a file.

Explanation: A call was made to the `setvbuf()` function after the file had been read or written.

Programmer Response: Use the `setvbuf()` function to set the buffering mode before any read or write I/O operations are done.

System Action: The `setvbuf()` function returns EOF.

Symbolic Feedback Code: EDC4TB

EDC5036I The specification of a member is invalid.

Explanation: On a `remove()` or `rename()` function call, a member has been specified for a file that does not have members, or a member has been specified for one name of a `rename()` function call, but not for the second name.

Programmer Response: If the file does not have members, remove the member specification. If this is a `rename()` call and only one name specifies a member, either remove the member specification or add a member specification to the second name.

System Action: The `remove()`/`rename()` function fails.

Symbolic Feedback Code: EDC4TC

EDC5037I The specified ddname was not found.

Explanation: A ddname was specified for a file name parameter, but the ddname was not defined. The functions that support ddnames as file names are `fopen()`, `freopen()`, and `remove()`.

Programmer Response: See *OS/390 C/C++ Programming Guide* for details on how to define a ddname in the environments supported. See *OS/390 C/C++ Run-Time Library Reference* for the math functions.

System Action: The function fails.

Symbolic Feedback Code: EDC4TD

EDC5038I An error occurred when the system flushed terminal output before retrieving terminal input.

Explanation: When a terminal read cannot get any data from the buffer and must perform a system terminal read, all terminal output data not yet flushed to the system must be output. While writing the unflushed terminal output data, an error occurred.

Programmer Response: Change the code so all terminal output is completed and flushed to the terminal before the terminal input operation. Check all return codes to find out if any output operation gets an error; then check the errno value for further information regarding any errors encountered.

System Action: The terminal input operation fails.

Symbolic Feedback Code: EDC4TE

EDC5039I A writable CMS minidisk could not be found to hold the output file specified.

Explanation: An attempt has been made to open a CMS minidisk file for `'write'` or `'append'`, but there is no CMS minidisk accessed `'r/w'` to write the output file.

Programmer Response: Access a CMS minidisk in `'r/w'` mode.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4TF

EDC5040I An attempt was made to open a flat file as a PDS.

Explanation: When a memory file is created without members, its name cannot be used with a member specified.

Programmer Response: Either specify a memory file that already has members, or remove the flat memory file before specifying the open with the member specified and open the file for `'write'`.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4TG

EDC5041I An error was detected at the system level when opening a file.

Explanation: A system level error was detected.

Programmer Response: Look in the __amrc structure for further details regarding the error. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure. Or check the MVS job log for an error message.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4TH

EDC5042I A special internally-generated memory file name was specified for opening, but a memory file with this name does not exist.

Explanation: A name was specified of the form: `'((x))'`, where `'x'` is a decimal number, but the name did not match an existing memory file. A name of this format may not be used to create a memory file. The name is generated internally by C/MVS when a user opens a memory file with a name of `'*'` for output. C/MVS generates the name so that the user can acquire it using the `fldata()` function and then can read, update, append, or remove the memory file.

Programmer Response: If using memory files created with a name of `'*'`, issue `fldata()` to acquire the correct name. If the name was properly acquired using `fldata()`, make sure it has not been closed and removed before opening the generated name.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4TI

EDC5043I An attempt was made to open a non-memory file as a memory file.

Explanation: An open for read has specified 'type=memory', but the file is not a memory file.

Programmer Response: Remove the 'type=memory' specification on the `fopen()/freopen()`.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4TJ

EDC5044I An error occurred when attempting to erase a CMS file.

Explanation: When the `remove()` function was invoked, either the CMS file was not found to be erased, or an error occurred when the system attempted to erase the file.

Programmer Response: Ensure that the file name specified to the `remove()` function exists and is on a disk accessed for write.

System Action: The `remove()` function fails.

Symbolic Feedback Code: EDC4TK

EDC5045I The operation attempted could not be performed because the file was open.

Explanation: An attempt was made to remove or rename a file that was still open, or an attempt was made to open a file for output or append that was already open.

Programmer Response: The `remove()` function can only be invoked with files that have been closed. The `fopen()` function cannot open a memory or disk file for write/update/append if the file is already opened. A memory file opened with a member specified will prevent the name from being used without a member, and vice-versa. For example, it is not possible to have memory files: 'a.b' and 'a.b(c)' opened at the same time. In either case, the original open file must be closed.

System Action: The `remove()`, `rename()`, `fopen()`, or `freopen()` function fails.

Symbolic Feedback Code: EDC4TL

EDC5046I The file could not be deleted.

Explanation: The `remove()` function could not remove the file specified on MVS.

Programmer Response: Verify that the file name specified to the `remove()` function is erasable.

System Action: The `remove()` function fails.

Symbolic Feedback Code: EDC4TM

EDC5047I An invalid file name was specified as a function parameter.

Explanation: The name specified to the `remove()`, `rename()`, `fopen()`, or `freopen()` functions was invalid. The name is either not valid for the system (MVS, CMS), is not a valid memory file name, or is a '*' or GDG data set name specified to the `rename()` function.

Programmer Response: Specify a valid file name according to the system, or to the memory file name rules to the `remove()`, `rename()`, `fopen()`, and `freopen()` functions.

System Action: The invoked function fails.

Symbolic Feedback Code: EDC4TN

EDC5048I A Language Environment internal routine has failed unexpectedly.

Explanation: An internal call to a Language Environment internal routine has failed, but the failure is not anticipated, and recovery is not possible.

Programmer Response: Contact your IBM Support Center.

System Action: Current library function using an internal routine fails.

Symbolic Feedback Code: EDC4TO

EDC5049I The specified file name could not be located.

Explanation: When the `rename()` function was invoked, the old file name could not be found or the new file name could not be allocated or, when the `fopen()`/`freopen()` function was invoked, the specified file name opened for read could not be found.

Programmer Response: Verify that the specified file exists.

System Action: The `fopen()`, `freopen()`, or `rename()` function fails.

Symbolic Feedback Code: EDC4TP

EDC5051I An error occurred when renaming a file.

Explanation: A rename error has occurred.

Programmer Response: For disk files, ensure that the old file name exists. For memory files, ensure that different names are specified to the `rename()` function and that PDS-style naming conventions are used consistently for old and new names. For MVS, check the __amrc for further details.

System Action: The `rename()` function fails.

Symbolic Feedback Code: EDC4TR

EDC5052S The application is running with AMODE=24 while the run-time library was installed above the line.

Explanation: The application which is accessing the run-time library is running with AMODE=24. But the run-time library was installed above the 16MB line, which the application cannot address.

Programmer Response: Ensure the AMODE of the application matches that of the run-time library. If you must run with AMODE=24, then the run-time library must be installed below the line. Otherwise, relink your application to have AMODE=31. If the application is using Language Environment Preinitialization services, ensure that the high order bit is on in either the supplied entry point address of PIPI table entries or the specified routine entry on the PIPI call to add_entry for adding an entry to the PIPI table.

System Action: Application is terminated with 3000 abend.

Symbolic Feedback Code: EDC4TS

EDC5053S The Language Environment run-time library load module EDCZ24 could not be loaded.

Explanation: An error has occurred when Language Environment tried to load the run-time library load module EDCZ24.

Programmer Response: Check the data sets in the go steplib for the job to ensure that EDCZ24 is available. (For example, check SCEERUN.)

System Action: The program ends and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000 is returned.

Symbolic Feedback Code: EDC4TT

EDC5054I An attempt to override the disposition was ignored. The file may still be removed.

Explanation: The `remove()` function attempted to delete the data set by using a disposition of DELETE. The data set would not allow an override of the disposition.

Programmer Response: Change the disposition on the original allocation, or remove the data set outside of your C program.

System Action: The `remove()` function fails, but the data set may have been removed if the original allocation specified DELETE as the normal disposition.

Symbolic Feedback Code: EDC4TU

EDC5055I An error occurred trying to remove the file before its expiration date.

Explanation: When the `remove()` function attempted to erase the file, an error was returned indicating that the expiration date had not yet occurred.

Programmer Response: Change the expiration date of the data set.

System Action: The `remove()` function fails.

Symbolic Feedback Code: EDC4TV

EDC5057I The open mode string was invalid.

Explanation: The mode string passed to the `fopen()`/`freopen()` function was found to have invalid keywords, combinations, or characters.

Programmer Response: Correct the mode string and reissue the `fopen()`/`freopen()`.

System Action: The `fopen()`/`freopen()` function fails.

Symbolic Feedback Code: EDC4U1

EDC5059I An attempt to reposition a VSAM file failed.

Explanation: When the `flocate()` function was invoked, the reposition was not successful, or `rewind()` could not position to the beginning of the file.

Programmer Response: For `flocate()`, verify that the attributes of the VSAM file match the type of repositioning being attempted. For a `rewind()` error, check the __amrc structure. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The `flocate()` function fails. The `rewind()` function does not reposition to the start of the data set.

Symbolic Feedback Code: EDC4U3

EDC5060I An invalid file position was passed to the fsetpos() function.

Explanation: When `fsetpos()` was invoked, the fpos_t structure passed did not represent a valid position in the current file.

Programmer Response: Verify that the fpos_t structure set by `fgetpos()` is a valid file position before calling `fsetpos()`. Also verify that the file has not changed between the time of the `fgetpos()` and `fsetpos()`.

System Action: The `fsetpos()` function fails.

Symbolic Feedback Code: EDC4U4

EDC5061I An error occurred when attempting to define a file to the system.

Explanation: The `fopen()/freopen()` function or the `remove()` function could not successfully allocate or FILEDEF the specified file.

Programmer Response: Check the __amrc structure for more information. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The `fopen()`, `freopen()`, or `remove()` function fails.

Symbolic Feedback Code: EDC4U5

EDC5063I An error was detected in an internal control block.

Explanation: One of the internal I/O control blocks was corrupted and is causing unexpected behavior.

Programmer Response: Ensure that the application program is not overwriting storage. If the error cannot be located, contact the IBM Support Center.

System Action: The I/O operation fails and the stream is marked as invalid for further I/O.

Symbolic Feedback Code: EDC4U7

EDC5065I A write system error was detected.

Explanation: A system level write error has occurred.

Programmer Response: Check the __amrc structure for more information. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The write operation fails.

Symbolic Feedback Code: EDC4U9

EDC5066I A read system error was detected.

Explanation: A system level read error has occurred.

Programmer Response: Check the __amrc structure for more information. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The read operation fails.

Symbolic Feedback Code: EDC4UA

EDC5067I An attempt was made to open a nonexistent file for read.

Explanation: The `fopen()/freopen()` function was invoked for read, but the file specified did not exist, or the data set name `'*'` was attempted to be opened for read in MVS batch.

Programmer Response: Ensure that the file to be opened for read exists, or that the interactive terminal is not being opened for read in MVS batch.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4UB

EDC5072I An attempt was made to open a KSDS or Path VSAM data set without specifying record I/O.

Explanation: Key Sequenced VSAM data sets and Path VSAM data sets may not be opened as streams for writing. Only Entry Sequenced VSAM data sets and Relative Record VSAM data sets may be opened this way.

Programmer Response: Change the type string parameter on the `fopen()` function to include `'type=record'`.

System Action: The `fopen()/freopen()` function returns NULL.

Symbolic Feedback Code: EDC4UG

EDC5073I The maximum number of attempts to obtain temporary names was exceeded.

Explanation: The `tmpnam()` function was invoked more than the maximum number of times allowed.

Programmer Response: The programmer should alter the application to minimize the number of calls to `tmpnam()`. The system can only ensure that TMP_MAX calls will work.

System Action: The `tmpnam()` function returns NULL and does not generate any more unique names.

Symbolic Feedback Code: EDC4UH

EDC5074I The open parameters were missing the 'type=record' specifier.

Explanation: The open type keyword parameter `'acc='` is not valid unless `'type=record'` is also specified.

Programmer Response: Specify `'type=record'` on the `fopen()/freopen()` statement.

System Action: The `fopen()/freopen()` function returns NULL.

Symbolic Feedback Code: EDC4UI

EDC5076I An fread() was not performed before calling the fdelrec() or fupdate() functions.

Explanation: The `fdelrec()` and `fupdate()` functions may not be invoked without first calling the `fread()` function.

Programmer Response: Invoke the `fread()` function directly before these functions.

System Action: The `fdelrec()` and `fupdate()` functions fail.

Symbolic Feedback Code: EDC4UK

EDC5077I An error occurred trying to erase a VSAM record.

Explanation: The `fdelrec()` function could not successfully erase the last record read from the specified VSAM file.

Programmer Response: Examine the values of __amrc__code__feedback__rc and __amrc__code__feedback__fdbk immediately after receiving this errno. Look up the __rc and __fdbk values in a VSAM Macro Reference manual, such as *MVS/ESA VSAM Administration: Macro Instruction Reference*. __rc corresponds to the register 15 value, __fdbk corresponds to the Reason Code. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The `fdelrec()` function fails.

Symbolic Feedback Code: EDC4UL

EDC5078I The requested operation is valid only for VSAM data sets.

Explanation: The `fdelrec()`, `flocate()` and `fupdate()` functions may only be invoked with VSAM data sets.

Programmer Response: Use the `fseek()/ftell()` or `fgetpos()/fsetpos()` functions for positioning within a non-VSAM file. To update, use `fread()/fwrite()` or the byte I/O functions instead of `fupdate()`.

System Action: The `fdelrec()`, `flocate()` and `fupdate()` functions fail.

Symbolic Feedback Code: EDC4UM

EDC5079I The file was not opened with a 'type=record' specification.

Explanation: The `fdelrec()` and `fupdate()` functions are not valid for VSAM data sets opened as streams.

Programmer Response: Change the `fopen()` type parameter string to include `'type=record'`.

System Action: The `fdelrec()` and `fupdate()` functions failed.

Symbolic Feedback Code: EDC4UN

EDC5080I An invalid option was passed to the flocate() function.

Explanation: The parameter that specifies the position options to the `flocate()` function contained an invalid value.

Programmer Response: Use one of the following as the options parameter: __KEY_FIRST, __KEY_LAST, __KEY_EQ, __KEY_EQ_BWD, __KEY_GE, __RBA_EQ or __RBA_EQ_BWD, as defined in `stdio.h`.

System Action: The `flocate()` function fails.

Symbolic Feedback Code: EDC4UO

EDC5083I An error occurred attempting to load a module into storage.

Explanation: The library has attempted to dynamically load a module and a failure resulted. This is usually as a result of a `system()` call.

Programmer Response: Verify that the specified program/command has been made accessible for loading. You may also need to adjust your region size. For MVS batch, check the job log for messages which will help to pinpoint the name of the module.

System Action: The called library function fail.

Symbolic Feedback Code: EDC4UR

EDC5084I The program was not run because of redirection errors on the command line.

Explanation: An error was detected when the input string to `main()` was being parsed. One of the following may have occurred: 1) the file name specified with the redirection symbols could not be opened (for read, write, or append); 2) the file name specified with the write redirection symbol was already opened; or 3) the same redirection symbol was specified more than once in the command string.

Programmer Response: Correct the input string passed to main and if the `system()` call is being used to invoke another C `main()` program, the files that are still open in the first program will be considered open when the redirection statements are being verified.

System Action: This errno is used internally to generate the redirection error message. The program is terminated or the `system()` call returns the failure and does not invoke the second program.

Symbolic Feedback Code: EDC4US

EDC5086I An unsupported open mode was specified for a PDS member.

Explanation: The `fopen()`/`freopen()` function was incorrectly invoked specifying write-update, append, or append-update for a PDS member.

Programmer Response: Open a PDS member with open modes: read, read-update, or write.

System Action: The `fopen()`/`freopen()` function fails.

Symbolic Feedback Code: EDC4UU

EDC5087I The specified file characteristics did not match those of the existing file.

Explanation: The `fopen()/freopen()` was attempting to perform an open that used an existing data set, but found that the specified attributes did not match the existing file attributes; specifically, LRECL, BLKSIZE, or record format.

Programmer Response: Verify that the attributes of the physical file are as expected by the application program.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4UV

EDC5088I An invalid open mode was specified for the current device.

Explanation: The following open modes and device types are invalid combinations: 1) opening the interactive terminal for update; 2) reading a display or printer; 2) writing to a character reader; 3) updating a magnetic tape device; 4) opening SYSIN or SYSOUT for `'append'` or `'update'`; 5) opening SYSIN for anything except `'read'`; or 6) opening SYSOUT `'read'`.

Programmer Response: Correct the open mode on the `fopen()/freopen()` call and/or verify the that the current device type is what is expected.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4V0

EDC5089I Open mode is invalid for a SYSIN or SYSOUT data set.

Explanation: One of the following was attempted: 1) opening a JCL instream data set for `'update'`, `'write'`, or `'append'`; 2) opening a SYSOUT data set for `'read'` or `'update'`.

Programmer Response: Correct the open mode on the `fopen()/freopen()` call.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4V1

EDC5091I The requested function could not be performed because a system utility failed.

Explanation: A system level utility used by the library unexpectedly returned a failure code.

Programmer Response: Check the __amrc structure and *OS/390 C/C++ Programming Guide* for further details.

System Action: The requested function fails.

Symbolic Feedback Code: EDC4V3

EDC5092I An I/O abend was trapped.

Explanation: An I/O abend has occurred during an I/O operation (open, read, write, position, or close) and has been trapped. Recovery was attempted.

Programmer Response: Check the __amrc structure defined in *OS/390 C/C++ Programming Guide* for an explanation of the fields.

System Action: The I/O operation fails. The stream is marked in error and all further I/O operations on this stream fail.

Symbolic Feedback Code: EDC4V4

EDC5094I An attempt was made to push back the EOF character using ungetc().

Explanation: The `ungetc()` function may not be invoked with the EOF character.

Programmer Response: Do not call `ungetc()` with EOF.

System Action: The `ungetc()` function fails.

Symbolic Feedback Code: EDC4V6

EDC5095I The requested CMS minidisk was not accessed.

Explanation: The `fopen()/freopen()` function could not open the CMS file specified because the specified minidisk was not accessed.

Programmer Response: Access the correct disk when attempting to open a file.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4V7

EDC5098I An invalid RECFM was specified when opening a PDS member.

Explanation: The resultant record format for the open function is invalid. Under CMS, record formats containing ASA characters or machine characters are invalid for PDS members, as well as files with the spanned attribute. Under MVS, spanned record formats are not valid.

Programmer Response: Issue the `fopen()/freopen()` function with valid attributes, or verify the attributes specified when the ddname is defined.

System Action: The `fopen()/freopen()` function fails.

Symbolic Feedback Code: EDC4VA

EDC5099I The function specified is not supported under CICS.

Explanation: The function specified is not supported under CICS.

Programmer Response: Refer to *OS/390 C/C++ Programming Guide* for more information on running with C/MVS under CICS.

System Action: The specified function fails.

Symbolic Feedback Code: EDC4VB

EDC5100I An attempt was made to perform disk file I/O under CICS.

Explanation: The `fopen()`, `freopen()`, `rename()` and `remove()` functions only support memory files. The standard streams must be memory files or use the specified queues.

Programmer Response: Only invoke `fopen()`, `freopen()`, `rename()` or `remove()` with memory files when running under CICS.

System Action: The `fopen()`, `freopen()`, `rename()`, and `remove()` functions fail, and all writes to stdout/stderr fail.

Symbolic Feedback Code: EDC4VC

EDC5101I The transient data queue was not enabled for the standard streams.

Explanation: An attempt was made to write to stdout or stderr, when running under CICS, when the requested transient data queue was not enabled.

Programmer Response: Ensure that the DFHDCT macro has been assembled and defined correctly in the start-up CICS JCL. The systems programmer will know the name, type of queue, and associated ddnames at your installation.

System Action: The write I/O operation fails.

Symbolic Feedback Code: EDC4VD

EDC5102I The transient data queue was not opened for the standard streams.

Explanation: When the first I/O operation was requested for stdout or stderr when running under CICS, the Transient Data Queue inquiry indicated that the requested TD queue was not opened.

Programmer Response: Verify that the start-up CICS JCL opened the specified TD queues correctly.

System Action: The write I/O operation fails.

Symbolic Feedback Code: EDC4VE

EDC5103I An attempt was made to map remote queues to the standard streams under CICS.

Explanation: When the first I/O operation was requested for stdout or stderr when running under CICS, the Transient Data Queue inquiry indicated that the requested queue was a REMOTE queue.

Programmer Response: Correct the start-up JCL to specify (using the DFHDCT macro) the standard stream queues to be EXTRAPARTITION, INTRAPARTITION, or INDIRECT.

System Action: The write I/O operation fails.

Symbolic Feedback Code: EDC4VF

EDC5106I An error occurred creating a hiperspace memory file.

Explanation: An error has occurred while trying to create a hiperspace for a `'type=memory(hiperspace)'` file. The error may result from a shortage of resources.

Programmer Response: Check with your system programmer if hiperspace facilities are available at your installation, and if available, if there is currently a shortage of resources for hiperspaces.

System Action: The `fopen()/freopen()` or other I/O operation fails.

Symbolic Feedback Code: EDC4VI

EDC5107I An error occurred writing to a hiperspace memory file.

Explanation: An error occurred when writing to a hiperspace memory file. The return code from the HSPSERV macro was greater than 4.

Programmer Response: Check the __amrc structure for the return code from HSPSERV. Refer to *OS/390 MVS Programming: Assembler Services Reference* for more information regarding the return code. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The write I/O operation fails.

Symbolic Feedback Code: EDC4VJ

EDC5108I An error occurred reading from a hiperspace memory file.

Explanation: An error occurred when reading from a hiperspace memory file. The return code from the HSPSERV macro was greater than 4.

Programmer Response: Check the __amrc structure for the return code from HSPSERV. Refer to *OS/390 MVS Programming: Assembler Services Reference* for more information regarding the return code. See *OS/390 C/C++ Programming Guide* for more information on the __amrc structure.

System Action: The read I/O operation fails.

Symbolic Feedback Code: EDC4VK

EDC5111I Permission denied.

Explanation: An attempt was made to access a file in a way that violates its file access permissions. This message is equivalent to the POSIX.1 EACCES errno.

Programmer Response: The specific reason for the access denial depends on the function being attempted. Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The access request is denied. The application continues to run.

Symbolic Feedback Code: EDC4VN

EDC5112I Resource temporarily unavailable.

Explanation: A (temporary) condition has occurred which makes the resource unavailable. Later calls may complete normally. This message is equivalent to the POSIX.1 EAGAIN errno.

Programmer Response: The reason for the resource being unavailable depends on the function being attempted. Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC4VO

EDC5113I Bad file descriptor.

Explanation: The file descriptor used referred to a file which was not open or was out of range, or a read request was made to a file that was only open for writing, or a write request was made to a file that was open only for reading. This message is equivalent to the POSIX.1 EBADF errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC4VP

EDC5114I Resource busy.

Explanation: An attempt was made to use a system resource that was not available because it was being used by another process or thread in a manner that would have conflicted with the request being made by this process/thread. This message is equivalent to the POSIX.1 EBUSY errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC4VQ

EDC5115I No child processes.

Explanation: A `wait()` or `waitpid()` function was executed by a process that had no existing or unwaited-for child processes. This message is equivalent to the POSIX.1 ECHILD errno.

Programmer Response: Ensure that a child process exists.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC4VR

EDC5116I Resource deadlock avoided.

Explanation: An attempt was made to lock a system resource that would have resulted in a deadlock situation. This message is equivalent to the POSIX.1 EDEADLK errno.

Programmer Response: Refer to *OS/390 C/C++ Programming Guide* for the function being attempted for the specific reason for failure.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC4VS

EDC5117I File exists.

Explanation: An inappropriate action was requested for an existing file. For instance, a `mkdir()` is attempted for a file that already exists. This message is equivalent to the POSIX.1 EEXIST errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC4VT

EDC5118I Incorrect address.

Explanation: The system detected an invalid address when using an argument of a call. Note that not all functions detect this error. This message is equivalent to the POSIX.1 EFAULT errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure. This failure is usually caused by an invalid argument address.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC4VU

EDC5119I File too large.

Explanation: The size of a file would exceed the maximum allowed. The maximum file size allowed for HFS files is 2 gigabytes. This message is equivalent to the POSIX.1 EFBIG errno.

Programmer Response: Ensure that enough space is available in the file.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC4VV

EDC5120I Interrupted function call.

Explanation: An asynchronous signal was caught by the (POSIX) process during the execution of an interruptible function, and the signal handler (or default action) resulted in a normal return. This resulted in the interrupted function returning this error condition. This message is equivalent to the POSIX.1 EINTR errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for possible side effects from the function being interrupted.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC500

EDC5121I Invalid argument.

Explanation: An argument supplied was invalid. This message is equivalent to the POSIX.1 EINVAL errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC501

EDC5122I Input/output error.

Explanation: An input or output error occurred. This message is equivalent to the POSIX.1 EIO errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC502

EDC5123I Is a directory.

Explanation: The program attempted to write to a file descriptor that is a directory. This message is equivalent to the POSIX.1 EISDIR errno.

Programmer Response: Ensure that the file being written to is not a directory.

System Action: The request has failed. The application continues to run.

Symbolic Feedback Code: EDC503

EDC5124I Too many open files.

Explanation: An attempt was made to open more than the maximum number of file descriptors allowed for this (POSIX) process. This message is equivalent to the POSIX.1 EMFILE errno.

Programmer Response: The maximum number of files allowed per (POSIX) process is controlled by the OPEN_MAX run-time invariant, which can be determined during program execution using the `sysconf()` function.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC504

EDC5125I Too many links.

Explanation: An attempt was made to have the link count of a file exceed the maximum value allowed. For instance, this can occur while using the `link()` or `rename()` functions. This message is equivalent to the POSIX.1 EMLINK errno.

Programmer Response: The maximum number of links for a file is established by the LINK_MAX pathname variable value, and which can be determined at execution time using the `pathconf()` function.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC505

EDC5126I Filename too long.

Explanation: The size of a pathname string exceeded the maximum allowed, or a pathname component was longer than the maximum allowed and no truncation is in effect. This message is equivalent to the POSIX.1 ENAMETOOLONG errno.

Programmer Response: The maximum allowable pathname is controlled by the PATH_MAX pathname variable value, which can be determined at execution time using the `pathconf()` function. The maximum allowable file name is controlled by the NAME_MAX pathname variable value, which can be determined at execution time using the `pathconf()` function. Truncation of the pathname component is not allowed if the _POSIX_NO_TRUNC execution time symbolic is set. This can be determined by using the `pathconf()` function.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC506

EDC5127I Too many open files in system.

Explanation: The system reached its predefined limit for files open at one time. This message is equivalent to the POSIX.1 ENFILE errno.

Programmer Response: The request may succeed later if fewer files are in use.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC507

EDC5128I No such device.

Explanation: The function being attempted is not allowed by the specified device. For instance, the program attempted to read from a printer. This message is equivalent to the POSIX.1 ENODEV errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC508

EDC5129I No such file or directory.

Explanation: A name in the pathname does not exist, or the pathname is an empty string. This message is equivalent to the POSIX.1 ENOENT errno.

Programmer Response: Ensure the pathname for the object being accessed is correct. Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted, for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC509

EDC5130I Exec format error.

Explanation: A request was made to execute a file that was not in a format that may be executed (however, the file does have the appropriate permissions). This message is equivalent to the POSIX.1 ENOEXEC errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50A

EDC5131I No locks available.

Explanation: No file and/or record locks are available. The system limit has been reached. This message is equivalent to the POSIX.1 ENOLCK errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50B

EDC5132I Not enough memory.

Explanation: There is not enough memory space available to create the new object. This message is equivalent to the POSIX.1 ENOMEM errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50C

EDC5133I No space left on device.

Explanation: During a `write()` function to a file, there was no free space left in the HFS. This error may also occur when extending a directory. This message is equivalent to the POSIX.1 ENOSPC errno.

Programmer Response: Allocate additional space for the file system. Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50D

EDC5134I Function not implemented.

Explanation: The function to be executed has not been implemented. This message is equivalent to the POSIX.1 ENOSYS errno.

Programmer Response: The function may not be used by the application program.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50E

EDC5135I Not a directory.

Explanation: A component in a pathname or directory specified an object that was not a directory. This message is equivalent to the POSIX.1 ENOTDIR errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50F

EDC5136I Directory not empty.

Explanation: A directory that was expected to be empty was not. This message is equivalent to the POSIX.1 ENOTEMPTY errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50G

EDC5137I Inappropriate I/O control operation.

Explanation: A control function was attempted for a file or a special file for which the operation was inappropriate. For instance, the file is not a terminal. This message is equivalent to the POSIX.1 ENOTTY errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50H

EDC5138I No such device or address.

Explanation: Input or output on a special file referred to a device that did not exist, or made a request beyond the limits of the device. For instance, I/O was sent to a tape drive that is not online. This message is equivalent to the POSIX.1 ENXIO errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50I

EDC5139I Operation not permitted.

Explanation: An attempt was made to perform an operation limited to processes with appropriate privileges, or to the owner of a file or other resource. This message is equivalent to the POSIX.1 EPERM errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50J

EDC5140I Broken pipe.

Explanation: A write was attempted on a pipe or FIFO for which there was no process to read the data. This message is equivalent to the POSIX.1 EPIPE errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50K

EDC5141I Read-only file system.

Explanation: An attempt was made to modify a file or directory on a file system that was read-only. This message is equivalent to the POSIX.1 EROFS errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50L

EDC5142I Invalid seek.

Explanation: A seek function was issued on a pipe or FIFO. It is invalid to do a positioning operation on a pipe or FIFO. This message is equivalent to the POSIX.1 ESPIPE errno.

Programmer Response: Do not attempt a seek function on a device that cannot seek.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50M

EDC5143I No such process.

Explanation: The process ID does not correspond to an existing process. This error may also apply to the process group ID. This message is equivalent to the POSIX.1 ESRCH errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50N

EDC5144I Improper link.

Explanation: A link to a file on another file system was attempted. This message is equivalent to the POSIX.1 EXDEV errno.

Programmer Response: Files may be linked only within the same file system. Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50O

EDC5145I Arg list too long.

Explanation: The sum of the number of bytes for the new process image's argument list and the environment list was greater than the system limit.

Programmer Response: The system limit is defined by the ARG_MAX run-time invariant value, and can be determined at execution time using the `sysconf()` function. Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50P

EDC5146I Too many levels of symbolic links.

Explanation: Only POSIX_SYMLOOP symlinks are allowed during pathname resolution. This message is equivalent to the POSIX.1 ELOOP errno. POSIX_SYMLOOP is an invariant variable.

Programmer Response: Verify that the specified pathname can be resolved, and that no loop exists (of a symbolic link referring to itself). Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50Q

EDC5147I Illegal byte sequence.

Explanation: The string contains an illegal sequence of bytes. For example, an unmatched shift out / shift in condition exists. This message is equivalent to the OS/390 UNIX System Services errno, EILSEQ.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50R

EDC5150I OpenEdition MVS is not active.

Explanation: The function being requested cannot be performed because the OpenEdition MVS kernel is not active. This message is equivalent to the OpenEdition MVS EMVSNOTUP errno.

Programmer Response: Have the operator start OpenEdition MVS (START OMVS).

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50U

EDC5151I Dynamic allocation error.

Explanation: The mount of an HFS data set or VM/ESA Byte File System (BFS) failed in dynamic allocation. The dynamic allocation reason code returned in errno2 is documented in *OS/390 MVS Programming: Authorized Assembler Services Guide* or *VM/ESA Application Development Guide: Authorized Assembler Language Programs.* This message is equivalent to the OpenEdition errno, EMVSDYNALC.

Programmer Response: Have the system programmer correct the allocation of the HFS data set or VM/ESA BFS.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC50V

EDC5152I Catalog Volume Access Facility error.

Explanation: The mount of an HFS data set failed on a catalog error. The catalog reason code returned in errno2 is documented in *MVS/DFP System Programming Reference*. This message is equivalent to the OS/390 UNIX System Services errno, EMVSCVAF.

Programmer Response: Have the system programmer correct the allocation of the HFS data set.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC510

EDC5153I Catalog obtain error.

Explanation: The mount of an HFS data set failed on a catalog error. The catalog reason code returned in errno2 is documented in *MVS/DFP System Programming Reference*. This message is equivalent to the OS/390 UNIX System Services errno, EMVSCATLG.

Programmer Response: Have the system programmer correct the allocation of the HFS data set.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC511

EDC5156I Process initialization error.

Explanation: A process initialization error has occurred. A further explanation can be found in *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* or *OpenEdition for VM/ESA: Callable Services Reference.*

Programmer Response: Use the function `errno2()` to retrieve the value of the OpenEdition kernel reason code to determine further information from *OS/390 UNIX System Services Programming: Assembler Callable Services Reference* or *OpenEdition for VM/ESA: Callable Services Reference.*

System Action: Process does not start.

Symbolic Feedback Code: EDC514

EDC5157I An internal error has occurred.

Explanation: This message is equivalent to the OS/390 UNIX System Services errno, EMVSERR or ECMSERR.

Programmer Response: Report this problem to your system programmer.

System Action: A system dump is taken of the error and MVS or VM attempts to continue.

Symbolic Feedback Code: EDC515

EDC5158I Bad parameters were passed to the service.

Explanation: A bad parameter was passed to an OS/390 UNIX System Services service. This message is equivalent to the OS/390 UNIX System Services errno, EMVSPARMERR.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC516

EDC5159I The Physical File System encountered a permanent file error.

Explanation: This message is equivalent to the OS/390 UNIX System Services errno, EMVSPFSFILERR or ECMSPFSFILE.

Programmer Response: Report this problem to your system programmer.

System Action: A system dump is taken of the error and MVS or VM attempts to continue.

Symbolic Feedback Code: EDC517

EDC5160I Bad character in environment variable name.

Explanation: An invalid character was found in the 'name' or 'value' string specified on a `getenv()` or `setenv()` function. This message is equivalent to the OS/390 UNIX System Services errno, EMVSBADCHAR.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC518

EDC5162I The Physical File System encountered a system error.

Explanation: This message is equivalent to the OS/390 UNIX System Services errno, EMVSPFSPERMERR or ECMSPFSPERM.

Programmer Response: Report this problem to your system programmer.

System Action: A system dump is taken of the error and MVS or VM attempts to continue.

Symbolic Feedback Code: EDC51A

EDC5163I SAF/RACF extract error.

Explanation: An authorization failure occurred when attempting the service. This message is equivalent to the OS/390 UNIX System Services errno, EMVSSAFEXTERR.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC51B

EDC5164I SAF/RACF error.

Explanation: An internal SAF/RACF error occurred. This message is equivalent to the OS/390 UNIX System Services errno, EMVSSAF2ERR.

Programmer Response: Report this problem to your system programmer.

System Action: A system dump is taken of the error and MVS or VM attempts to continue.

Symbolic Feedback Code: EDC51C

EDC5165I System TOD clock not set.

Explanation: The system time of day (TOD) clock is in error, stopped, or in a non-operational state. This message is equivalent to the OS/390 UNIX System Services errno, EMVSTODNOTSET.

Programmer Response: Report this problem to your system programmer.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC51D

EDC5166I Access mode argument on function call conflicts with PATHOPTS parameter on JCL DD statement.

Explanation: An open or reopen was issued to a DD which specified PATHOPTS. The PATHOPTS specified on the DD conflict with those specified in the function call. This message is equivalent to the OS/390 UNIX System Services errno, EMVSPATHOPTS.

Programmer Response: Correct either the open/reopen call or the PATHOPTS specified on the DD being opened.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC51E

EDC5167I Access to the OpenEdition MVS or OpenEdition VM version of the C RTL is denied.

Explanation: An attempt was made to issue an Open C library function that has a dependency on OpenEdition MVS or OpenEdition VM and the subsystem was not available or at the incorrect release level. This message is equivalent to the OpenEdition errno, EMVSNORTL.

Programmer Response: You need to either install the correct level of the subsystem or modify your program to not issue the function or conditionally issue the function. If you received this message and you are not running under OpenEdition, make sure that POSIX(ON) is set.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC51F

EDC5168I Password has expired.

Explanation: The verification request has failed because the password has expired. This message is equivalent to the OS/390 UNIX System Services errno, EMVSEXPIRE.

Programmer Response: Change the password.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC51G

EDC5169I Password is invalid.

Explanation: The verification or change password request has failed because the supplied password is invalid. This message is equivalent to the OS/390 UNIX System Services errno, EMVSPASSWORD.

Programmer Response: Correct the supplied password, and retry the request.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC51H

EDC5170I An error was encountered with WLM.

Explanation: A WLM error was detected.

Programmer Response: Report the failure to your local administrator for the WLM function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC51I

EDC5200I The application contains a Language Environment member language that cannot tolerate a fork().

Explanation: An application that uses the `fork()` function cannot use other Language Environment member languages that do not support `fork()`.

Programmer Response: Restructure your application so that it contains only C source, or remove the `fork()` function.

System Action: The `fork()` function is not performed.

Symbolic Feedback Code: EDC52G

EDC5201I The Language Environment message file was not found in the hierarchical file system.

Explanation: For Language Environment messaging to work correctly in a child process, the Language Environment message file must reside in the hierarchical file system.

Programmer Response: Define your message file as a hierarchical file.

System Action: The `fork()` function is not performed.

Symbolic Feedback Code: EDC52H

EDC5202E DLL facilities are not supported under SPC environment.

Explanation: An SPC application is attempting to use DLL callable services, or the SPC application is compiled with DLL compiler options.

Programmer Response: Make sure that `dllload()`, `dllqueryvar()`, `dllqueryfn()`, and `dllfree()` functions are not invoked from your application, or your application is not compiled with the DLL compile-time option.

System Action: The request is not completed.

Symbolic Feedback Code: EDC52I

EDC5203E DLL facilities are not supported under POSIX environment.

Explanation: A POSIX application is attempting to use DLL callable services, or the POSIX application is compiled with the DLL compiler option.

Programmer Response: Make sure that `dllload()`, `dllqueryvar()`, `dllqueryfn()`, and `dllfree()` functions are not invoked from your application, or your application is not compiled with the DLL compiler-time option.

System Action: The request is not completed.

Symbolic Feedback Code: EDC52J

EDC5204E Not enough storage to load DLL module.

Explanation: Not enough storage was available to load the requested DLL load module into virtual storage. If this was an implicit load request, this message is preceded by message EDC6063I that identifies the DLL load module name.

Programmer Response: Ensure that the REGION size is large enough to run the application. If necessary, delete modules not currently needed by the application, or free unused storage, and retry the load request.

System Action: The DLL module is not loaded.

Symbolic Feedback Code: EDC52K

EDC5205S DLL module not found.

Explanation: The system could not find the DLL load module name specified on the parameter list to Language Environment load service, in either the job library or link library. If this was an implicit load request, this message is preceded by message EDC6063I that identifies the DLL load module name.

Programmer Response: Ensure that the requesting DLL name was correctly modified. Make sure that the job step indicates the correct library. Correct the error and run the job step again.

System Action: DLL module is not loaded.

Symbolic Feedback Code: EDC52L

EDC5206S DLL module name too long.

Explanation: The module name length is greater than the name length supported by the underlying operating system. If this was an implicit load request, this message is preceded by message EDC6063I that identifies the DLL load module name.

Programmer Response: Correct the module name length and run the job again.

System Action: The name length is truncated to the name length supported by the underlying operating system. The requested module may or may not be loaded.

Symbolic Feedback Code: EDC52M

EDC5207S Load request for DLL load module unsuccessful.

Explanation: The system cannot load the DLL load module. If this was an implicit load request, this message is preceded by message EDC6063I that identifies the DLL load module name.

Programmer Response: Check the original abend from the operating system, and refer to the underlying operating system message manual for explanation and programmer's action.

System Action: The DLL module is not loaded. The application may abend.

Symbolic Feedback Code: EDC52N

EDC5208I dllHandle supplied to the dllqueryvar() function is not available for use.

Explanation: The dllHandle supplied to the `dllqueryvar()` call is inactive, because the DLL is logically freed by a successful call to `dllfree()`

Programmer Response: Ensure that the proper dllHandle is supplied to the `dllqueryvar()` service, or that the subject DLL is not freed prematurely.

System Action: The request is ignored.

Symbolic Feedback Code: EDC52O

EDC5209I No variables exported from this dllHandle.

Explanation: Attempting to query an external variable, but the DLL does not contain any imported variables.

Programmer Response: Ensure that the DLL load module indicated in the job library or link library is the correct version, and that it contains the external variable.

System Action: The request is ignored.

Symbolic Feedback Code: EDC52P

EDC5210I Requested variable not found in this DLL.

Explanation: Attempting to query an external variable, but the variable name is not found in the export section of the DLL.

Programmer Response: Ensure that the variable name specified on the `dllqueryvar()` function call is correct, or that the DLL load module indicated in the job library or link library is the correct version, and that it contains the external variable.

System Action: The request is ignored.

Symbolic Feedback Code: EDC52Q

EDC5211I DLL load module does not contain a writeable static area.

Explanation: DLL load module that you loaded does not contain any writeable static.

Programmer Response: Ensure that the load module name specified is correct, or that the DLL load module indicated in the job library or link library is the correct version. Also check that the DLL load module was built properly.

1. Specify #pragma export in your source, or compile with EXPORTALL compiler option.
2. Compile with DLL, RENT, and LONGNAME compiler options.
3. Prelink.

System Action: The request is ignored. Load module is deleted from storage.

Symbolic Feedback Code: EDC52R

EDC5212I dllHandle supplied to dllqueryfn() function is not available for use.

Explanation: The dllHandle supplied to `dllqueryfn()` call is inactive because the DLL is logically freed as a result of a successful call to the `dllfree()` function.

Programmer Response: Ensure that the proper dllHandle is supplied to the `dllqueryfn()` function, or that the subject DLL is not freed prematurely.

System Action: The request is ignored.

Symbolic Feedback Code: EDC52S

EDC5213I No functions exported from this dllHandle.

Explanation: Attempting to query an external function, but the DLL does not contain any imported functions.

Programmer Response: Ensure that the DLL load module indicated in the job library or link library is the correct version, and that it contains the external function.

System Action: The request is ignored.

Symbolic Feedback Code: EDC52T

EDC5214I Requested function not found in this DLL.

Explanation: Attempting to query an external function, but the function name is not found in the export section of the DLL.

Programmer Response: Ensure that the function name specified on `dllqueryfn()` is correct, or that the DLL load module indicated in the job library or link library is the correct version, and that it contains the external function.

System Action: The request is ignored.

Symbolic Feedback Code: EDC52U

EDC5215I Not enough storage available for writeable static.

Explanation: Not enough heap storage was available for allocation of writeable static for the DLL load module.

Programmer Response: Increase heap size or free unused heap storage.

System Action: The request is ignored. Load module is deleted from storage.

Symbolic Feedback Code: EDC52V

EDC5216I dllHandle supplied is NULL.

Explanation: The dllHandle supplied to the dllfree call is invalid.

Programmer Response: You must call the dllload service to initialize a dllHandle properly before attempting to free a DLL.

System Action: The request is ignored.

Symbolic Feedback Code: EDC530

EDC5217I No DLLs to be freed.

Explanation: Attempting to free a DLL, but all DLLs are freed already, or the dllHandle passed is inactive.

Programmer Response: Ensure that `dllfree()` is invoked after the call to `dlload()` is completed successfully, or that you have no extra calls to `dllfree()` with this dllHandle in your application.

System Action: The request is ignored.

Symbolic Feedback Code: EDC531

EDC5218I Logical delete performed, but the DLL is not physically deleted.

Explanation: The `dllfree()` function completed successfully. The DLL is not physically deleted because either there is an implicit dllload performed against this DLL by the application, or multiple calls were made to the `dlload()` service.

Programmer Response: If the DLL was loaded implicitly by referring to an external variable or an external function, it will be physically deleted by the run-time library at enclave termination. Otherwise, to free the DLL, invoke `dllfree()` with the proper dllHandle.

System Action: Execution continues.

Symbolic Feedback Code: EDC532

EDC5220I Invalid dllHandle.

Explanation: The dllHandle supplied to the dllfree call could not be matched to a DLL loaded by this application.

Programmer Response: Ensure that the dllHandle supplied to `dllfree()` is the same as the one returned from `dlload()` accidentally, and that it has not been overwritten.

System Action: The request is ignored.

Symbolic Feedback Code: EDC534

EDC5221S Load request for DLL not supported while running C++ destructors.

Explanation: The application is attempting to load a DLL explicitly while running C++ destructors.

Programmer Response: Make sure that you are not invoking `dlload()` from your C++ destructors.

System Action: The request is ignored. Execution continues but results are unpredictable.

Symbolic Feedback Code: EDC535

EDC5222S IOStreams do not support Record Mode I/O.

Explanation: The application is attempting to initialize an IOStreams object to perform Record Mode I/O. Record Mode I/O is not supported in IOStreams objects.

Programmer Response: Remove the "type=record" specification from the constructor or `open()` function call.

System Action: The attempt to initialize the object fails. Execution continues.

Symbolic Feedback Code: EDC536

EDC5223S Too many characters.

Explanation: The application called the `form()` function with a format specifier string that caused `form()` to write past the end of the format buffer. `form()` is provided in stream.h for compatibility.

Programmer Response: Split the call to `form()` into two or more calls.

System Action: Execution ends.

Symbolic Feedback Code: EDC537

EDC5224S Singularity: log((0,0))

Explanation: The application is attempting to take the log of (0.0, 0.0).

Programmer Response: Correct the value passed to `log()` and resubmit.

System Action: Execution ends.

Symbolic Feedback Code: EDC538

EDC5225E DLL function is not allowed because destructors are running for the DLL

Explanation: A dllfree(), dllqueryvar(), or dllqueryfn() function was invoked for a DLL that is currently running destructors. Since destructors are running the DLL is about to be freed. Further function requests using this DLL are not allowed.

Programmer Response: Do not issue DLL function requests from one thread while the DLL is being freed from another thread.

System Action: The request failed. Application execution continues. The dllfree() function returns a value of 7. The dllqueryvar() and dllqueryfn() functions return a null pointer.

Symbolic Feedback Code: EDC539

EDC5226S A load of DLL from the HFS failed

Explanation: A load attempt for a DLL in the hierarchical file system (HFS) failed. If this was an implicit load request, this message is preceded by message EDC6063I that identifies the DLL load module name.

Programmer Response: Verify that the DLL is available in the HFS and that the application has access to the file.

System Action: If the DLL was explicitly loaded using the dllload() function, the request fails and the DLL is not loaded. If the DLL was implicitly loaded by reference to a variable or function contained in it, the application is ends with return code 3000.

Symbolic Feedback Code: EDC53A

EDC5227I Buffer is not long enough to contain a path definition

Explanation: The request for a path definition for the specified ddname cannot be satisfied because the path name length of the path associated with this ddname is greater than the specified buffer length.

Programmer Response: Specify a larger buffer.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC53B

EDC5228I The file referred to is an external link

Explanation: An I/O operation cannot be satisfied because the file referred to is an external link.

Programmer Response: Refer to *OS/390 UNIX System Services for VM/ESA: User's Guide* for information on how to perform I/O operations on external links.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC53C

EDC5229I No path definition for ddname in effect

Explanation: The request to obtain the path definition for the specified ddname cannot be satisfied because no OPENVM PATHDEF CREATE command was issued to associate a BFS path definition with this ddname.

Programmer Response: Issue OPENVM PATHDEF CREATE command to associate this ddname with a path name definition.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC53D

EDC5230I ESM error.

Explanation: An internal External Security Manager (ESM) error occurred. This message is equivalent to the OS/390 UNIX System Services errno ECMSESMERR.

Programmer Response: Report this problem to your system programmer.

System Action: Messages are displayed on the file pool server operator console indicating the error and VM processing continues.

Symbolic Feedback Code: EDC53E

EDC5231I CP or the external security manager had an error

Explanation: An error occurred in CP or the external security manager. This message is equivalent to the OS/390 UNIX System Services errno ECPERR.

Programmer Response: Try the command again. If the problem persists, report it to your system programmer.

System Action: None.

Symbolic Feedback Code: EDC53F

EDC5232I The function failed because it was invoked from a multithread environment.

Explanation: An application may not use the *exec()*, *fork()*, or *vfork()* functions from within a multithread environment.

Programmer Response: Restructure your application so that it is not multithreaded, or remove the function.

System Action: The function is not performed.

Symbolic Feedback Code: EDC53G

EDC6000E The raise() function was issued for the signal SIGFPE.

Explanation: The program has invoked the `raise()` function with the SIGFPE signal specified and the default action specified.

Programmer Response: None.

System Action: The program is terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RG

EDC6001E The raise() function was issued for the signal SIGILL.

Explanation: The program has invoked the `raise()` function with the SIGILL signal specified and the default action specified.

Programmer Response: None.

System Action: The program is terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RH

EDC6002E The raise() function was issued for the signal SIGSEGV.

Explanation: The program has invoked the `raise()` function with the SIGSEGV signal specified and the default action specified.

Programmer Response: None.

System Action: The program will be terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RI

EDC6003E The raise() function was issued for the signal SIGABND.

Explanation: The program has invoked the `raise()` function with the SIGABND signal specified and the default action specified.

Programmer Response: None.

System Action: The program will be terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RJ

EDC6004E The raise() function was issued for the signal SIGTERM.

Explanation: The program has invoked the `raise()` function with the SIGTERM signal specified and the default action specified.

Programmer Response: None.

System Action: The program will be terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RK

EDC6005E The raise() function was issued for the signal SIGINT.

Explanation: The program has invoked the `raise()` function with the SIGINT signal specified and the default action specified.

Programmer Response: None.

System Action: The program will be terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RL

EDC6006E The raise() function was issued for the signal SIGABRT.

Explanation: The program has invoked the `raise()` function with the SIGABRT signal specified and the default action specified.

Programmer Response: None.

System Action: The program will be terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 2000(MVS) or 2000000(VM) is returned.

Symbolic Feedback Code: EDC5RM

EDC6007E The raise() function was issued for the signal SIGUSR1.

Explanation: The program has invoked the `raise()` function with the SIGUSR1 signal specified and the default action specified.

Programmer Response: None.

System Action: The program will be terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RN

EDC6008E The raise() function was issued for the signal SIGUSR2.

Explanation: The program has invoked the `raise()` function with the SIGUSR2 signal specified and the default action specified.

Programmer Response: None.

System Action: The program will be terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RO

EDC6009E The raise() function was issued for the signal SIGIOERR.

Explanation: The program has invoked the `raise()` function with the SIGIOERR signal specified and the default action specified.

Programmer Response: None.

System Action: The program will be terminated and a traceback or dump is issued, depending on the TERMTHDACT run-time option. A return code of 3000(MVS) or 3000000(VM) is returned.

Symbolic Feedback Code: EDC5RP

EDC6010E An object was thrown which was not caught by any catch clauses.

Explanation: An object was thrown for which no `catch` clauses exist to catch it.

Programmer Response: None.

System Action: The program ends abnormally.

Symbolic Feedback Code: EDC5RQ

EDC6052S An AMODE 24 application is attempting to load an AMODE 31 DLL load module.

Explanation: An application with AMODE=24 is attempting to load a DLL load module link-edited as an AMODE=31 load module.

Programmer Response: Ensure that the AMODE of the application and the AMODE of the DLL load module are the same. If you must run your application in AMODE=24, make sure that the run-time library of the Language Environment is installed below the line. Otherwise, re-link your application to have AMODE=31.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5T4

EDC6053S An AMODE 31 application is attempting to load an AMODE 24 DLL load module.

Explanation: An application with AMODE=31 is attempting to load a DLL load module link-edited as a load module with AMODE=24.

Programmer Response: Ensure that the AMODE of the application and the AMODE of the DLL load module are the same. Re-link your DLL load module to have AMODE=31.

System Action: Application is terminated with return code 3000.

Symbolic Feedback Code: EDC5T5

EDC6054S External variable is not found in DLL load module.

Explanation: The application is attempting to refer to an external variable that is not defined in the DLL load module.

Programmer Response: Ensure that the DLL load module indicated in the job library or link library is the correct version, and that it contains the external variable.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5T6

EDC6055S External function is not found in DLL load module.

Explanation: The application is attempting to refer to an external function that is not defined in the DLL load module.

Programmer Response: Ensure that the DLL load module indicated in the job library or link library is the correct version, and that it contains the external function.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5T7

EDC6056S Attempting to load a DLL while running C++ destructors.

Explanation: The application is attempting to load a DLL implicitly while running C++ destructors.

Programmer Response: Make sure that you are not referring to variables or functions implicitly from your C++ destructors.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5T8

EDC6057S A DLL load module that you are attempting to load does not contain a CEESTART csect.

Explanation: The application is attempting to load a DLL load module implicitly or explicitly, but the CEESTART csect cannot be located within it.

Programmer Response: Make sure that when you generate the DLL load module, it contains a CEESTART csect.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5T9

EDC6058S There is not enough heap storage to load DLL.

Explanation: There is insufficient heap storage to satisfy DLL load request.

Programmer Response: Increase the allocation of your application heap storage by using the heap run-time option.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5TA

EDC6059S The DLL that you have loaded does not export any variables or functions.

Explanation: A DLL was loaded successfully, but the DLL does not export any variables or functions. Either the definition side-deck supplied to your application is incorrect, or the DLL load module is generated incorrectly.

Programmer Response: Ensure that the DLL load module was built properly.

1. Specify #pragma export in your source or compile with EXPORTALL compiler option.
2. Compile with DLL, RENT, and LONGNAME compiler options.
3. Prelink.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5TB

EDC6060S The DLL that you are attempting to load does not contain any C functions.

Explanation: A DLL was loaded successfully, but the load module does not contain any C functions.

Programmer Response: Make sure that you are loading the correct load module, and that the DLL load module is built correctly.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5TC

EDC6061S You are attempting to load DLLs that are in a circular list.

Explanation: The run-time library discovered a deadlock condition while processing a DLL load request. The deadlock condition exists because the DLLs that are being loaded depend on each other. The following situation illustrates a deadlock condition. DLL A has static constructors that require objects from DLL B. DLL B has static constructors that require objects from DLL A. When DLL A is loaded, its static constructors require objects from DLL B. This forces DLL B to be loaded, requiring objects from DLL A. Since the loading of DLL A has not completed, a deadlock condition exists.

Programmer Response: Remove the circular list dependency from the DLLs.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5TD

EDC6062S DLL constructors or destructors did not complete, so DLL cannot be used.

Explanation: A DLL being loaded or freed was in the process of running static constructors or destructors but the process did not complete (probably because the thread was abnormally terminated). The DLL is left in an indeterminate state. Another thread that was waiting for the constructors or destructors to complete while attempting a load or free of the same DLL detected this error.

Programmer Response: Determine the cause of the incomplete constructor or destructor process. Ensure that the constructors or destructors are not the cause of the thread termination that lead to this condition.

System Action: The application ends with return code 3000.

Symbolic Feedback Code: EDC5TE

EDC6063I DLL name is ***dll_name*****.**

Explanation: This message accompanies other DLL load error messages (for example EDC5205S). It identifies the name of the DLL for which the load failed.

Programmer Response: Refer to the accompanying DLL error message.

System Action: None.

Symbolic Feedback Code: EDC5TF

EDC6200E An invalid argument list was specified.

Explanation: The parameter list specified to DLLRNAME is invalid. See *OS/390 C/C++ User's Guide* for proper syntax.

Programmer Response: Ensure that:

1. At least 1 input module or DLL is specified.
2. The syntax of the parameters matches listed syntax for environment.
3. Valid options are specified correctly.

System Action: DLLRNAME: fails with return code 8.

Symbolic Feedback Code: EDC61O

EDC6201S A failure occurred accessing @1.

Explanation: An unexpected error occurred when DLLRNAME accessed an input file.

Programmer Response: Look up subsequent error message and perform Programmer Response if possible (for example, file not found error might mean to fix input file name). Otherwise, report the problem to your IBM Support Center.

System Action: DLLRNAME prints out a perror() message then terminates with rc=16.

Symbolic Feedback Code: EDC61P

EDC6202S A DLL named " @1 " is already imported.

Explanation: A DLLRNAME operation has found that an old DLL name to be renamed is being renamed to a new name that is already imported in the current module being processed.

Programmer Response: User has specified DLL to rename, but the new name chosen matches a DLL in the import list.

System Action: DLLRNAME fails with rc=12.

Symbolic Feedback Code: EDC61Q

EDC6203E A DLL name was specified more than once for a rename.

Explanation: On a DLLRNAME, user has specified a DLL name twice in the "oldname=newname" list. Examples are: (A=B,A=C or A=C,B=C or A=B,B=C or A=B,C=A or A=A).

Programmer Response: Fix the argument list. A DLL cannot appear twice in the argument list.

System Action: DLLRNAME fails with rc=8.

Symbolic Feedback Code: EDC61R

EDC6204E No argument list was provided.

Explanation: User did not provide any argument list.

Programmer Response: An argument list must be provided (for example, through SYSIN or standard streams redirection).

System Action: DLLRNAME fails with rc=8.

Symbolic Feedback Code: EDC61S

EDC7000C Signal delivery has failed because the service BPX1SIA failed.

Explanation: The callable service, BPX1SIA (`sigaction()`), unexpectedly returned a failure code. This service was invoked by the library during delivery of a signal to a user catcher function.

Programmer Response: Contact your IBM Support Center.

System Action: The application ends.

Symbolic Feedback Code: EDC6QO

EDC7001C Signal delivery has failed because the service BPX1SPM failed.

Explanation: The callable service BPX1SPM (`sigprocmask()`) unexpectedly returned a failure code. This service was invoked by the library during delivery of a signal to a user catcher function.

Programmer Response: Contact your IBM Support Center.

System Action: The application ends.

Symbolic Feedback Code: EDC6QP

EDC7002C Signal delivery has failed because the MVS service CSRL16J failed.

Explanation: The MVS callable service CSRL16J unexpectedly returned a failure code. This service was invoked by the library following the return from a user signal catcher function.

Programmer Response: Contact your IBM Support Center.

System Action: The application ends.

Symbolic Feedback Code: EDC6QQ

EDC7003C Invalid signal received from the OS/390 UNIX System Services kernel.

Explanation: The library has been interrupted by the OS/390 UNIX System Services kernel to perform default signal processing. However, the signal was not one of the supported types (SIGHUP, SIGINT, SIGABRT, SIGILL, SIGFPE, SIGSEGV, SIGPIPE, SIGALRM, SIGTERM, SIGUSR1, SIGUSR2, SIGABND, SIGQUIT, or SIGTRAP).

Programmer Response: Contact your IBM Support Center.

System Action: The application ends.

Symbolic Feedback Code: EDC6QR

EDC7004C The library function sigsetjmp() or siglongjmp() failed because the service BPX1SPM failed.

Explanation: The callable service BPX1SPM (`sigprocmask()`) unexpectedly returned a failure code. The library was attempting to save or restore the signal mask as part of the `sigsetjmp()` or `siglongjmp()` functions.

Programmer Response: Contact your IBM Support Center.

System Action: The application ends.

Symbolic Feedback Code: EDC6QS

EDC7005E The getopt() function detected an invalid option character *option_char* **when it was invoked from program** *program_name***.**

Explanation: The `getopt()` function detected that an option character that was parsed was not one of the recognized set of specified option characters.

Programmer Response: Respecify a recognized option character.

System Action: The `getopt()` function returns the character in error. The application continues to run.

Symbolic Feedback Code: EDC6QT

EDC7006E The getopt() function detected an option character *option_char* that is missing an argument when it was invoked from program *program_name*.

Explanation: The `getopt()` function encountered an option character that required an option-argument, but the option-argument was not found.

Programmer Response: Respecify the option character with an option-argument.

System Action: The `getopt()` function returns the character in error. The application continues to run.

Symbolic Feedback Code: EDC6QU

EDC7007C No memory available for the random() function family internal structure.

Explanation: The initialization routine for the `random()` function family was unable to allocate memory for the internal structure used by the functions.

Programmer Response: Reduce memory use and try again.

System Action: The application ends.

Symbolic Feedback Code: EDC6QV

EDC7008E No previous regular expression.

Explanation: The `re_comp()` function was invoked with either a null pointer argument or a null regular expression, and a compiled regular expression does not currently exist.

Programmer Response: Invoke the `re_comp()` with a valid regular expression.

System Action: The `re_comp()` function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R0

EDC7009E Regular expression too long.

Explanation: The input regular expression for the `re_comp()` function is too long. The compiled regular expression cannot fit in the internal work buffer, which is of limited size.

Programmer Response: Invoke the `re_comp()` with a shorter regular expression.

System Action: The `re_comp()` function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R1

EDC7010E *paren_pair* imbalance.

Explanation: The `re_comp()` function detected an error in the input regular expression. The character sequences **\(** (left parenthesis) were found without a matching **\)** (right parenthesis), or vice versa.

Programmer Response: Correct the regular expression pattern and retry the `re_comp()`.

System Action: The `re_comp()` function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R2

EDC7011E *brace_pair* **imbalance.**

Explanation: The `re_comp()` function detected an error in the input regular expression. The character sequences **\{** (left brace) were found without a matching **\}** (right brace), or vice versa.

Programmer Response: Correct the regular expression pattern and retry the `re_comp()`.

System Action: The `re_comp()` function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R3

EDC7012E *square_bracket* **imbalance.**

Explanation: The `re_comp()` function detected an error in the input regular expression. The left square bracket **[** was found without a matching right square bracket **]**.

Programmer Response: Correct the regular expression pattern and retry the `re_comp()`.

System Action: The `re_comp()` function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R4

EDC7013E Too many *paren_pair* **pairs.**

Explanation: The `re_comp()` function detected an error in the input regular expression. Too many \(\) sub-expression pairs were specified. Up to nine such \(\) pairs are allowed.

Programmer Response: Correct the regular expression pattern and retry the `re_comp()`.

System Action: The `re_comp()` function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R5

EDC7014E Incorrect range values in *brace_pair.*

Explanation: The `re_comp()` function detected an error in the input regular expression. The repetition interval specified within the \{*m,n*\} is incorrect. Specifically, one or more of the following errors may have occurred:

- One or more numbers within the \{\} are too large. They must be less than 256.
- Bad numbers (for example, non-numeric values) are used as range values.
- More than two numbers are given within the \{\}.
- First number exceeds the second number within the \{\}.

Programmer Response: Correct the regular expression pattern and retry the `re_comp()`.

System Action: The `re_comp()` function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R6

EDC7015E Back-reference number in *backslash* **digit incorrect.**

Explanation: The `re_comp()` function detected an error in the input regular expression. The back-reference number, *digit*, in *digit* is incorrect. This value must be between 1 and 9 (inclusive), and must correspond to one of the earlier bracketed sub-expressions (that is, sub-expressions enclosed in \(\)). The expression is invalid if less than *digit* sub-expressions precede the *digit*. For example, if five bracketed sub-expressions are defined in the regular expression, then it is valid to refer to them by specifying from \1 to \5. However, it is incorrect to specify \6, \7, \8, or \9.

Programmer Response: Correct the regular expression pattern and retry the `re_comp()`.

System Action: The re_comp() function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R7

EDC7016E Incorrect endpoint in range expression.

Explanation: The re_comp() function detected an error in the input regular expression. The ending range point in a *range expression* must collate equal to or higher than the starting range point. For example, it is an error to specify [d-a].

Programmer Response: Correct the regular expression pattern and retry the re_comp().

System Action: The re_comp() function returns with a pointer to this error message. The application continues to run.

Symbolic Feedback Code: EDC6R8

EDC7022I USERID:

Explanation: A userid was not specified, while executing the REXEC command. If a userid was specified, it was not found to be valid at the host, when searching the $HOME/.netrc file. A userid must be input at the invocation of this message.

System Action: System waits for user input of userid.

Symbolic Feedback Code: EDC6RE

EDC7023I PASSWORD:

Explanation: A password was not specified, while executing the REXEC command. If a password was specified, it was not found to be valid at the host, when searching the $HOME/.netrc file. A password must be input at the invocation of this message.

System Action: System waits for user input.

Symbolic Feedback Code: EDC6RF

EDC7024I $HOME/.netrc file cannot be opened.

Explanation: The $HOME/.netrc file cannot be opened for an FOPEN error other than ENONET.

System Action: The system continues, asking the user to enter the user ID and password.

Symbolic Feedback Code: EDC6RG

EDC7025I fstat() failed on $HOME/.netrc file.

Explanation: An fstat() was performed on the $HOME/.netrc file, and had an unsuccessful return code.

System Action: The system stops trying to find the user ID and password through the $HOME/.netrc file. The user must enter them instead.

Symbolic Feedback Code: EDC6RH

EDC7026I $HOME/.netrc file is not in the correct mode.

Explanation: If the $HOME/.netrc file contains a login password, the file's permissions must be set to 600 (read and write by owner only). The system detected that the $HOME/.netrc file was not set to 600.

System Action: The system asks the user to enter the user ID and and password.

Symbolic Feedback Code: EDC6RI

EDC7027I Remove password or correct $HOME/.netrc mode.

Explanation: This message follows EDC7026 and advises the user how to correct the problem with the $HOME/.netrc file.

System Action: The system asks the user to enter a user ID and password.

Symbolic Feedback Code: EDC6RJ

EDC7028I Unknown $HOME/.netrc option.

Explanation: The system has successfully examined the $HOME/.netrc file for the user ID. However, the rest of the $HOME/.netrc file is in a syntax that the system cannot understand.

System Action: The system stops trying to find the password in the $HOME/.netrc file. The user must then enter it instead.

Symbolic Feedback Code: EDC6RK

EDC7100E *errval* **: error unknown**

Explanation: An unrecognized XTI error value was passed to t_error or t_strerror.

System Action: Pass a valid XTI error value to the function.

Symbolic Feedback Code: EDC61O

EDC7101I incorrect addr format

Explanation: A transport address was passed to an XTI function which had an invalid format.

System Action: The function fails. A correct address should be passed to the function.

Symbolic Feedback Code: EDC61P

EDC7102I incorrect option format

Explanation: An option buffer was passed to an XTI function which had inconsistent length indication or contained an invalid option value.

System Action: The function fails. An option buffer with valid format should be passed to the function.

Symbolic Feedback Code: EDC61Q

EDC7103I incorrect permissions

Explanation: An XTI caller tried to change a transport option for which they lacked privilege.

System Action: The function fails. The caller should not attempt to change the option while operating without adequate privilege.

Symbolic Feedback Code: EDC61R

EDC7104I illegal transport fd

Explanation: The descriptor did not refer to a valid XTI transport endpoint.

System Action: The function fails. Pass a descriptor referring to a valid transport endpoint.

Symbolic Feedback Code: EDC61S

EDC7105I couldn't allocate addr

Explanation: The XTI transport provider couldn't allocate a transport address.

System Action: The function fails. Reattempt when addresses are available.

Symbolic Feedback Code: EDC61T

EDC7106I out of state

Explanation: A transport endpoint was not in a valid state for the function to be performed.

System Action: The function fails. Manipulate the endpoint to bring it into the correct state before reattempting.

Symbolic Feedback Code: EDC61U

EDC7107I bad call sequence number

Explanation: An invalid sequence number was specified in a t_accept call.

System Action: The function fails. Specify a valid sequence number.

Symbolic Feedback Code: EDC61V

EDC7108I system error

Explanation: A system error occurred during the execution of an XTI function.

System Action: The function fails. Correct the underlying problem.

Symbolic Feedback Code: EDC620

EDC7109I event requires attention

Explanation: An event on an XTI endpoint requires attention.

System Action: The function fails. Call t_look to process the event.

Symbolic Feedback Code: EDC621

EDC7110I illegal amount of data

Explanation: An invalid amount of user data was passed to an XTI function.

System Action: The function fails. Correct the amount of data passed.

Symbolic Feedback Code: EDC622

EDC7111I buffer not large enough

Explanation: The buffer provided to return a value from an XTI function was not large enough.

System Action: The function fails. Pass a larger return buffer.

Symbolic Feedback Code: EDC623

EDC7112I flow control

Explanation: O_NONBLOCK was set in a call to an XTI function to send data, but the transport flow control mechanism prevented the transport provider from accepting any data at this time.

System Action: The function fails. Call the function again when the flow control condition no longer exists.

Symbolic Feedback Code: EDC624

EDC7113I no data

Explanation: An XTI function to accept a connection or receive data was called with O_NONBLOCK set on the endpoint, and no connection/data was pending.

System Action: The function fails. Retry.

Symbolic Feedback Code: EDC625

EDC7114I discon_ind not found on queue

Explanation: No disconnect indication was found on the specified XTI endpoint.

System Action: The function fails. Retry.

Symbolic Feedback Code: EDC626

EDC7115I unitdata error not found

Explanation: No unitdata error was found on the specified XTI endpoint.

System Action: The function fails. Retry.

Symbolic Feedback Code: EDC627

EDC7116I bad flags

Explanation: An invalid flags value was passed to t_optmgmt.

System Action: The function fails. Retry with a valid flags value.

Symbolic Feedback Code: EDC628

EDC7117I no ord rel found on queue

Explanation: No orderly release indication was found on the specified XTI endpoint.

System Action: The function fails. Retry.

Symbolic Feedback Code: EDC629

EDC7118I primitive/action not supported

Explanation: An operation unsupported by the underlying transport provider was requested.

System Action: The function fails.

Symbolic Feedback Code: EDC62A

EDC7119I state is in process of changing

Explanation: An operation was requested on an XTI endpoint whose state was in the process of changing.

System Action: The function fails. Retry.

Symbolic Feedback Code: EDC62B

EDC7120I unsupported struct-type requested

Explanation: Allocation of an unsupported XTI structure type was requested from t_alloc.

System Action: The function fails. Pass a correct structure type.

Symbolic Feedback Code: EDC62C

EDC7121I invalid transport provider name

Explanation: An invalid transport provider name was specified when attempting to open an XTI endpoint.

System Action: The function fails. Specify a valid transport provider.

Symbolic Feedback Code: EDC62D

EDC7122I qlen is zero

Explanation: An attempt was made to listen on an XTI endpoint whose connection queue length is zero.

System Action: The function fails. Specify an endpoint with a non-zero queue length.

Symbolic Feedback Code: EDC62E

EDC7123I address in use

Explanation: An attempt was made to bind to a transport address which is already in use.

System Action: The function fails. Specify an address which is available.

Symbolic Feedback Code: EDC62F

EDC7124I outstanding connection indications

Explanation: The XTI endpoint specified for both fd and resfd in a call to t_accept has outstanding connect requests.

System Action: The function fails. Specify an endpoint with no outstanding connect requests.

Symbolic Feedback Code: EDC62G

EDC7125I transport provider mismatch

Explanation: The listening and responding endpoints in a t_accept call do not refer to the same transport provider.

System Action: The function fails. Specify two endpoints which both refer to the same transport provider.

Symbolic Feedback Code: EDC62H

EDC7126I resfd specified to accept w/qlen >0

Explanation: The XTI endpoint specified as resfd to t_accept is a passive endpoint.

System Action: The function fails. Specify an endpoint with zero queue length.

Symbolic Feedback Code: EDC62I

EDC7127I resfd not bound to same addr as fd

Explanation: The responding endpoint in a call to t_accept is not bound to the same address as the listening endpoint.

System Action: The function fails. Specify two endpoints both bound to the same address.

Symbolic Feedback Code: EDC62J

EDC7128I incoming connection queue full

Explanation: The connection queue of the endpoint specified in a call to t_listen is full.

System Action: The function fails. Accept pending connections on the endpoint and retry.

Symbolic Feedback Code: EDC62K

EDC7129I XTI protocol error

Explanation: A communication problem has been detected between XTI and the transport provider to which an endpoint refers.

System Action: The function fails. Refer to diagnostic procedures for the transport provider.

Symbolic Feedback Code: EDC62L

EDC8000I A bad socket-call constant was found in the IUCV header.

Explanation: A problem has occurred between MVS or VM and TCP/IP.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q0

EDC8001I An error was found in the IUCV header.

Explanation: An error was found in the IUCV header, such as a bad length.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q1

EDC8002I A socket descriptor is out of range.

Explanation: A socket number assigned by client interface code (for `socket()` and `accept()`) is out of range.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q2

EDC8003I A socket descriptor is in use.

Explanation: A socket number assigned by client interface code is already in use.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q3

EDC8004I Request failed because of an IUCV error.

Explanation: The request failed because of IUCV error. This error is generated by the client stub code.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q4

EDC8005I Offload box error.

Explanation: A problem has occurred between MVS or VM and TCP/IP.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q5

EDC8006I Offload box restarted.

Explanation: A problem has occurred between MVS or VM and TCP/IP.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q6

EDC8007I Offload box down.

Explanation: A problem has occurred between MVS or VM and TCP/IP.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q7

EDC8008I Already a conflicting call outstanding on socket.

Explanation: A problem has occurred between MVS or VM and TCP/IP.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q8

EDC8009I Request cancelled using a SOCKcallCANCEL request.

Explanation: A problem has occurred between MVS or VM and TCP/IP.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7Q9

EDC8011I A name of a PFS was specified that either is not configured or is not a Sockets PFS.

Explanation: A problem has occurred between MVS or VM and TCP/IP.

Programmer Response: Record this error and report the failure using your local procedure to report failures to the IBM Service support contact.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7QB

EDC8100I Block device required.

Explanation: A non-block file was specified when a block device is required.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7T4

EDC8101I Text file busy.

Explanation: An attempt is made to run a pure-procedure program that is currently open for writing or reading. It also occurs when an attempt is made to open for writing, or to remove, a pure-procedure program or shared library while that program or library is being run.

Programmer Response: Proceed with cleanup of the application resources; then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7T5

EDC8102I Operation would block.

Explanation: An operation on a socket marked as non-blocking has encountered a situation, such as no data available, that otherwise would have caused the function to suspend execution.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7T6

EDC8103I Operation now in progress.

Explanation: The socket was marked O_NDELAY or O_NONBLOCK using `fcntl()`, and the connection cannot be immediately established.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7T7

EDC8104I Connection already in progress.

Explanation: A connection or disconnection request is already in progress for the specified socket.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7T8

EDC8105I Socket operation on non-socket.

Explanation: The file descriptor does not refer to a socket.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7T9

EDC8106I Destination address required.

Explanation: The socket operation failed because a destination address was not provided. No bind address was established.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TA

EDC8107I Message too long.

Explanation: The socket data transfer failed because the message exceeded the size limits. A message sent on a transport provider was longer than an internal message buffer or some other network limit.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TB

EDC8108I Protocol wrong type for socket.

Explanation: Either the two sockets to be connected are not of the same type, or the protocol used does not support this type of socket.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TC

EDC8109I Protocol not available.

Explanation: The protocol option specified to `setsockopt()` is not supported by this implementation.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TD

EDC8110I Protocol not supported.

Explanation: This protocol is not supported by the address family, or the protocol is not supported by this implementation.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TE

EDC8111I Socket type not supported.

Explanation: The type of socket specified is not supported. Do not use this type of socket in your program.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TF

EDC8112I Operation not supported on socket.

Explanation: This socket, with its particular type, domain, and protocol, does not allow the requested operation.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TG

EDC8113I Protocol family not supported.

Explanation: The socket protocol specified is not supported. Do not use this protocol in your program.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TH

EDC8114I Address family not supported.

Explanation: This implementation does not support the specified address family, or the specified address is not valid for the address family of the specified socket.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TI

EDC8115I Address already in use.

Explanation: A bind or connect operation was attempted using a socket name that is already in use.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TJ

EDC8116I Address not available.

Explanation: The requested socket address is not available to this machine. Either an incorrect socket address was used, or there is a problem at the remote node where the socket address should be.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TK

EDC8117I Network is down.

Explanation: A socket operation failed because the network is not available. The local interface to use or reach the destination is not available.

Programmer Response: Proceed with cleanup of the application resources and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TL

EDC8118I Network is unreachable.

Explanation: A socket operation failed because the destination is at a remote node that cannot be reached over the network. No route to the network exists.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TM

EDC8119I Network dropped connection on reset.

Explanation: The host to which the socket was connected went down. The connection can be reestablished after the remote node is restarted.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TN

EDC8120I Connection ended abnormally.

Explanation: The connection between a socket and a remote node was terminated at the local node, the remote node, or the network level.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TO

EDC8121I Connection reset.

Explanation: The connection was forcibly closed by the peer. This errno can be set because of an error, or because of a connection that was closed.

Programmer Response: Proceed with cleanup of the application resources and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TP

EDC8122I No buffer space available.

Explanation: Not enough buffer space is available in the system to perform the requested socket operation.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TQ

EDC8123I Socket already connected.

Explanation: A connect operation was attempted on a socket that is already connected.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TR

EDC8124I Socket not connected.

Explanation: A socket operation, other than a connect, was attempted on a socket that is not currently connected, or a send operation that does not require a connection was attempted without a destination address.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TS

EDC8125I Can't send after socket shutdown.

Explanation: An attempt was made to send data after a socket was shut down.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TT

EDC8126I Too many references; can't splice.

Explanation: Too many references have been specified.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TU

EDC8127I Connection timed out.

Explanation: A remote socket did not respond within the timeout period set by the protocol of the socket on this node. If the connection timed out during execution of the function that reported this error (as opposed to timing out before the function being called), results are unpredictable.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7TV

EDC8128I Connection refused.

Explanation: A remote node refused to allow the attempted connect operation. The attempt to connect to a socket was refused because there was no process listening, or because the queue of connection requests was full and the underlying protocol does not support retransmissions.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U0

EDC8129I Host is not available.

Explanation: A socket operation failed because the remote node specified is not available.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U1

EDC8130I Host cannot be reached.

Explanation: A socket operation failed because no route to the remote node was available because of an incorrect address, an incorrect routing table, or network hardware problems.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U2

EDC8131I Too many processes.

Explanation: The system process limit has been exceeded.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U3

EDC8132I Too many users.

Explanation: The maximum number of users has been reached.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U4

EDC8133I Disk quota exceeded.

Explanation: A write to an ordinary file, the creation of a directory or symbolic link, or the creation of a directory entry failed because the user's quota of disk blocks is exhausted.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U5

EDC8134I Stale file handle.

Explanation: The current directory, the root directory, or a file descriptor to a file refers to a file system that is no longer accessible. This error may be caused by the local or remote file system being unmounted, or by a remote file server disabling currently open file handles for implementation-defined reasons.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U6

EDC8136I File is not a STREAM.

Explanation: A STREAM operation was attempted on a file descriptor which was not associated with a STREAM.

Programmer Response: Report the failure to your local administrator.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U8

EDC8137I STREAMS ioctl() timeout.

Explanation: The timer set for a STREAMS `ioctl()` call has expired. The cause of this error is device-specific and indicates either a hardware or software failure, or a timeout value that is too short for the specific operation. The status of the `ioctl()` operation is unpredictable.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7U9

EDC8138I No STREAMS resources.

Explanation: Insufficient STREAMS memory resources are available to perform a STREAMS-related function. This is a temporary condition; recovery is possible if other processes release resources.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7UA

EDC8139I The message identified by set_id and msg_id is not in the message catalog.

Explanation: This message is equivalent to the ENOMSG errno.

Programmer Response: Refer to *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7UB

EDC8140I Bad message.

Explanation: During a `read()`, `getmsg()`, or `ioctl()` I_RECVFD request to a STREAMS device, a message arrived at the head of the STREAMS that is inappropriate for the function receiving the message:

- `read()`—The message waiting to be read on a STREAMS is not a data message.
- `getmsg()`—A file descriptor was received instead of a control message.
- `ioctl()`—Control or data information was received instead of a file descriptor when I_RECVFD was specified.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7UC

EDC8141I Identifier removed.

Explanation: Returned during interprocess communication if an identifier has been removed from the system.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7UD

EDC8144I The link has been severed.

Explanation: This error may be reported by a function that refers to a remote file, when the communications link to the server for that resource has been lost, any file descriptor associated with this remote file should not be used for future I/O.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7UG

EDC8148I Protocol error.

Explanation: A protocol error occurred. This error is device-specific, but is usually not caused by a hardware failure.

Programmer Response: Proceed with cleanup of the application resources, and then close the socket. When the socket has been freed, the application may begin the process again.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7UK

EDC8149I Multihop not allowed.

Explanation: For a function that has a pathname as one of its arguments, resolution of that pathname requires multihop access to a remote resource, and multihop access is not supported by the underlying implementation.

Programmer Response: Report the failure to your local administrator for the TCP/IP function. Try the application again when the problem has been corrected.

System Action: The request fails. The application continues to run.

Symbolic Feedback Code: EDC7UL

EDC8159I Function call was interrupted before any data was received.

Explanation: An asynchronous signal was caught by the (POSIX) process during the execution of an interruptible function, and the signal handler (or default action) resulted in a normal return. This caused the interrupted function to return this errno. The signal arrived after the socket connection was established but before any data was received over the connection.

Programmer Response: See *OS/390 C/C++ Run-Time Library Reference* for information about possible side effects of interrupting the function.

System Action: The request fails and no data is returned. The socket connection is established. The application continues to run.

Symbolic Feedback Code: EDC7UV

EDC8160I Socket reuse is not supported.

Explanation: An attempt was made to reuse the specified socket for this function. Reuse of this socket by this function is not allowed.

Programmer Response: See *OS/390 C/C++ Run-Time Library Reference* for the function being attempted for the specific reason for failure, and for any side effects from the function.

System Action: The socket is not reused. Refer to the *OS/390 C/C++ Run-Time Library Reference* for more information on how each function reacts to this error. The application continues to run.

Symbolic Feedback Code: EDC7V0

Chapter 13. Fortran Run-Time Messages

This chapter shows the ranges of Fortran message numbers by message type, and explains qualifying data, permissible resume actions, and locator-text in the Fortran messages. Finally, the list of the Fortran messages is given.

Fortran Run-Time Message Number Ranges

Component or Language Element	Range of Message Numbers
(Reserved)	0000–0099
Service Subroutines	0100–0299
Common Blocks	0300–0339
Operator Messages	0340–0344
(Reserved)	0345–0400
Run-time Environment	0401–0499
Implicit Routines	0500–0599
Intrinsic Functions	0600–0699
(Reserved)	0700–0999
I/O	1000–1999
Input Conversion	1000–1019
Sequential I/O	1020–1069
Direct I/O	1070–1099
Keyed I/O	1100–1179
Formatted I/O	1180–1199
Unformatted I/O	1200–1209
List Directed I/O	1210–1219
Namelist I/O	1220–1249
Striped I/O	1250–1269
Asynchronous I/O	1270–1329
VSAM I/O	1330–1339
INQUIRE	1340–1359
CLOSE semantics	1360–1379
OPEN / DEFINE FILE semantics	1380–1449
(Reserved)	1450–1499
System-detected errors	1500–1549
Command / Macro / Service failure	1550–1599
File Disconnection	1900–1909
End of Data	1910–1914
Invalid unit	1915–1919
Miscellaneous	1920–1999
Multitasking Facility (MTF)	2000–2099
AUTOTASK	2000–2029
AUTOTASK DD Statement	2030–2039
Function invalid	2040–2049
Miscellaneous	2050–2099
Vector	2100–2119
Run-Time Options	2120–2129
Miscellaneous	2130–2199
Separation Tool	2200–2249
Static Debug	2250–2279
Miscellaneous	2280–2999
(Reserved)	3000–9999

Qualifying Data

Many of the messages listed have a section called Qualifying Data describing qualifying data (q_data) associated with the condition. (Qualifying data (or q_data) consists of variables that contain information about the occurrence of a particular condition, such as the input values to the service that detected the condition. This information is useful for a condition handler to determine what corrective actions to take.)

Many of the conditions have q_data descriptors (indicated by data type Q_DATA_DESC) as part of their qualifying data. A q_data descriptor indicates the data type and length of the immediately following element of qualifying data.

The first qualifying data for any condition is *parm-count*, the total number of elements of qualifying data including *parm-count* itself, associated with that condition token.

For I/O errors, the first four qualifying data are defined as shown in Table 9:

Table 9. Basic Set of Qualifying Data for I/O Conditions

No.	Name	Input/Output	Type	Value
1	*parm-count*	Input	INTEGER*4	The total number of elements of qualifying data including this one. If there is no additional qualifying data beyond the basic set shown here, then this value is 4. Otherwise, it includes the first four shown here plus whatever additional qualifying data is applicable to the condition.
2	*statement*	Input	CHARACTER*12	The name of the I/O statement being processed.
3	*unit*	Input	INTEGER*4	–1 if the I/O statement is directed to an internal file; otherwise, the unit number specified on the I/O statement.
4	*file*	Input	CHARACTER*62	Blank if if the I/O statement refers to an internal file or if the name of the file is not provided as part of the message text for this condition. Otherwise, a structure, whose contents are shown below, which gives the name of the external file to which the I/O statement refers.

When the *file* qualifying data is not blank, it gives the file name of the file involved in the I/O statement, and has the following format:

Position	Length	Contents
1	8	The ddname for the file.
9	1	A code that indicates whether the file is identified in the Fortran program either by its ddname or by its data set name. A value of blank indicates that the file is referred to through its ddname. Any non-blank character indicates that it is referred to by its data set name.

For OS/390 (when position 9 is other than blank):

9	44	Data set name
53	8	PDS member name (or blank if not a PDS)
61	2	Not used

For more information on qualifying data, see *OS/390 Language Environment Programming Guide*.

Permissible Resume Actions

Many of the messages listed have a section called Permissible Resume Actions describing which resume actions a user condition handler can request when the resume cursor has not been moved.

The following table shows the names (that is, the two-character codes) of the resume actions. It also contains a description of the values that the user condition handler must set for the indicated parameters to request that resume action. (*result_code* and *new_condition* are defined in *OS/390 Language Environment Programming Guide*.)

Name	Corresponding Resume Action	result_code Parameter	new_condition Parameter
RN	Resume without moving the resume cursor	10	—
RI	Resume with new input value	60	CEE0CE
RO	Resume with new output value	60	CEE0CF

If a user condition handler requests a resume action that is not listed as one of the permissible resume actions for the condition being processed, either the condition CEE088 (invalid request for the resume action) or the condition CEE087 (invalid request for the fix-up and resume action) is signaled. If a user condition handler attempts to resume without moving the resume cursor for the condition CEE088 or CEE087, the condition is percolated to the next condition handler to avoid a program loop.

Regardless of what is listed for a message under Permissible Resume Actions, you can always move the resume cursor by invoking the callable service CEEMRCE and then requesting the resume action. In this case, the only actions that are taken are those described under System Action; none of those listed under Permissible Resume Actions is taken.

Name	Resume Action	*result_code* Parameter	*new_condition* Parameter
—	Resume after moving the resume cursor	10	—

locator-text in the Run-Time Message Texts

In many message texts for conditions involving I/O statements, *locator-text* is shown as part of the message text. This *locator-text* identifies the Fortran statement for which the error was detected and can be one of the following:

- The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed.
- The *statement* statement for an internal file failed.

- An error occurred during enclave termination.
- The *statement* statement for unit *unit-number* failed.
- The INQUIRE statement failed.

List of Run-Time Messages

The following messages pertain to Fortran. Messages are followed by an explanation describing the condition that caused the message (except for those messages for which the message text is self-explanatory), a programmer response suggesting how you might prevent the message from occurring again, and a system action indicating how the system responds to the condition that caused the message.

The messages also contain a symbolic feedback code, which represents the first 8 bytes of a 12-byte condition token. You can think of the symbolic feedback code as the nickname for a condition. As such, the symbolic feedback code can be used in user-written condition handlers to screen for a given condition, even if it occurs at different locations in an application.

Some messages also contain qualifying data and permissible resume actions, as discussed in “Qualifying Data” on page 450, and “Permissible Resume Actions” on page 451, respectively. The VS FORTRAN Version 2 error number is shown for those messages that existed in VS FORTRAN Version 2.

The messages in this section contain alphabetic suffixes that have the following meaning:

I Informational message
W Warning message
E Error message
S Severe error message
C Critical error message

FOR0096W The symbol table in storage was corrupted and couldn't be used to produce a dump.

Explanation: During the printing of a dump, a Language Environment routine detected an inconsistency in a symbol table, which contains information about the type and location of the variables in a Fortran program unit. Most likely the symbol table in virtual storage was overlaid by some routine (but not necessarily by the routine with the overlaid symbol table).

Programmer Response: Determine and correct the cause of the overlaid symbol table. In Fortran program units, this is often caused by:

- Using subscripts that reference virtual storage outside the declared bounds of an array.
- Referring to variables that are in EQUIVALENCE statements when the variables are declared to overlay too much storage.
- Referring to storage that's addressed through a pointer whose value isn't properly established.
- In a CALL statement or function reference, providing actual arguments that are not consistent with the dummy arguments declared in the subprogram. The actual arguments could be of the wrong type, rank, or have the wrong array bounds. There could be an incorrect number of actual arguments.

System Action: The dump or the remainder of the dump for this program unit is not created.

Symbolic Feedback Code: FOR0096

FOR0100S The DIV callable service *service-name* **for the dynamic common block** *common-name* **failed. A** *macro-name* **macro instruction had a system completion (abend) code of** *abend-code***, and a reason code of** *reason-code***. Seek assistance from your Language Environment support personnel. VS FORTRAN Version Error 2 Number: AFB143I-1**

Explanation: The DIV callable service *service-name* failed because the macro instruction *macro-name*, which was used internally by Language Environment, failed. The system completion (abend) codes and reason codes are described in *OS/390 MVS Programming: Assembler Services Reference*.

Programmer Response: Refer to the one of the publications listed under "Explanation" for the cause of the error. You might require the assistance of your Language Environment support personnel to resolve many of these errors.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is not completed, a return code of 128 is set, and execution resumes.

Symbolic Feedback Code: FOR0100

FOR0101S The DIV callable service *service-name* **failed for the dynamic common block** *common-name***. A** *macro-name* **macro instruction had a return code of** *return-code***, and a reason code of** *reason-code***. Seek assistance from your Language Environment support personnel. VS FORTRAN Version Error 2 Number: AFB143I-2**

Explanation: The DIV callable service *service-name* failed because the macro instruction *macro-name*, which was used internally by Language Environment, failed. The return codes and reason codes are described in *OS/390 MVS Programming: Assembler Services Reference*.

Programmer Response: Refer to the one of the publications listed under "Explanation" for the cause of the error. You might require the assistance of your Language Environment support personnel to resolve many of these errors.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is not completed, a return code of 128 is set, and execution resumes.

Symbolic Feedback Code: FOR0101

FOR0102S The DIV callable service *service-name* **failed. The return code was** *return-code***. VS FORTRAN Version Error 2 Number: AFB144I-1, AFB144I-2**

Explanation: The DIV callable service *service-name* failed because of one of the following errors, which is identified by the return code *return-code*. The arguments mentioned in the explanations are those described for the DIV callable services in *VS FORTRAN Version 2 Language and Library Reference*.

Return Code	Explanation
8	The value of the *dyncom* argument wasn't the name of a dynamic common block.
12	The value of the *type* argument was neither DDNAME, DSNAME, nor DSN.
16	If the value of the *type* argument was DSNAME or DSN, the value of the *access* argument was neither READ nor READWRITE. If the value of the *type* argument was DDNAME, the value of the *access* argument was neither READ, READWRITE, nor blank.
20	The value of the *access* argument was READ, but the data object was empty.
24	The object specified by the *divobj* argument was already associated with a dynamic common block or an object ID through a different ddname.
28	The ddname or data set name given as the *divobj* argument did not refer to a VSAM linear data set.
32	The value supplied for *divobj* argument was not a valid ddname or data set name (as determined by the value of the *type* argument).
36	The value of the *divobj* argument conflicted with the value of the *type* argument. For example, this return code could indicate that the *type* argument had a value of DDNAME, and the *divobj* had a value that could only be a data set name rather than a ddname.
40	The data set that had the name given as the value of the *divobj* argument and that should have been a VSAM linear data set could not be dynamically allocated, possibly because it didn't exist.
44	The dynamic common block whose name was given as the value of the *dyncom* argument was already associated with another data object through a the use of the DIVINF or DIVVWV callable service.
48	The argument list passed to the DIV callable service was invalid for one or more of these reasons: • The call was made from a program compiled by the VS FORTRAN Version 1 or the VS FORTRAN Version 2 compiler with the the LANGLVL(66) compiler option. • The call was made from a program compiled by the VS FORTRAN Version 1 compiler at a level prior to Release 3. • The call was made from a program compiled by the FORTRAN IV H Extended or the FORTRAN IV G1 compiler. • An incorrect number of arguments was provided. • One or more of the arguments wasn't of the type required by the callable service. • The call was made from an assembler language program, and the arguments were not provided in the form required when there are character arguments.
52	The value of the *mapnum* argument implied a range in the data object that overlaps a range that was already mapped.
56	The value of the *obj-id* argument did not have an association with any data object.
60	The value of the *offset* argument was negative.
64	The dynamic common block whose name was given as the value of the *dyncom* argument was not associated with any data object.
68	The DIVSAV callable service was invoked, but the data object associated with the dynamic common whose name was given as the value of the *dyncom* argument was not accessed using a value of READWRITE for the *access* argument.
72	The value of the *mapnum* argument was zero or negative.
76	The DIV callable service was called from within an MTF parallel subroutine.

Programmer Response: Based on the return code identified by *return-code*, take the action indicated. The arguments mentioned are those described for the DIV callable services in *VS FORTRAN Version 2 Language and Library Reference*.

Return Code	Explanation
8	Specify the name of the common block as one of the suboptions of the DC compiler option.

Return Code	Explanation
12	Change the value of the *type* argument to DDNAME, DSNAME, or DSN depending on whether a ddname or a data set name is given as the value of the *divobj* argument. (Lowercase characters are allowed.)
16	Change the value of the *access* argument to READ or READWRITE. (Lowercase characters are allowed.)
20	Ensure that name given as the *divobj* argument refers to the data object (VSAM linear data set) that was intended, or change the value of the *access* argument to READWRITE.
24	Remove this call to the DIVINF or DIVINV callable service if an existing association can be used. Alternatively, terminate the existing association using the DIVTRF or DIVTRV callable service before calling DIVINF or DIVINV.
28	Ensure that the ddname or the data set name given as the *divobj* argument refers to a VSAM linear data set.
32	Ensure that the value of the *divobj* argument is a valid ddname or a data set name that refers to a VSAM linear data set. Also ensure that it is correctly specified as either a ddname or a data set name in the *type* argument.
36	If the *type* argument has a value of DDNAME, then ensure that a ddname referring to a VSAM linear data set is given as the value of the *divobj* argument. If the *type* has a value of DSNAME or DSN, then ensure that a data set name of a VSAM linear data set is given as the value of the *divobj* argument. Change either or both of these arguments to make them consistent.
40	Ensure that the data set name refers to a VSAM linear data set, which can be created using Access Method Services.
44	Make one or more of these changes: • Remove the call to the DIVINF or DIVVWV if an existing association can be used. • Use a different dynamic common block name. • First terminate the existing association using the DIVTRF or DIVTRV callable service.
48	If the calling program is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option. If it is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section “Passing Character Arguments Using the Standard Linkage Convention” in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.
52	Use a different value for the *mapnum* argument to avoid overlapping an existing mapping of the data object. Use the DIVCML callable service if necessary to determine the length of the dynamic common blocks so that overlapping mappings can be avoided.
56	Ensure that the value of the *obj-id* argument is the same as what was returned by a previous call to the DIVINV callable service. Also ensure that the previous call to the DIVINV callable service completely successfully. If it's possible that a user-written condition handler requested that execution resume in the event of an error, then provide logic to handle the nonzero return code.
60	Provide a value for the *offset* argument that is not less than 0.
64	Ensure that the name given as the value of the *dyncom* argument has been associated with a data object using the DIVINF callable service. Also ensure that the previous call to the DIVINF callable service completely successfully by checking the return code if it's possible that a user-written condition handler requested that resumption of execution occur.
68	If the changes made in the dynamic common block are to be saved in the data object, then ensure that the value of the *access* argument in the call to the DIVINF or DIVINV callable service is READWRITE. If the changes are not to be saved, then remove the call to the DIVSAV callable service.
72	Provide a positive value for the *mapnum* argument. Also see the actions for return code 52.
76	Restructure the application so that there are no calls to the data-in-virtual callable service in MTF parallel subroutines. However, these services can be used in the main task program, and the SHRCOM callable service can be used to allow sharing of the dynamic common blocks among the main task program and the parallel subroutines.

System Action: The service is not completed, and the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	3
2	*subroutine-name*	Input	CHARACTER*8	The name of the DIV subroutine
3	*return-code*	Input	INTEGER*4	The return code from the Fortran DIV subroutine.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is not completed, a return code of *return code* is set, and execution resumes.

Symbolic Feedback Code: FOR0102

FOR0103W The DIV callable service *service-name* **completed successfully, but the dynamic common block** *common-name* **had a length of** *length***, which was not a multiple of 4096.**

Programmer Response: If dynamic common block *common-name* will be modified and the changes saved in the data object or if you want to avoid the signaling of this condition, change the declarations of the variables in *common-name* such that the length of this common block becomes an exact multiple of 4096 (4096, 8192, 12288, and so on). Otherwise, you can ignore this condition.

System Action: The service is completed and execution resumes.

Qualifying Data: None

Permissable Resume Actions:

Name	Action Taken after Resumption
RN	The service is not completed, a return code of 4 is set, and execution resumes.

Symbolic Feedback Code: FOR0103

FOR0104S The DIV callable service *service-name* **failed. It was called with no argument list. VS FORTRAN Version Error 2 Number: AFB154I**

Programmer Response: Provide the arguments that are required for the *service-name* callable service. The data-in-virtual callable services are described in detail in *VS FORTRAN Version 2 Language and Library Reference*.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissable Resume Actions:

Name	Action Taken after Resumption
RN	The service is not completed, a return code of 48 is set, and execution resumes.

Symbolic Feedback Code: FOR0104

FOR0105S The DIV callable service *service-name* failed. It was called with an incorrect number of arguments. VS FORTRAN Version Error 2 Number: AFB154I

Programmer Response: Provide the arguments that are required for the *service-name* callable service. The data-in-virtual callable services are described in detail in *VS FORTRAN Version 2 Language and Library Reference*.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, a return code of 48 is set, and execution resumes.

Symbolic Feedback Code: FOR0105

FOR0106S The DIV callable service *service-name* failed. It was called with an argument list in an incorrect format. This probably occurred because a required character argument was not provided. VS FORTRAN Version Error 2 Number: AFB154I

Explanation: The argument list provided to the *service-name* callable service wasn't in the internally-generated form produced by the Fortran compiler when there are character arguments. This could have occurred for one or more of these reasons:

- The call was made from a program compiled by the VS FORTRAN Version 1 or the VS FORTRAN Version 2 compiler with the the LANGLVL(66) compiler option.
- The call was made from a program compiled by the VS FORTRAN Version 1 compiler at a level prior to Release 3.
- The call was made from a program compiled by the FORTRAN IV H Extended or the FORTRAN IV G1 compiler.
- An incorrect number of arguments was provided.
- One or more of the arguments wasn't of the type required by the callable service.
- The call was made from an assembler language program, and the arguments were not provided in the form required when there are character arguments.

Programmer Response: Provide the arguments that are required for the *service-name* callable service. The data-in-virtual callable services are described in detail in *VS FORTRAN Version 2 Language and Library Reference*.

If the program is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option. If it is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section “Passing Character Arguments Using the Standard Linkage Convention” in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, a return code of 48 is set, and execution resumes.

Symbolic Feedback Code: FOR0106

FOR0120S The FILEINF callable service failed. It was called with an argument list in an incorrect format. VS FORTRAN Version Error 2 Number: AFB096I-1

Explanation: The argument list provided in the call to the FILEINF callable service was incorrect in one of these ways:

- There was no argument list.
- The argument list had an even number of arguments.
- The argument list wasn't in the internally-generated form produced by the Fortran compiler when there are character arguments. This could have occurred for one or more of these reasons:
  - One or more of the keyword arguments (CYL, RECFM, and so on) weren't provided as character expressions.
  - The call was made from a program compiled by the VS FORTRAN Version 1 or the VS FORTRAN Version 2 compiler with the the LANGLVL(66) compiler option.
  - The call was made from a program compiled by the VS FORTRAN Version 1 compiler at a level prior to Release 3.
  - The call was made from a program compiled by the FORTRAN IV H Extended or the FORTRAN IV G1 compiler.
  - The call was made from an assembler language program, and the arguments were not provided in the form required when there are character arguments.

Programmer Response: Be sure that the argument list contains an odd number of arguments and that the even-numbered arguments are character expressions whose values are the permissible keyword arguments.

If the program is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option. If it is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section “Passing Character Arguments Using the Standard Linkage Convention” in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.

Refer to “System Action” regarding the detection of error FOR1926 on a subsequent OPEN or CLOSE statement.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated. However, if the **RN** action listed under “Permissible Resume Actions” is taken to resume execution following the call, then the file information provided is ignored, and error FOR1926 is detected during execution of a subsequent OPEN or INQUIRE statement. Detection of error FOR1926 can be suppressed if, following the failing call to the FILEINF callable service, another call is made either with no arguments or with arguments that don't cause another error to be detected.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes. Refer to “System Action” regarding the detection of error FOR1926 following this resumption.

Symbolic Feedback Code: FOR0120

FOR0121S The FILEINF callable service failed. The argument in position *position* of the argument list was not one of the character values that the FILEINF callable service understands as an argument. VS FORTRAN Version Error 2 Number: AFB096I-2

Explanation: Position *position* of the argument list for the FILEINF callable service was not a character expression whose value was one of the permissible keyword arguments. These permissible keyword arguments are values such as RECFM, CYL, and so on.

Programmer Response: Correct the argument list by coding the first argument as an integer variable and the remaining pairs of arguments as one of the permissible keyword arguments followed by its value. The keyword arguments are listed in the description of the FILEINF callable service in *VS FORTRAN Version 2 Language and Library Reference*.

Be sure that each keyword argument is coded as a character expression. Remember that if a character constant is used, the keyword argument, such as RECFM, must be enclosed in quotes or apostrophes.

Refer to “System Action” regarding the detection of error FOR1926 on a subsequent OPEN or CLOSE statement.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated. However, if the **RN** action listed under “Permissible Resume Actions” is taken to resume execution following the call, then the file information provided is ignored, and error FOR1926 is detected during execution of a subsequent OPEN or INQUIRE statement. Detection of error FOR1926 can be suppressed if, following the failing call to the FILEINF callable service, another call is made either with no arguments or with arguments that don't cause another error to be detected.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes. Refer to “System Action” regarding the detection of error FOR1926 following this resumption.

Symbolic Feedback Code: FOR0121

FOR0122S The FILEINF callable service failed. An incorrect value was provided for the actual argument immediately following the actual argument with the value of *keyword*. VS FORTRAN Version Error 2 Number: AFB096I-3

Programmer Response: Change the argument list by providing a value that's allowed to follow and correspond to the keyword argument *keyword*. The permissible values are shown in the description of the FILEINF callable service in *VS FORTRAN Version 2 Language and Library Reference*.

If the value is of character type, such as FB, and it is coded as a character constant, be sure to enclose the value in quotes or apostrophes.

Refer to “System Action” regarding the detection of error FOR1926 on a subsequent OPEN or CLOSE statement.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated. However, if the **RN** action listed under “Permissible Resume Actions” is taken to resume execution following the call, then the file information provided is ignored, and error FOR1926 is detected during execution of a subsequent OPEN or INQUIRE statement. Detection of error FOR1926 can be suppressed if, following the failing call to the FILEINF callable service, another call is made either with no arguments or with arguments that don't cause another error to be detected.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes. Refer to “System Action” regarding the detection of error FOR1926 following this resumption.

Symbolic Feedback Code: FOR0122

FOR0123S The FILEINF callable service failed. VSAM record level sharing (RLS) was specified, but execution was on a system without both MVS/ESA SP Version 5 Release 2 or later and DFSMS/MVS Version 1 Release 3 or later.

Programmer Response: Ensure that the Fortran application that connects a VSAM file using RLS mode is run on MVS/SP Version 5 Release 2 or later and DFSMS/MVS Version 1 Release 3 or later. If these levels aren't available, then you can't use RLS mode. In this case, remove the RLS keyword argument and its corresponding value from the argument list for the FILEINF callable service.

Refer to “System Action” regarding the detection of error FOR1926 on a subsequent OPEN or CLOSE statement.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated. However, if the **RN** action listed under “Permissible Resume Actions” is taken to resume execution following the call, then the file information provided is ignored, and error FOR1926 is detected during execution of a subsequent OPEN or INQUIRE statement. Detection of error FOR1926 can be suppressed if, following the failing call to the FILEINF callable service, another call is made either with no arguments or with arguments that don't cause another error to be detected.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes. Refer to “System Action” regarding the detection of error FOR1926 following this resumption.

Symbolic Feedback Code: FOR0123

FOR0130S The ARGSTR callable service failed. It was called with an argument list in an incorrect format.

Explanation: The argument list provided in the call to the ARGSTR callable service was incorrect in one of these ways:

- There was no argument list.
- The argument list had other than two arguments.
- The argument list wasn't in the internally-generated form produced by the Fortran compiler when there are character arguments. This could have occurred because:
  - The first argument wasn't of character type.
  - The call was made from a program compiled by the VS FORTRAN Version 1 or the VS FORTRAN Version 2 compiler with the the LANGLVL(66) compiler option.
  - The call was made from a program compiled by the VS FORTRAN Version 1 compiler at a level prior to Release 3.
  - The call was made from a program compiled by the FORTRAN IV H Extended or the FORTRAN IV G1 compiler.
  - The call was made from an assembler language program, and the arguments were not provided in the form required when there are character arguments.

Programmer Response: Be sure that the argument list contains two arguments, the first of which is a character variable and the second of which is an integer variable of length 4.

If the program is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option. If it is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section "Passing Character Arguments Using the Standard Linkage Convention" in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.

System Action: The service is ignored, and the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes.

Symbolic Feedback Code: FOR0130

FOR0300S One program unit specified common block *common-name* **in a DC compiler option, but another program unit did not specify it in a DC compiler option. VS FORTRAN Version Error 2 Number: AFB158I-2**

Programmer Response: If you want *common-name* to be a dynamic common block, compile all program units that refer to it using a DC compiler option that has as a suboption either *common-name* or an asterisk. If you want *common-name* to be a static common block, do not compile any program units that refer to it using a DC compiler option that has as a suboption either *common-name* or an asterisk unless *common-name* is used as a suboption of the SC compiler option.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	2
2	*common name*	Input	CHARACTER*31	The name of the common block

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	*common-name* is not made available to one or more program units and execution contintues. The results of execution are unpredictable if data in the dynamic common block is subsequently referenced.

Symbolic Feedback Code: FOR0300

FOR0301S The common block *common-name* **of length** *length* **could not be created because there was insufficient virtual storage. VS FORTRAN Version Error 2 Number: AFB156I**

Programmer Response: Run your application in a larger region. You can change the region size with the REGION parameter on the EXEC statement in your JCL.

If the application allows it, you could also recompile all program units that refer to common block *common-name* with declarations that result in a smaller length for this or for other common blocks.

If there are allocatable arrays that are allocated but not currently in use, then deallocate them to make more storage available.

If one of your routines is running in 24-bit addressing mode, remember that dynamic common blocks acquired for it are created in virtual storage below 16 Mb, where storage is limited. However, when the routine is running in 31-bit addressing mode, dynamic common blocks acquired for it are created in virtual storage above 16 Mb, where there is normally much more storage available. Therefore, if your application is running in 24-bit addressing mode and if it could run in 31-bit addressing mode instead, then making this change could alleviate this storage constraint. But before link editing the application with the AMODE=31 option, you should be sure that there aren't any program units, such as those compiled with the FORTRAN IV H Extended compiler, that aren't capable of running in 31-bit addressing mode.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	3
2	*common-name*	Input	CHARACTER*31	The name of the common block.
3	*length*	Input/Output	INTEGER*4	The length of the common block.

Permissable Resume Actions:

Name	Action Taken after Resumption
RN	The service is not completed, a return code of *return code* is set, and execution resumes.
RI	An attempt is made to acquire virtual storage for the common block. *common-name* using the length provided in *length*. If this is successful, execution continues but the results of execution are unpredictable if data in the dynamic common block beyond the length provided as *length* is referenced.

Symbolic Feedback Code: FOR0301

FOR0302S Common block *common-name* **was defined with a length of** *length1*, **but it was defined with a length of** *length2* **in a program unit that was invoked earlier. VS FORTRAN Version Error 2 Number: AFB158I-1**

Programmer Response: In all program units that refer to the common block *common-name* ensure that the declarations of the common block are such that the length of the common block is the same.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	4
2	*common-name*	Input	CHARACTER*31	The name of the common block
3	*length-1*	Input	INTEGER*4	The length of the common block as defined in program unit 1.
4	*length-2*	Input	INTEGER*4	The length of the common block as defined in program unit 2.

Permissable Resume Actions:

Name	Action Taken after Resumption
RN	*common-name* is not made available to one or more program units and execution continues. The results of execution are unpredictable if data in the dynamic common block is subsequently referenced.

Symbolic Feedback Code: FOR0302

FOR0303S The common block callable service *service-name* failed. It was called with an argument list in an incorrect format. VS FORTRAN Version Error 2 Number: AFB920I-2, AFB157I-3

Explanation: The argument list provided in the call to the *service-name* callable service was incorrect in one of these ways:

- There was no argument list.
- The argument list had the wrong number of arguments.
- The argument list wasn't in the internally-generated form produced by the Fortran compiler when there are character arguments. This could have occurred for one or more of these reasons:
  - The common block name wasn't provided as a character expression.
  - The call was made from a program compiled by the VS FORTRAN Version 1 or the VS FORTRAN Version 2 compiler with the the LANGLVL(66) compiler option.
  - The call was made from a program compiled by the VS FORTRAN Version 1 compiler at a level prior to Release 3.
  - The call was made from a program compiled by the FORTRAN IV H Extended or the FORTRAN IV G1 compiler.
  - The call was made from an assembler language program, and the arguments were not provided in the form required when there are character arguments.

Programmer Response: Be sure that the argument list contains the number of arguments required by *service-name* and that they are of the correct type. In particular, if the common block name is coded as a character constant, be sure to enclose the value in quotes or apostrophes.

If the program is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option. If it is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section “Passing Character Arguments Using the Standard Linkage Convention” in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.

System Action: The service is ignored, and the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	2
2	*service-name*	Input	CHARACTER*8	The name of the common block callable service that was called.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes.

Symbolic Feedback Code: FOR0303

FOR0304S The common block callable service *service-name* **failed. The common block name had an incorrect format. The invalid name was '***common-name***'. VS FORTRAN Version Error 2 Number: AFB157I-2**

Explanation: The name of the dynamic common block provided to the *service-name* was not a valid name because it either:

- Began with a blank or was all blank,
- Was longer than 31 characters, or
- Contained an imbedded blank

Programmer Response: Be sure the character expression for the dynamic common block name passed to *service-name* is a valid Fortran name. In particular, it must:

- Be left-adjusted with trailing blanks,
- Begin with a letter, underscore (_), or dollar sign ($),
- Contain only alphameric characters, that is, letters, digits, underscores (_), or dollar signs ($),
- Contain at least 1 but no more than 31 nonblank characters, and
- Have no imbedded blanks.

If the common block name is coded as a character constant, be sure to enclose the value in quotes or apostrophes.

If the program is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option. If it is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section “Passing Character Arguments Using the Standard Linkage Convention” in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	3
2	*service-name*	Input	CHARACTER*8	The name of the common block callable service that was called.
3	*common-name*	Input	CHARACTER*31	The common block name (or the first 31 characters of the name) that was provided for *service-name*.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes.

Symbolic Feedback Code: FOR0304

FOR0310S The ALLOCATE statement could not be completed. The object *object_name* **of length** *object_length* **could not be created because there was insufficient virtual storage.**

Programmer Response: Run your application in a larger region. You can change the region size with the REGION parameter on the EXEC statement in your JCL.

If the application allows it, you could also reduce the size of the allocatable array so that it doesn't require as much storage.

If there are other allocatable arrays that are allocated but not currently in use, then deallocate them to make more storage available.

If there are common blocks or other large storage areas that could be reduced in size, then doing so could make more storage available.

If a routine is running in 24-bit addressing mode, remember that allocatable arrays acquired for it are created in virtual storage below 16 Mb, where storage is limited. However, when the routine is running in 31-bit addressing mode, allocatable arrays acquired for it are created in virtual storage above 16 Mb, where there is normally much more storage available. Therefore, if your application is running in 24-bit addressing mode and if it could run in 31-bit addressing mode instead, then making this change could alleviate this storage constraint. But before link editing the application with the AMODE=31 option, you should be sure that there aren't any program units, such as those compiled with the FORTRAN IV H Extended compiler, that aren't capable of running in 31-bit addressing mode.

System Action: If the STAT specifier is not present on the ALLOCATE statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	3
2	*object-name*	Input	CHARACTER*250	The name of the object specified in the ALLOCATE statement.
3	*object-length*	Input	INTEGER*4	The length of the object specified in the ALLOCATE statement.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The current operation is ignored. The remainder of the allocation is processed and exection continues.

Symbolic Feedback Code: FOR0310

FOR0311S The ALLOCATE statement could not be completed. The object *object_name* **was already allocated.**

Programmer Response: Correct the logic of your program so that the same allocatable array isn't allocated again until its first occurrence is deallocated.

System Action: If the STAT specifier is not present on the ALLOCATE statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	2
2	*object-name*	Input	CHARACTER*250	The name of the object specified in the ALLOCATE subroutine.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The curent operation is ignored. The remainder of the allocation list is processed and execution continues.

Symbolic Feedback Code: FOR0311

FOR0312S The DEALLOCATE statement could not be completed. The object *object_name* was not allocated.

Programmer Response: Correct the logic of your program so that you don't deallocate an array isn't allocated.

System Action: If the STAT specifier is not present on the DEALLOCATE statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	2
2	*object-name*	Input	CHARACTER*250	The name of the object specified in the DEALLOCATE statement.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The current operation is ignored. The remainder of the deallocation list is processed and execution continues.

Symbolic Feedback Code: FOR0312

FOR0340A PAUSE *message* VS FORTRAN Version Error 2 Number: AFB001I

Explanation: A PAUSE statement has been executed from a Fortran routine. The message text *message* is whatever information was provided by the programmer with the PAUSE statement.

Programmer Response: Follow the instructions given by *message* or by the person who submitted the job for execution. These instructions should indicate the action to be taken.

To resume execution, provide any single character as a response to the outstanding console message after taking the actions requested.

System Action: Execution of the program waits for a response, which can be any character. After the response is entered, execution of the program continues with the statement following the PAUSE statement.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR0340

FOR0341I STOP *message* VS FORTRAN Version Error 2 Number: AFB002I

Explanation: A STOP statement has been executed from a Fortran routine. The message text *message* is whatever information was provided by the programmer with the STOP statement.

System Action: The termination imminent condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Symbolic Feedback Code: FOR0341

FOR0400S A Fortran main program was executed from within an enclave that had already started executing. VS FORTRAN Version Error 2 Number: AFB905I

Programmer Response: If you intended to call a Fortran subroutine rather than a main program, then code a SUBROUTINE statement as the first statement of that called routine.

If you want to call a main program, which will be in a new enclave, do this in one of these two ways:

- Invoke an assembler language program that uses a LINK macro instruction to pass control to the main program and implicitly create a new enclave.
- Invoke the callable service CEE3CRE, which creates a new enclave and passes control to the main program.

In both cases, the main program that is specified must be in a separate load module.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

FOR0401S The execution of program unit *program-unit* **failed at ISN** *statement-number* **because an error was detected by the compiler at that statement. VS FORTRAN Version Error 2 Number: AFB230I**

Programmer Response: Refer to the printed output of the compilation of program unit *program-unit* to determine the error that occurred at ISN *statement-number*. Correct the error, then compile, link edit, and execute the job again.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR0401

FOR0402S *program-name2***, which has one or more dummy arguments of character type with an assumed length, was called by** *program-name1* **with an argument list that didn't provide the lengths of the character arguments. VS FORTRAN Version Error 2 Number: AFB153I**

Explanation: The subprogram *program-name2* had a dummy argument of character type with an assumed length, that is, for which the current length needs to be provided by the calling routine. However, the argument list provided by program unit *program-name1* wasn't in the internally-generated form produced by the Fortran compiler when there are character arguments. This could have occurred because:

- A dummy argument in *program-name2* was inadvertently coded as a character dummy argument with an assumed length as in this example:

  ```
  CHARACTER*(*)  INPUT_ARG
  ```

- *program-name1* didn't provide one or more of the character arguments that were required by *program-name2*.
- *program-name1* was compiled by the VS FORTRAN Version 1 or the VS FORTRAN Version 2 compiler with the the LANGLVL(66) compiler option.
- *program-name1* was compiled by the VS FORTRAN Version 1 compiler at a level prior to Release 3.
- *program-name1* was compiled by the FORTRAN IV H Extended or the FORTRAN IV G1 compiler.

- *program-name1* was an assembler language program, and the arguments were not provided in the form required when there are character arguments.

Programmer Response: Be sure that the argument list provided by *program-name1* contains the number of arguments required by *program-name2* and that they are of the correct type.

If a character argument is coded as a character constant, be sure to enclose the value in quotes or apostrophes.

If *program-name1* is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option.

If *program-name1* is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section "Passing Character Arguments Using the Standard Linkage Convention" in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.

If *program-name1* is neither a Fortran nor an assembler language program, the required argument list cannot be generated. In this case, change *program-name2* so the character data in the dummy argument list is of fixed, rather than of assumed, length.

Permissible Resume Actions: None

Symbolic Feedback Code: FOR0405

FOR0406C The shareable load module *module-name* **was loaded at an address above 16 Mb by the nonshareable part of program unit** *program-unit***, which was running in 24-bit addressing mode. VS FORTRAN Version Error 2 Number: AFB146I**

Explanation: Program unit *program-unit* was compiled with the RENT compiler option and was separated into its nonshareable and shareable parts. The nonshareable part was entered in 24-bit addressing mode but was unable to pass control to its shareable part because the shareable part was loaded above 16 Mb.

Programmer Response: Either:

- Run the program in 31-bit addressing mode by link editing the nonshareable parts with AMODE=31 as a linkage editor parameter. This can be done only if the load module has no routines, such as those compiled with the FORTRAN IV H Extended compiler, that are not capable of executing in 31-bit addressing mode.
- Link edit the shareable load module using AMODE=24 as a linkage editor parameter.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR0406

FOR0407C The shareable load module *module-name* **that was loaded by the nonshareable part of program unit** *program-unit* **had an incorrect format. VS FORTRAN Version Error 2 Number: AFB147I**

Explanation: Program unit *program-unit* was compiled with the RENT compiler option and was separated into its nonshareable and shareable parts. During execution, the program's nonshareable part loaded a load module that was supposed to contain the program's shareable part. However, the load module was not in the expected format.

Programmer Response: Use the Fortran reentrant program separation tool to separate the shareable and nonshareable parts of the program that was compiled with the RENT compiler option. (This tool is invoked by the use of the cataloged procedures AFHWRL and AFHWRLG.) Then ensure that during the execution of the program, the load module containing the shareable part is available either in a library referenced by a STEPLIB DD statement or in a link pack area.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Symbolic Feedback Code: FOR0407

FOR0409C The shareable load module *module-name* **that was loaded by the nonshareable part of program unit** *nonshareable-part-name* **had a timestamp of** *timestamp1* **in the shareable part of program unit** *shareable-part-name***. This timestamp differed from the timestamp of** *timestamp2* **in the nonshareable part of program unit** *nonshareable-part-name***. VS FORTRAN Version Error 2 Number:AFB149I**

Explanation: Program unit *program-unit* was compiled with the RENT compiler option and was separated into its nonshareable and shareable parts. During execution, the program's nonshareable part loaded a load module that was supposed to contain the program's shareable part. However, the load module contained a copy of the code that was compiled at a different time than the nonshareable part. The parts are assumed to be incompatible.

Programmer Response: Use the Fortran reentrant program separation tool to separate the shareable and nonshareable parts of the program that was compiled with the RENT compiler option. (This tool is invoked by the use of the cataloged procedures AFHWRL and AFHWRLG.) Then ensure that during the execution of the program, the load module containing the shareable part is available either in a library referenced by a STEPLIB DD statement or in a link pack area. Also ensure that some previous copy isn't accessible so that only the corresponding copy of the shareable part load module is available to the executing program.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR0409

FOR0410C A Fortran subprogram was called before the Fortran run-time environment was initialized. VS FORTRAN Version Error 2 Number: AFB932I

Explanation: Language Environment did not become aware of the existence of a Fortran subprogram in the application prior to the invocation of that subprogram. Usually the presence of a Fortran routine in the application is detected either at the time a main program is started or at the time a subsequent load module is dynamically loaded using various languages' dynamic call facilities. However, because Fortran compiled code doesn't conform to the current Language Environment linkage conventions, sometimes a Fortran subprogram isn't detected, especially if it doesn't require the use of an run-time library services such as input/output.

Programmer Response: Ensure that there is a main program (not necessarily written in Fortran) in the application and that it is executed before any Fortran subprograms. If this was already the case, then provide the following linkage editor control statement in the input that link edits the main program:

```
INCLUDE SYSLIB(CEESG007)
```

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Symbolic Feedback Code: FOR0614

FOR0650S The callable service *service-name* failed. Qualifying datum number *index* was specified as the second argument, but that qualifying datum was not available for the condition.

Explanation: Either QDFETCH or QDSTORE was called to obtain or update an element of qualifying data, but *index*, which specifies the ordinal number of the qualifying datum to be referenced, was either less than 1 or greater than the total number of elements of qualifying data associated with this instance of the condition.

Programmer Response:

Ensure that the second argument is a positive integer whose value is the ordinal number of an element of qualifying data.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes.

Symbolic Feedback Code: FOR0650

FOR0651S The callable service *service-name* failed. The first argument, the condition token, was not a character variable or array element of length 12.

Explanation: Either the first argument was not a character variable or character array element of length 12 or the argument list wasn't in the internally-generated form produced by the Fortran compiler when there are character arguments. The latter could have occurred because:

- The call was made from a program compiled by the VS FORTRAN Version 1 or the VS FORTRAN Version 2 compiler with the the LANGLVL(66) compiler option.
- The call was made from a program compiled by the VS FORTRAN Version 1 compiler at a level prior to Release 3.

- The call was made from a program compiled by the FORTRAN IV H Extended or the FORTRAN IV G1 compiler.
- The call was made from an assembler language program, and the arguments were not provided in the form required when there are character arguments.

Programmer Response: Be sure that the argument list contains the number of arguments required by *service-name* and that they are of the correct type. In particular, ensure that the first argument is a condition token whose declaration is a character variable or character array element of length 12.

If the program is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option. If it is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section "Passing Character Arguments Using the Standard Linkage Convention" in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution continues.

Symbolic Feedback Code: FOR0651

FOR1000S *locator-text* **The formatted input data** *input-field* **had a value that was outside the range of values that could be contained within the integer item in the input item list. VS FORTRAN Version 2 Error Number: AFB206I**

Explanation: *input-field* is a character string that was interpreted as an integer value; an integer variable or array element that was given in the input item list of a READ statement was supposed to become defined with this value. However, the value of *input-field* was outside the acceptable range. These are the ranges of integer values corresponding to integer data items of different lengths:

Data Type	Maximum Positive Value	Maximum Negative Value
INTEGER*1	127 (2^7 –1)	–128 (–2^7)
INTEGER*2	32767 (2^{15}–1)	–32768 (–2^{15})
INTEGER*4	2147483647 (2^{31}–1)	–2147483648 (–2^{31})
INTEGER*8	9223372036854775807 (2^{63}–1)	–9223372036854775808 (–2^{63})

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number* which was connected to *file-name* failed.

Programmer Response: Ensure that the following are true:

- The edit descriptor specifies the correct field width.
- The value specified by *input-field* is within the required range for the integer variable size.
- *input-field* doesn't have any imbedded or trailing blanks that are incorrectly treated as zeros, thus changing the intended magnitude of the number. Blanks are treated as zeros in these cases:
  - The BLANK specifier is given on the OPEN statement with value of ZERO.

– The BZ edit descriptor is included in the format specification.

– There is no OPEN statement, and there is no BN edit descriptor in the format specification.

System Action: The input item being processed and the remainder of the items in the input item list become undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.
6	*subroutine-name*	Input	CHARACTER*n	The formatted input data; that is, the character string that is being interpreted as an integer value. The length *n* is part of *input_field-desc* and has a maximum possible value of 255.
7	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
7	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
8	*record*	Input	CHARACTER*n	The formatted input record that contained the character string being interpreted as an integer value. The length *n* which includes only the data portion of the record, is part of *record-desc*.
9	*result-desc*	Input	Q_DATA_DESC	The q_data descriptor for *result*. It contains the data type and the length of *result*.
10	*result*	output	INTEGER*n	The new output value, where *n*, the length, is part of *result-desc* and could be 1, 2, 4, or 8.

Name	Action Taken after Resumption
R0	The input item receives the value placed in *result*, execution continues, and the remainder of the input item list is processed.

Symbolic Feedback Code: FOR1000

FOR1001E *locator-text* **The length of the record to be written exceeded the maximum data length,** *data-length***, allowed for records in the file. VS FORTRAN Version 2 Error Number: AFB164I, AFB201I (format 1), AFB201I (format 2), AFB204I, AFB212I, AFB213I**

Explanation: Based on the type of formatting described by the FMT specifier (or by its absence) on the WRITE or REWRITE statement, one of the following exceeded *data-length*, which is the smaller of either the maximum length of the data that can fit in a record in the file or the value given in the RECL specifier, if any, on the OPEN statement:

For output using a format specification:

- The length of the record described by the output item list and the format specification.

For list-directed output or namelist output:

- For an output item of neither character type nor complex type, the formatted length of the item.
- For an output item of complex type, the formatted length of the real or the imaginary part.

The formatted lengths of the output from list-directed formatting for the various data types is listed in "WRITE Statement — List-Directed I/O to External Devices" in *VS FORTRAN Version 2 Language and Library Reference*. For namelist formatting, the lengths of the data are the same.

For unformatted output:

- The total length of all the items in the output item list.

The maximum length of a record that can be written on a particular file depends on the values of certain specifiers given on the OPEN statement and on various file characteristics managed by the underlying operating system's access methods. Length is taken from one or more of the following:

- **Files connected for sequential access:**
  - **Non-VSAM files**
    - From the LRECL value given in the DD statement or ALLOCATE command (when dynamic file allocation is not involved).
    - From the LRECL value given in the invocation of the FILEINF callable service (when dynamic file allocation is involved).
    - For a DASD or labeled tape file for which the data set existed previously, from the LRECL value given when the file was either allocated or created.
    - From the default LRECL value specified for the unit in the Unit Attribute Table either as shipped by IBM or as customized for the installation.
    - From the LRECL value derived from the RECFM and BLKSIZE values when there is a conflict among these three parameters. Refer to "Considerations for Specifying RECFM, LRECL, and BLKSIZE" in Chapter 12, or in *VS Fortran Version 2 Programming Guide for CMS and MVS*.

    Note: When the record format is one of the variable-length formats, that is, variable (V), variable blocked (VB), variable spanned (VS), or variable blocked spanned (VBS), the maximum length of the data that can be written is four bytes less than the LRECL value.
  - **VSAM files**
    - From the maximum record length given as the second sub-parameter of the RECORDSIZE parameter of the Access Method Services DEFINE command that was used to define the cluster.
- **Files connected for direct access:**
  - From the value given by the RECL specifier on the OPEN statement.

    In certain cases, this value must be consistent with the record length specified previously:
    - **VSAM files (RRDSs):**

      With the maximum record length given as the second sub-parameter of the RECORDSIZE parameter of the Access Method Services DEFINE command that was used to define the cluster.
    - **Non-VSAM files that existed previously and are not being reformatted:**

      With the record length given in the RECL specifier on the OPEN statement that was used to create the file.

    Note: An existing file connected for direct access is not reformatted unless one or more of the following is true:

- WRITE is given as the value of the ACTION specifier on the OPEN statement.
- NEW is given as the value of the STATUS specifier on the OPEN statement.
- No records have been written into the file previously.

- **Files connected for keyed access:**

  From the maximum record length given as the second sub-parameter of the RECORDSIZE parameter of the Access Method Services DEFINE command that was used to define the cluster.

- **Internal files:**

  From the length of the record or records that comprise the internal file. This is the length of the character variable, of the character substring, or of the character array element that comprises the internal file. For an internal file that is a character array, this is the length of the corresponding character array element.

locator-text gives more information about the location of the error, and can be one of the following:

The WRITE statement for an internal file failed.
The *statement* statement for unit *unit-number* which was connected to *file-name*, failed.

Programmer Response:

Ensure that the length of the record described or implied by the output item list and the format identifier, if any, is no longer than the maximum length record that can be written to the file. Either the length of the record to be written or the maximum record length allowed for the file must be changed to correct the condition or conditions described in “Explanation.” If the length of the record being written isn't what you intended, then you might have to change:

- The type of formatting indicated by FMT specifier (or its absence) in the I/O statement. For example, perhaps you intended to write the file using a format specification rather than using list-directed formatting.
- The format specification. This can include errors in the edit descriptors, field widths, repetition factors, nesting levels, Hollerith constants (H edit descriptor), and character constants.
- The output item list. There could be errors in the number of items in the list, in the data types and lengths of individual items, and in the specification of implied DOs in the output item list.

If the length of the record is what you intended, then the maximum record length allowed for the file must be increased. If you are creating a new file, you might have to change:

- The record length given in the RECL specifier of the OPEN statement
- The LRECL parameter on a DD statement or a TSO ALLOCATE command (when dynamic file allocation is not involved) or the LRECL parameter for the FILEINF callable service (when dynamic allocation is involved)

  For record formats of variable spanned or variable blocked spanned, you can make the record length larger than the block size. You can also define the record to be of unlimited length in one of these ways:

  – When dynamic file allocation is not involved, provide a value of X for the LRECL parameter of a DD statement or a TSO ALLOCATE command.

  – When dynamic file allocation is involved, provide a value of −1 for LRECL in the arguments for the FILEINF callable service.

  For any of the variable-length record formats, that is, for variable (V), variable blocked (VB), variable spanned (VS), or variable blocked spanned (VBS), the length given as LRECL includes a 4-byte record descriptor word. Therefore, the LRECL value must be four bytes larger than the largest amount of data that you want to write in a single record.

- The RECFM and BKLSIZE parameters on a DD statement or a TSO ALLOCATE command when dynamic file allocation is not involved or as parameters for the FILEINF callable service when dynamic file allocation is involved. Note that when not all of the RECFM, LRECL, and BLKSIZE parameters have been specified for a particular program, the defaults in the Unit Attribute Table are applied for the omitted ones. Sometimes this causes inconsistencies among the parameters; this is resolved as described in "Considerations for Specifying RECFM, LRECL, and BLKSIZE" in Chapter 12, or in *VS Fortran Version 2 Programming Guide for CMS and MVS*.
- The use of a particular device or file itself if the device or file isn't capable of accepting a large enough record
- The maximum record length given as the second sub-parameter of the RECORDSIZE parameter on the DEFINE command that defined a VSAM cluster

If you are writing on an existing file whose previous contents you want to retain, then you generally cannot increase the record length without recreating the file.

The person at your installation who gives system support for Language Environment can change your installation's default values for record format, record length, and block size for various units. This is done by customizing the the Unit Attribute Table. As part of this process, the SFLRECL or SULRECL parameters on the AFHODCBM macro instructions can specify larger default values for formatted or unformatted I/O. Each unit (other than the error message unit) can be given different default values.

System Action: If either the ERR or the IOSTAT specifier is present on the I/O statement, then before control returns to the program, the record described for the action **RN** is written.

If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition either is unhandled or is handled by moving the resume cursor and resuming, then the record described for the action **RN** is written. If the condition is unhandled, the enclave stops executing after the record has been written.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 10. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*access*	Input	CHARACTER*10	For an external file, the value SEQUENTIAL, DIRECT, or KEYED, depending on whether the file is connected for sequential, direct, or keyed access, respectively. For an internal file, this qualifying datum contains the value SEQUENTIAL.
6	*fmt-type*	Input	CHARACTER*8	One of the following values to indicate the type of formatting indicated by the FMT specifier (or its absence) on the WRITE or REWRITE statement: **Value** — **Type of Formatting** blanks — Unformatted FORMAT — Format specification * — List-directed formatting NAMELIST — Namelist formatting

No.	Name	Input/Output	Data Type and Length	Value
7	*data_len*	Input	INTEGER*4	The maximum length of the data that can be written into the records in the file during this connection. If this length is controlled by a RECL specifier on the OPEN statement, then this qualifying datum has that value given by that RECL specifier; otherwise, this is the maximum amount of data that can be written in the records in the file. When the record format is one of the variable-length formats, that is, variable (V), variable blocked (VB), variable spanned (VS), or variable blocked spanned (VBS), the length given here is the LRECL value less 4 (unless the RECL specifier had a smaller value).

Name	Action Taken after Resumption
RN	A record is written, but its length does not exceed the maximum length allowed for the file, and no additional record is written. Formatted and unformatted output are handled slightly differently: **Formatted output:** For a data item of other than character type that doesn't fit in the record, that data item is ignored, that is, none of it is placed in the record. (If the records are of fixed-length format, blanks fill the rest of the record. Otherwise, no additional characters are added to the record.) The rest of the output item list and the rest of the format specification, if any, are ignored. For a data item of character type, including a character constant in the format specification, that doesn't fit in the record, as much of the item as can fit is placed in the record. The rest of this item, the rest of the output item list, and the rest of the format specification, if any, are ignored. **Unformatted output:** As much of the data from the output item list as can fit is placed in the record. This includes the data item that would overflow the record; as much of it as can fit is placed in the record. The rest of this item and the rest of the output item list are ignored. In either case, execution then continues.

Name	Action Taken after Resumption
RF	This action depends on several factors: • The type of formatting, if any, specified in the WRITE or REWRITE statement, • Whether the file is connected for sequential, direct, or keyed access, and • The record format. **For output using a format specification**: • **Files connected for sequential access**: For a formatted data item of other than character type that doesn't fit in the record, none of it is placed in the record from which it would overflow. (If the records are of fixed-length format, blanks fill the rest of the record. Otherwise, no additional characters are added to the record.) The entire formatted data item is placed into the next record beginning at character position 1. Should the maximum length record be too short to hold this data item, as much of the data as can fit is placed in this next record, and the rest of the data is lost. No error is detected for this loss of data. For a data item of character type (including a character constant in the format specification) that doesn't fit in the record, as much of the item as can fit is placed in this record, and the remainder continues into the next record or records for as many records as it takes to hold the entire item. After the formatted data item is placed in the next record, normal processing of the rest of the format specification and the output item list continues. This same condition could be detected again for the same WRITE or REWRITE statement. • **Files connected for direct access**: The action is the same as for sequential access. When applied to direct access, the term *next record* refers to the record with the next higher record number. • **Files connected for keyed access**: This action is the same as **RN** on page 483. **For list-directed and namelist output**: For the formatted data item (or the real or imaginary part of an item of complex type) that's longer than the record, none of the data is placed in the record. (If the records are of fixed-length format, blanks fill the rest of the record. Otherwise, no additional characters are added to the record.) The rest of the output item list is ignored. For data of character type, this error is not detected. Such data is automatically spanned across records without this being considered an error. **For unformatted output**: • **Files connected for sequential access**: For non-VSAM files that have a record format of variable spanned (VS) or variable blocked spanned (VBS), a record of the size required by the output item list is written. This is just as though the LRECL value specified an unlimited record length. Such records generally cannot be read using languages other than Fortran because the lengths of records in the file exceed the LRECL value associated with the file. For other files connected for sequential access, this action is the same as **RN** on page 483. • **Files connected for direct access**: As much of the data from the output item list as can fit is placed in the record. This includes the data item that would overflow the record; as much of it as can fit is placed in the record. The rest of this item plus the remaining data items in the output item list are written into as many records as necessary to hold the data. Each successive record is written as the record with the next higher record number. • **Files connected for keyed access**: This action is the same as **RN** on page 483. Symbolic Feedback Code: FOR1001

FOR1002E *locator-text* **An input item required data from beyond the end of the data that was available in a record. The length of the available data was** *data-length***. VS FORTRAN Version 2 Error Number: AFB164I, AFB201I (format 1), AFB201I (format 2), AFB204I, AFB212I, AFB213I**

Explanation: In a READ statement, one or more of the input items in the input item list required that data be transferred from beyond position *data-length* of the record. *data-length* is the smaller of either the value given in the RECL specifier, if any, on the OPEN statement **or** the length of the record available from the underlying system access methods. This latter

length is limited by the value of the LRECL parameter, if any, in the file definition if this LRECL value is less than the actual length of the previously written record. The specific error that is detected differs based on these factors:

- The type of formatting described by the FMT specifier (or by its absence) on the READ statement
- The record format (the RECFM value) for the file
- The value given in the PAD specifier, if any, on the OPEN statement
- The value of the RECPAD run-time option

These are the specific errors that this condition represents:

- **For input using a format specification**:

  Both of the following (1 and 2) were true:

  1. Either of these two conditions occurred:
     - An input item referred to a field that started beyond position *data-length* in the record.
     - An input item with a corresponding edit descriptor of A referred to a field that extended beyond position *data-length* in the record.

     (Note that because the T edit descriptor could have been used to specify the position at which data transfer was to begin, this condition doesn't necessarily imply that just the input items along with their corresponding repeatable edit descriptors represented more data than the record contained.)
  2. Either of these two conditions applied:
     - The OPEN statement had a PAD specifier whose value was NO.
     - There was no PAD specifier on the OPEN statement (or there was no OPEN statement because the file is a preconnected file or an internal file). In addition, one of these cases applied:
       - The RECPAD(NONE) run-time option was in effect.
       - The RECPAD(VAR) run-time option was in effect and the file was an external file that was a non-VSAM file with a record format (that is, the RECFM value that was applied to the file) of either fixed (F) or fixed blocked (FB).
       - The RECPAD(VAR) run-time option was in effect and the file was an external file that was a VSAM relative record data set (RRDS).

- **For unformatted input**:

  All three of the following were true:

  1. The total length of the items in the input item list exceeded the number of bytes of data (*data-length*) available from the record.
  2. The NUM specifier was not given in the READ statement.
  3. If the unit was connected for direct access, the OPEN statement rather than the DEFINE FILE statement from the FORTRAN 66 language standard was used to connect the file.

- **For list-directed input**:
  - Both of the following were true:
    1. There were no characters other than blanks in the record that corresponded to one or more input items.
    2. The record format (that is, the RECFM value that was applied to the file) was either variable spanned (VS) or variable blocked spanned (VBS).

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number* which was connected to *file-name* failed.

Programmer Response:

If you want to read an existing record, change one or more of the following:

- The type of formatting indicated by FMT specifier (or its absence) in the I/O statement. For example, you might have to read the record with list-directed formatting rather than with a format specification in order to be consistent with the structure of the existing record.
- The format specification. This could include errors in the edit descriptors field widths, repetition factors, and nesting levels.
- The input item list. There could be errors in the number of items in the list, in the data types and lengths of individual items, and in the specification of implied DOs in the input item list.
- The value given for the RECL specifier on the the OPEN statement. If this value is limiting the available amount of data to less than what the record actually contains, you should increase it to allow additional data to be read.
- The NUM specifier for an unformatted READ statement. When there is a NUM specifier on an unformatted READ statement, encountering a record that is shorter than the total length of all of the input items does not cause this error to be detected. In this case:
  1. All of the data from the record is transferred to the input items. This includes the data item for which there was not enough data in the record; as much of it as is available is transferred to the item.
  2. The rest of this input item and the remaining input items, if any, are not modified.
  3. The variable or array element *num* given in the NUM=*num* specifier becomes defined with the number of bytes of data that were transferred to the input items.
- The position of the file. Perhaps previous I/O statements (READ, WRITE, BACKSPACE, REWIND, and so on) caused the file to be positioned to a record other than the one you intended to read.
- Blank padding, which can be used when your READ statement has a format specification. When it is used, records are treated as though they were extended with a sufficient number of blanks to supply data for all of the input items. Blank padding is in effect either when the OPEN statement has a PAD specifier that has a value of YES or when there is no PAD specifier when certain sub-options of the RECPAD run-time option are in effect.

  Here are the RECPAD run-time option values that cause blank padding to be in effect:

This run-time option	**Applies blank padding to these types of files**
RECPAD(VAR)	Any of the following: – An external file that is a non-VSAM file with a record format (the RECFM value) of **other than** fixed (F) or fixed blocked (FB) – An external file that is a VSAM entry-sequenced data set (ESDS) or key-sequenced data set (KSDS) – An internal file (Note that for an external file connected for direct access, a non-VSAM file must have a record format of fixed, and a VSAM file must be an RRDS; therefore, the run-time option RECPAD(VAR) won't alleviate the problem for a file connected for direct access.)

RECPAD(ALL) Any file (internal or external; VSAM of any type; non-VSAM with any record format)

When blank padding is used to treat a record as though it were extended with blanks, the values that would be provided for the input items that would otherwise have caused this error to be detected are as follows:

- For a field that corresponded to an edit descriptor of A and that would have extended beyond the number of characters available from the record, the portion of the field in the record would be extended with blanks and transferred to the input item.
- For a field that corresponded to an edit descriptor of A and that would have started beyond the number of characters available from the record, the input item becomes defined with a value of blanks.
- For a field that corresponded to an edit descriptor of L and that would have started beyond the number of characters available from the record, the input item becomes defined with a value of false.
- For a field that corresponded to one of the numeric edit descriptors and that would have started beyond the number of characters available from the record, the input item becomes defined with a value of zero.

Note that because a run-time option controls this extension of records with blanks, the appropriate action is taken for all records and files to which it applies.

If the existing record of the file doesn't have the length or structure that you intended, you might have to recreate the file after correcting either the program that originally wrote the file or the file definitions that were in effect when the file was created. There is more detailed information on this subject in the “Programmer Response” section for condition FOR1001 on page 481.

System Action: If either the ERR or the IOSTAT specifier is present on the READ statement, then before control returns to the program, the **RN** action described on page 488 is taken.

If neither the ERR nor the IOSTAT specifier is present on the READ statement, the condition is signaled. If the condition either is unhandled or is handled by moving the resume cursor and resuming, then the **RN** action described on page 488 is taken. If the condition is unhandled, execution of the enclave terminates.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within the basic set, *statement* has a value of READ, and *parm_count* has a value of 7. In addition, there are these qualifying sets:

No.	Name	Input/Output	Data Type and Length	Value
5	*access*	Input	CHARACTER*10	For an external file, the value SEQUENTIAL, DIRECT, or KEYED depending on whether the file is connected for sequential, direct, or keyed access, respectively. For an internal file, this qualifying datum contains the value SEQUENTIAL.
6	*fmt-type*	Input	CHARACTER*8	One of the following values to indicate the type of formatting indicated by the FMT specifier (or its absence) on the READ statement: **Value** **Type of Formatting** blanks Unformatted FORMAT Format specification * List-directed formatting

No.	Name	Input/Output	Data Type and Length	Value
7	*data-length*	Input	INTEGER*4	The maximum length of data available to be read. If the OPEN statement had a RECL specifier, then *data-length* could be less than what is reflected in *record-desc*.
8	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
9	*record*	Input	CHARACTER**n*	For a formatted READ statement or for an unformatted READ statement directed to a file with other than spanned records (VS or VBS), the whole input record. For an unformatted READ statement that read from a record that spans more than one block, only the single record segment that includes position *data-length* of the record. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	Formatted and unformatted input are handled slightly differently:

Formatted input:

The input item that required data from beyond the end of the record as well as any remaining input items, if any, are not modified. The remainder of the format specification, if any, is ignored.

Unformatted input:

All of the data from the record is transferred to the items in the input item list. This includes the item for which there was not enough data in the record; as much of it as is available is transferred to the item. The rest of this item and the remaining input items, if any, are not modified.

In both cases, the file is positioned to the end of the record that was read (that is, to the end of the record that was too short).

RF If the READ statement is for unformatted I/O and it refers to a unit that is connected for direct access, then data from as many of the succeeding records as necessary is transferred to the input items, and the file is positioned to the end of the last record from which data was transferred. (This action is similar to the semantics of the FORTRAN 66 standard except that there is no associated variable.)

For other READ statements, this action is the same as **RN**.

Symbolic Feedback Code: FOR1002

FOR1003S *locator-text* **A character that wasn't numeric was found in the formatted input data where a numeric character was expected. The input field was '***input-field***'. VS FORTRAN Version 2 Error Number: AFB215I**

Explanation: For a READ statement, *input-field* is a character string that was interpreted as an integer, real or complex value either because the input item in the input item list was an integer, real or complex data type, or because the format specification had an I, E, F, Q or D edit descriptor. *input-field* contained characters other than 0 through 9 where only these characters were allowed.

When the input is interpreted as a complex value, the expected format of *input-field* depends on whether a format specification is used. If a format specification is used, two Fortran real numbers are used to describe a complex number: one describing the real part of the complex number, the other describing the imaginary part of the complex number. For list-directed or namelist, *input-field* should have the form of a complex constant. Note, however, that for list-directed or namelist input, condition FOR1006 could be detected in some cases for complex input.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number* which was connected to *file-name* failed.

Programmer Response: Ensure that:

- *input-field* contains formatted data that can be converted to the expected data type (refer to *VS FORTRAN Version 2 Language and Library Reference* for the form that integer, real and complex constants can have),
- The edit descriptor does not indicate numeric input where other input should be indicated,
- The edit descriptor specifies the correct field width.

System Action: The input item being processed, and the remainder of the items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm-count* has a value of 8. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.
6	*input-field*	input/output	CHARACTER*n	The formatted input data; that is, the character string that is being interpreted as either an integer, real, or complex value. The length *n* is part of *input-field-desc* and has a maximum possible value of 255.
7	*index*	Input	INTEGER*4	The index in *input_* field of the character in error.
8	*record_desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
9	*record*	Input	CHARACTER*n	The formatted input record that contained the character string being interpreted as a numeric value. The length *n*, which includes only the data portion of the record, is part of *record-desc*.
10	*result-desc*	Input	Q_DATA_DESC	The q_data descriptor for *result*. It contains the data type and the length of *result*.

No.	Name	Input/Output	Data Type and Length	Value
11	*result*	output	See *result_desc*.	The result value that is used when the release_option action is requested by the user condition handler. The data type can be an integer with a length of 1, 2, 4, or 8, or it can be real with a length of 4, 8, or 16. When a format specification is used, th real or imaginary part of a number is supplied as qualifying data as a real number of half the length.

Name	Action Taken after Resumption
RI	The character string that is in *input-field* (whose length is part of *input-field-desc*) is converted to a value that has the data type specified by *result-desc* and the data type specified by *result-desc*, and the input item becomes defined with this value. Execution continues, and the remainder of the input item list is processed.
release-option	The input item, or the real or imaginary part of a complex input item, becomes defined with the value *result*.

Symbolic Feedback Code: FOR1003

FOR1004S *locator-text* **A character that wasn't a hexadecimal character was found in the formatted input data where a hexadecimal character was expected. The input field was '***input-field***'. VS FORTRAN Version 2 Error Number: AFB225I**

Explanation: For a READ statement, *input-field* is a character string that was interpreted as hexadecimal data because there was a Z edit descriptor in the format specification. Hexadecimal data consists of the characters 0 through 9 and A through F, but *input-field* contained other characters.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number* which was connected to *file-name* failed.

Programmer Response: Ensure that:

- *input-field* contains formatted data that can be converted to hexadecimal data,
- The edit descriptor does not indicate hexadecimal input where other input should be indicated.
- The edit descriptor specifies the correct field width.

System Action: The input item being processed, and the remainder of the items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 11. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.

No.	Name	Input/Output	Data Type and Length	Value
6	*input-field*	input/output	CHARACTER**n*	The formatted input data, that is, the character string that is being interpreted as a hexadecimal value. The length *n* is part of *input-field-desc* and has a maximum possible value of 255.
7	*index*	Input	INTEGER*4	The index in *input_* field of the character in error.
8	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
9	*record*	Input	CHARACTER**n*	The formatted input record that contained the character string being interpreted as a numeric value. The length *n*, which includes only the data portion of the record, is part of *record-desc*.
10	*result-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
11	*result*	output	Q_DATA_DESC	The result value that is used when the release_option action is requested by the user condition handler.

Name	Action Taken after Resumption
RI	The character string that is in *input-field* whose length is part of *input-field-desc*) is converted to a hexadecimal value, and the input item becomes defined with this value. Execution continues, and th remainder of the input list is processed.
release_option	The input item becomes defined with the value *result*.

Symbolic Feedback Code: FOR1004

FOR1005S *locator-text* **The formatted input data** *input-field* **was outside the range of values that could be contained within the real or complex input item. VS FORTRAN Version 2 Error Number: AFB226I**

Explanation: For a READ statement, *input-field* is a character string that was interpreted either as the value of a real number or as the value of the real or the imaginary part of a complex number. This value exceeded the permissible range for a floating-point number. The largest magnitude is approximately 7.2E+75, and the smallest magnitude is approximately 5.4E−79.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that:

- The formatted data in *input-field* is within the required range for a real number,
- *input-field* does not contain trailing blanks if either the BLANK specifier is given on the OPEN statement with value of ZERO or the BZ edit descriptor is included on the format specification.

System Action: The input item being processed, and the remainder of the items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the

I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 10. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.
6	*input-field*	Input	CHARACTER*n	The formatted input data, that is, the character string that is being interpreted as a a real value or as the real or imaginary part of a complex value. The length *n* is part of *input-field-desc* and has a maximum possible value of 255.
7	*return-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
9	*record_desc*	Input	Q_DATA_DESC	The q_data descriptor for *result*. It contains the data type and the length of *result*.
9	*result*	output	REAL**n*	The new output value, where *n*, the length is part of *result-desc* an dcould be 4, 8, or 16.

Name	Action Taken after Resumption
release_option	The input item becomes defined with the value in *result*. Execution continues, and the remainder of the input item list is processed.

Symbolic Feedback Code: FOR1005

FOR1006S *locator-text* **For list-directed input, the variable was of complex type, but the formatted input data was not in the correct format for a complex constant. The formatted input data was** *input-field***. VS FORTRAN Version 2 Error Number: AFB238I**

Explanation: For a READ statement, *input-field* is a portion of the character string that was interpreted as a complex constant for list-directed input, and can be either the real part, the imaginary part, or both. *input-field* either contained embedded blanks in the real part or the imaginary part of the complex number, did not contain a comma as a separator between the real part and the imaginary part, or was not enclosed in parentheses. Or, the end of the record occurred other than between the real part and the comma or between the comma and the imaginary part.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number* which was connected to *file-name*, failed.

Programmer Response: Ensure that *input-field* contains no embedded blanks in the real part or the imaginary part of the complex number, contains a comma as a separator, is enclosed by a left and a right parenthesis, and, if the the complex number does not fit into one record, that the end of the record occurs between the real part and the comma or between the comma and the imaginary part.

System Action: The input item being processed, and the remainder of the items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the

I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 8. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.
5	*input-field*	Input	CHARACTER*n	The formatted input data, that is, a part of the character string that is being interpreted as a complex number. It can be either the real part, the imaginary part, or both. The length *n* is part of *input-field-desc* and has a maximum possible value of 255.
7	*return-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
8	*record*	Input	CHARACTER**n*	The formatted input record that contained the character string being interpreted as a complex number. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	The current operation is ignored. The remainder of the deallocation list is processed and execution continues.

Permissable Resume Actions:

Name	Action Taken after Resumption
RN	Execution continues, and the remainder of the input item list is ignored.

Symbolic Feedback Code: FOR1006

FOR1007S *locator-text* **The input item was of type character, but the formatted input data did not begin with an apostrophe or with a quote. The input field was** *input-field***. VS FORTRAN Version 2 Error Number: AFB238I**

Explanation: For a READ statement, *input-field* is a character string that was interpreted as a character constant for list-directed input. *input-field* did not begin with an apostrophe or with a quote.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that *input-field* is delimited by apostrophes or quotes, and that the beginning and ending delimiters are the same.

System Action: The input item being processed and the remainder of the input items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 8. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.
6	*input-field*	Input	CHARACTER*n	The formatted input data, that is, the character string that is being interpreted as a character value. The length *n* is part of *input-field-desc* and has a maximum possible value of 255.
7	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
8	*record*	Input	CHARACTER*n	The formatted input record that contained the character string being interpreted as a character value. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	The remainder of the input items in the input item list are ignored, and execution continues.

Symbolic Feedback Code: FOR1008

FOR1009S *locator-text* **The list-directed input data did not have a value separator following the ending delimiter. The input data ended with** *input-field***. VS FORTRAN Version 2 Error Number: AFB238I**

Explanation: For a READ statement, *input-field* is a character string that was interpreted as a character constant (delimited by apostrophes or quotes) or a complex constant (delimited by parentheses) for list-directed input. *input-field* was not followed by a value separator, where a value separator can be either a comma (**,**), a blank, or a slash (**/**).

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that *input-field* is followed by a value separator.

System Action: The input item being processed and the remainder of the items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 8. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.

No.	Name	Input/Output	Data Type and Length	Value
6	*input-field*	Input	CHARACTER**n*	The formatted input data; that is, the character string that is being interpreted either as a character value or as a complex number. The length *n* is part of *input-field-desc* and has a maximum possible value of 255.
7	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
8	*record*	Input	CHARACTER**n*	The formatted input record that contained the character constant with no delimiter. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1009

FOR1010S *locator-text* **A character that wasn't a binary character was found in the formatted input data where a binary character was expected. The input field was '***input-field***'.**

Explanation: For a READ statement, *input-field* is a character string that was interpreted as binary data because there was a B edit descriptor in the format specification. Binary data consists of the characters 0 and 1, but *input-field* contained other characters.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that:

- *input-field* contains formatted data that can be converted to binary data,
- The edit descriptor does not indicate binary input where other input should be indicated,
- The edit descriptor specifies the correct field width.

System Action: The input item being processed and the remainder of the items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 11. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.

No.	Name	Input/Output	Data Type and Length	Value
6	*input-field*	Input / output	CHARACTER*n	The formatted input data; that is, the character string that is being interpreted as a binary value. The length *n* is part of *input-field-desc* and has a maximum possible value of 255.
7	*index*	Input	INTEGER*4	The index in *input_* field of the character in error.
8	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
9	*record*	Input	CHARACTER*n	The formatted input record that contained the character string being interpreted as a binary value. The length *n*, which includes only the data portion of the record, is part of *record-desc*.
10	*result-desc*	Input	Q_DATA_DESC	The q_data descriptor for *result*. It contains the data type and the length of *result*.
11	*result*	output	See *result-desc*	The result value that is used when the release_option action is requested by the user condition handler.

Permissable Resume Actions:

Name	Action Taken after Resumption
RI	The character string that is in *input-field* (whose length is part of *input-field-desc*) is converted to a binary value, and the input item becomes defined with this value. Execution continues, and the remainder of the input item list is processed.
release_option	The input item becomes defined with the value *result*.

Symbolic Feedback Code: FOR1010

FOR1011S *locator-text* **A character that wasn't an octal character was found in the formatted input data where an octal character was expected. The input field was '***input-field***'.**

Explanation: For a READ statement, *input-field* is a character string that was interpreted as octal data because there was an O edit descriptor in the format specification. Octal data consists of the characters 0 through 7, but *input-field* contained other characters.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that:

- *input-field* contains formatted data that can be converted to octal data,
- The edit descriptor does not indicate octal input where other input should be indicated.
- The edit descriptor specifies the correct field width.

System Action: The input item being processed and the remainder of the items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O

statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 11. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*input-field-desc*	Input	Q_DATA_DESC	The q_data descriptor for *input-field*. It contains the data type and the length of *input-field*.
6	*input-field*	Input/Output	CHARACTER**n*	The formatted input data, that is, the character string that is being interpreted as an octal value. The length *n* is part of *input-field-desc* and has a maximum possible value of 255.
7	*index*	Input	INTEGER*4	The index in *input_* field of the character in error.
8	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.

10	*result-desc*	Input	Q_DATA_DESC	The q_data descriptor for *result*. It contains the data type and the length of *result*.
11	*result*	output	See *result-desc*	The result value that is used when the release_option action is requested by the user condition handler.

Name	Action Taken after Resumption
RI	The character string that is in *input-field* (whose length is part of *input-field-desc*) is converted to a binary value, and the input item becomes defined with this value. Execution continues, and the remainder of the input item list is processed.
release_option	The input item becomes defined with the value *result*.

Symbolic Feedback Code: FOR1011

FOR1020S The *statement* statement for sequential access for unit *unit-number*, which was connected to *file-name*, failed. The file had been connected for *access* access. VS FORTRAN Version 2 Error Number: AFB163I, AFB231I (format 1)

Programmer Response: Ensure that you use only the I/O statements that are consistent with the access mode in use for the file connection. For example, if you intend to use direct access, then don't use the file positioning statements (BACKSPACE, ENDFILE, REWIND). Instead, use only READ or WRITE statements with a REC specifier; the value given for the REC specifier is the number of the record that you want to read or write.

If you want to read the file sequentially, then you must connect the file for sequential access by executing an OPEN statement in which the access specifier has a value of SEQUENTIAL (or in which the access specifier is omitted). If the file was already connected for direct

access and you want to process it with sequential access, then you must execute a CLOSE statement before the OPEN statement.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1020

FOR1022S The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The file was already positioned after the endfile record. VS FORTRAN Version 2 Error Number: AFB101I, AFB218I (format 8)

Explanation: The file was positioned after the endfile record either because the end-of-file condition was just detected for a READ statement or because you just executed an ENDFILE statement. Your *statement* statement implied the use of a subsequent subfile, but your file did not have multiple subfiles because it was a dynamically allocated scratch file, a named file, or a striped file.

Programmer Response: Do not try to read or write records beyond the endfile record for the files that don't support multiple subfiles. The only files that can have multiple subfiles are unnamed files that are neither striped files nor dynamically allocated.

Check the logic of your program to ensure that you haven't inadvertently executed a READ or WRITE statement either after reaching the end of the file or after executing an ENDFILE statement. Use the END specifier, if necessary, to detect the end of the file.

If you want to extend an existing file after reading through the data records and detecting the end of the file, you can do so by executing a BACKSPACE statement (which positions the file just beyond the last data record and just before the endfile record) followed by WRITE statements.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1022

FOR1023S The *statement* statement for unit *unit*, which was connected to *file-name*, failed. The file definition statement referred to a file on a device or with a file organization for which the *statement* statement is not supported. VS FORTRAN Version 2 Error Number: AFB095I (format 1), AFB166

Explanation: Your program executed a *statement* statement, but the file to which the unit is connected doesn't support this statement. For example, the following statements are inconsistent with the types of files indicated:

Statement	Inconsistent file type
BACKSPACE	Printer
BACKSPACE	Striped file
ENDFILE	PDS member
REWIND	Language Environment message file

Programmer Response: Either

- Change the logic of your program to avoid the use of the prohibited I/O statements for the file that you're using, or
- Change the file definition (DD statement, ALLOCATE command) to refer to a different type of file, and maintain the data in that other type of file.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1023

FOR1024S The BACKSPACE statement for unit *unit-number*, which was connected to *file-name*, failed. The file definition statement refers to a PDS member and the previous statement was a WRITE statement. VS FORTRAN Version 2 Error Number: AFB095I (format 2)

Programmer Response: Because the sequence of a WRITE statement followed by a BACKSPACE statement isn't allowed for a file that is a PDS member, make or both of these changes:

- Modify the program so it doesn't use this sequence of statements.
- Change the file definition (DD statement, ALLOCATE command) to refer to a different type of file, and maintain the data in that other type of file.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of BACKSPACE, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1024

FOR1025S The BACKSPACE statement for unit *unit-number*, which was connected to *file-name*, failed. The file definition statement referred to a PDS member, and BUFNO had a value greater than 1. VS FORTRAN Version 2 Error Number: AFB095I (format 2)

Programmer Response: Because the BACKSPACE statement isn't allowed with a file that is a PDS member and that is processed with more than one buffer, make one or more of these changes:

- Modify the program so it does not use a BACKSPACE statement.
- Change the file definition (DD statement, ALLOCATE command) to refer to a different type of file, and maintain the data in that other type of file.
- Change the file definition statement either by removing the BUFNO parameter that has a value greater than 1 or by providing a BUFNO=1 parameter.
- For a dynamically allocated file that has an associated call to the FILEINF callable service, either remove the BUFNO parameter that has a value greater than 1 or provide a a BUFNO parameter with an associated value of 1.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of BACKSPACE, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1025

FOR1026S The *statement* **statement for unit** *unit-number*, **which was connected to** *file-name*, **failed. The file definition statement referred to a PDS member, and** *statement* **statement nor a REWIND statement. VS FORTRAN Version 2 Error Number: AFB123I (format 6), AFB123I (format 7)**

Explanation: The sequence of I/O statements that was executed for a file that was a PDS member caused a change either from input to output processing or from output to input processing without an intervening REWIND statement.

Programmer Response: Change the logic of the program to avoid switching between input and output processing.

If you must do both input and output processing on the file, either

- Insert an intervening REWIND statement (or a CLOSE followed by an OPEN statement) between the two types of processing if the logic of the program and the desired file positioning allows it, or
- Change the file definition (DD statement, ALLOCATE command) to refer to a different type of file, and maintain the data in that other type of file.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1026

FOR1027S The READ statement for unit *unit-number*, **which was connected to** *file-name*, **failed. The file definition statement referred to a system output (sysout) data set. VS FORTRAN Version 2 Error Number: AFB218I (format 3)**

Programmer Response: If the file is supposed to be a system output data set (SYSOUT parameter on the DD statement), then change the logic of your program so that you don't execute a READ statement for a unit that's connected to this file.

If the file should be another type, then change the file definition (DD statement, ALLOCATE command) to refer to the file that you intend to use.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1027

FOR1028S The *statement* statement for unit *unit-number*, failed. The file was already positioned after the endfile record of the 999th subfile, which is the last subfile allowed.

Explanation: Your program has already processed 999 subfiles and is trying to position itself into the next one; however, 999 is the maximum number of subfiles that can be handled. Note that each subsequent subfile is referenced when you execute a READ, WRITE, or ENDFILE statement either after the end-of-file condition was just detected for a READ statement or after you just executed an ENDFILE statement.

Programmer Response: Ensure that your program doesn't inadvertently execute a READ, WRITE, or ENDFILE statement for the same unit either after reaching the end of the file or after executing an ENDFILE statement. Use the END specifier, if necessary, on the READ statement to detect the end of the file.

If you want to extend an existing file after reading through the data records and detecting the end of the file, you can do so by executing a BACKSPACE statement (which positions the file just beyond the last data record and just before the endfile record) followed by WRITE statements

System Action: The file is closed. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1028

FOR1070S The direct access *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The REC specifier had a value of *record-number*, which either was not positive or exceeded *num-records*, the number of records in the file. VS FORTRAN Version 2 Error Number: AFB232I

Programmer Response: Ensure that the REC specifier on the direct access READ or WRITE statement has a value that is neither less than 1 or greater than the number of records in the file.

If you're sure that the file contains the correct number of records, then just correct the logic of your program to provide the correct value for the REC specifier.

If you expect the file to contain more records than it does, then you'll have to delete the existing file and create it again to give it additional space. In this case, the term *delete* means that the data set's disk space must be released and the data set allocated again. Note that unless the file is dynamically allocated, neither of the following release the data set's existing space on the disk volume:

- A CLOSE statement with a STATUS specifier value of DELETE or
- An OPEN statement with a STATUS specifier value of REPLACE.

However, if the file is dynamically allocated, you can use these forms of the OPEN and CLOSE statements to release the space from within your Fortran program.

For a non-VSAM file, you should indicate the amount of space in the file by one of the following:

- In MVS JCL: the SPACE parameter on the DD statement
- In the TSO ALLOCATE command: the SPACE operand along with the BLOCK, TRACKS, or CYLINDERS operand

- In the FILEINF argument list for a dynamically allocated file: the CYL, TRK, or MAXREC keyword argument

For a VSAM relative record data set (RRDS), you should indicate the amount of space on the Access Method Services DEFINE CLUSTER command with the CYLINDERS, RECORDS, or TRACKS parameter.

When the new file is first connected with a Fortran OPEN statement whose ACCESS specifier has a value of DIRECT, it is automatically formatted with as many records as will fit in the space allocated to the data set. (However, when the DEFINE FILE statement from the FORTRAN 66 language standard is used, only the number of records specified in that statement is formatted.)

Alternatively, you can format a newly created file by using sequential access rather than direct access. In this case, simply write as many records as the file is supposed to to hold, then close the file, and reconnect it for direct access. Remember that a file connected for direct access must have a record format that indicates fixed-length unblocked records and a record length that is the same as the value of the RECL specifier on the OPEN statement that's used to connect the file for direct access. Therefore, if you're using sequential access to format the file, ensure that the record format and record length are correctly specified in the DD statement, in the TSO ALLOCATE command, or in the the arguments for the FILEINF callable service.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 6. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*record-number*	Input	INTEGER*4	The invalid record number that was given in the REC specifier.
6	*num-records*	Input	INTEGER*4	The number of records for which there is space within the file.

Permissable Resume Actions:

Name	Action Taken after Resumption
RN	The remainder of the input item is ignored, and execution continues.

Symbolic Feedback Code: FOR1070

FOR1071S The direct access *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The file had been connected for *access* access. VS FORTRAN Version 2 Error Number: AFB235I

Explanation: Your program executed a *statement* statement with a REC specifier, which indicates direct access, but the file was connected for *access* rather than direct access.

Programmer Response: Ensure that you use only the I/O statements that are consistent with the access mode in use for the file connection. For example, if you intend to use sequential access, then don't use READ or WRITE statements with a REC specifier because these apply only to direct access.

If you want to read the file using direct access, then connect the file by executing an OPEN statement in which the access specifier has a value of DIRECT. (In a program that uses the FORTRAN 66 language standard, the DEFINE FILE statement has a function similar to the OPEN statement.)

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1071

FOR1072S The direct access READ statement for unit *unit-number*, which was connected to *file-name*, failed. The file was empty. VS FORTRAN Version 2 Error Number: AFB236I (format 1)

Programmer Response: Ensure that whatever program created the file actually wrote records into the file. The three most common ways of writing these records are:

- Using the OPEN statement with a value of DIRECT for the ACCESS specifier when the file doesn't yet exist. If the OPEN statement does **not** have either:
  - A STATUS specifier with a value of OLD, or
  - An ACTION specifier with a value of READ.

  then during execution of the OPEN statement the file should be formatted automatically with as many records as it can hold.
- Using sequential access to write the records. In this case, simply write as many records as the file is supposed to to hold, then close the file, and reconnect it for direct access. Remember that a file connected for direct access must have a record format that indicates fixed-length unblocked records and a record length that is the same as the value of the RECL specifier on the OPEN statement that's used to connect the file for direct access. Therefore, if you're using sequential access to format the file, ensure that the record format and record length are correctly specified in the DD statement, in the TSO ALLOCATE command, or in the the arguments for the FILEINF callable service.
- Using a utility program or a program written in some other language. If the file is to be used with direct access by a Fortran, it must have a record format that indicates fixed-length unblocked records and a record length that is the same as the value of the RECL specifier on the Fortran OPEN statement that will be used to connect the file for direct access.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1072

FOR1100S The REWRITE statement for unit *unit-number*, which was connected to *file-name*, failed. The key of reference had a value of *new-rec-key* (X'*new-rec-key-hex*'), which was different from *orig-rec-key* (X'*orig-rec-key-hex*'), the value of that key in the record that was read. The key of reference had a KEYID value of *keyid*. VS FORTRAN Version 2 Error Number: AFB139I

Explanation: You read a record and, in trying to rewrite it, provided a record in your output item with a key of reference whose value differed from that in the original record. You cannot use the REWRITE statement to replace a record if you change the value of the key of reference.

The term *key of reference* means the key (that is, certain positions within the record) that was used for the sequential or direct retrieval of the record that was read. The term *KEYID value* means the relative position of the start-end pair for this key within the start-end pairs listed in the KEYS specifier on the OPEN statement.

Programmer Response: If you intended to replace an existing record rather than to write one with a modified key value, ensure that:

- The value of the key in the output item list is the same as what was just read and that it is in the correct position in the record,
- The output item list contains all the fields of the record to be rewritten, and
- Any changes in the order or length of various fields in the record have not caused the value of the key of reference within the record to be shifted from its original position.

If you want to replace the record with one having a different key value, use the DELETE statement to delete the record that was read, and then

- If there isn't already a record in the file with the different key value, then use the WRITE statement, rather than the REWRITE statement, to add the record with a new key value.
- If there is already a record in the file with the different key value, then use the READ statement to read that record, and then use the REWRITE statement to replace that record.

If you want to add a new record with a key value that doesn't already exist in the file, then use the WRITE statement to add it.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of REWRITE, and *parm_count* has a value of 6. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
6	*record*	Input	CHARACTER*n	The record. The length *n* is part of *record-desc*.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1100

FOR1102S The WRITE statement for unit *unit-number*, which was connected to *file-name*, failed. Records were being loaded into the file, and the primary key had a value of *new-key* (X'*new-key-hex*'), which was not greater than *prev-key* (X'*prev-key-hex*'), the value of the primary key in the previous record. VS FORTRAN Version 2 Error Number: AFB140I

Explanation: Because the OPEN statement for this file connection had a value of WRITE for the ACTION specifier, the file was connected for use in loading records in order of ascending primary key value. You attempted to load a record in which the value of the primary key was not greater than the value of the primary key in the previous record. The term *primary key* refers to the main key for the VSAM key-sequenced data set as it was declared in the Access Method Services DEFINE CLUSTER command.

Programmer Response: Ensure that your output item list has the primary key at its proper position within the record being written. If you're not sure where this key is located in the record, use the Access Method Services LISTCAT command to find out. Then change your

output item list (and the KEYS specifier, if present, on the OPEN statement) so that it is consistent with the primary key position known to VSAM. On the other hand, if the output of the LISTCAT command shows the key in a different position than you intended, then delete and redefine the file with the Access Method Services DELETE and DEFINE CLUSTER commands.

Change the logic of your program or the order of the records being loaded so that the records are presented in increasing sequence of their primary key values.

If you cannot present the records in increasing key sequence, then on the OPEN statement change the value of the ACTION specifier to READWRITE. This allows records to be added to the file without regard for the order of their keys.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of WRITE, and *parm_count* has a value of 6. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
6	*record*	Input	CHARACTER**n*	The record. The length *n* is part of *record-desc*.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1102

FOR1103S The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The previous I/O statement for this unit resulted in a condition that caused the loss of position in the file. VS FORTRAN Version 2 Error Number: AFB123I (format 1), AFB123I (format 2), AFB123I (format 3), AFB123I (format 4), AFB123I (format 5)

Explanation: The *statement* statement was not allowed for either or both of these reasons:

- It depended on a previous statement to establish or retain a position (or record pointer) within the file.
- The execution of a previous statement caused the loss of position in the file. This file position could have been lost because of any of a number of conditions:
  - Record-not-found condition
  - Duplicate-key condition
  - End-of-file condition
  - Any error condition

You can neither read records sequentially nor use a BACKSPACE statement until you have reestablished file position. In addition, you cannot use a DELETE, or REWRITE statement except immediately after successfully reading a record.

Programmer Response: Ensure that a BACKSPACE statement or a sequential retrieval READ statement isn't executed until a position has been established within the file. This position can be established by a successfully executed OPEN, REWIND, or direct retrieval READ statement.

Ensure that a DELETE or REWRITE statement isn't executed unless a record has just been read.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1103

FOR1104S The READ statement for unit *unit-number*, **which was connected to** *file-name*, **failed. The KEYID specifier had a value of** *keyid*, **which conflicted with** *num-keys*, **the number of keys specified in the KEYS specifier on the OPEN statement. VS FORTRAN Version 2 Error Number: AFB124I**

Explanation: The value of the KEYID specifier on the OPEN statement is either less than 1 or greater than the number of start-end pairs in the KEYS specifier. Therefore, no pair (and hence no key) can be associated with the value of the KEYID specifier.

This conflict can arise even if no KEYS specifier is coded: a default of one key is assumed, so if KEYID has a value greater than 1, an error is detected.

Programmer Response: If the KEYS specifier on the OPEN statement accurately indicates the keys that you want to use, then change the value of the KEYID specifier so that it is a positive integer that is no larger than the number of start-end pairs in the KEYS specifier. Its value should be the ordinal number of the start-end pair for the key that you want to use.

If you intended to have additional keys available for use, then specify their starting and ending record positions as start-end pairs in the KEYS specifier on the OPEN statement. In addition, provide the file definitions (DD statements or TSO ALLOCATE commands) to refer VSAM paths for the additional keys.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1104

FOR1106S The READ statement for unit *unit-number*, **which was connected to** *file-name*, **failed. The argument to be used in searching for a key had a length of** *arg-length*, **which was greater than** *key-length*, **the length of the key on which the search is being made. The KEYID value was** *keyid*. **VS FORTRAN Version 2 Error Number: AFB125I**

Explanation: The argument to be used in searching for a key was given in the KEY, KEYGE, or KEYGT specifier of a READ statement. However, the length of this argument is greater than the length of the key of reference.

The term *key of reference* means the key (that is, certain positions within the record) that was used for the direct retrieval of the record that was to be read. The key of reference is indicated by the *KEYID value*, which is the relative position of the start-end pair for this key within the start-end pairs listed in the KEYS specifier on the OPEN statement. The key of reference can be established through the KEYID specifier on a direct retrieval READ statement and remains in effect until it is changed in another direct retrieval READ statement. The KEYID value is 1 if it has not been specified since the file was connected.

Programmer Response: Provide a search argument in the KEY, KEYGE, or KEYGT specifier whose length does not exceed that of the key of reference. If you want to search with a different key of reference, then for the KEYID specifier specify the ordinal number of the desired key's start-end pair in the KEYS specifier on the OPEN statement.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 7. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*key-desc*	Input	Q_DATA_DESC	The q_data descriptor for *key*. It contains the data type and the length of *key*.
6	*key*	Input	See *key-desc*	The value of the key argument. The data type can be integer of length 1, 2, 4, or 8, or it can be character with any positive length not exceeding 255.
7	*keyid*	Input	INTEGER*4	The value of the KEYID specifier.

Name	Action Taken after Resumption
RN	The current operation is ignored. The remainder of the deallocation list is processed and execution continues.

Symbolic Feedback Code: FOR1106

FOR1107S No record with the specified key could be found for the keyed access READ statement for unit *unit-number*, **which was connected to** *file-name*. **The** *key* **specifier had a value of** *value* **(X'***hex-value***'). The KEYID value was** *keyid* **(***start*:*end***). VS FORTRAN Version 2 Error Number: AFB126I**

Explanation: For the key of reference there was no record in the file meeting the search criterion indicated by the search argument in the KEY, KEYGE, or KEYGT specifier on the READ statement. This is the *record not found condition* and might not be an error.

The term *key of reference* means the key (that is, certain positions within the record) that was used for the direct retrieval of the record that was to be read. The key of reference is indicated by the *KEYID value*, which is the relative position of the start-end pair for this key within the start-end pairs listed in the KEYS specifier on the OPEN statement. The key of reference can be established through the KEYID specifier on a direct retrieval READ statement and remains in effect until it is changed in another direct retrieval READ statement. The KEYID value is 1 if it has not been specified since the file was connected.

Programmer Response: Ensure that the KEYID value on this or an a previously executed READ statement represents the desired key of reference.

Check the value of the KEY, KEYGE, or KEYGT specifier to ensure that it provides the desired search argument.

Check the program and the data that was used to create the file to ensure that the expected records are actually in the file.

If you want your program to get control in the event of a record not found condition, then on the READ statement add a NOTFOUND specifier with the label of the statement to be given control should the record not found condition occur.

System Action: If the IOSTAT=*ios* specifier is present on the READ statement, *ios* becomes defined either with the value 1107 if *ios* is an integer variable or with the condition token for FOR1107 if *ios* is a character variable of length 12.

If the NOTFOUND=*nfd* specifier is present on the READ statement, control passes to the label *nfd*. If the NOTFOUND specifier is not present on the READ statement but the ERR=*err* specifier is present, control passes to the label *err*.

If neither the ERR, the NOTFOUND, nor the IOSTAT specifier is present on the READ statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 7. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*key-desc*	Input	Q_DATA_DESC	The q_data descriptor for *key*. It contains the data type and the length of *key*.
6	*key*	Input	See *key-desc*	The value of the key argument. The data type can be integer of length 1, 2, 4, or 8, or it can be character with any positive length not exceeding 255.
7	*keyid*	Input	INTEGER*4	The value of the KEYID specifier.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1107

FOR1112S The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The record being written had a length of *length*, which was too short to contain all the keys. VS FORTRAN Version 2 Error Number: AFB129I (format 1), AFB129I (format 2)

Explanation: The record described by the output item list on the *statement* statement wasn't long enough to contain all of the keys that were defined for the file through Access Method Services. The record being written must be long enough to contain all of these keys even if one or more of the keys wasn't listed as a start-end pair in the KEYS specifier of the OPEN statement.

Programmer Response: Ensure that the output item list defines a record long enough to contain all of the keys made known to VSAM through the DEFINE CLUSTER, DEFINE ALTERNATE INDEX, and DEFINE PATH commands for Access Method Services. Use the LISTCAT command if necessary to determine the position of these keys.

Remember that with a REWRITE statement the output item list must provide output items that describe the whole record rather than just the portions that are to be rewritten.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 6. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
6	*record*	Input	CHARACTER*n	The record. The length *n* is part of *record_desc*.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1112

FOR1113S The *statement* **statement for unit** *unit-number*, **which was connected to** *file-name*, **failed. The file had been connected for** *access* **access, and the** *statement* **statement was of a form that applies to keyed access. VS FORTRAN Version 2 Error Number: AFB127I, AFB128I**

Explanation: One of the following specifiers was given on the *statement* statement:

KEY
KEYGE
KEYGT
NOTFOUND
DUPKEY
KEYID

These specifiers are applicable only to files connected for keyed access, but the file connection was for *access* access.

Programmer Response: If your file is a VSAM key-sequenced data set (KSDS), then provide a value of KEYED for the ACCESS specifier on the OPEN statement. This will allow you to use I/O statements that apply to keyed access.

If your file is not a VSAM KSDS, then you cannot use keyed access nor can you use I/O statements that apply only to keyed access. In this case, you have two choices:

- Change the logic of your program to use only the statements that apply to sequential or direct access.
- Define or redefine the file using Access Method Services to make it a VSAM KSDS. Then you can connect the file for keyed access and use any of the I/O statements that apply to keyed access.

Do not confuse sequential or direct access with sequential or direct retrieval statements. Sequential and direct access are indicated by the ACCESS specifier on the OPEN statement. Sequential and direct retrieval statements are forms of the READ statement that can be used when the file is connected for keyed access, that is, when the ACCESS specifier on the OPEN statement has a value of KEYED.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1113

FOR1114S The WRITE statement for unit *unit-number*, **which was connected to** *file-name*, **failed. A key value within the record to be written was a duplicate of a key in a record already in the file. The key of reference had a position of** *start* **:** *end* **in the record, a hexadecimal value of** *value*, **and a KEYID of** *keyid*. **VS FORTRAN Version 2 Error Number: AFB135I**

Explanation: A WRITE statement that was used with a file that was connected for keyed access provided in its output item list a record with a key whose value was the same as one that was already in the file. The duplicate key value was either for the primary key, which never allows duplicate key values, or for an alternate-index key that does not allow duplicate values because it was defined to be unique through the Access Method Services DEFINE

ALTERNATEINDEX command. The key whose value is duplicated is not necessarily the key of reference, which is indicated in the message text, and it isn't even necessarily among the keys listed in the KEYS specifier of the OPEN statement for the file. However, the key is one that was defined using the Access Method Services DEFINE CLUSTER or DEFINE ALTERNATE INDEX command.

This is the *duplicate key condition* and might not be an error.

(The term *key of reference* means the key (that is, certain positions within the record) that is currently in use for reading and writing records. The key of reference is indicated by the *KEYID value*, which is the relative position of the start-end pair for this key within the start-end pairs listed in the KEYS specifier on the OPEN statement. The key of reference can be established through the KEYID specifier on a direct retrieval READ statement and remains in effect until it is changed in another direct retrieval READ statement. The KEYID value is 1 if it has not been specified since the file was connected.)

Programmer Response: Ensure that the output item list defines a record such that no key positions have values that are the same as values that are already in the file. This applies both to the primary key and to all alternate index keys whose values are supposed to be unique. Carefully check the record to be sure that it is in the intended format.

Remember that the key whose value has been duplicated in your record might not be one that your program uses. You'll have to check all of the keys made known to VSAM through the DEFINE CLUSTER, DEFINE ALTERNATE INDEX, and DEFINE PATH commands for Access Method Services. Use the LISTCAT command if necessary to determine the position of these keys.

If you want your program to get control in the event of a duplicate key condition, then on the WRITE or REWRITE statement add a DUPKEY specifier with the label of the statement to be given control should the duplicate key condition occur.

System Action: If the IOSTAT=*ios* specifier is present on the I/O statement, *ios* becomes defined either with the value 1114 if *ios* is an integer variable or with the condition token for FOR1114 if *ios* is a character variable of length 12.

If the DUPKEY=*dky* specifier is present on the I/O statement, control passes to the label *dky*. If the DUPKEY specifier is not present on the I/O statement but the ERR=*err* specifier is present, control passes to the label *err*.

If neither ERR, the DUPKEY, nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of WRITE, and *parm_count* has a value of 6. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
6	*record*	CHAR-ACTER*n	The record. The length *n* is part of *record-desc*.	

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1114

FOR1180S The formatted *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The file was connected for unformatted I/O. VS FORTRAN Version 2 Error Number: AFB174I

Explanation: A formatted *statement* statement was executed for a unit that was connected for unformatted input/output operations.

A formatted I/O statement is a PRINT statement, or it is identified by the presence of an FMT specifier in the I/O statement's control list as follows:

- The presence of a FMT specifier with the FMT keyword. For example:

```
READ (FMT=*, UNIT=8) A

READ (8, FMT=10) A
```

- The absence of the UNIT keyword in the unit specifier and the presence of an immediately following specifier that has no keyword. For example:

```
READ (8, NL1) A

READ (8, *) A
```

The file was connected for unformatted input/output operations because either:

- A value of UNFORMATTED was given for the FORM specifier on the OPEN statement,
- The FORM specifier was omitted from the OPEN statement for a file that was connected for direct or keyed access, or
- The first I/O statement that was executed for a preconnected file was an unformatted I/O statement, that is, an I/O statement with no FMT specifier.

Programmer Response: Determine whether you want to perform formatted or unformatted input/output operations on the file. If you want to use unformatted I/O statements, remove or change the formatted I/O statements.

If you want to use formatted I/O statements, then:

- For an OPEN statement that connects a file for sequential access, either omit the FORM specifier or provide one with a value of FORMATTED.
- For an OPEN statement that connects a file for direct or keyed access, provide a FORM specifier with a value of FORMATTED.
- Do not execute an unformatted I/O statement for the unit.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 7.

Permissable Resume Actions:

Name	Action Taken after Resumption
RN	The remainder of the input item list is ignored, and execution continues.

Symbolic Feedback Code: FOR1180

FOR1181S *locator-text* A format specification contained an invalid edit descriptor of *code*. VS FORTRAN Version 2 Error Number: AFB211I

Explanation: A format specification referenced by the I/O statement contained an edit descriptor (sometimes called a *format code*) that was

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for an internal file failed.

The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: If the FMT specifier on the I/O statement referred to the format specification in a variable (rather than as a constant or as a label of a FORMAT statement), ensure that the format specification was constructed according to the same rules that apply for a FORMAT statement. In particular, it must start with a left parenthesis, end with a right parenthesis, have no imbedded blanks except within a pair of quotes or apostrophes, and use only the edit descriptors that are allowed by the Fortran language.

Ensure that the logic of your program didn't inadvertently overlay storage such as by referring to array elements outside the declared bounds of the array.

System Action: The input or output item being processed and the remainder of the items in the input/output item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The invalid edit descriptor is treated as the end of the format specification, and execution continues.

Symbolic Feedback Code: FOR1181

FOR1182S *locator-text* **A format specification contained more than 51 nested parenthesis groups. VS FORTRAN Version 2 Error Number: AFB160I**

Programmer Response: In your format specification, do not use more than 51 levels of nesting for parenthesis groups.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The parenthesis group is ignored, and execution continues. The results are unpredictable.

Symbolic Feedback Code: FOR1182

FOR1183S *locator-text* **The format specifier on the I/O statement did not refer to a FORMAT statement. VS FORTRAN Version 2 Error Number: AFB211I**

Programmer Response: Ensure that the format specifier refers to a correctly structured format specification. Either provide the label of a FORMAT statement or character expression whose value is a format specification.

Ensure that the logic of your program didn't inadvertently overlay storage such as by referring to array elements outside the declared bounds of the array.

System Action: The input or output item being processed and the remainder of the items in the input/output item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The format field is treated as an end of format, and execution continues.

Symbolic Feedback Code: FOR1184

FOR1200S The unformatted *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The file was connected for formatted I/O. VS FORTRAN Version 2 Error Number: AFB173I

Explanation: An unformatted *statement* statement was executed for a unit that was connected for formatted input/output operations.

An unformatted I/O statement is recognized by the absence of an FMT specifier. For example, these are unformatted I/O statements:

```
WRITE (10) A, B

READ (7, END=88) A, B
```

and these are formatted I/O statements:

```
WRITE (FMT=*, UNIT=8) A

WRITE (8, FMT=*) A

READ (8, NL1) A

READ (8, *, END=77) A

PRINT 10, A, B, C
```

The file was connected for formatted input/output operations because either:

- A value of FORMATTED was given for the FORM specifier on the OPEN statement,
- The FORM specifier was omitted from the OPEN statement for a file that was connected for sequential access, or
- The first I/O statement that was executed for a preconnected file was a formatted I/O statement, that is, an I/O statement with an FMT specifier.

Programmer Response: Determine whether you want to perform formatted or unformatted input/output operations on the file. If you want to use formatted I/O statements, remove or change the unformatted I/O statements.

If you want to use unformatted I/O statements, then:

- For an OPEN statement that connects a file for sequential access, provide a FORM specifier with a value of UNFORMATTED.
- For an OPEN statement that connects a file for direct or keyed access, either omit the FORM specifier or provide one with a value of UNFORMATTED.
- Do not execute a formatted I/O statement for the unit.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken sfter Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1200

FOR1201S The unformatted READ statement for unit *unit-number*, which was connected to *file-name*, failed. The file definition statement referred to an ASCII tape. VS FORTRAN Version 2 Error Number: AFB214I

Explanation: An unformatted READ statement referred to a unit that was connected to a file whose DCB information indicated variable-length ASCII tape records. These ASCII tape records are indicated by a RECFM value of D.

Programmer Response: If you have an ASCII tape to be read, then change your program to use formatted rather than unformatted READ statements.

If your input file is not an ASCII tape, then ensure that you provide DCB information that does not include a value of D for the RECFM parameter.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1201

FOR1210S *locator-text* There was an invalid repeat specification in a record being read with list-directed formatting. VS FORTRAN Version 2 Error Number: AFB227I

Explanation: An input field in a record that was read with a list-directed READ statement had the form *n*value*, where *n*, which is the repeat specification, should be an integer constant and *value* should be the value to be assigned to *n* successive variables or array elements in the input item list. However, there was an error in the format of *n*value*. Possible errors might include an incorrect integer value for the repeat specification, a second asterisk, or an invalid value following the asterisk.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for an internal file failed.
The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: In the record to be read, ensure that the repeat specification and the constant following the asterisk are coded in the correct format.

System Action: The input item being processed and the remainder of the items in the input item list are undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 6. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.

No.	Name	Input/Output	Data Type and Length	Value
6	*record*	Input	CHARACTER*n	The formatted input record that contained the invalid repeat specification. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	3
2	*subroutine-name*	Input	CHARACTER*8	The name of the DIV subroutine
3	*return-code*	Input	INTEGER*4	The return code from the Fortran DIV subroutine

Symbolic Feedback Code: FOR1227

FOR1228S *locator-text* **Within the namelist group** *group-name* **in the namelist input file there were too many values given for the variable** *var-name***. VS FORTRAN Version 2 Error Number: AFB222I**

Explanation: The namelist group *group-name* in the namelist input file contained the variable name *var-name* followed by an the equal sign (=), which separates the name and the values. However, following that equal sign there were more values than there were intrinsic data items comprising the variable. There were either:

- more values than there were elements in an array variable,
- more values than there were intrinsic data items within a variable of derived type, or
- more than one value for a scalar variable of an intrinsic data type.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for an internal file failed.
The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Code the name-value pair in the form of the variable name followed by an equal sign followed by no more values than comprise the variable. For example, a scalar variable of an intrinsic data type cannot have more than one value. If an assumed-shape or deferred-shape array is involved, ensure that the number of values doesn't exceed the number of elements represented by the current shape of the array. If a variable of derived type is involved, ensure that there aren't more values than there are intrinsic data items within the derived type, and ensure that the values are of the proper type to correspond with the intrinsic data items.

If you intended for the extraneous value to be interpreted as the next variable name rather than as a value, then code this variable name followed by an equal sign followed by this variable's value or values.

System Action: The variable being processed and the remainder of the variables given in the namelist input file become undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 10. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*group-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *group-name*. It contains the data type and the length of *group-name*.
6	*group-name*	Input	CHARACTER*n	The namelist group name that contained the variable that had too many values. The length *n* is part of *group-name-desc* and has a maximum possible value of 255.
7	*var-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *var-name*. It contains the data type and the length of *var-name*.
8	*var-name*	Input	CHARACTER*n	The name of the variable that had too many values. The length *n*, which is part of *var-name-desc*, has a maximum possible value of 255 even if the variable name is actually longer.
9	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
10	*record*	Input	CHARACTER*n	The formatted input record that contained the value that exceeded the number of allowable ones. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	The I/O operation is not complete, and execution continues.

Symbolic Feedback Code: FOR1228

FOR1229S *locator-text* **Within the namelist group** *group-name* **in the namelist input file the character** *not-name-char* **was found instead of the beginning of a variable name.**

Explanation: In the namelist group *group-name* in the namelist input file, there wasn't a variable name at a place where a variable name should have been. Instead, there was the character *not-name-char*, which cannot begin a variable name. This could have occurred at the beginning of the namelist group. Alternatively, following some other variable and its values there could have been some string of characters that wasn't recognized either as a value or as another variable name.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for an internal file failed.
The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Code the name-value pairs in the form of the variable name followed by an equal sign followed by no more values than comprise the variable. Be sure that each variable name is the name of a variable given for the namelist group in the NAMELIST statement in the Fortran program. Also be sure that the value or values are coded as literal constants rather than as named constants.

System Action: The variable being processed and the remainder of the variables given in the namelist input file become undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 8. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*group-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *group-name*. It contains the data type and the length of *group-name*.
6	*group-name*	Input	CHARACTER*n	The namelist group name that was too long in *group-name* in the namelist input file. The length *n* is part of *group-name-desc* and has a maximum possible value of 255.
7	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
8	*record*	Input	CHARACTER*n	The formatted input record that contained the string of characters that was expected to be a variable name but wasn't in the correct format for a name. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	The I/O operation is not complete, and execution continues.

Symbolic Feedback Code: FOR1229

FOR1230S *locator-text* **In the namelist group** *group-name* **in a namelist input file, the value for the variable** *object-name* **was not in the form of a complex constant even though the variable was of complex type. The formatted input data was** *input-field***.**

Explanation: For a READ statement, *input-field* is a portion of the character string that is being interpreted as a complex constant for namelist input, and can be either the real part, the imaginary part, or both. *input-field* either contained embedded blanks in the real part or the imaginary part of the complex number, did not contain a comma as a separator between the real part and the imaginary part, or was not enclosed in parentheses.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that *input-field* contains no embedded blanks in the real part or the imaginary part of the complex number, contains a comma as a separator, is enclosed by a left and a right parenthesis, and, if the the complex number does not fit into

one record, that the end of the record occurs between the real part and the comma or between the comma and the imaginary part.

System Action: The variable being processed and the remainder of the variables given in the namelist input file become undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 10. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*group-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *group_name*. It contains the data type and the length of *group-name*.
6	*group-name*	Input	CHARACTER*n	The namelist group name in the namelist input file. The length *n* is part of *group-name-desc*.
7	*object-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *object_name*. It contains the data type and the length of *group-name*.
8	*object-name*	Input	CHARACTER*n	The name of the complex variable that has an incorrect value in *group-name* in the namelist input file. The length *n* is part of *object-name-desc*.
9	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
10	*record*	Input	CHARACTER*n	The formatted input record that contained the name of the array that had an incorrect subscript value. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	Execution continues, and the remainder of the input item list is ignored.

Symbolic Feedback Code: FOR1230

FOR1231S *locator-text* **In the namelist group** *group-name* **in a namelist input file, the value for the variable** *object-name* **was not a delimited character constant even though the variable was of character type. The formatted input data was** *input-field***.**

Explanation: For a READ statement, *input-field* is a portion of the character string that is being interpreted as a character constant for namelist input. It was not delimited by apostrophes (') or by quotes (") as required for namelist input.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that the character constant used as the value for the variable is delimited either by apostrophes (') or by quotes (").

System Action: The variable being processed and the remainder of the variables given in the namelist input file become undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 10. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*group-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *group-name*. It contains the data type and the length of *group-name*.
6	*group-name*	Input	CHARACTER**n*	The namelist group name in the namelist input file. The length *n* is part of *group-name-desc*.
7	*object-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *object-name*. It contains the data type and the length of *object-name*.
8	*object-name*	Input	CHARACTER**n*	The name of the character variable that has a value that was not properly delimited in *group-name* in the namelist input file. The length *n* is part of *object-name-desc*.
9	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
10	*record*	Input	CHARACTER**n*	The formatted input record that contained the value that was not properly delimited. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	Execution continues, and the remainder of the input item list is ignored.

Symbolic Feedback Code: FOR1231

FOR1232S *locator-text* **In the namelist group** *group-name* **in a namelist input file, the variable** *object-name* **was a delimited character constant for which there was no ending delimiter. The character constant contained or began with the characters** *input-field***.**

Explanation: For a READ statement, *input-field* is a portion of the character string that is being interpreted as a character constant for namelist input. It had a starting delimiter of either an apostrophe or a quote, but there was corresponding ending delimiter before the end of the file.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that the character constant used as the value for the variable is delimited either by apostrophes (') or by quotes ("). Both the starting and ending delimiter must both be apostrophes or both be quotes.

Check for a doubled occurrence of the delimiter that started the character constant. Such a doubled delimiter is not interpreted as the ending delimiter but rather as one occurrence of that delimiter as a character within the character constant. In this case, a single occurrence of the delimiter must follow to indicate the end of the character constant.

System Action: The variable being processed becomes undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 10. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*group-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *group-name*. It contains the data type and the length of *group-name*.
6	*group-name*	Input	CHARACTER*n	The namelist group name in the namelist input file. The length *n* is part of *group-name-desc*.
7	*object-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *object-name*. It contains the data type and the length of *object-name*.
8	*object-name*	Input	CHARACTER*n	The name of the character variable that has a value that did not have an ending delimiter in *group-name* in the namelist input file. The length *n* is part of *object-name-desc*.
9	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
10	*record*	Input	CHARACTER*n	The formatted input record that contained the value that did not have an ending delimiter. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	Execution continues, and the remainder of the input item list is ignored.

Symbolic Feedback Code: FOR1232

FOR1233S *locator-text* **In the namelist group** *group-name* **in a namelist input file, the variable** *object-name* **was a delimited character constant whose length,** *length***, exceeded** *max-char-length***, the maximum length allowed for a character constant. The character constant began with the characters** *input-field***.**

Explanation: For a READ statement, *input-field* is a portion of the character string that is being interpreted as a character constant for namelist input. This length of this constant, not counting the starting and ending delimiters, was *length*, but this was longer than *max-char-length*, the product-imposed maximum length of a character constant that can be interpreted as namelist input.

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to *file-name*, failed.

Programmer Response: Ensure that the character constant used as the value for the variable is delimited either by apostrophes (') or by quotes ("). Both the starting and ending delimiter must both be apostrophes or both be quotes.

Check for a doubled occurrence of the delimiter that started the character constant. Such a doubled delimiter is not interpreted as the ending delimiter but rather as one occurrence of that delimiter as a character within the character constant. In this case, a single occurrence of the delimiter must follow to indicate the end of the character constant.

System Action: The variable being processed and the remainder of the variables given in the namelist input file become undefined. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 10. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*group-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *group-name*. It contains the data type and the length of *group-name*.
6	*group-name*	Input	CHARACTER**n*	The namelist group name in the namelist input file. The length *n* is part of *group-name-desc*.
7	*object-name-desc*	Input	Q_DATA_DESC	The q_data descriptor for *object-name*. It contains the data type and the length of *object-name*.
8	*object-name*	Input	CHARACTER**n*	The name of the character variable that has a value that was too long in *group-name* in the namelist input file. The length *n* is part of *object-name-desc*.
9	*record-desc*	Input	Q_DATA_DESC	The q_data descriptor for *record*. It contains the data type and the length of *record*.
10	*record*	Input	CHARACTER**n*	The formatted input record that contained the value that was too long. The length *n*, which includes only the data portion of the record, is part of *record-desc*.

Name	Action Taken after Resumption
RN	Execution continues, and the remainder of the input item list is ignored.

Symbolic Feedback Code: FOR1233

FOR1250S *locator-text* **The file definitions for the stripes of** *file-name* **did not define consistent characteristics for all the stripes. VS FORTRAN Version 2 Error Number: AFB092I**

Explanation: A striped file, that is, one with ddnames of the form FT*nn*P001, FT*nn*P002, and so on, had different characteristics given in its file definitions (DD statements or ALLOCATE commands) or data set labels for the different stripes. One or more of the following parameters had different values among the stripes:

- RECFM
- LRECL
- BLKSIZE
- BUFOFF
- IN or OUT (fourth subparameter of the LABEL parameter)

- DISP

locator-text gives more information about the location of the error, and can be one of the following:

The READ statement for an internal file failed.
The READ statement for unit *unit-number*, which was connected to file-name, failed.

Programmer Response: Ensure that the file definitions for all of the stripes have identical values for the parameters listed in "Explanation." If an existing data set was used, be sure that the whatever was in the existing data set label doesn't cause this conflict; override such a conflicting value if necessary.

System Action: If the error occurred during the execution of an OPEN statement, the unit is not connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is not complete, and execution continues.

Symbolic Feedback Code: FOR1250

FOR1251S *locator-text* **The file definition statements for the stripes of** *file-name* **had inconsistent ddnames or data set names. VS FORTRAN Version 2 Error Number: AFB093I**

Explanation: A striped file, that is, one with ddnames of the form FT*nn*P001, FT*nn*P002, and so on, had inconsistent ddnames and data set names in one or more of its file definitions (DD statements or ALLOCATE commands). The inconsistency could be one of the following:

- A file definition for ddname FT*nn*P*mmm* did not refer to a data set name that ends in the form *xxx*P*yyy*, where *xxx* is the number of stripes and *yyy* is a particular stripe number.
- A file definition for ddname FT*nn*P*mmm* did refer to a data set name that ends in the form *xxx*P*yyy*, and either:
  - The stripe numbers *mmm* and *yyy* did not match,
  - The portion of the data set name other than the stripe number, that is, other than the *yyy*, differed from that for other stripes, or
  - The stripe number *yyy* and the maximum stripe number *xxx* did not have the same number of digits.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statment for *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: Assuming that there are *xxx* stripes, ensure that:

- There are *xxx* file definitions and that the file definitions have the ddnames FT*nn*P001, FT*nn*P002, ... FT*nn*P*sss*, where *nn* is the two-digit unit number and *sss* is the three-digit representation of the number of stripes (*xxx*),
- In the file definition with the ddname FT*nn*P*mmm*, the final characters of the end of the data set name are *xxx*P*yyy*, where *yyy* is the stripe number, that is, *yyy* has the same numeric value as *mmm*,
- The number of digits in *xxx* is the same as the number of digits in each *yyy*, and
- All the data set names are identical except for the trailing *mmm*.

Here is an example of DD statements for a striped file with six stripes:

```
//FT10P001 DD  DSN=MYNAME.MYFILE.ABC6P1,DISP=OLD
//FT10P002 DD  DSN=MYNAME.MYFILE.ABC6P2,DISP=OLD
//FT10P003 DD  DSN=MYNAME.MYFILE.ABC6P3,DISP=OLD
//FT10P004 DD  DSN=MYNAME.MYFILE.ABC6P4,DISP=OLD
//FT10P005 DD  DSN=MYNAME.MYFILE.ABC6P5,DISP=OLD
//FT10P006 DD  DSN=MYNAME.MYFILE.ABC6P6,DISP=OLD
```

System Action: If the error occurred during the execution of an OPEN statement, the unit is not connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4. In addition, there are these qualifying data:

Name	Action Taken after Resumption
RN	The I/O operation is not complete, and execution continues.

Symbolic Feedback Code: FOR1251

FOR1252S *locator-text* **A file definition statement for one of the stripes of** *file-name* **referred to a file type or device type that cannot be used for a striped file. VS FORTRAN Version 2 Error Number: AFB094I**

Explanation: A file definition (DD statement or ALLOCATE command) for a striped file referred to a file on a device that was neither a tape nor a non-VSAM disk file other than a PDS member.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statment for *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: Ensure that for each of the stripes of a striped file the file definition refers either to a tape or to a non-VSAM disk file other than a PDS member.

System Action: If the error occurred during the execution of an OPEN statement, the unit is not connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is not complete, and execution continues.

Symbolic Feedback Code: FOR1252

FOR1270S The WAIT statement for unit *unit-number*, **which was connected to** *file-name*, **failed. There was no corresponding READ or WRITE statement. VS FORTRAN Version 2 Error Number: AFB287I**

Programmer Response: Ensure that the program executes a WAIT statement only after a corresponding asynchronous READ or WRITE statement.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of WAIT, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The WAIT statement is ignored, and execution continues.

Symbolic Feedback Code: FOR1270

FOR1271S The asynchronous *statement* **statement for unit** *unit-number*, **which was connected to** *file-name*, **failed. In the file definition statement, the BLKSIZE parameter either was omitted or had a value of 0. VS FORTRAN Version 2 Error Number: AFB239I**

Programmer Response: Ensure that for a new file the block size (BLKSIZE parameter in the DD statement or ALLOCATE command) has a nonzero value.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is not complete, and execution continues.

Symbolic Feedback Code: FOR1271

FOR1272S The asynchronous *statement* **statement for unit** *unit-number*, **which was connected to** *file-name*, **failed. The last array element in the input item list had a lower subscript value than the first. VS FORTRAN Version 2 Error Number: AFB228I**

Programmer Response: Ensure that the starting and ending elements in the input/output item list are specified with the lower-valued subscript first. If the subscripts involve an variable, ensure that the variables are set to their intended values.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is not complete, and execution continues.

Symbolic Feedback Code: FOR1272

FOR1273S The asynchronous *statement* **statement for unit** *unit-number*, **which was connected to** *file-name*, **failed. The previous I/O statement for this unit was neither a REWIND nor another asynchronous I/O statement. VS FORTRAN Version 2 Error Number: AFB286I**

Programmer Response: If you want to switch back and forth between asynchronous I/O statements and the sequential I/O statement defined by the Fortran language standard, then you must execute a REWIND statement each time you switch between the two. (Of course you can also execute a CLOSE statement followed by an OPEN statement.) While positioned within a file, you cannot switch between the two forms of I/O statements. If executing the REWIND statement doesn't provide the file positioning that your program requires, then change the program so that either asynchronous I/O statements or standard sequential I/O statements are used exclusively.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1273

FOR1274S The *statement* statement, which was not of the asynchronous form, for unit *unit-number*, which was connected to *file-name*, failed. The previous asynchronous I/O statement was not followed by a REWIND statement. VS FORTRAN Version 2 Error Number: AFB286I

Programmer Response: If you want to switch back and forth between asynchronous I/O statements and the sequential I/O statements defined by the Fortran language standard, then execute a REWIND statement each time you switch between the two. (Alternatively, you could execute a CLOSE statement followed by an OPEN statement.) While positioned within a file, you cannot switch between the two forms of I/O statements. If executing the REWIND statement doesn't provide the file positioning that your program requires, then change the program so that either asynchronous I/O statements or standard sequential I/O statements are used exclusively.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1274

FOR1275S There was no corresponding WAIT statement for an asynchronous *statement* statement that was executed for unit *unit-number*, which was connected to *file-name*. VS FORTRAN Version 2 Error Number: AFB288I

Programmer Response: Ensure that the Fortran program executes a WAIT statement after each asynchronous READ or WRITE statement.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	Execution continues with an implied WAIT.

Symbolic Feedback Code: FOR1275

FOR1276S The asynchronous *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The file definition statement referred to a file type or device type that cannot be used for asynchronous I/O. VS FORTRAN Version 2 Error Number: AFB090I (format 2), AFB194I (format 1)

Explanation: An asynchronous *statement* statement was executed for unit *unit*, and one of the following was true:

- The file definition (DD statement or ALLOCATE statement) for the ddname FT*nn*F001 referred to a file that was neither a tape nor an non-VSAM disk file other than a PDS member.
- There was a file definition with the ddname FT*nn***P**001.

Programmer Response: If you want to use asynchronous I/O, then provide a file definition that refers to either a tape nor an non-VSAM disk file other than a PDS member. Also, do not provide a file definition with the ddname FT*nn*P001 because asynchronous I/O cannot be performed on striped files.

If you didn't intend to use an asynchronous I/O statement, which is identified by the ID specifier, then correct your program so that you don't use one for a unit that's connected to one of the prohibited file or device types.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1276

FOR1277S The asynchronous *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The unit was being used as one of the Fortran standard I/O units. VS FORTRAN Version 2 Error Number: AFB192I

Explanation: The asynchronous *statement* referred to a unit that was either the standard input unit, the error message unit, the print unit (which could be the same as the error message unit), or the punch unit. These unit numbers are specified by the RDRUNIT, ERRUNIT, PRTUNIT, and PUNUNIT run-time options, respectively.

Programmer Response: If you want to use asynchronous I/O, do one of the following:

- Change the unit number in your asynchronous I/O statements to refer to some unit other than one of the prohibited units listed under “Explanation.”
- Change the value of one or more of the RDRUNIT, ERRUNIT, PRTUNIT, or PUNUNIT run-time options so that one of them refers to the unit that you want to use for asynchronous I/O, ensuring, of course, that you don't create a conflict with some other unit that's used by your program.

If you didn't intend to use asynchronous I/O, then change the form of the I/O statement by removing the ID specifier and making whatever other changes are needed. Note that unformatted I/O statements are similar in function to asynchronous I/O statements.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1277

FOR1278S The asynchronous *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The program was executed on other than an MVS system. VS FORTRAN Version 2 Error Number: AFB161I

Programmer Response: If you didn't intend to use asynchronous I/O, then change the form of the I/O statement by removing the ID specifier and making whatever other changes are needed. Note that unformatted I/O statements are similar in function to asynchronous I/O statements.

If the performance requirements of your program are such that asynchronous I/O is needed, then you'll have to run the program on MVS.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1278

FOR1279S The asynchronous *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The I/O subtask terminated abnormally with the system completion code *completion-code*. VS FORTRAN Version 2 Error Number:AFB205I

Explanation: Much of the processing for an asynchronous I/O statement is done in an MVS subtask so that its processing can overlap that of your program. The asynchronous I/O subtask terminated abnormally with a system completion (abend) code of *completion-code*.

Programmer Response: Ensure that the file definition (DD statement or ALLOCATE command) for the file you are using is coded correctly.

Ensure that your program uses the correct sequence of asynchronous READ, WRITE, and WAIT statements with no intervening I/O statements of the standard sequential form unless a REWIND statement is used to separate the uses of the two forms.

For the meaning of *completion-code*, and for possible corrective actions, refer to *DFSMS/MVS Macro Instructions for Data Sets*.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is not complete, and execution continues.

FOR1280S The asynchronous *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The record format was other than variable spanned. VS FORTRAN Version 2 Error Number: AFB214I (format 2)

Programmer Response: Ensure that the file definition (DD statement or ALLOCATE command) for the file indicates a RECFM value of VS.

If you're reading an existing file that has some a record format of other than variable spanned, then you can't use asynchronous I/O statements to read it. In this case, either change your program to use the standard sequential I/O statements, or recreate the file so that it has variable spanned records. If you choose to recreate the file using a Fortran program, you can produce variable spanned records with either asynchronous I/O state-

ments or with standard unformatted I/O statements. Ensure that when you recreate the file, the file definition has a RECFM value of VS.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The READ statement is ignored, and execution continues.
RF	For an input operation, the READ statement is not completed and execution continues. For an output operation, VS is assumed, and execution continues.

Symbolic Feedback Code: FOR1280

FOR1281S The asynchronous *statement* **statement for unit** *unit-number*, **which was connected to** *file-name*, **failed. The program resides in authorized library. VS FORTRAN Version 2 Error Number: AFB952I (format 8)**

Explanation: Your program was link edited with an AC option that provided an authorization code of other than 0, and your program was in an authorized library. In addition, your program used an asynchronous I/O statement, but this is inconsistent with executing in an authorized state because of the internal implementation of asynchronous I/O.

Language Environment does not support execution of Fortran programs running in an authorized state. Running such programs, while not diagnosed in all cases, causes a system integrity exposure.

Programmer Response: Link edit your program without the AC option so that it does not run in an authorized state.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The READ statement is ignored, and execution continues.

Symbolic Feedback Code: FOR1281

FOR1330S The *statement* **statement for unit** *unit-number* **failed. The file definition statement for** *file-name* **referred to a VSAM file, but the file had not been connected to the unit with an OPEN statement. VS FORTRAN Version 2 Error Number: AFB168I**

Programmer Response: If you intend to process a VSAM file, ensure that your program executes an OPEN statement before any other I/O statements.

If you don't intend to process a VSAM file, change the file definition (DD statement or ALLOCATE command) to refer to some other file.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The READ statement is ignored, and execution continues.

Symbolic Feedback Code: FOR1330

FOR1331S The WRITE statement for sequential access for unit *unit-number*, which was connected to *file-name*, failed. The file was a VSAM RRDS that already contained records. VS FORTRAN Version 2 Error Number: AFB162I

Programmer Response: Ensure that you don't use the sequential access form of the WRITE statement for a VSAM relative record data set (RRDS) if the data set already contains records.

If you want to replace individual records, use a value of DIRECT for the ACCESS specifier on the OPEN statement, and use the direct access form of the WRITE statement, that is, with a REC specifier whose value indicates the specific record to be written.

If you want to extend the file at the end or rewrite the file sequentially from somewhere other than the end, the file can't be a VSAM RRDS, so change the file definition (DD statement or ALLOCATE command) to refer to a non-VSAM file.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1331

FOR1340S The INQUIRE statement failed. The FILE specifier had a value of blanks, but the UNIT specifier was not given. VS FORTRAN Version 2 Error Number: AFB106I

Programmer Response: Correct your program to use of the four acceptable forms of the INQUIRE statement:

INQUIRE by file
No UNIT specifier; FILE specifier with a value that is either a data set name preceded by a slash (**/**) or a ddname other than one of the default ddnames such as FT*nn*F001

INQUIRE by unit
UNIT specifier; no FILE specifier

INQUIRE by unnamed file, format 1
UNIT specifier; FILE specifier with a value of blanks

INQUIRE by unnamed file, format 2
No UNIT specifier; FILE specifier with a value that is one of the defaults ddnames such as FT*nn*F001

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	4
2	*statement*	Input	CHARACTER*12	INQUIRE
3	*unit*	Input	INTEGER*4	Undefined
4	*file*	Input	CHARACTER*62	Undefined

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1340

FOR1341S The INQUIRE statement failed. The FILE specifier had a value of *file-name*, which, because it was other than all blanks, conflicted with the presence of the UNIT specifier. VS FORTRAN Version 2 Error Number: AFB109I

Programmer Response: Correct your program to use of the four acceptable forms of the INQUIRE statement:

INQUIRE by file
No UNIT specifier; FILE specifier with a value that is either a data set name preceded by a slash (**/**) or a ddname other than one of the default ddnames such as FT*nn*F001

INQUIRE by unit
UNIT specifier; no FILE specifier

INQUIRE by unnamed file, format 1
UNIT specifier; FILE specifier with a value of blanks

INQUIRE by unnamed file, format 2
No UNIT specifier; FILE specifier with a value that is one of the defaults ddnames such as FT*nn*F001

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of INQUIRE, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1341

FOR1342S The INQUIRE statement failed. The FILE specifier had a value of *file-name*, which was not in the correct format for a file name. VS FORTRAN Version 2 Error Number: AFB180I (format 1)

Programmer Response: Correct your program to use of the four acceptable forms of the INQUIRE statement:

INQUIRE by file
No UNIT specifier; FILE specifier with a value that is either a data set name preceded by a slash (**/**) or a ddname other than one of the default ddnames such as FT*nn*F001

INQUIRE by unit
UNIT specifier; no FILE specifier

INQUIRE by unnamed file, format 1
UNIT specifier; FILE specifier with a value of blanks

INQUIRE by unnamed file, format 2
No UNIT specifier; FILE specifier with a value that is one of the defaults ddnames such as FT*nn*F001

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	4

No.	Name	Input/Output	Data Type and Length	Value
2	*statement*	Input	CHARACTER*12	INQUIRE
3	*unit*	Input	INTEGER*4	Undefined
4	*file*	Input	CHARACTER*62	The name of the file to which the INQUIRE statement was directed.

Name	Action Taken after Resumption
RN	The I/O operation is ignored, and execution continues.

Symbolic Feedback Code: FOR1342

FOR1360E On the CLOSE statement for unit ***unit-number*****, which was connected to** ***file-name*****, the STATUS specifier had a value of KEEP, but the STATUS specifier on the OPEN statement had a value of SCRATCH. VS FORTRAN Version 2 Error Number: AFB171I**

Programmer Response: Either change the OPEN statement so that its STATUS specifier has a value of other than SCRATCH, or change the CLOSE statement so that its STATUS specifier is either omitted or has a value of DELETE. In the latter case, the scratch file will be deleted.

System Action: The file is closed as though STATUS='DELETE' had been specified. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of CLOSE, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	Execution continues.

Symbolic Feedback Code: FOR1360

FOR1361E On the CLOSE statement for unit ***unit-number*****, the STATUS specifier had a value of** ***status*****, which was other than KEEP or DELETE. VS FORTRAN Version 2 Error Number: AFB186I**

Programmer Response: Correct the value of the STATUS specifier on the CLOSE statement so that it has a value of either KEEP or DELETE. You can also omit the STATUS specifier in which case the default value is:

- DELETE if the OPEN statement had a STATUS specifier with a value of SCRATCH, or
- KEEP if the OPEN statement either had no STATUS specifier or a STATUS specifier with a value of other than SCRATCH.

System Action: The file is closed as though STATUS='KEEP' had been specified. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: The basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of CLOSE, and *parm_count* has a value of 4.

Name	Action Taken after Resumption
RN	Execution continues.

Symbolic Feedback Code: FOR1361

FOR1380S The OPEN statement could not connect unit *unit-number* to *file-name*. The STATUS specifier had a value of *status*, which was other than NEW, OLD, REPLACE, SCRATCH, or UNKNOWN. VS Fortran Version 2 Error Number: AFB251I

Programmer Response: Based on whether the file you're connecting exists or not, change the value of the STATUS specifier on the OPEN statement to NEW, OLD, REPLACE, SCRATCH, or UNKNOWN. If you code the value as a character constant, enclose the value in quotes or apostrophes.

For the error message unit, either omit the STATUS specifier, or provide a value of UNKNOWN.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1380

FOR1381S The OPEN statement for unit *unit-number* failed. The FILE specifier had a value of *ddname*, which is a ddname reserved for unnamed files. VS Fortran Version 2 Error Number: AFB107I

Programmer Response: If you want to connect the unit to an unnamed file, that is, to a file with a ddname of FT*nn*F*mmm*, FT*nn*K*mm*, FTERR*sss*, or FTPRT*sss*, then omit the FILE specifier from the OPEN statement. A file definition (DD statement or ALLOCATE command) for that ddname would still be required, however.

If you want to refer to a named file, then for the FILE specifier provide a value than isn't one of the ddnames that are used for unnamed files.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1381

FOR1382S The OPEN statement could not connect unit *unit-number* to *file-name*. The ACTION specifier had a value of *action*, which was other than READ, WRITE, or READWRITE. VS Fortran Version 2 Error Number: AFB136I

Programmer Response: Depending on whether you intend to use only input statements, only output statements, or both, change the value of the ACTION specifier on the OPEN statement to READ, WRITE, or READWRITE. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1382

FOR1383S The OPEN statement for unit *unit-number* failed. The FILE specifier had a value of *file-name*, which was not in the correct format for a file name.

Explanation: VS Fortran Version 2 Error Number: AFB180I (format 2)

Programmer Response: Correct the value of the FILE specifier. If you're providing a ddname, ensure that it consists of no more than eight characters, all of which must be alphanumeric, and that its first character is alphabetic.

If you're providing a data set name, code the value of the FILE specifier as a slash (*/*) followed by the data set name. The data set name, which can be followed by a member name surrounded by parentheses, must be in the format required by the DSNAME parameter of a DD statement as described in *DFSMS/MVS Macro Instructions for Data Sets*.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1383

FOR1384S The OPEN statement could not connect unit *unit-number* to *file-name*. The ACCESS specifier had a value of *access*, which was other than SEQUENTIAL, DIRECT, or KEYED.

Explanation: VS Fortran Version 2 Error Number: AFB182I

Programmer Response: Depending on the type of I/O statements that you want to use for the file that you're connecting, change the value of the ACCESS specifier on the OPEN statement to SEQUENTIAL, DIRECT, or KEYED. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1384

FOR1385S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The BLANK specifier had a value of** *blank***, which was other than ZERO or NULL.**

Explanation: VS Fortran Version 2 Error Number: AFB183I

Programmer Response: Depending on whether you want blanks in input fields that are read with formatted READ statements to be interpreted as zeros or nulls, change the value of the BLANK specifier on the OPEN statement to ZERO or NULL, respectively. If you code the value as a character constant, enclose the value in quotes or apostrophes.

If you omit the FILE specifier from the OPEN statement, a value of NULL is assumed.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1385

FOR1386S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The FORM specifier had a value of** *format***, which was other than FORMATTED or UNFORMATTED.**

Explanation: VS Fortran Version 2 Error Number: AFB184I

Programmer Response: Depending on whether you intend to use formatted or unformatted input/output statements for the file, change the value of the FORM specifier on the OPEN statement to FORMATTED or UNFORMATTED, respectively. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1386

FOR1387S The OPEN statement could not connect unit *unit-number* to *file-name*. The CHAR specifier had a value of *char*, which was other than DBCS or NODBCS. Fortran Version 2 Error Number: AFB104I

Programmer Response: Depending on whether your input file contains double-byte characters that are to be read with a formatted READ statement, change the value of the CHAR specifier on the OPEN statement to DBCS or NODBCS. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1387

FOR1389S The OPEN statement could not connect unit *unit-number* to *file-name*. The RECL specifier had a value of *recl*, which was not within the range 1 to 32760, inclusive. Fortran Version 2 Error Number: AFB233I

Programmer Response: Ensure that the value of the RECL specifier on the OPEN statement is an integer that is neither less than 1 nor greater than 32760. In addition, ensure that this value is the same as the value that's associated with the file through one or more of the following, as applicable:

- The label of an existing data set
- The LRECL parameter of the DD statement or ALLOCATE command
- The LRECL value given in an invocation of the FILEINF callable service
- The record length given in the RECORDSIZE parameter of the Access Method Services DEFINE command that was used to define the VSAM cluster.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 5.

No.	Name	Input/Output	Data Type and Length	Value
5	*record-length*	Input/Output	INTEGER*4	The value of the RECL specifier on the OPEN statement.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues. The remainder of the deallocation list is processed and execution continues.
RI	The value placed in *record_length* is used as the new value for the RECL specifier, and execution continues.

Symbolic Feedback Code: FOR1389

FOR1390S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The SMSVSAM server was not available.**

Explanation: VSAM record level sharing was requested for the file either because of the RLS parameter on the DD statement or ALLOCATE command or because of the RLS argument in the call to the FILEINF callable service. Record level sharing couldn't be provided because the SMSVSAM server was not available.

Programmer Response: If VSAM record level sharing isn't required, then don't request it in the DD statement, in the ALLOCATE command, or in the call to the FILEINF callable service. Otherwise, correct the situation that caused the SMSVSAM server not to be available.

If you cannot resolve the problem, seek assistance from your Language Environment support personnel.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1390

FOR1393S *locator-text* **The VSAM** *macro-name* **macro instruction executed for** *file-name* **had a return code of** *return-code* **and an error code of X'** *hex-code* **' (***decimal-code***). The SMSVSAM server was not available.**

Explanation: In support of the Fortran I/O statement indicated by the message text, Language Environment executed a VSAM *macro-name* macro instruction. DFSMS/MVS detected the error indicated by the return code *return-code* and the error code with a hexadecimal value of *hex-code* (decimal value of *decimal-code*). This error code indicates that VSAM record level sharing couldn't be provided because the SMSVSAM server was not available. (VSAM record level sharing was requested for the file either because of the RLS parameter on the DD statement or ALLOCATE command or because of the RLS argument in the call to the FILEINF callable service.)

Programmer Response: For the meaning of return code *return-code* and error code *hex-code* (or *decimal-code*), refer to *DFSMS/MVS Macro Instructions for Data Sets*.

If VSAM record level sharing isn't required, then don't request it in the DD statement, in the ALLOCATE command, or in the call to the FILEINF callable service. Otherwise, correct the situation that caused the SMSVSAM server not to be available.

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1393

FOR1394S The OPEN statement could not connect unit *unit-number*, the error message unit, to *file-name*. The FILE specifier had a value that started with a slash (/).

Explanation: On the OPEN statement the UNIT specifier had a value that was the error message unit number, and the FILE specifier had a value with a leading slash (**/**). The leading slash indicated dynamic file allocation, that is, that a data set name rather than a ddname was given.

Programmer Response: Dynamic allocation cannot be done from a Fortran program for a file that's being connected to the error message unit. Therefore, take one of these actions:

- Provide a file definition (DD statement or ALLOCATE command) for the file, and use its ddname without a slash as the value of the FILE specifier on the OPEN statement.
- Connect that file to a unit other than the error message unit by changing the unit identifier.
- Remove the slash from the value of the FILE specifier if an intended ddname followed the slash.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1394

FOR1395S The OPEN statement could not connect unit *unit-number* to *file-name*. The ACCESS specifier had a value of KEYED, and the FILE specifier had a value that started with a slash (/). Fortran Version 2 Error Number: AFB102I

Explanation: The OPEN statement had a value for the ACCESS specifier that indicated keyed access and a value for the FILE specifier with a leading slash (**/**). The leading slash indicated dynamic file allocation, that is, that a data set name rather than a ddname was given.

Programmer Response: Dynamic allocation cannot be done from a Fortran program for a file that's being connected for keyed access. If you intend to use keyed access because the file is a VSAM key-sequenced data set, take on of these actions:

- Provide a file definition (DD statement or ALLOCATE command) for the file, and use its ddname without a slash as the value of the FILE specifier on the OPEN statement.
- Remove the slash from the value of the FILE specifier if an intended ddname followed the slash.

If the file isn't a VSAM key-sequenced data set, then change the value of the ACCESS specifier to either SEQUENTIAL or DIRECT.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1395

FOR1396S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The STATUS specifier had a value of NEW, but the file already existed. Fortran Version 2 Error Number: AFB108I (format 1)**

Explanation: The OCSTATUS run-time option was in effect, and the STATUS specifier on the OPEN statement had a value of NEW, but the file already existed according to the Fortran definitions of file existence. These definitions are explained in *VS FORTRAN Version 2 Programming Guide for CMS and MVS* in the chapter "What Determines File Existence" and generally reflect the operating system view of file existence; however, there are a few differences. For example, using a DD statement or ALLOCATE command to allocate space for a file on a disk volume does not mean that the file exists from the Fortran point of view. Such a file doesn't exist until an OPEN or WRITE statement for it has been used in a Fortran program or until it has had records written into it by some non-Fortran program or utility.

Programmer Response: The changes that you must make depend on how you intend to processed the file in your program.

If you want to read an existing file, then change the value of the STATUS specifier to OLD.

If you want to read or update an existing file being connected for direct or keyed access, then change the value of the STATUS specifier to OLD.

If you want to extend an existing file being connected for sequential access, then change the value of the STATUS specifier to OLD, and take one of these actions:

- Provide the DISP=MOD parameter on the DD statement, the MOD parameter in the ALLOCATE command, or a value of MOD for the DISP argument in the invocation of the FILEINF callable service.
- Provide a value of APPEND for the POSITION specifier.

If you want to replace all of the records in an existing file being connected for sequential access, then make one of these changes:

- Provide a value of OLD for the STATUS specifier and do not provide either the DISP=MOD parameter on the DD statement, the MOD parameter on the ALLOCATE command, nor a value of MOD for the DISP argument in the invocation of the FILEINF callable service, or
- Provide a value of REPLACE for the STATUS specifier. In this case, if the disk file is dynamically allocated, the original space, if any, is released, and new space is allocated.

If you want to replace all of the records in an existing file, being connected for direct or keyed access, then provide a value of REPLACE for the STATUS specifier. In this case, if the disk file is dynamically allocated, the original space, if any, is released, and new space is allocated.

If you want to create and write to a new file in your program, then the STATUS specifier value of NEW is correct. Ensure that all of the following are true:

- The file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to the file that you intended.
- No other unit is connected to the same file and has updated it before this OPEN statement was executed.
- The file does not exist according to the Fortran rules of file existence. (For example, under certain circumstances, a file that is present on a disk volume but contains no data can still exist according to this definition.)

If the file does exist according to the Fortran definition of file existence, but you still want the STATUS specifier value to be NEW, then use the NOOCSTATUS run-time option. However, consider the following:

- Because file existence is not checked, the STATUS specifier value of NEW takes precedence, meaning that any records already in the file could be overwritten.
- This run-time option causes file existence checking to be bypassed for all OPEN statements.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1396

FOR1397S The OPEN statement could not connect unit *unit-number* to *file-name*. The STATUS specifier had a value of NEW, but the file definition referred to a file or device that was restricted to input only. Fortran Version 2 Error Number: AFB108I (format 2)

Explanation: The STATUS specifier had a value of NEW, which implied that a file was to be created. However, the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement referred to a file or device that doesn't allow output operations. Examples of such files include:

- An in-stream data set (DD *)
- A data set whose DD statement specifies LABEL=(,,,IN)
- A file for which the system's access control facility (such as RACF) prevents you from updating the data set.

Programmer Response: If you want to read from a file or a device that doesn't permit output, either omit the STATUS specifier or provide a value of OLD or UNKNOWN for the STATUS specifier. Ensure that the file really exists and that you can read from it.

If you want to create a new file and write records on it, then the STATUS specifier value of NEW is correct. In this case, change either of the following, as applicable, to refer to a file or device on which you can write records:

- The file definition (DD statement or ALLOCATE command)
- For a dynamically allocated data, the data set name that follows the slash (**/**) in the FILE specifier.

Don't refer to a data set such as an in-stream data set (DD *), a data set for which you don't have RACF authority to update, or a data set whose DD statement has a LABEL=(,,,IN) parameter.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1397

FOR1398S The OPEN statement could not connect unit *unit-number* to *file-name*. The STATUS specifier had a value of OLD, but the file did not exist. Fortran Version 2 Error Number: AFB108I (format 3)

Explanation: The OCSTATUS run-time option was in effect, and the STATUS specifier on the OPEN statement had a value of OLD, but the file didn't exist according to the Fortran definitions of file existence. These definitions are explained in *VS FORTRAN Version 2 Programming Guide for CMS and MVS* in the chapter "What Determines File Existence" and generally reflect the operating system view of file existence; however, there are a few differences. For example, using a DD statement or ALLOCATE command to allocate space for a file on a disk volume does not mean that the file exists from the Fortran point of view. Such a file doesn't exist until an OPEN or WRITE statement for it has been used in a Fortran program or until it has had records written into it by a non-Fortran program or utility.

Programmer Response: If you want to create a new file and write records on it, then change the value of the STATUS specifier to NEW, REPLACE, or UNKNOWN.

If you want to read from or write to an existing file, then the STATUS specifier value of OLD is correct. Ensure that all of the following are true:

- The file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to the file that you intended.
- No other unit has been connected to the same file and has caused the file to be deleted before this OPEN statement was executed.
- The file exists according to the Fortran rules of file existence. (For example, under certain circumstances, a file that is present on a disk volume but contains no data doesn't exist according to this definition.)

If the file doesn't exist according to the Fortran definition of file existence, but you still want the STATUS specifier value to be OLD, then use the NOOCSTATUS run-time option. However, consider the following:

- Because file existence is not checked, the STATUS specifier value of OLD will take precedence, meaning that there must be records in the file if you want to read them.
- This run-time option causes file existence checking to be bypassed for all OPEN statements.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1398

FOR1399S The OPEN statement could not connect unit *unit-number* to *file-name*. The ACTION specifier had a value of READ, but the file did not exist. Fortran Version 2 Error Number: AFB108I (format 4)

Explanation: The ACTION specifier on the OPEN statement had a value of READ, but the file didn't exist according to the Fortran definitions of file existence. These definitions are explained in *VS FORTRAN Version 2 Programming Guide for CMS and MVS* in the chapter "What Determines File Existence" and generally reflect the operating system view of file existence; however, there are a few differences. For example, using a DD statement or ALLOCATE command to allocate space for a file on a disk volume does not mean that the file exists from the Fortran point of view. Such a file doesn't exist until an OPEN or WRITE statement for it has been used in a Fortran program or until it has had records written into it by some non-Fortran program or utility.

Programmer Response: If you want to write records on the file, then either omit the ACTION specifier, or change the value of the ACTION specifier to WRITE or READWRITE.

If you want to just read from an existing file, then the ACTION specifier value of READ is correct. Ensure that all of the following are true:

- The file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to the file that you intended.
- No other unit has been connected to the same file and has caused the file to be deleted before this OPEN statement was executed.
- The file exists according to the Fortran rules of file existence. (For example, under certain circumstances, a file that is present on a disk volume but contains no data doesn't exist according to this definition.)

If the file doesn't exist according to the Fortran definition of file existence, but you still want to read from the file, then omit the ACTION specifier to avoid detecting this error. In this case, ensure that the file has records that can be read.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1399

FOR1400S The OPEN statement could not connect unit *unit-number* to *file-name*. The ACTION specifier had a value of READ, but the file definition referred to a file or device that was restricted to output only. Fortran Version 2 Error Number: AFB108I (format 5)

Explanation: The ACTION specifier had a value of READ, which implied that only input processing would be performed on the file. However, the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement referred to a file or device that allows only output operations. Examples of such files include:

- A system output data set (SYSOUT parameter on the DD statement)
- A data set whose DD statement specifies LABEL=(,,,OUT)

Programmer Response: Ensure that the value of the ACTION specifier is consistent with the capabilities of the file or device referenced by the file definition (DD statement or ALLO-

CATE command) or by the data set name given in the FILE specifier on the OPEN statement. You might have to change either the ACTION specifier, the file definition, or the data set name.

If you want to write on a file or device that allows only output, either omit the ACTION specifier or provide a value of WRITE for the action specifier.

If you want to read from a file, then change the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement to refer to a file or device from which you can read records. Ensure that the file exists or that are records to be read.

If you want to read to and write from the file, then ensure that the file or device allows you to perform both input and output. In this case, either omit the ACTION specifier, or provide a value of READWRITE for the ACTION specifier.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1400

FOR1401S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The ACTION specifier had a value of** *action***, but the file definition referred to a file or device that was restricted to input only. Fortran Version 2 Error Number: AFB108I (format 6)**

Explanation: The ACTION specifier had a value of *action*, which implied that output statements, such WRITE or ENDFILE, would to be executed. However, the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement referred to a file or device that doesn't allow output operations. Examples of such files include:

- An in-stream data set (DD *)
- A data set whose DD statement specifies LABEL=(,,,IN)
- A file for which the system's access control facility (such as RACF) prevents you from updating the data set.

Programmer Response: Ensure that the value of the ACTION specifier is consistent with the capabilities of the file or device referenced by the file definition (DD statement or ALLOCATE command) or by the data set name given in the FILE specifier on the OPEN statement. You might have to change either the ACTION specifier, the file definition, or the data set name.

If you want to read from a file or a device that doesn't permit output, either omit the ACTION specifier or provide a value of READ for the STATUS specifier. Ensure that the file really exists and that you can read from it.

If you want to create a new file and write records on it, then provide a value of WRITE for the ACTION specifier. In this case, ensure that either of the following, as applicable, refers to a file or device on which you can write records:

- The file definition (DD statement or ALLOCATE command)
- For a dynamically allocated data, the data set name that follows the slash (**/**) in the FILE specifier

If you want to read to and write from the file, then ensure that the file or device allows you to perform both input and output. In this case, either omit the ACTION specifier, or provide a value of READWRITE for the ACTION specifier.

If you provide a value of WRITE or READWRITE for the ACTION specifier, don't refer to a data set such as an in-stream data set (DD *), a data set for which you don't have RACF authority to update, or a data set whose DD statement has a LABEL=(,,,IN) parameter.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1401

FOR1402S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The ACTION specifier, which had a value of READ, conflicted with the STATUS specifier, which had a value of** *status***. Fortran Version 2 Error Number: AFB108I (format 8)**

Explanation: The ACTION specifier on the OPEN statement had a value of READ, which implied that you would read from but not write to a file which should already exist. However, the value of *status* for the STATUS implied that a new file was to be created. This was inconsistent because you can't read from a newly created file until records have been written on it.

Programmer Response: If you want to read from an existing file without writing on it, then the value of READ for the ACTION specifier is correct. Either omit the STATUS specifier, or provide a value of OLD or UNKNOWN for the STATUS specifier. Ensure that the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to a file that exists so that you can read from it.

If you want to write records on the file, change the value of the ACTION specifier to WRITE, or, if you want to both write to and read from the file, either change the value of the ACTION specifier to READWRITE or omit the ACTION specifier. For the STATUS specifier, use a value of NEW if you want to create a file that doesn't already exist, a value of REPLACE if you want to create a new file replacing the existing one if it already exists, or a value of OLD if you want to use an existing file even if you want to rewrite it. Omitting the STATUS specifier or providing value of UNKNOWN is the equivalent of NEW if the file doesn't exist or of OLD if it does exist.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1402

FOR1403S The OPEN statement could not connect unit *unit-number* to *file-name*. The file did not exist, and the file definition referred to a file or device that was restricted to input only. Fortran Version 2 Error Number: AFB108I (format 9)

Explanation: The file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement referred to a file or device that doesn't allow output operations. Examples of such files include:

- A data set whose DD statement specifies LABEL=(,,,IN)
- A file for which the system's access control facility (such as RACF) prevents you from updating the data set.

However, the file didn't exist according to the Fortran definitions of file existence; this precludes any meaningful access to the file.

The Fortran definitions of file existence are explained in *VS FORTRAN Version 2 Programming Guide for CMS and MVS* in the chapter "What Determines File Existence" and generally reflect the operating system view of file existence; however, there are a few differences. For example, using a DD statement or ALLOCATE command to allocate space for a file on a disk volume does not mean that the file exists from the Fortran point of view. Such a file doesn't exist until an OPEN or WRITE statement for it has been used in a Fortran program or until it has had records written into it by some non-Fortran program or utility.

Programmer Response: If you want to create a new file, ensure that the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to a file or device that allows you to perform output operations.

If you want to read from an existing file, ensure that all of the following are true:

- The file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to the file that you intended.
- No other unit has been connected to the same file and has caused the file to be deleted before this OPEN statement was executed.
- The file exists according to the Fortran rules of file existence. (For example, under certain circumstances, a file that is present on a disk volume but contains no data doesn't exist according to this definition.)

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1403

FOR1404S The OPEN statement could not connect unit *unit-number* to *file-name*. The ACCESS specifier had a value of DIRECT, and the file already existed, but the file was empty. Fortran Version 2 Error Number: AFB108I (format 10)

Explanation: The file that was to be connected for direct access existed prior to the execution of the OPEN statement. However, there were no records in the file, and such a file can't be used for direct access. The fact that the file seemed to exist is based on one of the following:

- The file was previously connected for sequential access within the same executable program and was closed without any records having been written. Unless the STATUS

specifier on that CLOSE statement had a value of DELETE, such a file is seen as an existing file according to the Fortran definitions of file existence, which are explained in *VS FORTRAN Version 2 Programming Guide for CMS and MVS* in the chapter "What Determines File Existence."

- The file was dynamically allocated, that is, the FILE specifier had a data set name preceded by a slash (*/*), and before execution of the OPEN statement the data set existed on the disk volume but contained no records.
- The NOOCSTATUS run-time option was in effect, the file didn't contain any records, and the file hadn't been used previously within the same executable program.

Programmer Response: If you want to connect an existing file for direct access, ensure that all of the following are true:

- The file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to the file that you intended.
- The file contains at least one record.
- The program that created the file successfully closed it.
- The file contains unblocked fixed-length records, that is, the RECFM value is F.

If you want to create a new file, then change the value of the STATUS specifier to NEW or SCRATCH.

If the file might have existed before the execution of the OPEN statement and if you want to replace whatever might have been in that file, then take one of these actions, as applicable:

- If the file is a named file, provide a value of REPLACE for the STATUS specifier.
- If the file was used earlier in a Fortran program, provide a value of DELETE for the STATUS specifier on the CLOSE statement for that previous use of the file.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

FOR1405S The OPEN statement could not connect unit *unit-number* to *file-name*. The ACTION specifier, which had a value of WRITE, conflicted with the KEYS specifier, which listed more than one key. Fortran Version 2 Error Number: AFB121I

Explanation: A value of WRITE was provided for the ACTION specifier on an an OPEN statement that specified keyed access; this implied that records were to be loaded into the file using the file's primary key. However, the KEYS specifier listed more than one start-end pair, and this is not permitted when loading records into the file.

Programmer Response: If you want to load records into the file with records that are presented in increasing sequence of the primary key, then either remove the KEYS specifier or specify only the start-end pair that represents the primary key for the file. Ensure that the file definition (DD statement or ALLOCATE command) refers to the base cluster of the VSAM key-sequenced data set rather than to a path that corresponds to one of the alternate index keys.

If you want to process a file that is not empty, change the value of the ACTION specifier to READ or READWRITE.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1405

FOR1406S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The KEYS specifier was given, but the ACCESS specifier did not have a value of KEYED. Fortran Version 2 Error Number: AFB137I**

Programmer Response: If you were connecting a VSAM key-sequenced data set (KSDS), then change the value of the ACCESS specifier to KEYED. Otherwise, remove the KEYS specifier from the OPEN statement, and ensure that the ACCESS specifier has a value of either SEQUENTIAL or DIRECT, as appropriate to your use of the file. If you code the value of the ACCESS specifier as a character constant, enclose the value in quotes or apostrophes.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1406

FOR1407S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The ACCESS specifier had a value of KEYED, and the ACTION specifier had a value of READ, but the file was empty. Fortran Version 2 Error Number: AFB138I**

Programmer Response: Ensure that the VSAM key-sequenced data set (KSDS) that you want to process is referenced by the file definition (DD statement or ALLOCATE command).

If you want to read from a file that has records, then:

- If the file referenced by the file definition is a base cluster, that is, the file with the primary key, then ensure that is was successfully loaded with records, either in a Fortran program or by a program written in some other language.
- If the file referenced by the file definition is a path for an alternate index, then ensure that the Access Method Services BLDINDEX command successfully built the alternate index after the base cluster was loaded.

If you want to start with an empty file and add records to it in other than ascending sequence of the primary key, then change the value of the ACCESS specifier to READWRITE. In this case the OPEN statement processing simulates the loading of the file and deletes all loaded records; then VSAM no longer considers the file to be empty.

If you want to load records into an empty file in the fastest way, follow these steps:

1. On the file definition (DD statement or ALLOCATE command), provide the data set name of the file's base cluster, that is, of the file with the primary key.
2. Execute an OPEN statement with a value of WRITE for the ACTION specifier and a value of KEYED for the ACCESS specifier; either omit the KEYS specifier or provide a KEYS specifier with a single start-end pair that represents the position in the record of the file's primary key.
3. Execute at least one WRITE statement to write the records; ensure that you write the records in ascending sequence of the primary key.
4. Execute a CLOSE statement.

After these steps, the file is available to be connected using an ACTION specifier of either READ or READWRITE.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1407

FOR1408S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The RECL specifier was given, but the ACCESS specifier did not have a value of DIRECT. Fortran Version 2 Error Number: AFB155I (format 1)**

Programmer Response: If you intend to execute direct access READ or WRITE statements, which have a REC specifier, then change the value of the ACCESS specifier to DIRECT. If you code the value as a character constant, enclose the value in quotes or apostrophes.

If you want to use sequential or keyed access, then remove the RECL specifier from the OPEN statement.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1408

FOR1409S The OPEN statement could not connect unit *unit-number* to *file-name*. The ACCESS specifier had a value of DIRECT, but the RECL specifier was not given. Fortran Version 2 Error Number: AFB155I (format 2)

Programmer Response: If you intend to execute direct access READ or WRITE statements, which have a REC specifier, then add the RECL specifier to the OPEN statement. Ensure that this value given for the RECL specifier is the same as the value that's associated with the file through one or more of the following, as applicable:

- The label of an existing data set
- The LRECL parameter of the DD statement or ALLOCATE command
- The LRECL value given in an invocation of the FILEINF callable service
- The record length given in the RECORDSIZE parameter of the Access Method Services DEFINE command that was used to define the VSAM cluster

If you want to use sequential or keyed access, then change the value of the ACCESS specifier to SEQUENTIAL or KEYED. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1409

FOR1410S The OPEN statement could not connect unit *unit-number* to *file-name*. The FILE specifier was given, but the STATUS specifier had a value of SCRATCH. Fortran Version 2 Error Number: AFB255I

Programmer Response: If you want to connect a named file, then on the OPEN statement provide the FILE specifier and either omit the STATUS specifier or change the value of the STATUS specifier to NEW, OLD, REPLACE, or UNKNOWN.

If you want to connect a file as a scratch (or temporary) file, then omit the FILE specifier and provide a value of SCRATCH for the STATUS specifier.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1410

FOR1411S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The ACCESS specifier had a value of DIRECT, but the file definition referred to a file or device that was not supported for direct access. Fortran Version 2 Error Number: AFB090I, AFB114I (format 1), AFB165I (format 1)**

Programmer Response: If you intend to use direct access, ensure that the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to one of the following:

- For a non-VSAM file, a disk file that is not a PDS member.
- A VSAM relative record data set (RRDS).

If you intend to use direct access and you want to use an unnamed file (that is, you've omitted the FILE specifier on the OPEN statement), then ensure that there is no corresponding file definition with a ddname of the form that is used for a striped file. (This prohibited form is FT*nn*P*mmm*, where *nn* is the unit number given on the OPEN statement.) Instead, use a ddname of the form FT*nn*F001. If you need the file definition with a ddname of the form FT*nn*P*mmm* because you're also processing a striped file, then change the unit number either for the direct access I/O or for the striped file I/O.

If you didn't intend to use direct access I/O, change the ACCESS specifier on the OPEN statement to either SEQUENTIAL or KEYED.

If you want to process a VSAM key-sequenced data set (KSDS), then change the ACCESS specifier on the OPEN statement to KEYED. Do not confuse sequential or direct access with the sequential or direct retrieval statements that are used with keyed access. Sequential and direct access are indicated by the ACCESS specifier on the OPEN statement. Sequential and direct retrieval statements are forms of the READ statement that can be used when the file is connected for keyed access, that is, when the ACCESS specifier on the OPEN statement has a value of KEYED.

If you want to process a VSAM linear data set, don't use Fortran I/O statements; instead, use the data-in-virtual callable services described in *VS FORTRAN Version 2 Language and Library Reference*.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1411

FOR1412S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The ACCESS specifier had a value of SEQUENTIAL, but the file definition referred to a file or device that was not supported for sequential access. Fortran Version 2 Error Number: AFB165I (format 1)**

Programmer Response: If you want to use sequential access, ensure that the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement does not refer to a VSAM key-sequenced data set (KSDS) nor to a VSAM linear data set.

If you want to process a VSAM key-sequenced data set (KSDS), then change the ACCESS specifier on the OPEN statement to KEYED. Do not confuse sequential or direct access with the sequential or direct retrieval statements that are used with keyed access. Sequential and direct access are indicated by the ACCESS specifier on the OPEN statement. Sequential

and direct retrieval statements are forms of the READ statement that can be used when the file is connected for keyed access, that is, when the ACCESS specifier on the OPEN statement has a value of KEYED.

If you want to process a VSAM linear data set, don't use Fortran I/O statements; instead, use the data-in-virtual callable services described in *VS FORTRAN Version 2 Language and Library Reference*.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1412

FOR1413S The OPEN statement for unit *unit-number* **failed. The unit was already connected to** *file-name*, **and the** *specifier* **specifier had a value that differed from the value that was already established. Fortran Version 2 Error Number: AFB120I, AFB100I**

Explanation: The OPEN statement referred to a unit that was already connected to a file. Because the FILE specifier was either omitted or had a value that was same as the name of the file to which the unit was already connected, the OPEN statement did not cause the file to be disconnected and opened again; instead, the OPEN statement applied to the already existing connection. In addition, the *specifier* specifier on the OPEN statement had a value that was different from the value established earlier. This is not allowed because only the BLANK, CHAR, DELIM, and PAD specifiers can change the properties of the connection when the OPEN statement refers to an existing connection between a unit and a file.

Programmer Response: Ensure that both the OPEN statement and any previously executed I/O statements refer to the unit number that you intend.

If you want to retain the existing connection between the unit and the file, then take one of these actions:

- Remove the *specifier* specifier from the OPEN statement.
- If you do use the *specifier* specifier, then ensure that its value is the same as what is already in effect.

If you want to use the OPEN statement to establish a new connection between the unit and the file, then take one of the following actions to disconnect the unit from the file to which it's already connected and to connect the unit to a different file:

1. Execute a CLOSE statement followed by another OPEN statement.
2. For a named file only, execute an OPEN statement with a FILE specifier whose value is different from the name of the file to which the unit is already connected. This has the effect of executing a CLOSE statement with no STATUS specifier followed by the OPEN statement.

For either of these two cases, all specifiers coded on the OPEN statement and the default values for all omitted specifiers provide the properties of the new connection between the unit and the file.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1413

FOR1414S The OPEN statement could not connect unit *unit-number* to *file-name*. The KEYS specifier referred to a key with a record position of *start* : *end*, but none of the file definitions for this file referred to a file with this key. Fortran Version 2 Error Number: AFB134I

Programmer Response: Ensure that the start-end pairs given in the KEYS specifier on the OPEN statement refer to files that have keys in the indicated positions in the record.

Provide the same number of file definitions (DD statements or ALLOCATE commands) as there are start-end pairs in the KEYS specifier. Use file definitions with these ddnames:

- For an unnamed file: FT*nn*K01, FT*nn*K02, ... FT*nn*K*kk*, where *nn* is the unit number and *kk* is the number of start-end pairs in the KEYS specifier. Both *nn* and *kk* consist of exactly two digits.
- For a named file: *file-name*, *file-name*1, *file-name*2, ... *file-name k*, where *file-name* is the file name given in the FILE specifier and *k* is an integer whose value is one less than the number of start-end pairs in the KEYS specifier. If *file-name* is eight characters long, the numeric suffixes overlay the last character of *file-name*.

Ensure that each of the file definitions with the ddnames used for keyed access files refers to a file with one of the keys listed as a start-end pair in the KEYS specifier. Check the VSAM Access Method Services DEFINE CLUSTER, DEFINE ALTERNATE INDEX, and DEFINE PATH commands that were used for the file to ensure that the intended keys are referenced. In referring to the positions with a record, the first position in a record is position 1 from the point of view of the KEYS specifier on the OPEN statement, but the first position in a record is position 0 from the point of view of KEYS parameter on the DEFINE CLUSTER or DEFINE ALTERNATEINDEX command. Therefore, the following KEYS specifier on an OPEN statement:

```
KEYS(9:11)
```

is equivalent to the following KEYS parameter on the DEFINE CLUSTER or DEFINE ALTERNATEINDEX command:

```
KEYS(3 8)
```

Each indicates a three-character key starting in the ninth position in the record.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1414

FOR1415S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The file was already connected to another unit. Fortran Version 2 Error Number: AFB172I**

Programmer Response: Ensure that the file name *file-name* isn't used in the FILE specifier on an OPEN statement while this same file is still connected to another unit. Correct the logic of the program to take one of these actions:

- Execute a CLOSE statement if necessary to disconnect the file from the first unit before you execute the second OPEN statement.
- Change the name given in the FILE specifier on one of the applicable OPEN statements to refer to a different file.
- If you intended to change only the values of the BLANK, CHAR, DELIM, or PAD specifiers for an existing connection of a unit and file (rather than establishing a connection), then ensure that the OPEN statement refers to the same unit as the one to which the file is already connected.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1415

FOR1416S The OPEN statement could not connect *unit-number* **to** *ddname***, the error message unit. The** *specifier* **specifier had a value that is not allowed for the error message unit.**

Programmer Response: If you want to execute an OPEN statement that refers to the error message unit and therefore to the Language Environment message file, then ensure that the following specifiers are either omitted or given the values indicated:

Specifier	Acceptable value
STATUS	UNKNOWN
ACCESS	SEQUENTIAL
FORM	FORMATTED
ACTION	WRITE
POSITION	ASIS

Facilities other than what are implied by the acceptable values in the preceding list are not available with the error message unit. If you require the one of these unavailable facilities, change the OPEN statement and the other I/O statements to refer to a unit other than the error message unit.

Designating the error message unit and the print unit as different units lets you use the print unit in a manner similar to what was available with the error message unit in VS FORTRAN Version 2. This is because the print unit doesn't have the usage restrictions of the error message unit unless it's the same unit as the error message unit. Use the ERRUNIT and PRTUNIT run-time options to provide the unit numbers for the error message unit and the print unit.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1416

FOR1417S The OPEN statement could not connect unit *unit-number* **to** *file-name*. **Because there were** *key-count* **keys listed in the KEYS specifier, conflicting ddnames were generated to refer to different parts of the file. Fortran Version 2 Error Number: AFB131I**

Explanation: The OPEN statement for keyed access referred to the named file *file-name* and specified more that one start-end pair in the keys specifier. The required file definitions have the following ddnames: *file-name*, *file-name*1, *file-name*2, ... *file-name k*, where *file-name* is the file name given in the FILE specifier and *k* is an integer whose value is one less than the number of start-end pairs in the KEYS specifier. However, in this case *file-name* was eight characters long, and the numeric suffixes had to overlay the last character of *file-name*. But *file-name* itself ended in one of the required suffix characters, thus causing a conflict in the ddnames. For example, suppose that the OPEN statement contained the following specifiers:

```
FILE='CONFILE2'
KEYS=(2:4, 6:10, 15:20)
```

In this example, because there are three keys and because the ddname is eight characters long, the ddnames CONFILE2, CONFILE1, and CONFILE2 would be needed. The conflict is that there are only two rather than three unique ddnames.

Programmer Response: If you intend to use *key-count* keys, then change the the file name in the FILE specifier on OPEN statement to one that has at least one of these characteristics:

- Fewer than eight characters
- An alphabetic character in the last position
- A digit in the last position, where the numeric value of that digit is not less than *key-count*

Also provide file definitions (DD statements or ALLOCATE commands) for the ddnames listed under “Explanation.”

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1417

FOR1425S The OPEN statement for unit *unit-number* **failed. For a keyed file, the file definition statement for** *ddname1* **referred to a file that had a record length of** *length1***, but** *ddname2* **referred to a file that had a record length of** *length2***. Fortran Version 2 Error Number: AFB132I**

Programmer Response: Change the file definitions (DD statements or ALLOCATE commands) for this file so that they all refer to files that represent the same base cluster. For each of the alternate index keys that you want to use, do not refer to the data set name of the alternate index itself. Instead, use the data set name of the path that refers to the alternate index. Such a path is defined with the Access Method Services DEFINE PATH command. This path gives you access to the records in the base cluster through the alternate index.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1425

FOR1419S The OPEN statement for unit *unit-number* **failed. More than one key was specified for a keyed file, but the file definition statement for** *ddname* **referred to a file that was empty. Fortran Version 2 Error Number: AFB133I**

Programmer Response: You cannot load records into an empty file and refer to more than one key using a single OPEN statement.

If you have already loaded the file with records and have established the alternate indexes, then ensure that the file definitions (DD statements or ALLOCATE commands) refer to the appropriate base cluster and to the various paths that are associated with the alternate indexes. Follow steps 8 through 9 in the list that follows.

If you just want to load records into an empty file, then don't refer to more than one key in the KEYS specifier. To load records into the file, follow steps 1 through 4 in the list that follows.

To establish the file so that you can use more that one key, as indicated by the KEYS specifier, then follow these steps to load records into the base cluster and to make alternate indexes available:

1. On the file definition (DD statement or ALLOCATE command), provide the data set name of the file's base cluster, that is, of the file with the primary key.
2. Execute an OPEN statement with a value of WRITE for the ACTION specifier and a value of KEYED for the ACCESS specifier; either omit the KEYS specifier or provide a KEYS specifier with a single start-end pair that represents the position in the record of the file's primary key.
3. Execute at least one WRITE statement to write the records; ensure that you write the records in ascending sequence of the primary key.
4. Execute a CLOSE statement.

Perform the following with Access Method Service commands rather than with Fortran I/O statements:

5. Define each alternate index with the DEFINE ALTERNATEINDEX command.

6. Build each alternate index with the BLDINDEX command.
7. Create a path for each alternate index with the DEFINE PATH command.

In a Fortran program you can then use keyed access to refer to more than one key as follows:

8. In the KEYS specifier on the OPEN statement, provide a start-end pair for each of the keys, either the primary key or one or more alternate index keys, that you want to use in your program.
9. Provide file definitions (DD statements or ALLOCATE commands) that refer to files representing each of the keys indicated by the KEYS specifier. For an alternate index keys, ensure that the file definition refers to the data set name of the path rather than of the alternate index itself.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1419

FOR1420S The OPEN statement for unit *unit-number* failed. The FILE specifier had a value of CEEDUMP, which is the ddname of the Language Environment dump file.

Programmer Response: Either use a ddname of other than CEEDUMP in the FILE specifier on the OPEN statement or omit the FILE specifier to refer to an unnamed file.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1420

FOR1421S The OPEN statement for unit *unit-number* failed. The FILE specifier had a value of *ddname*, which was the ddname of the Language Environment message file.

Explanation: The ddname of *ddname*, which was given as the value of the FILE specifier on the OPEN statement, is already a Language Environment message file. This message file could be the current one, or it could be some previously used message file that hasn't yet been closed.

Programmer Response: Take one or more of these actions:

- Use a ddname other than *ddname* as the value of the FILE specifier on the OPEN statement. Ensure that the ddname that you select isn't also a message file.
- Change the ddname of the message file to a value other than *ddname*. Do this by changing the ddname given in the MSGFILE run-time option or by changing the value of the FILE specifier in an OPEN statement that refers to the error message unit.
- Close the current message file with a CLOSE statement that refers to the error message unit, and connect the error message unit to a different message file with an OPEN statement that refers to the error message unit. (Closing the current message file causes the current message file to revert back to the ddname given in the MSGFILE run-time option.)

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1421

FOR1423S The OPEN statement could not connect unit *unit-number*. The STATUS specifier had a value of REPLACE, but there was no FILE specifier.

Programmer Response: Ensure that if the OPEN statement has a value of REPLACE for the STATUS specifier then it also has a FILE specifier.

If you don't want to replace a possibly existing file, then don't use a value of REPLACE for the STATUS specifier.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1423

FOR1424S The OPEN statement could not connect unit *unit-number* to *file-name*. The PAD specifier was given, but the file was to be connected for unformatted input/output.

Programmer Response: Make one of these changes in the OPEN statement:

- If you want to use formatted input/output statements, then:
  - For sequential access either omit the FORM specifier, or change the value of the FORM specifier to FORMATTED.
  - For direct or keyed access, provide a value of FORMATTED of the FORM specifier.
- If you want to use unformatted input/output statements, then remove the PAD specifier.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1424

FOR1425S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The PAD specifier had a value of** *pad***, which was other than YES or NO.**

Programmer Response: Based on whether you want formatted records to be treated as though they were padded with blanks when they are read, change the value of the PAD specifier on the OPEN statement to YES or NO. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1425

FOR1426S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The RECL specifier had a value of** *recl-val***, which was incompatible with the maximum record length,** *record-size***, which was given in the DEFINE CLUSTER command for the VSAM relative record data set (RRDS).**

Programmer Response: Ensure that the file definition (DD statement or ALLOCATE command) refers to the data set that you intend.

Ensure that the value given in the RECL specifier on the OPEN statement that was used for direct access is the same as the value given in RECORDSIZE parameter of the Access Method Services DEFINE CLUSTER command that defined the VSAM relative record data set (RRDS). Use the LISTCAT command, if necessary, to determine the value that was given when the DEFINE CLUSTER command defined the RRDS.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of OPEN, and *parm_count* has a value of 6.

No.	Name	Input/Output	Data Type and Length	Value
5	*record-size*	Input	INTEGER*4	The length of the data (or the maximum length of the data) established for the file through the DEFINE CLUSTER command for the VSAM data set
6	*recl-val*	Input	INTEGER*4	The length of the data indicated by the RECL specifier.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1426

FOR1427S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The RECL specifier had a value of** *recl-val***, which was incompatible with the length of the data,** *data-length***, which the records in the file can hold.**

Explanation: The value of the RECL specifier on the OPEN statement was incorrect in one or more of these ways:

- It was not a positive value.
- It exceeded the maximum data length that was established for the records in a file with variable-length records.
- It was not identical to the record length established for a file with fixed-length records.

The data length for the file could have been established on the file definition (DD statement or ALLOCATE command), in a call to the FILEINF callable service that applied to a file that was dynamically allocated, or in the Access Method services DEFINE CLUSTER command. For a file that already existed prior to execution of the OPEN statement, this length might have been established when the file was first created.

Programmer Response: Ensure that the file definition or FILE specifier on the OPEN statement refers to the file that you intended.

Change the value of the RECL specifier on the OPEN statement, or change the record length wherever it was established. For a file with fixed-length records, the value of the RECL specifier must be identical to the value established elsewhere for the file.

For a file with variable-length records, the value of the RECL specifier must not exceed the length of the data that the records can hold. In this case, remember that the value of the LRECL parameter (for example, as a DCB subparameter on a DD statement) includes the four-byte record descriptor word, but the value of RECL specifier on the OPEN statement does not. Therefore, when you use variable-length records, the value of the RECL specifier cannot exceed the LRECL value less 4.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of OPEN, and *parm_count* has a value of 6.

No.	Name	Input/Output	Data Type and Length	Value
5	*data-length*	Input	INTEGER*4	The length of the data (or the maximum length of the data) established for the file.

No.	Name	Input/Output	Data Type and Length	Value
6	*recl-val*	Input	INTEGER*4	The length of the data indicated by the RECL specifier.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1427

FOR1428S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The STATUS specifier had a value of REPLACE, but the file definition referred to a file or device that was restricted to input only.**

Explanation: The STATUS specifier had a value of REPLACE, which implied that a file should be created after deleting the existing one, if any. However, the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement referred to a file or device that doesn't allow output operations. Examples of such files include:

- An in-stream data set (DD *)
- A data set whose DD statement specifies LABEL=(,,,IN)
- A file for which the system's access control facility (such as RACF) prevents you from updating the data set

Programmer Response: If you want to read from a file or a device that doesn't permit output, either omit the STATUS specifier or provide a value of OLD or UNKNOWN for the STATUS specifier. Ensure that the file really exists and that you can read from it.

If you want to delete a file that might exist and to create a new file and write records on it, then the STATUS specifier value of REPLACE is correct. As an alternative, use a value of NEW for the STATUS specifier if the file isn't supposed to exist before the execution of the OPEN statement. In either case, change either of the following, as applicable, to refer to a file or device on which you can write records:

- The file definition (DD statement or ALLOCATE command)
- For a dynamically allocated data, the data set name that follows the slash (**/**) in the FILE specifier

Don't refer to a data set such as an in-stream data set (DD *), a data set for which you don't have RACF authority to update, or a data set whose DD statement has a LABEL=(,,,IN) parameter.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1428

FOR1429S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The POSITION specifier had a value of** *pos***, which was other than ASIS, REWIND, or APPEND.**

Programmer Response: Based on where you want the file to be positioned after execution of the OPEN statement, change the value of the POSITION specifier on the OPEN statement to ASIS, REWIND, or APPEND. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1429

FOR1430S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The POSITION specifier was given, and the ACCESS specifier had a value of** *access***.**

Programmer Response: If you want to connect the file for sequential access, then change the value of the ACCESS specifier on the OPEN statement to SEQUENTIAL.

If you want to connect a file for direct or keyed access, then remove the POSITION specifier from the OPEN statement because the POSITION specifier applies only to sequential access.

Do not confuse sequential or direct access with the sequential or direct retrieval statements that are used with keyed access. Sequential and direct access are indicated by the ACCESS specifier on the OPEN statement. Sequential and direct retrieval statements are forms of the READ statement that can be used when the file is connected for keyed access, that is, when the ACCESS specifier on the OPEN statement has a value of KEYED.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1430

FOR1431S The OPEN statement could not connect unit *unit-number* to *file-name*. The DELIM specifier had a value of *delim*, which was other than APOSTROPHE, QUOTE, or NONE.

Programmer Response: Based on what delimiters you want to surround character values in output written with list-directed and namelist formatting, change the value of the DELIM specifier on the OPEN statement to APOSTROPHE, QUOTE, or NONE. If you code the value as a character constant, enclose the value in quotes or apostrophes.

A value of APOSTROPHE causes delimiters of **'** to be used in the output, and a value of QUOTE causes delimiters of **"** to be used.

If you omit the DELIM specifier, then for list-directed formatting the character values are written without delimiters, and for namelist formatting the character values are surrounded by apostrophes.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1431

FOR1432S The OPEN statement could not connect unit *unit-number* to *file-name*. The DELIM specifier was given, but the file was to be connected for unformatted input/output.

Programmer Response: Make one of these changes in the OPEN statement:

- If you want to use formatted input/output statements, then:
  - For sequential access either omit the FORM specifier, or change the value of the FORM specifier to FORMATTED.
  - For direct or keyed access, provide a value FORMATTED of the FORM specifier.
- If you want to use unformatted input/output statements, then remove the DELIM specifier.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1432

FOR1433S The OPEN statement could not connect unit *unit-number* to *file-name*. The POSITION specifier had a value of APPEND, but the file definition referred to a file or a device for which positioning to the end is not allowed.

Explanation: The POSITION specifier had a value of APPEND on an OPEN statement for a file that resides on a device that does not honor positioning commands in a way that would permit positioning the file to its terminal point. Most tape and disk files support positioning commands, whereas the following do not:

- In-stream data sets (DD *)
- System output data sets (SYSOUT parameter on the DD statement)
- Terminals
- Card readers
- Printers
- Card punches

Programmer Response: Ensure that the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to the file that you intended.

If the logic of your program requires that the file be positioned at its terminal point when it is connected, change the file definition or the data set name given in the FILE specifier to refer to a file or a device that supports this type of positioning. If the positioning to the terminal point is not required, either remove the POSITION specifier on the OPEN statement or change its value to ASIS or REWIND.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1433

FOR1434S The OPEN statement could not connect unit *unit-number* to *file-name*. The file definition referred to a member of a partitioned data set (PDS), the POSITION specifier had a value of APPEND, and the ACTION specifier didn't have a value of READ.

Explanation: The file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement referred to a member of a partitioned data set (PDS). The OPEN statement had a POSITION specifier with a value of APPEND, which indicates that the file should be positioned to its endfile record. However, because the ACTION specifier was either omitted or was coded with a value of other than READ, writing of records onto the file is implied. It is not possible to write records onto the end of an existing member of a PDS.

Programmer Response: Ensure that the file definition or FILE specifier on the OPEN statement refers to the file that you intended.

If you want to write a new or replacement member of a PDS, then remove the POSITION specifier and provide a value of WRITE for the ACTION specifier.

If you want to read an existing member of a PDS from the beginning, provide a value of READ for the ACTION specifier and either remove the POSITION specifier or provide a value of REWIND for it.

If you want to read an existing member of a PDS after first positioning the file to the end (so that you can execute BACKSPACE statements, for example), then the value of APPEND for the POSITION specifier is correct. In this case, provide a value of READ for the ACTION specifier.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1434

FOR1435S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The file definition referred to a concatenation of data sets, and the POSITION specifier had a value of APPEND.**

Explanation: The file definition (DD statement or ALLOCATE command) referred to a concatenation of data sets, that is, to a sequence data sets that was to be processed as though it consisted of a continuous sequence of records in a single file. The POSITION specifier on the OPEN statement had a value of APPEND, which implied that this file was to be positioned at its terminal point. Such positioning cannot be done for a file that is a concatenation of data sets.

Programmer Response: Ensure that the file definition refers to the file that you intended.

If the file that you want to process is a concatenation of data sets, either remove the POSITION specifier on the OPEN statement or change its value to REWIND or ASIS. You won't be able to position this file to its terminal point.

If the logic of your program requires that the file be positioned at its terminal point when it is connected, change the file definition to refer to a file or a device that supports this type of positioning.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1435

FOR1436S The OPEN statement could not connect unit *unit-number* to *file-name*. The file definition referred to a concatenation of data sets, and the STATUS specifier had a value of REPLACE.

Explanation: The file definition (DD statement or ALLOCATE command) referred to a concatenation of data sets, that is, to a sequence data sets that was to be processed as though it consisted of a continuous sequence of records in a single file. The STATUS specifier on the OPEN statement had a value of REPLACE, which implied that this file was to be deleted and recreated. This deletion and recreation cannot be done for a file that is a concatenation of data sets.

Programmer Response: Ensure that the file definition refers to the file that you intended.

If the file that you want to process is a concatenation of data sets, either remove the STATUS specifier on the OPEN statement or change its value to OLD or UNKNOWN. You won't be able to delete the existing file.

If the logic of your program requires that the file be deleted and recreated, change the file definition to refer to a file or a device that supports file deletion.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1436

FOR1437S The OPEN statement could not connect unit *unit-number* to *file-name*. The file definitions referred to a striped file, and the POSITION specifier had a value of APPEND.

Explanation: The file definitions (DD statements or ALLOCATE commands) referred to a striped file, that is, to a file with ddnames of the form FT*nn*P*mmm*, where *nn* is the unit number and *mmm* is the stripe number. The POSITION specifier on the OPEN statement had a value of APPEND, which implied that this file was to be positioned at its terminal point. Such positioning cannot be done for a striped file.

Programmer Response: Ensure that the file definition refers to the file that you intended.

If the file that you want to process is a striped file, either remove the POSITION specifier on the OPEN statement or change its value to REWIND or ASIS. You won't be able to position this file to its terminal point.

If the logic of your program requires that the file be positioned at its terminal point when it is connected, change the ddname on the file definition to the form FT*nn*F001. Ensure that the file or a device referenced by the file definition is one that supports this type of positioning.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1437

FOR1438S The OPEN statement could not connect unit *unit-number* to *file-name*. The RECL specifier had a value of *recl-val*, which is smaller than the minimum length, *high-key-pos*, needed to contain all of the file's keys.

Programmer Response: Either remove the RECL specifier from the OPEN statement or increase its value so that it is large enough to contain all record positions of each of the keys listed as start-end pairs in the KEYS specifier on the OPEN statement.

If you don't need to refer to certain of the keys, then don't list the unneeded ones as start-end pairs in the KEYS specifier.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of OPEN, and *parm_count* has a value of 6.

No.	Name	Input/Output	Data Type and Length	Value
5	*recl-val*	Input	INTEGER*4	The value from the RECL specifier in the OPEN statement.
6	*high-key-pos*	Input	INTEGER*4	The minimum record size needed to include all the keys specified in the KEYS specifier.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1438

FOR1439S The OPEN statement for unit *unit-number*, which was already connected to file *file-name*, failed. The POSITION specifier had a value of *position*, which was other than ASIS.

Explanation: The OPEN statement referred to a unit that was already connected to a file. Because the FILE specifier was either omitted or had a value that was same as the name of the file to which the unit was already connected, the OPEN statement did not cause the file to be disconnected and opened again; instead, the OPEN statement applied to the already existing connection. In addition, the POSITION specifier on the OPEN statement had a value of either REWIND or APPEND. This is not allowed because only the BLANK, CHAR, DELIM, and PAD specifiers can change the properties of the connection when the OPEN statement refers to an existing connection between a unit and a file.

Programmer Response: Ensure that both the OPEN statement and any previously executed I/O statements refer to the unit number that you intend.

If you want to retain the existing connection between the unit and the file, then either remove the POSITION specifier from the OPEN statement or change the value of the POSITION specifier to ASIS.

If you want to use the OPEN statement to establish a new connection between the unit and the file, then take one of the following actions to disconnect the unit from the file to which it's already connected and to connect the unit to a different file:

- Execute a CLOSE statement followed by another OPEN statement.
- For a named file only, execute an OPEN statement with a FILE specifier whose value is different from the name of the file to which the unit is already connected. This has the effect of executing a CLOSE statement with no STATUS specifier followed by the OPEN statement.

For either of these two cases, all specifiers coded on the OPEN statement and the default values for all omitted specifiers provide the properties of the new connection between the unit and the file.

System Action: If the unit is other than the error message unit, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1439

FOR1440S The OPEN statement could not connect unit *unit-number* **to** *file-name***. The STATUS specifier had a value of SCRATCH, but the file definition referred to a file or device that is restricted to input only.**

Explanation: The STATUS specifier had a value of SCRATCH, which implied that a temporary file was to be created and that output statements, such WRITE or ENDFILE, would be executed. However, the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement referred to a file or device that doesn't allow output operations. Examples of such files include:

- An in-stream data set (DD *)
- A data set whose DD statement specifies LABEL=(,,,IN)
- A file for which the system's access control facility (such as RACF) prevents you from updating the data set

Programmer Response: Ensure that the value of the STATUS specifier is consistent with the capabilities of the file or device referenced by the file definition (DD statement or ALLOCATE command) or by the data set name given in the FILE specifier on the OPEN statement. You might have to change either the STATUS specifier, the file definition, or the data set name.

If you want to read from a file or a device that doesn't permit output, either remove the STATUS specifier or change its value to OLD. Ensure that the file really exists and that you can read from it.

If you want to create a temporary file and write records on it, then the value of SCRATCH for the STATUS specifier is correct. In this case, ensure that the file definition refers to a file or device on which you can write records. Note that when the STATUS specifier has a value of SCRATCH, you must omit the FILE specifier.

If you want to create a new file that is other than a temporary file, either remove the STATUS specifier or change its value to NEW or REPLACE. The value of REPLACE allows you to create a new file if it doesn't already exist or to delete an existing one and create a new one.

If you want to overwrite the records in an existing file, either remove the STATUS specifier or change its value to OLD. Unless you specify either a value of APPEND for the POSITION specifier, the DISP=MOD parameter in the DD statement, or the MOD specifier in the ALLO-

CATE command, the file will be positioned to the beginning and the first WRITE statement will overwrite any existing records.

In any of the cases for which a file is to be created or records are to be written, ensure that the file definition refers to a file or device on which you can write records. For example, don't refer to a data set such as an in-stream data set (DD *), a data set for which you don't have RACF authority to update, or a data set whose DD statement has a LABEL=(,,,IN) parameter.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1440

FOR1441S The OPEN statement could not connect unit *unit-number* to *file-name*. The STATUS specifier had a value of SCRATCH, but the ACTION specifier had a value of READ

Explanation: The STATUS specifier had a value of SCRATCH, which implied that a temporary file was to be created and that output statements, such WRITE or ENDFILE, would be executed. However, the ACTION specifier had a value of READ, which implied that that no output statements would be executed.

Programmer Response: Ensure that the value of the STATUS specifier is consistent with the value of the ACTION specifier and with the capabilities of the file or device referenced by the file definition (DD statement or ALLOCATE command) or by the data set name given in the FILE specifier on the OPEN statement. You might have to change either the STATUS specifier, the ACTION specifier, the file definition, or the data set name.

If you just want to read from a file, then the value of READ for the ACTION specifier is correct. In this case, either remove the STATUS specifier or change its value to OLD. Ensure that the file really exists and that you can read from it.

If you want to create a temporary file and write records on it, then the value of SCRATCH for the STATUS specifier is correct. In this case, either remove the ACTION specifier or change its value to READWRITE. Also ensure that the file definition refers to a file or device on which you can write records. Note that when the STATUS specifier has a value of SCRATCH, you must omit the FILE specifier.

System Action: The unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The OPEN statement is not completed, and execution continues.

Symbolic Feedback Code: FOR1441

FOR1500S *locator-text System-message* **Fortran Version 2 Error Number: AFB225I (format 1), AFB225I (format 2)**

Explanation: An I/O error was detected by one of the underlying operating system's access methods; the error is described by *System-message*. Examples of causes include these situations:

- A permanent I/O error was encountered.
- The length of the data to be read or written was inconsistent with the block size specified in the file definition (DD statement or ALLOCATE command) or in the call to the FILEINF callable service for a dynamically allocated file.
- The length of the data to be read or written was inconsistent with the capabilities of the I/O device.
- The physical end of a tape was encountered while reading or writing a record.
- A storage medium error occurred on either tape or disk.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.
An error occurred during enclave termination.

Programmer Response: Examine the description of the error described by *System-message*, and try to determine and fix the cause of the error. Check the possibilities listed under "Explanation." If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1501

FOR1502S *locator-text* **The volume** *volser* **did not have enough space available to create the new data set** *data-set-name***. Fortran Version 2 Error Number: AFB103I (format 1)**

Explanation: The data set *data-set-name* was to be created using dynamic file allocation. (Dynamic allocation occurred either because *data-set-name* was given in the FILE specifier on the OPEN statement or because a value of SCRATCH was given in the STATUS specifier and there was no corresponding file definition, that is, no DD statement or ALLOCATE command.) The volume serial number *volser* was given as a value for the VOLSER or VOLSERS argument on the immediately preceding call to the FILEINF callable service, and this disk volume didn't have the amount of space either indicated by the CYL, TRK, MAXBLK, or MAXREC argument on the FILEINF call.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

where *statement* is the OPEN statement.

Programmer Response: Take one or more of these actions:

- If amount of space indicated by the CYL, TRK, MAXBLK, or MAXREC argument on the call to the FILEINF callable service is larger than you need, reduce the value.
- Use a volume other than *volser* if you know of one that might have more space.
- Remove the VOLSER or VOLSERS argument on the call to the FILEINF callable service so that space can be found on any available disk volume.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1502

FOR1503S *locator-text* **The data set** *data-set-name* **had been allocated to another job and was not available. Fortran Version 2 Error Number: AFB103I (format 2), AFB103I (format 3)**

Explanation: The data set *data-set-name* was to be connected using dynamic file allocation. (Dynamic allocation occurred either because *data-set-name* was given in the FILE specifier on the OPEN statement or because a value of SCRATCH was given in the STATUS specifier and there was no corresponding file definition, that is, no DD statement or ALLOCATE command.) However, your use of the data set was denied because one or both of these conditions existed:

- Another job had exclusive use of *data-set-name*.
- Another job was using *data-set-name* but your job wanted exclusive use of it.

The job, either your job or the other job, that requested exclusive use of the data set did so in one or more of these ways:

- In the immediately preceding call to the FILEINF callable service, the DISP argument had a value of NEW, OLD, or MOD.
- On the DD statement the DISP parameter had a value of NEW, OLD, or MOD.
- The ALLOCATE command had a NEW, OLD, or MOD parameter. For a non-VSAM data set or for a VSAM data set when VSAM record level sharing was not used (that is, there was no RLS parameter on the DD statement, on the ALLOCATE command, or on the call to FILEINF), either of the following implied exclusive use of the data set:
- On the OPEN statement the STATUS specifier had a value of NEW.
- On the OPEN statement the ACTION specifier was either omitted or had a value of READWRITE or WRITE.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: If you can run the conflicting jobs, or at least the portions of them that use the data set *data-set-name*, at different times, then schedule the jobs accordingly.

If you must run the conflicting jobs at the same time and if both need the data set at the same time, then change either or both jobs so that they request shared use of the data set. To do this, take one or more of the following actions, as applicable, in both jobs:

- Change the value of the DISP argument for the FILEINF callable service to SHR.
- Change the value of the DISP parameter on the DD statement to SHR.
- Remove the NEW, OLD, or MOD parameter on the ALLOCATE command and replace it with SHR. For a non-VSAM data set or for a VSAM data set when VSAM record level sharing is not used:
- Change the value of the STATUS specifier on the OPEN statement to OLD.
- Change the value of the ACTION specifier on the OPEN statement to READ.

Note that except when VSAM record level sharing is used, the changes listed don't allow a file to be created nor do they allow either job to update the file.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1503

FOR1504S *locator-text* **The volume** *volser***, which should have contained the data set** *data-set-name***, could not be found. Fortran Version 2 Error Number: AFB103I (format 4)**

Explanation: The data set *data-set-name* was to be connected using dynamic file allocation. (Dynamic allocation occurred either because *data-set-name* was given in the FILE specifier on the OPEN statement.) The volume serial number *volser* was given as a value for the VOLSER or VOLSERS argument on the immediately preceding call to the FILEINF callable service, but this disk volume wasn't available.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: Ensure that volume serial number given as the value of the VOLSER or VOLSERS argument on the call to the FILEINF callable service is one that resides on the device given by the DEVICE argument.

If the data set is cataloged, you don't need to specify the volume serial number, so remove the VOLSER or VOLSERS argument.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1504

FOR1505S *locator-text* **An incorrect device name,** *dev-name***, was specified for the data set** *data-set-name***. Fortran Version 2 Error Number: AFB103I (format 5)**

Explanation: The data set *data-set-name* was to be connected using dynamic file allocation. (Dynamic allocation occurred either because *data-set-name* was given in the FILE specifier on the OPEN statement or because a value of SCRATCH was given in the STATUS specifier and there was no corresponding file definition, that is, no DD statement or ALLOCATE command.) The device name *dev-name* was given either as the value for the DEVICE argument on the immediately preceding call to the FILEINF callable service or as the default value that was established during the installation of Language Environment. However, this device name wasn't known on your system.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: Ensure that the value given for the DEVICE argument in the call to the FILEINF callable service is a valid device on your system. If you didn't provide the DEVICE argument, then *dev-name* was the default value assigned during the installation of Language Environment. In this latter case or if you are unable to resolve the problem, seek assistance from your Language Environment support personnel to determine the device names that can be used at your site.

You can code the device name in the same three ways that you can code this same information in the UNIT parameter on the DD statement:

- A three-character hexadecimal number of the device. For example, 130.
- The generic name of the device that identifies a device by machine type and model. For example, 3380.
- A group name, which identifies a group of devices by a symbolic name. For example, SYSDA.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1505

FOR1506S *locator-text* **The volume did not have enough space for the directory for the data set** *data-set-name***. Fortran Version 2 Error Number: AFB103I (format 6)**

Explanation: The data set *data-set-name* was to be created using dynamic file allocation. (Dynamic allocation occurred because *data-set-name* was given in the FILE specifier on the OPEN statement.) The data set was to be a partitioned data set (PDS) and the number of directory blocks was given as the value of the DIR argument on the immediately preceding call to the FILEINF callable service. However, the number of directory blocks was so large that there wasn't enough space for the whole directory on the volume given by the VOLSER or VOLSERS argument, if any, on the FILEINF call.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: Take one or more of these actions:

- If the number of directory blocks indicated by the DIR argument on the call to the FILEINF callable service is larger than you need, reduce the value.
- On the VOLSER or VOLSERS argument on the call to FILEINF, specify a volume that might have more space.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1506

FOR1507S *locator-text* **The space requested for the directory was greater than the amount of primary space requested for the data set** *data-set-name***. Fortran Version 2 Error Number: AFB103I (format 7)**

Explanation: The data set *data-set-name* was to be created using dynamic file allocation. (Dynamic allocation occurred because *data-set-name* was given in the FILE specifier on the OPEN statement.) The data set was to be a partitioned data set (PDS) and the number of 256-byte directory blocks was given as the value of the DIR argument on the immediately preceding call to the FILEINF callable service. However, the number of directory blocks was so large that it wouldn't fit into the amount of disk space indicated by the CYL, TRK, MAXBLK, or MAXREC argument on the call to FILEINF.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

where *statement* is the OPEN statement.

Programmer Response: Take one or more of these actions:

- If the number of directory blocks indicated by the DIR argument on the call to the FILEINF callable service is larger than you need, reduce the value.

- Increase the amount of disk space indicated by the CYL, TRK, MAXBLK, or MAXREC argument on the call to FILEINF. Ensure that you have available to you a disk volume with enough space to allocate a data set of this size.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1507

FOR1508S *locator-text* **A required catalog was not available for the data set** *data-set-name***. Fortran Version 2 Error Number: AFB103I (format 8)**

Explanation: The data set *data-set-name* was to be referenced using dynamic file allocation. (Dynamic allocation occurred because *data-set-name* was given in the FILE specifier on the OPEN statement.) However, a catalog in which the data set was supposed to be cataloged wasn't available.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: If the data set was created using Access Method Services and if the CATALOG parameter was used on the DEFINE command. then supply a JOBCAT or STEPCAT DD statement that refers to that same catalog.

In this doesn't resolve the problem, seek assistance from your Language Environment support personnel.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1508

FOR1509S *locator-text* **The catalog did not have enough space to add an entry for the data set** *data-set-name***. Fortran Version 2 Error Number: AFB103I (format 9)**

Explanation: The data set *data-set-name* was to be created using dynamic file allocation. (Dynamic allocation occurred because *data-set-name* was given in the FILE specifier on the OPEN statement.) However, there wasn't enough space available in a catalog for the new data set to be cataloged.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

where *statement* is the OPEN statement.

Programmer Response: Seek assistance from your Language Environment support personnel.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1509

FOR1510S *locator-text* **The data set** *data-set-name* **could not be dynamically allocated because the limit had been reached for the number of dynamically allocated files that could be in use at the same time. Fortran Version 2 Error Number: AFB169I (format 2)**

Explanation: The data set *data-set-name* was to be referenced using dynamic file allocation. (Dynamic allocation occurred either because *data-set-name* was given in the FILE specifier on the OPEN statement or because a value of SCRATCH was given in the STATUS specifier and there was no corresponding file definition, that is, no DD statement or ALLOCATE command.) All possible ddnames that can be used for dynamic allocated files were in use, so no more files could be dynamically allocated.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: Reduce the number of dynamically allocated files.

If you've happened to use ddnames of either of these forms:

*s*DF*nnnnn*
DF*snnnnn*

where *s* is @, #, or $, and *nnnnn* is in the range from 00000 to 99999, then don't use these as ddnames of your own because they are what Language Environment uses internally for dynamically allocated files.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1510

FOR1511S *locator-text* **A permanent I/O error was detected while searching the partitioned data set (PDS) directory for** *file-name***. Fortran Version 2 Error Number: AFB219I (format 11)**

Programmer Response: Ensure that the following are true:

- The data set was a PDS.
- The data set name wasn't used without a member name for input/output operations. Violating this restriction might have caused the directory to be overwritten.
- There weren't two different members in the data set being used for output operations at the same time.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1512

FOR1550S *locator-text* **The SVC 99 function executed for the data set** *data-set-name* **had a return code of** *return-code* **and an error reason code of** *reason-code***.** *System-message* **Seek assistance from your Language Environment support personnel. Fortran Version 2 Error Number: AFB103I (format 10)**

Explanation: The data set *data-set-name* was to be referenced using dynamic file allocation. (Dynamic allocation occurred either because *data-set-name* was given in the FILE specifier on the OPEN statement or because a value of SCRATCH was given in the STATUS specifier and there was no corresponding file definition, that is, no DD statement or ALLOCATE command.) The internally executed SVC 99 service, which performs the dynamic allocation, detected the error reflected by return code *return-code* and error reason code *reason-code*. It also provided *System-message* to explain the error.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: For the meaning of return code *return-code* and error reason code *reason-code*, refer to *DFSMS/MVS Macro Instructions for Data Sets*.

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1550

FOR1551W *locator-text* **The SVC 99 function executed for the data set** *data-set-name* **was successful, but an unusual condition occurred. The information reason code was** *information-code***.** *System-message* **Fortran Version 2 Error Number: AFB103I (format 10)**

Explanation: The data set *data-set-name* was to be referenced using dynamic file allocation. (Dynamic allocation occurred either because *data-set-name* was given in the FILE specifier on the OPEN statement or because a value of SCRATCH was given in the STATUS specifier and there was no corresponding file definition, that is, no DD statement or ALLOCATE command.) The internally executed SVC 99 service, which performs the dynamic allocation, detected an exceptional situation (not necessarily an error) reflected by information code *information-code*. It also provided *System-message* to explain the situation.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.

Programmer Response: For the meaning of information code *information-code*, refer to *DFSMS/MVS Macro Instructions for Data Sets*.

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: The file is allocated or deallocated, and execution continues.

Qualifying Data: None

Name	Action Taken after Resumption
RN	Execution resumes.

Symbolic Feedback Code: FOR1551

FOR1552C The SVC 99 function executed for the file *file-name* **during enclave initialization had a return code of** *return-code* **and an error reason code of** *reason-code***.** *System-message* **Seek assistance from your Language Environment support personnel. Fortran Version 2 Error Number: AFB936I (format 2)**

Explanation: Dynamic allocation occurred for the print unit, file name *file-name*, because there was no corresponding file definition, that is, no DD statement or ALLOCATE command. The internally executed SVC 99 service, which performs the dynamic allocation, detected the error reflected by return code *return-code* and error reason code *reason-code*. It also provided *System-message* to explain the error.

Programmer Response: For the meaning of return code *return-code* and error reason code *reason-code*, refer to *DFSMS/MVS Macro Instructions for Data Sets*.

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: The condition is signaled, and execution of the enclave terminates.

Qualifying Data: None

Permissible Resume Actions: None Symbolic Feedback Code: FOR1552

FOR1553C The SVC 99 function executed for the file *file-name* **during enclave termination had a return code of** *return-code* **and an error reason code of** *reason-code***.** *System-message* **Seek assistance from your Language Environment support personnel. Fortran Version 2 Error Number: AFB936I (format 3)**

Explanation: Dynamic allocation had occurred earlier for the print unit, file name *file-name*, because there was no corresponding file definition, that is, no DD statement or ALLOCATE command. Then during termination, the deallocation of this file occurred. The internally executed SVC 99 service, which performs the dynamic allocation, detected the error reflected by return code *return-code* and error reason code *reason-code*. It also provided *System-message* to explain the error.

Programmer Response: For the meaning of return code *return-code* and error reason code *reason-code*, refer to *DFSMS/MVS Macro Instructions for Data Sets*.

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: The condition is signaled, and execution of the enclave terminates.

Qualifying Data: None

Permissible Resume Actions: None Symbolic Feedback Code: FOR1553

FOR1554S *locator-text* **The** *macro-name* **macro instruction executed for** *file-name* **had a return code of** *return-code* **and a reason code of** *reason-code***. Seek assistance from your Language Environment support personnel. Fortran Version 2 Error Number: AFB091I, AFB225I (format 5), AFB219I (format 9)**

Explanation: In support of the Fortran I/O statement indicated by the message text, Language Environment executed a non-VSAM *macro-name* macro instruction. DFSMS/MVS detected the error indicated by return code *return-code* and reason code *reason-code*.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.
An error occurred during enclave termination.

Programmer Response: For the meaning of return code *return-code* and reason code *reason-code*, refer to *DFSMS/MVS Macro Instructions for Data Sets*. If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1556

FOR1557S *locator-text* **The VSAM** *macro-name* **macro instruction executed for** *file-name* **had a return code of** *return-code***. Seek assistance from your Language Environment support personnel. Fortran Version 2 Error Number: AFB111I (format 4), AFB130I, AFB167I**

Explanation: In support of the Fortran I/O statement indicated by the message text, Language Environment executed a VSAM *macro-name* macro instruction. DFSMS/MVS detected the error indicated by return code *return-code*.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.
An error occurred during enclave termination.

Programmer Response: For the meaning of return code *return-code* refer to *DFSMS/MVS Macro Instructions for Data Sets*. If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: If the error occurred during enclave termination or from a CLOSE statement, the file is disconnected, but not deleted (as though the STATUS specifier had been coded with a value of KEEP). If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file.

If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

FOR1558S *locator-text* **The VSAM** *macro-name* **macro instruction executed for** *file-name* **had a return code of** *return-code* **and an error code of X'***hex-code***' (***decimal-code***). Seek assistance from your Language Environment support personnel. Fortran Version 2 Error Number: AFB111I (format 4), AFB130I, AFB167I**

Explanation: In support of the Fortran I/O statement indicated by the message text, Language Environment executed a VSAM *macro-name* macro instruction. DFSMS/MVS detected the error indicated by the return code *return-code* and the error code with a hexadecimal value of *hex-code* (decimal value of *decimal-code*).

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.
An error occurred during enclave termination.

Programmer Response: For the meaning of return code *return-code* and error code *hex-code* (or *decimal-code*), refer to *DFSMS/MVS Macro Instructions for Data Sets*. If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: If the error occurred during enclave termination or from a CLOSE statement, the file is disconnected, but not deleted (as though the STATUS specifier had been coded with a value of KEEP). If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file.

If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1558

FOR1559S *locator-text* **There was a system completion code of** *completion-code* **involving file** *file-name***. Seek assistance from your Language Environment support personnel. Fortran Version 2 Error Number: AFB111I (format 1), AFB225I (format 4)**

Explanation: In support of the Fortran I/O statement indicated by the message text, Language Environment executed a data management macro instruction such as OPEN, READ, WRITE, or CHECK. Either MVS or DFSMS/MVS detected the error indicated by the system completion (abend) code *completion-code*.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.
An error occurred during enclave termination.

Programmer Response: Ensure that the file definition (DD statement or ALLOCATE command) for the file you are using is coded correctly. If the the program uses dynamic allocation for the file, ensure that both the data set name given in the FILE specifier on the OPEN statement and the arguments on call to the FILEINF callable service are coded correctly.

For the meaning of *completion-code* and for possible corrective actions, refer to *DFSMS/MVS Macro Instructions for Data Sets*.

System Action: If the error occurred during enclave termination or from a CLOSE statement, the file is disconnected, but not deleted (as though the STATUS specifier had been coded with a value of KEEP). If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file.

If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1561

FOR1563S The *statement* **statement for unit** *unit-number***, which was connected to** *file-name***, failed. A block that was read had an unexpected length. Fortran Version 2 Error Number: AFB091I**

Explanation: In a record of the file being read, there were one mor more of the following inconsistencies:

- The record format was either V, VS, D, VB, VBS, or DB, and the block descriptor did not match the actual block size.
- The record format was either V, VS, D, VB, VBS, or DB, and the record descriptor implied that the record extended past the end of the block.
- The record format was VBS, and a record descriptor value was too small; that is, it implied no data but it was not a valid VBS null segment.
- The record format was D, and the actual block size did not exceed the specified block size.
- The record format was FB with a block preface, and the actual block size did not exceed the specified block preface size.
- The record format was FB, and the last record extended beyond the end of the block.

(The *record format* refers to the RECFM value that is provided either in the file definition (DD statement or ALLOCATE command) or in the label of an existing file.)

Programmer Response: Ensure that the file definition (DD statement or ALLOCATE command) for the file you are using is coded correctly in the following ways:

- The file definition refers to the data set that you want to process.
- The RECFM value, if any, indicates the same record format that was specified when the file was created.
- The LRECL value, if any, indicates the same record length that was specified when the file was created.
- The BLKSIZE value, if any, indicates the same block length that was specified when the file was created.

Ensure that the file was closed successfully when it was created. If it wasn't, then the file must be created again because the last block might not have been written correctly.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption

Symbolic Feedback Code: FOR1565

FOR1570S *locator-text* **The file definition with the ddname** *ddname* **was missing.**
Fortran Version 2 Error Number: AFB219I (format 1), AFB219I (format 7)

Explanation: There was no file definition (DD statement or ALLOCATE command) with the ddname implied by the I/O statement.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.
An error occurred during enclave termination.

Programmer Response: Determine the ddname implied by the I/O statement, and provide a DD statement or ALLOCATE command with this ddname.

If the file is an unnamed file, then the ddname takes the form FT*nn*F001 for sequential and direct access files and the form FT*nn*K*mm* for keyed access files, where *nn* is the unit number. A file is an *unnamed file* in either of these cases:

- The OPEN statement that connects the unit and the file has no FILE specifier.
- The unit is seen as preconnected to a file because a sequential I/O statement is executed for the unit before an OPEN statement.

If the file is a named file, then the ddname has the value given for the FILE specifier on the OPEN statement.

If you want to refer to the file through dynamic allocation, then ensure that there is an OPEN statement with a FILE specifier whose value consists of a slash (**/**) followed by the data set name. In this case, no file definition is needed.

If the OPEN statement has no FILE specifier and you want that OPEN statement to refer to an existing connection between the unit and a file, then ensure that the unit is already connected to a file before the OPEN statement is executed. (Failure to observe this restriction could cause the OPEN statement to be interpreted as referring to an unnamed file.)

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1571

FOR1900E *locator-text* **The file** *file-name* **was to be deleted, but the file definition referred to a file or device for which file deletion was not possible. Fortran Version 2 Error Number: AFB105I, AFB111I (format 2)**

Explanation: One of the following implied that the file deletion was to occur:

- The CLOSE statement had a STATUS specifier with a value of DELETE.
- The CLOSE statement referred to a unit for which the corresponding OPEN statement had a STATUS specifier with a value of SCRATCH.
- During enclave termination, a unit was still connected to a file for which the corresponding OPEN statement had a STATUS specifier with a value of SCRATCH.

In addition, the OCSTATUS run-time option was in effect, and the file had a characteristic, such as one of the following, that precluded file deletion:

- VSAM data set that is not empty and that is not reusable
- Unlabeled tape data set
- In-stream (DD *) data set
- Sysout data set
- Terminal
- Unit record input data set
- Unit record output data set
- Subsystem file
- Concatenation of multiple data sets
- Keyed file with an alternate index
- LABEL=(,,,IN) parameter on the DD statement
- IN parameter on the ALLOCATE command
- Multiple sub-files
- Connected with an OPEN statement that had an ACTION specifier with a value of READ

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for unit *unit-number* failed.
The INQUIRE statement failed.
An error occurred during enclave termination.

Programmer Response: If file deletion is required so that further use of the file isn't possible, then change one or more of the following to avoid referring to a file with any of the characteristics listed under “Explanation”:

- The value of the ACTION specifier on the OPEN statement to either WRITE or READWRITE
- The value of the FILE specifier on the OPEN statement to refer to some other ddname
- The value of the FILE specifier on the OPEN statement to refer to some other data set name
- The value of the UNIT specifier on the OPEN statement to refer to some other Fortran unit number
- The DD statement parameters such as the reference to a particular device or data set
- The ALLOCATE command parameters such as the reference to a particular device or data set
- The reusability attribute of a VSAM data set in the Access Method Services DEFINE CLUSTER command
- The combination of DD statements or ALLOCATE command parameters that concatenate multiple data sets under a single ddname

If file deletion isn't required, then either use the NOOCSTATUS run-time option, or modify the program in one or more of the following ways so that file deletion won't occur:

- On the OPEN statement, either omit the STATUS specifier or provide a value other than SCRATCH.
- On the CLOSE statement, either omit the STATUS specifier or provide a value other than DELETE.

System Action: The file is disconnected, but not deleted (as though the STATUS specifier on the CLOSE statement had been coded with a value of KEEP). If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The file is closed but not deleted, and execution continues.

Symbolic Feedback Code: FOR1900

FOR1910S *locator-text* **The end of the file was reached. Fortran Version 2 Error Number: AFB200I, AFB217I**

Explanation: The execution of the READ statement requested that a record be read even though the file was already positioned beyond the last data record in the file.

This is the *end-of-file condition* and might not be an error.

For a READ statement that specified namelist formatting, this also could have occurred for the following reason: For the namelist group name given in the FMT specifier on the READ statement, there was no corresponding namelist group in the input file at a point beyond where the file was already positioned. Some syntax error within the input file, such as a missing &END delimiter or a missing quote or apostrophe delimiter, might have caused the namelist group to treated as part of some other construct and thus appear as though it wasn't in the input file.

locator-text gives more information about the location of the error, and can be one of the following:

The *statement* statement for an internal file failed.
The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed.

where *statement* is READ.

Programmer Response: Ensure that the READ statement refers to the unit that you intended, that the unit is connected to the file that you intended, and that the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement refers to the file that you intended. Also ensure that the file was created successfully, either in a program or by some manual process such as an editor.

If the file is the one you want to read, modify the program to detect the end of the file in one of these ways:

- Use the END specifier on the READ statement so that your program can gain control at some specific label when the end-of-file condition occurs.
- Use the IOSTAT specifier on the READ statement so that upon completion of the READ statement your program can determine whether the end-of-file condition occurred. A value of −1 in the variable given in the IOSTAT specifier indicates that the end-of-file condition occurred.
- If you know the number of records in the file prior to reading them, maintain a count of the number of records read so that your program doesn't attempt to read beyond the last data record.

If your program uses statements that position the file, ensure that the logic of the program and the contents of the file don't cause the file to be inadvertently positioned to the wrong place. The following statements affect the position within the file:

- ENDFILE
- BACKSPACE
- REWIND

- OPEN with a POSITION specifier that has a value of APPEND
- READ statement, even with no input item list
- READ statement with a format specification that has a slash (**/**) edit descriptor
- WRITE, which for sequential access causes the record that's written to become the last record in the file

In addition, if the DD statement has the DISP=MOD parameter or the ALLOCATE command has the MOD parameter, the file is positioned beyond the last data record when it's first connected.

If namelist formatting is requested on the READ statement because the FMT specifier refers to the a namelist group name declared in a NAMELIST statement, ensure that the namelist group indicated by the FMT specifier is actually in the file at some point beyond the current position. (There's no attempt to read through the entire file to find the namelist group; the search is only from the current file position.) In the file, identify the namelist group with an ampersand (&) followed by the namelist group name with no intervening blanks. Ensure that the ampersand begins in position 2 or later, and that all positions preceding the ampersand in the record are blank.

In a namelist input file, ensure that all namelist groups, especially any that precede the one referenced by the failing READ statement, are coded in the correct format. Remember that all information must start no earlier than position 2 of the records. Pay attention to all delimiters, such as commas, equal signs, quotes, and apostrophes, to ensure that they are used as required. Also ensure that each namelist group is ended by the characters &END.

System Action: If the IOSTAT=*ios* specifier is present on the READ statement, *ios* becomes defined either with the value –1 if *ios* is an integer variable or with the condition token for FOR1910 if *ios* is a character variable of length 12. If the END=*stl* specifier is present on the READ statement, control passes to the label *stl*. If neither the END nor the IOSTAT specifier is present on the READ statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *statement* has a value of READ, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.
RF	If the error occurred on a READ statement for sequential access to an unnamed file that is neither VSAM nor striped, the data set sequence number is increased by 1 and the next subfile is read; otherwise, execution continues.

Symbolic Feedback Code: FOR1910

FOR1915S The OPEN statement for unit *unit-number* failed. The FILE specifier was not given, and the unit number was greater than 99, the maximum unit number allowed for unnamed files. Fortran Version 2 Error Number: AFB175I

Programmer Response: If you want to connect an unnamed file, ensure that the value given for the the unit number does not exceed the smaller of either 99 or the highest unit number allowed at your site.

If you want to connect a named file, add a FILE specifier to the OPEN statement and provide either a ddname or a data set name, the latter preceded by a slash (**/**).

If you want the OPEN statement to refer to an existing connection between a unit and a file (so that you can use one or more of the BLANK, CHAR, DELIM, and PAD specifiers to change the properties of the connection), then ensure that the unit is connected to a file before executing the OPEN statement.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated. The statement is ignored, and processing continues.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *file* has a value of blanks, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1915

FOR1916S The *statement* statement for unit *unit-number* failed. The unit number was either less than 0 or greater than *max-unit-num*, the highest unit number allowed at your installation. Fortran Version 2 Error Number: AFB220I

Programmer Response: Ensure that the unit number given on the *statement* statement is a positive number that doesn't exceed *max-unit-num*, which was established during the installation or customization of Language Environment as the highest unit number available at your site.

The defaults provided by IBM have 99 as the highest unit number. However, this can be changed by updating the UNTABLE parameter of the AFHOUTCM macro instruction in the module AFHOUTAG. For more information, refer to *OS/390 Language Environment Customization*.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated. The statement is ignored, and execution continues.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *file* has a set of blanks, and *parm_count* has a value of 5. In addition, there are these qualifying data:

No.	Name	Input/Output	Data Type and Length	Value
5	*max-unit-name*	Input	INTEGER*4	The highest unit number allowed at your installation.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1916

FOR1917S The *statement* statement could not be executed for unit *unit-number*. The unit was not connected to a file. Fortran Version 2 Error Number: AFB110I

Programmer Response: Ensure that the *statement* statement refers to the unit that you intended.

Check the logic of your program to ensure that the unit *unit-number* is connected to a file before executing the *statement* statement. Here are some items to examine or correct:

- Determine whether some error occurred during the An error detected for an OPEN statement, for example, usually causes the unit to be disconnected from the file. If such an error occurred, correct the problem.

- Ensure that a CLOSE statement didn't disconnect the unit from the file. If it did, then either execute an OPEN statement to reconnect the unit to a file or don't execute the CLOSE statement.
- If you want to use a preconnected file, that is, one that can be read or written without first executing an OPEN statement, then ensure that there's a file definition (DD statement or ALLOCATE command) with a ddname FT*nn*F001, where *nn* is the two-digit unit number.
- If you want to use a unit number greater than 99, then use an OPEN statement to connect a named file to the unit. To connect a named file, provide the FILE specifier on the OPEN statement.

It's possible for the *statement* statement used for sequential access to automatically reconnect a unit to an unnamed file. To do this, ensure that these conditions are met:

- The unit number doesn't exceed 99.
- There's a file definition with the ddname FT*nn*F001, where *nn* is the two-digit unit number. This is the file to which the unit will be reconnected.
- The NOOCSTATUS run-time option is in effect.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *file* has a value of blanks, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1917

FOR1920S The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The file definition referred to a file or device that was restricted to input only. Fortran Version 2 Error Number: AFB108I (format 7)

Explanation: The *statement* is an output statement, but the file definition (DD statement or ALLOCATE command) or the data set name given in the FILE specifier on the OPEN statement referred to a file or device that doesn't allow output operations. Examples of such files include:

- An in-stream data set (DD *)
- A data set whose DD statement specifies LABEL=(,,,IN)
- A file for which the system's access control facility (such as RACF) prevents you from updating the data set

Programmer Response: Ensure that I/O statement to be executed is consistent with the capabilities of the file or device referenced by the file definition (DD statement or ALLOCATE command) or by the data set name given in the FILE specifier on the OPEN statement. You might have to change either the file definition, the data set name, or the I/O statements used to process the file.

If you want to perform output operations on a file, don't refer to an input-only data set such as an in-stream data set (DD *), a data set for which you don't have RACF authority to update, or a data set whose DD statement has a LABEL=(,,,IN) parameter.

System Action: If the error occurred during the execution of an OPEN statement, the unit is no longer connected to a file. If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1920

FOR1921S The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. Execution of this statement was inconsistent with the ACTION specifier on the OPEN statement, which had a value of *action*. Fortran Version 2 Error Number: AFB122I

Programmer Response: Either change the value of the ACTION specifier on the OPEN statement that connected the unit to the file, or change the logic of your program so that you don't execute a statement that isn't allowed by the value that you provide for the ACTION specifier. Also ensure that the ACCESS specifier has a value that indicates the type of file access that you want to use. Here are the permissible statements based on the values of the ACTION specifier and of the ACCESS specifier:

Value of ACTION Specifier	Value of ACCESS Specifier	Permissible Input/Output Statements
READ	SEQUENTIAL KEYED	READ, BACKSPACE, REWIND, CLOSE with STATUS='KEEP'
READ	DIRECT	READ, CLOSE with STATUS='KEEP'
READWRITE	SEQUENTIAL	READ, BACKSPACE, REWIND, WRITE, ENDFILE, CLOSE with STATUS='KEEP'
READWRITE	DIRECT	READ, WRITE, CLOSE with any STATUS value
READWRITE	KEYED	READ, BACKSPACE, REWIND, WRITE, REWRITE, DELETE, CLOSE with any STATUS value
WRITE	SEQUENTIAL	WRITE, ENDFILE, CLOSE with any STATUS value
WRITE	DIRECT	WRITE, CLOSE with any STATUS value
WRITE	KEYED	WRITE, CLOSE with STATUS='KEEP'

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1921

FOR1922S The *statement* statement for unit *unit-number*, which was connected to *file-name*, failed. The file was not usable because a permanent I/O error was detected Fortran Version 2 Error Number: AFB152I

Programmer Response: Determine the cause of the error on some previous I/O statement that was executed for this unit, and correct the problem.

To continue using a file connected for sequential access after an error has occurred, execute a REWIND statement.

To use the same unit or file through a newly established file connection, execute a CLOSE statement followed by an OPEN statement.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1922

FOR1923S The *statement* **statement for unit** *unit-number***, which was connected to** *file-name***, failed. An implied DO in the input or output item list inconsistently specified the initial, terminal, and increment values. The initial value was** *initial-value***; the terminal value was** *terminal-value***, and the increment value was** *increment-value***. Fortran Version 2 Error Number: AFB203I**

Explanation: In the input or output item list of a READ or WRITE statement there was an implied DO such as the following:

(A(I), I =*initial-value*, *terminal-value*, *increment-value*)

For one of the levels of nesting in the implied DO, the combination of *initial-value*, *terminal-value*, and *increment-value* was incorrect in one of these ways:

- *increment-value* = 0
- *terminal-value* < *initial-value* and *increment-value* > 0
- *terminal-value* > *initial-value* and *increment-value* < 0

Programmer Response: Ensure that the combination of the initial value, terminal value, and increment value in the implied DO doesn't have any of the inconsistencies listed under “Explanation” for any level of nesting.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1923

FOR1924S The *statement* **statement for unit** *unit-number* **failed. The statement was executed from within an MTF parallel subroutine and referred to an unnamed file. Fortran Version 2 Error Number: AFB923I**

Programmer Response: Change the MTF parallel subroutine so that the I/O statements refer only to named rather than to unnamed files. A file is an *unnamed file* in either of these cases:

- The OPEN statement that connects the unit and the file has no FILE specifier.
- The unit is seen as preconnected to a file because a sequential I/O statement is executed for the unit before an OPEN statement. (Except for the standard input unit, the error message unit, and the print unit, preconnected files don't exist in an MTF parallel subroutine.)

A file is a *named file* if the OPEN statement that connects the unit and the file has a FILE specifier. Therefore, in the parallel subroutine include the FILE specifier on each OPEN statement that's used to connect a unit to a file.

If the OPEN statement has no FILE specifier and you want that OPEN statement to refer to an existing connection between the unit and a file, then ensure that the unit is already connected to a file before the OPEN statement is executed. (Failure to observe this restriction could cause the OPEN statement to be interpreted as referring to an unnamed file.)

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled either in the parallel subroutine or in the main task program, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *file* has a value of blanks, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1924

FOR1925S The *statement* statement for unit *unit-number*, which was the error message unit, failed. The statement or the form of the statement that was used is not permitted for the error message unit. Fortran Version 2 Error Number: AFB234I

Explanation: The *statement* statement referred to the error message unit and therefore to the Language Environment message file, but was other than one of the following statements that is allowed to refer explicitly to the error message unit:

- OPEN statement
- INQUIRE statement
- CLOSE statement
- WRITE statement for sequential access and formatted I/O

The following statements refer to the print unit. They are allowed to refer implicitly to the error message unit when the error message unit and the print unit are the same unit:

- PRINT statement
- WRITE statement that has * as the unit identifier

Programmer Response: Change the program so that if you refer to the error message unit you use only the statements or forms of statements listed under “Explanation.” For example, do not use these statements:

- WRITE statement for direct access (REC specifier)
- WRITE statement for keyed access (KEY specifier)
- WRITE statement for asynchronous I/O (ID specifier)
- WRITE statement for unformatted I/O (no format specifier)
- ENDFILE statement
- REWIND statement
- BACKSPACE statement
- DELETE statement
- REWRITE statement

If you need to use any of the prohibited statements or forms of statements, change the unit specifier to refer to some unit other than the error message unit. If you need only the BACKSPACE, REWIND, or ENDFILE statements in conjunction with output that's directed to the print unit (rather than explicitly to the error message unit), then take both of the following actions:

- Use the ERRUNIT and PRTUNIT run-time options to define the error message unit and the print unit as different units.

- On the BACKSPACE, REWIND, or ENDFILE statement, provide a unit number that is the same as what you've used as the value of the PRTUNIT run-time option.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *file* has a value of blanks, and *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1925

FOR1926S *locator-text* **The file name was** *file-name***. The immediately previous invocation of the FILEINF callable service failed. Fortran Version 2 Error Number: AFB219I (format 9)**

Programmer Response: Determine the cause of the error that caused the previous call to the FILEINF callable service to fail; then correct the problem.

If the call to the FILEINF callable service doesn't need to be used for the OPEN or INQUIRE statement, then remove the call.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1926

FOR1927S An I/O statement was executed, but some other I/O statement had not yet completed. Fortran Version 2 Error Number: AFB904I

Explanation: There was a recursive call to the Fortran input/output library routines that are part of Language Environment. Here are some situations that could have caused the recursive call:

- Within the input item list on a READ statement there was a reference to a user-written function that performs some other I/O operation. To illustrate this situation, here's an example of a READ statement with a function reference:

  ```
  READ (8) I, A(INXFUNC(I))
  ```

  and here's an example of the referenced function subprogram with a PRINT statement whose execution causes error FOR1927 to be detected:

  ```
  FUNCTION INXFUNC ( X )
  INTEGER*4  INXFUNC
  INTEGER*4  X
  IF ( X .GT. 4 ) THEN
     PRINT *, 'INCORRECT SUBSCRIPT VALUE.  ASSUMING 1.'
     INXFUNC = 1
  ELSE
     INXFUNC = X
  ENDIF
  END
  ```

- As a result of some error that was detected during the execution of a Fortran I/O statement, the following occurred:

  1. The condition representing the error was signaled.
  2. Assuming that a user-written condition handler had been registered before the I/O statement was executed, the condition handler was entered. This condition handler included a Fortran subprogram.
  3. The Fortran subprogram executed a PRINT statement to report the error.

  The condition handling was considered to be a subordinate part of the original failing I/O statement. Therefore, execution of the PRINT statement in the condition handler caused the prohibited recursive entry into the input/output library and thus caused error FOR1927 to be detected.

Programmer Response: Restructure the program to avoid the recursive entry into the Fortran input/output library.

System Action: The ERR and IOSTAT specifiers are not honored. The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	4
2	*statement*	Input	CHARACTER*12	The name of the I/O statement being processed
3	*unit*	Input	INTEGER*4	Undefined
4	*file*	Input	CHARACTER*62	Undefined

Permissible Resume Actions: None Symbolic Feedback Code: FOR1927

FOR1928S During execution of an I/O statement that had an IOSTAT specifier, a condition occurred from the internal use of some Language Environment callable service.

Explanation: Some unusual condition occurred during the execution of an I/O statement that had an IOSTAT=*ios* specifier, where *ios* was an INTEGER*4 variable. This condition wasn't one that was detected by the Fortran library portion of Language Environment but rather by one of the internally used routines that are part of Language Environment. Because the IOSTAT specifier was present, this condition was not signaled. Instead, a value of 1928 was returned in *ios*.

(If *ios* had been a character variable of length 12, the condition token reflecting the condition that was detected would have been returned. If the IOSTAT specifier had not been present, that condition would have been signaled.)

Programmer Response: If there isn't some obvious problem involving either the I/O statement, the file definition (DD statement or ALLOCATE command), or the virtual storage available to the application, remove (at least temporarily) the IOSTAT specifier. Then the condition reflecting the problem that was detected will be signaled.

System Action: If the IOSTAT=*ios* specifier is present on the I/O statement, and if *ios* is an integer variable, the value 1928 is returned in *ios*. If *ios* is a character variable of length 12, the condition token that reflects the error that was detected by the internally executed callable service is returned in *ios*.

If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition detected by the internally executed callable service is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR1928

FOR1929S The *statement* statement for unit *unit-number*, which was connected to *filename*, failed. The ADVANCE specifier had a value of *advance*, which was other than YES or NO.

Programmer Response: Based on whether you want to use advancing or nonadvancing input/output, change the value of the ADVANCE specifier on the *statement* statement to YES or NO. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1929

FOR1930S The *statement* statement for unit *unit-number*, which was connected to *filename*, failed. The EOR specifier was provided on a formatted READ statement that did not have an ADVANCE specifier with the value NO.

Programmer Response: If you want to use the advancing READ statement, that is, the conventional form of the READ statement, remove the EOR specifier from the READ statement. Also remove the SIZE specifier if it is present.

If you want to use nonadvancing input/output, then on the READ statement provide an ADVANCE specifier with a value of NO. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1930

FOR1931S The *statement* statement for unit *unit-number*, which was connected to *filename*, failed. The SIZE specifier was provided on a formatted READ statement that did not have an ADVANCE specifier with the value NO.

Programmer Response: If you want to use the advancing READ statement, that is, the conventional form of the READ statement, remove the SIZE specifier from the READ statement. Also remove the EOR specifier if it is present.

If you want to use nonadvancing input/output, then on the READ statement provide an ADVANCE specifier with a value of NO. If you code the value as a character constant, enclose the value in quotes or apostrophes.

System Action: If neither the ERR nor the IOSTAT specifier is present on the I/O statement, the condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: Only the basic set of four qualifying data for I/O conditions as shown in Table 9 on page 450. Within this basic set, *parm_count* has a value of 4.

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The I/O operation is not completed, and execution continues.

Symbolic Feedback Code: FOR1931

FOR2000C The MTF parallel subroutine load module *module-name*, the name of which was specified in the AUTOTASK run-time option, did not exist in the load library specified by the AUTOTASK file definition statement. VS FORTRAN Version 2 Error Number: AFB919I-1

Programmer Response: Ensure that your multitasking facility (MTF) parallel subroutine load module was link-edited as a member of the partitioned data set referenced by the file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK. Use the name of this member in the AUTOTASK run-time option, which must be in the following format:

AUTOTASK(*loadmod*,*numtasks*)

where:

loadmod
Is the name of the parallel subroutine load module; that is, the name of the member in the data set referenced by the file definition with the ddname AUTOTASK.

numtasks
Is the number of tasks to be created by MTF.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2000

FOR2001C The PDS member *member-name*, the name of which was specified in the AUTOTASK run-time option as the name of the MTF parallel subroutine load module, was not a valid load module. VS FORTRAN Version 2 Error Number: AFB919I-2

Programmer Response: Ensure that your multitasking facility (MTF) parallel subroutine load module was link-edited as a member of the partitioned data set referenced by the file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK. Use the name of this member in the AUTOTASK run-time option, which must be in the following format:

AUTOTASK(*loadmod*,*numtasks*)

where:

loadmod
Is the name of the parallel subroutine load module; that is, the name of the member in the data set referenced by the file definition with the ddname AUTOTASK.

numtasks
Is the number of tasks to be created by MTF.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2001

FOR2003C The MTF parallel subroutine load module *module-name*, the name of which was specified in the AUTOTASK run-time option, had the not-editable linkage editor attribute. VS FORTRAN Version 2 Error Number: AFB919I-3

Programmer Response: Ensure that your multitasking facility (MTF) parallel subroutine load module was link-edited as a member of the partitioned data set referenced by the file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK. Also ensure that there were no failures during the link-editing process.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2003

FOR2004C The MTF parallel subroutine load module *module-name*, the name of which was specified in the AUTOTASK run-time option, did not contain the entry point VFEIS#. VS FORTRAN Version 2 Error Number: AFB919I-4

Programmer Response: Ensure that your multitasking facility (MTF) parallel subroutine load module was link-edited as a member of the partitioned data set referenced by the file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK. Also ensure that the module VFEIS# was included during the link-edit process. As an example of how to link-edit your parallel subroutine load module, assume that:

- You've compiled your parallel subroutine, and it's in the temporary data set &&LOADSET.
- You want the load module to be given the member name SUB001, and you want it placed in the load load with the data set name MY.SUB.LOAD.

Then you would code the following job step to link-edit your parallel subroutine load module:

```
//LINKPS EXEC  CEEWCL,PGMLIB='MY.SUB.LOAD',GOPGM=SUB001
//SYSLIN   DD  DSN=&&LOADSET,DISP=(OLD,DELETE)
//         DD  *
  INCLUDE SYSLIB(VFEIS#)
  ENTRY VFEIS#
/*
```

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2004

FOR2005C The MTF parallel subroutine load module *module-name*, the name of which was specified in the AUTOTASK run-time option, contained VFEIS#, but VFEIS# was not the entry point of the load module. VS FORTRAN Version 2 Error Number: AFB919I-5

Programmer Response: Ensure that your multitasking facility (MTF) parallel subroutine load module was link-edited as a member of the partitioned data set referenced by the file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK. Also ensure that the your parallel subroutine is a subroutine subprogram, or possibly more than one subroutine subprogram, and that there is no main program.

As an example of how to link-edit your parallel subroutine load module, assume that:

- You've compiled your parallel subroutine, and it's in the temporary data set &&LOADSET.

- You want the load module to be given the member name SUB001, and you want it placed in the load load with the data set name MY.SUB.LOAD.

Then you would code the following job step to link-edit your parallel subroutine load module:

```
//LINKPS EXEC  CEEWCL,PGMLIB='MY.SUB.LOAD',GOPGM=SUB001
//SYSLIN   DD  DSN=&&LOADSET,DISP=(OLD,DELETE)
//         DD  *
  INCLUDE SYSLIB(VFEIS#)
  ENTRY VFEIS#
/*
```

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

FOR2030C The AUTOTASK file definition statement was missing. VS FORTRAN Version 2 Error Number: AFB925I-1

Programmer Response: Ensure that your multitasking facility (MTF) parallel subroutine load module was link-edited as a member of a partitioned data set. Do not use a partitioned data set extended (PDSE). Provide a file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK; in this file definition, refer to the data set into which you link-edited your parallel subroutine load module.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2030

FOR2031C The AUTOTASK file definition statement did not specify a load library. VS FORTRAN Version 2 Error Number: AFB925I-2

Programmer Response: Ensure that your multitasking facility (MTF) parallel subroutine load module was link-edited as a member of a partitioned data set. Do not use a partitioned data set extended (PDSE). In the file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK, refer to the data set into which you link-edited your parallel subroutine load module.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2031

FOR2032C The OPEN macro instruction executed for the load library that was specified by the AUTOTASK file definition statement and that should contain the MTF parallel subroutine load module had a system completion code of *completion-code* **and a reason code of** *reason-code***. Seek assistance from your Language Environment support personnel. VS FORTRAN Version 2 Error Number: AFB925I-1**

Explanation: During the initialization of the Fortran multitasking facility (MTF), Language Environment executed an OPEN macro instruction that referred to the file definition (DD statement or ALLOCATE command) with a ddname of AUTOTASK. (This is the file definition that is supposed to refer to the partitioned data set (PDS) into which was link-edited the parallel subroutine load module with the name given in the AUTOTASK run-time option.) Either MVS or DFSMS/MVS detected the error indicated by system completion (abend) code *completion-code* and reason code *reason-code*.

Programmer Response: Ensure that the file definition with the ddname AUTOTASK is coded correctly and that it refers to the PDS (not PDSE) into which was link-edited the parallel subroutine load module with the name given in the AUTOTASK run-time option.

For the meaning of system completion code *completion-code* and reason code *reason-code*, and for possible corrective actions, refer to *OS/390 MVS System Codes*.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2032

FOR2040S The MTF callable service *service-name* failed. The service was called from an MTF parallel subroutine. VS FORTRAN Version 2 Error Number: AFB920I-1, AFB157I-1

Explanation: The multitasking facility (MTF) callable service *service-name* was called from a parallel subroutine. However, this service is restricted to use in the main task program.

Programmer Response: Remove the call to *service-name* from the parallel subroutine, and, if necessary, place the call in the main task program instead.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	2
2	*service-name*	Input	CHARACTER*6	The name of the MTF callable service

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes.

Symbolic Feedback Code: FOR2040

FOR2041S The MTF callable service *service-name* failed. The service was called with an argument list in an incorrect format. VS FORTRAN Version 2 Error Number: AFB920I-2, AFB157I-3

Explanation: The argument list provided in the call to the *service-name* callable service was incorrect in one of these ways:

- There was no argument list when one was required.
- The argument list had an incorrect number of arguments.
- For either the DSPTCH or SHRCOM callable service, the argument list wasn't in the internally-generated form produced by the Fortran compiler when there are character arguments. This could have occurred because:
  - The first argument was not of character type.
  - The call was made from a program compiled by the VS FORTRAN Version 1 or the VS FORTRAN Version 2 compiler with the the LANGLVL(66) compiler option.
  - The call was made from a program compiled by the VS FORTRAN Version 1 compiler at a level prior to Release 3.

– The call was made from a program compiled by the FORTRAN IV H Extended or the FORTRAN IV G1 compiler.

– The call was made from an assembler language program, and the arguments were not provided in the form required when there are character arguments.

Programmer Response: Ensure that the argument list contains the required number of arguments and that the arguments are of the required type. For further information, refer to the chapter "Multitasking Facility (MTF) Subroutines" in *VS FORTRAN Version 2 Language and Library Reference*.

For either the DSPTCH or SHRCOM callable service, follow these rules: If the program is written in Fortran, compile it with the VS FORTRAN Version 2 compiler, and do not specify the LANGLVL(66) compiler option. If it is written in assembler language, use the Fortran conventions for argument lists with character arguments. These conventions are described in the section "Passing Character Arguments Using the Standard Linkage Convention" in Appendix B of *VS FORTRAN Version 2 Programming Guide for CMS and MVS*.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	2
2	*service-name*	Input	CHARACTER*6 The name of the MTF callable service	

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes.

Symbolic Feedback Code: FOR2041

FOR2042S The MTF callable service *service-name* failed. The multitasking facility was not active. VS FORTRAN Version 2 Error Number: AFB920I-3

Programmer Response: If you intend to use the Fortran multitasking facility (MTF), then do the following to make MTF active for the application:

1. Link-edit your parallel subroutine load module as a member of a partitioned data set.
2. Provide a file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK. Refer this file definition to the data set into which you link-edited your parallel subroutine load module.
3. Provide the AUTOTASK run-time option in the following format:

   AUTOTASK(*loadmod*,*numtasks*)

   where:

   loadmod
   Is the name of the parallel subroutine load module; that is, the name of the member in the data set referenced by the file definition with the ddname AUTOTASK.

   numtasks
   Is the number of tasks to be created by MTF.

If you didn't intend to use MTF, then make one of these changes:

- If the call to *service-name* was meant to refer to one of your own routines rather than to the MTF callable service, then during the link-editing of your application, ensure that your

own routine is included in the load module. Do this either by using the linkage editor INCLUDE statement or by concatenating the library containing your routine ahead of the Language Environment product library in the SYSLIB DD statement.

- If the call to *service-name* was coded to use the MTF callable service, then remove the call because you can't use this callable service unless MTF is active for the application (as discussed earlier).

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	2
2	*service-name*	Input	CHARACTER*6	The name of the MTF callable service

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2043

FOR2044S The MTF callable service SHRCOM failed. The dynamic common block *common-name* **was not declared in any program unit that was invoked in the main task program. VS FORTRAN Version 2 Error Number: AFB099I**

Programmer Response: Ensure that common block name, *common-name*, given as the argument for the SHRCOM callable service is the name that you intended. If you code the name as a character constant, enclose the name in quotes or apostrophes.

Also ensure that at least one program unit that was entered before the SHRCOM callable service was invoked has a declaration of the common block as a dynamic common block. (Declaring it in the program unit that invokes the SHRCOM callable service meets this requirement.) Specify the common block as a dynamic common block by supplying its name as a suboption of the DC compile-time option.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	3
2	*service-name*	Input	CHARACTER*6	SHRCOM
3	*common-name*	Input	CHARACTER*31	The name of the dynamic common block

Permissible Resume Actions:

Permissible Resume Actions:

Name	Action Taken after Resumption
RN	The service is ignored, and execution resumes.

Symbolic Feedback Code: FOR2044

FOR2056S MTF subtask *subtask-number* **abnormally terminated during execution of parallel subroutine** *subroutine-name***. The system completion code was** *system-completion-code***, and the reason code was** *reason-code***. VS FORTRAN Version 2 Error Number: AFB922I-2**

Explanation: At the time that a call was made to one of multitasking facility (MTF) callable services SYNCRO, DSPTCH, or SHRCOM, Language Environment detected that the parallel subroutine *subroutine-name* in MTF subtask *subtask-number* had ended unexpectedly because of the abnormal termination indicated by the system completion code *completion-code* and reason code *reason-code*. The message describing this abnormal termination is in the message file for the subtask. This message file is the one referenced by the file definition (DD statement or ALLOCATE command) with the ddname FTERR*sss*, where *sss* is the three-digit representation of *subtask-number*.

Programmer Response: For the meaning of system completion code *completion-code* and reason code *reason-code*, and for possible corrective actions, refer to *OS/390 MVS System Codes*.

System Action: The condition FOR2056 is signaled in the main task program. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2056

FOR2057S MTF subtask *subtask-number* **abnormally terminated during execution of parallel subroutine** *subroutine-name***. The user completion code was** *user-completion-code***, and the reason code was** *reason-code***. VS FORTRAN Version 2 Error Number: AFB922I-2**

Explanation: At the time that a call was made to one of multitasking facility (MTF) callable services SYNCRO, DSPTCH, or SHRCOM, Language Environment detected that the parallel subroutine *subroutine-name* in MTF subtask *subtask-number* had ended unexpectedly because of the abnormal termination indicated by the user completion code *completion-code* and reason code *reason-code*. If the parallel subroutine wrote any output on the message file before terminating, that output is in the message file for the subtask. This message file is the one referenced by the file definition (DD statement or ALLOCATE command) with the ddname FTERR*sss*, where *sss* is the three-digit representation of *subtask-number*.

The abnormal termination was requested by executing an assembler language ABEND macro instruction or by calling one of the CEE3ABD, SYSABN, or SYSABD callable services, among others. The exact meaning of the user completion code *completion-code* and reason code *reason-code* depends on the application that requested the abnormal termination. Some form of information about the meaning of these codes should be available to users of that application.

Programmer Response: Correct the problem indicated by the user completion code *completion-code* and reason code *reason-code*.

System Action: The condition FOR2057 is signaled in the main task program. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2057

FOR2058S MTF subtask *subtask-number* **terminated during execution of MTF parallel subroutine** *subroutine-name* **because of an unhandled condition of severity** *severity***. VS FORTRAN Version 2 Error Number: AFB922I-2**

Explanation: At the time that a call was made to one of multitasking facility (MTF) callable services SYNCRO, DSPTCH, or SHRCOM, Language Environment detected that the parallel subroutine *subroutine-name* in MTF subtask *subtask-number* had ended unexpectedly because of an unhandled condition of severity *severity*. The message describing this condition is in the message file for the subtask. This message file is the one referenced by the file definition (DD statement or ALLOCATE command) with the ddname FTERR*sss*, where *sss* is the three-digit representation of *subtask-number*.

Programmer Response: Correct the problem indicated by the unhandled condition.

System Action: The condition FOR2058 is signaled in the main task program. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2058

FOR2059S A CSECT with the name CEEUOPT was present in the MTF parallel subroutine load module.

Programmer Response: Link-edit the parallel subroutine load module without the CSECT with the name CEEUOPT.

If you want to provide run-time options that are link-edited with the application, then link-edit the CSECT with the name CEEUOPT into the main task load module. The run-time options that you specify in this manner or in any other manner will apply in the main task program and in all parallel subroutines.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2059

FOR2060S The MTF callable service DSPTCH could not be completed. The first argument to the DSPTCH callable service specified that *subroutine-name* **was to be invoked as a parallel subroutine, but the parallel subroutine load module did not contain a subroutine with the specified name. VS FORTRAN Version 2 Error Number: AFB921I**

Programmer Response: Ensure that the parallel subroutine name, *subroutine-name*, given as the first argument for the DSPTCH callable service is the name that you intended. If you code the name as a character constant, enclose the name in quotes or apostrophes. Do not provide a name that exceeds eight characters in length.

Ensure that the parallel subroutine *subroutine-name* is link-edited into your multitasking facility (MTF) parallel subroutine load module. Also ensure that this load module is link-edited as a member of the partitioned data set referenced by the file definition (DD statement or ALLOCATE command) with the ddname of AUTOTASK. Use the name of this member in the AUTOTASK run-time option, which must be in the following format:

AUTOTASK(*loadmod*,*numtasks*)

where:

loadmod
Is the name of the parallel subroutine load module; that is, the name of the member in the data set referenced by the file definition with the ddname AUTOTASK.

numtasks
Is the number of tasks to be created by MTF.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	3
2	*service-name*	Input	CHARACTER*6	DSPTCH
3	*subroutine-name*	Input	CHARACTER*8	The name of the MTF parallel subroutine

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2060

FOR2062C During MTF initialization, the *macro-name* macro instruction had a return code of *return-code*. Seek assistance from your Language Environment support personnel. VS FORTRAN Version 2 Error Number: AFB924I

Explanation: During the initialization of the Fortran multitasking facility (MTF), Language Environment executed a *macro-name* macro instruction. Either MVS or DFSMS/MVS detected the error indicated by return code *return-code*.

Programmer Response:

For the meaning of return code *return-code*, and for possible corrective actions, refer to one of the following:

OS/390 MVS System Codes
DFSMS/MVS Macro Instructions for Data Sets

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2062

FOR2063C During MTF initialization, the *macro-name* macro instruction had a return code of *return-code* and a reason code of *reason-code*. Seek assistance from your Language Environment support personnel. VS FORTRAN Version 2 Error Number: AFB925I

Explanation: During the initialization of the Fortran multitasking facility (MTF), Language Environment executed a *macro-name* macro instruction. Either MVS or DFSMS/MVS detected the error indicated by return code *return-code* and reason code *reason-code*.

Programmer Response:

For the meaning of return code *return-code* and reason code *reason-code*, and for possible corrective actions, refer to one of the following:

OS/390 MVS System Codes
DFSMS/MVS Macro Instructions for Data Sets

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2063

FOR2064S The MTF callable service DSPTCH could not be completed. The MTF main task program was operating in 31-bit addressing mode, but the parallel subroutine load module had the linkage editor attribute that indicated 24-bit addressing mode. VS FORTRAN Version 2 Error Number: AFB927I

Programmer Response: Determine whether any routine in the parallel subroutine load module must execute in 24-bit addressing mode or why the linkage editor gave it the attribute indicating that it must. For example, code compiled by the FORTRAN IV H Extended compiler must run in 24-bit addressing mode; therefore, if the parallel subroutine load module contains such code, then this attribute is correct.

If a routine in the parallel subroutine load module must execute in 24-bit addressing mode, then ensure that the main task program is running in 24-bit addressing mode at the time that it calls the DSPTCH callable service. Do this in one of these ways:

- When you link-edit the main task program, provide these linkage editor options:

  AMODE=24
  RMODE=24

  This causes the main task program to be invoked in 24-bit addressing mode and to reside below 16 Mb.

- If a portion of the main task program must run in 31-bit addressing mode, then use an assembler language routine to switch into 24-bit addressing mode at some point prior to calling the DSPTCH callable service. (Also switch back into 31-bit addressing mode as necessary.) Remember that in order to switch successfully into 24-bit addressing mode, the load module must reside below 16 Mb. To ensure that the load module is loaded below 16 Mb, provide this linkage editor option:

  RMODE=24

If you're sure that no routine in the parallel subroutine load module must be invoked in 24-bit addressing mode, then when you link-edit this load module, provide this linkage editor option:

AMODE=31

In addition, if the parallel subroutine load module can reside above 16 Mb, then provide this linkage editor option as well:

RMODE=ANY

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data:

No.	Name	Input/Output	Data Type and Length	Value
1	*parm-count*	Input	INTEGER*4	3
2	*service-name*	Input	CHARACTER*6	DSPTCH
3	*subroutine-name*	Input	CHARACTER*8	The name of the MTF parallel subroutine

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2064

FOR2065C The MTF main task program load module was created with Language Environment, but the MTF parallel subroutine load module was created with VS FORTRAN. VS FORTRAN Version 2 Error Number: AFB928I

Programmer Response: Link-edit parallel subroutine load module using Language Environment. This is required because your main task program was link-edited using Language Environment.

If, when you link-edit your parallel subroutine load module, you want to use your executable load module (rather than the original object modules) as input to the linkage editor, then remember to replace the VS FORTRAN library modules that are in that load module. For information on how to do this, refer to *OS/390 Language Environment Programming Reference*.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2065

FOR2067S The MTF main task program terminated while subtask *subtask-number* **was still executing parallel subroutine** *subroutine-name***. VS FORTRAN Version 2 Error Number: AFB930I**

Programmer Response: Ensure that before the main task program ends it invokes the SYNCRO callable service to wait for the completion of the parallel subroutines.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Symbolic Feedback Code: FOR2072

FOR2073I MTF subtask *subtask-number* **abnormally terminated during execution of parallel subroutine** *subroutine-name***. The user completion code was** *user-completion-code***, and the reason code was** *reason-code***. VS FORTRAN Version 2 Error Number: AFB922I-2**

Explanation: The parallel subroutine *subroutine-name* in MTF subtask *subtask-number* ended unexpectedly because of the abnormal termination indicated by the user completion code *completion-code* and reason code *reason-code*. If the parallel subroutine wrote any output on the message file before terminating, that output is in the message file for the subtask. This message file is the one referenced by the file definition (DD statement or ALLOCATE command) with the ddname FTERR*sss*, where *sss* is the three-digit representation of *subtask-number*.

The abnormal termination was requested by executing an assembler language ABEND macro instruction or by calling one of the CEE3ABD, SYSABN, or SYSABD callable services, among others. The exact meaning of the user completion code *completion-code* and reason code *reason-code* depends on the application that requested the abnormal termination. Some form of information about the meaning of these codes should be available to users of that application.

Programmer Response: Correct the problem indicated by the user completion code *completion-code* and reason code *reason-code*.

System Action: The condition FOR2073 is signaled in the main task program during termination of the application.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2073

FOR2101S Based on the value given for the SIZE suboption of the VECTOR compile-time option, the program unit was compiled so that it could run only on a machine with a section size of *comp-section-size***. However, execution was on a machine with a section size of** *mach-section-size***. VS FORTRAN Version 2 Error Number: AFB934I**

Explanation: When the program unit was compiled, the VECTOR compile-time option had one of these forms:

VECTOR(... SIZE(LOCAL) ...)
In this case, the machine on which the program unit was compiled had a section size of *comp-section-size*, and the compiler produced code that could be run only on a machine with this same section size.

VECTOR(... SIZE(*comp-section-size*) ...)
In this case, the compiler was directed to produce code that could be run only on a machine with a section size of *comp-section-size*.

In either case, because the compiled code was capable of running only on a machine with a section size of *comp-section-size*, it couldn't be run on the machine that had a section size of *mach-section-size*.

Programmer Response: If you want the compiled code to be able on run on machines with various section sizes, then compile the program with the following VECTOR compile-time option, which has the IBM-supplied default for the SIZE suboption:

VECTOR(... SIZE(ANY) ...)

When the SIZE(ANY) suboption is used, the code sequences are not as efficient as they would be if the code were targeted only for machines with a specific section size.

If you can ensure that the compiled code will be run only on a machine with the a section size of *mach-section-size*, and if you want the code to be optimized for machines with that section size, then compile the program with the following VECTOR compile-time option:

VECTOR (... SIZE(*mach-section-size*) ...)

If you can ensure that the compiled code will be run only on a machine with the same section size as that on which it is compiled, and if you want the code to be optimized for machines with that section size, then compile the program with the following VECTOR compile-time option:

VECTOR(... SIZE(LOCAL) ...)

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2101

FOR2102S An internal table used to control the allocation of vector spill areas was corrupted and couldn't be used. VS FORTRAN Version 2 Error Number: AFB935I

Explanation: At entry to a program unit that was compiled with the VECTOR compile-time option, a Language Environment routine detected an inconsistency in a table that was supposed to control allocation of storage for vector spill areas, which are areas used to store the contents of vector registers. Most likely the table in virtual storage was overlaid by some routine (but not necessarily by the routine containing the table that was destroyed).

Programmer Response: Determine and correct the cause of the overlaid table. In Fortran program units, this is often caused by:

- Using subscripts that reference virtual storage outside the declared bounds of an array
- Referring to variables that are in EQUIVALENCE statements when the variables are declared to overlay too much storage
- Referring to storage that's addressed through a pointer whose value isn't properly established
- In a CALL statement or function reference, providing actual arguments that are not consistent with the dummy arguments declared in the subprogram. The actual arguments could be of the wrong type, rank, or have the wrong array bounds. There could be an incorrect number of actual arguments

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2102

FOR2121C A suboption of the AUTOTASK run-time option was missing. VS FORTRAN Version 2 Error Number: AFB917I-1

Programmer Response: If you want to use the Fortran multitasking facility (MTF), provide the AUTOTASK run-time option in the following format:

AUTOTASK(*loadmod*,*numtasks*)

where:

loadmod
Is the name of the parallel subroutine load module; that is, the name of the member in the data set referenced by the file definition with the ddname AUTOTASK.

numtasks
Is the number of tasks to be created by MTF.

If you didn't intend to use MTF, then either remove the AUTOTASK run-time option or specify the NOAUTOTASK run-time option.

System Action: The condition is signaled, and the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2121

FOR2130C A construct of the parallel feature of VS FORTRAN Version 2 could not be completed. Parallel programs cannot be executed using Language Environment.

Explanation: The program was compiled with VS FORTRAN Version 2 Release 5 or 6 and was considered to be a parallel program for one or more of these reasons:

- The program contained parallel language constructs.
- The program invoked one of the parallel callable services (PEORIG, PEPOST, PEWAIT, PETERM, PLCOND, PLFREE, PLLOCK, PLORIG, or PLTERM).
- The program was compiled with the PARALLEL compile-time option.

You cannot run a parallel program if it has been link-edited with Language Environment.

Programmer Response: If you want to link-edit and run the program with Language Environment, then compile it without the PARALLEL compile-time option, and remove the parallel language constructs and any calls to the parallel callable services.

If you want to continue to run the program as a parallel program, then link-edit it with the VS FORTRAN Version 2 Release 6 library. In this case, don't code anything in the program (including in any related subprograms) that makes use of any of the Language Environment features that aren't in VS FORTRAN Version 2 Release 6. You can then run the program either with the VS FORTRAN Version 2 Release 6 library or with Language Environment.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2130

FOR2131S The program *program-name* was compiled by VS FORTRAN Version 2 compiler with the EC option, which is not supported by Language Environment.

Explanation: The program was compiled with VS FORTRAN Version 2 Release 5 or 6 with the EC compile-time option. This option specified that certain common blocks were be treated as extended common blocks and that their virtual storage was to be allocated in data spaces. You cannot run such a program if it has been link-edited with Language Environment.

Programmer Response: If you want to link-edit and run the program with Language Environment, then compile it without the EC compile-time option. Specify the common blocks as dynamic common blocks by giving their names as suboptions of the DC compile-time option. However, unless you can reduce the size of the extended common blocks, this approach won't work if the program and the common blocks won't fit in the primary address space.

If you want to continue to run the program with extended common blocks, then link-edit it with the VS FORTRAN Version 2 Release 6 library. In this case, don't code anything in the program (including in any related subprograms) that makes use of any of the Language Environment features that aren't in VS FORTRAN Version 2 Release 6. You can then run

the program either with the VS FORTRAN Version 2 Release 6 library or with Language Environment.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2131

FOR2132S An invalid argument was provided to an INTEGER*8 simulation routine. VS FORTRAN Version 2 Error Number: AFB177I

Explanation: An INTEGER*8 simulation routine was implicitly referenced by the compiled code because of the use of an integer variable of length 8. One of the arguments to this routine had an unexpected value. Most likely the argument or argument list in virtual storage was overlaid by some routine (but not necessarily by the routine containing the argument that was destroyed).

Programmer Response: Determine and correct the cause of the overlaid argument. In Fortran program units, this is often caused by:

- Using subscripts that reference virtual storage outside the declared bounds of an array
- Referring to variables that are in EQUIVALENCE statements when the variables are declared to overlay too much storage
- Referring to storage that's addressed through a pointer whose value is not properly established
- In a CALL statement or function reference, providing actual arguments that are not consistent with the dummy arguments declared in the subprogram. The actual arguments could be of the wrong type, rank, or have the wrong array bounds. There could be an incorrect number of actual arguments

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Symbolic Feedback Code: FOR2132

FOR2133S A program interruption occurred during the simulation of an INTEGER*8 instruction. VS FORTRAN Version 2 Error Number: AFB178I

Explanation: An INTEGER*8 simulation routine in the Fortran library portion of Language Environment was implicitly referenced by the compiled code because of the use of an integer variable of length 8. During the execution of this simulation routine, a program interruption occurred.

Programmer Response: Examine the operands involved in any use of integer variables of length 8, and correct any errors that you find. Here are some errors that might have caused the program interruption:

- Using subscripts that reference virtual storage outside the declared bounds of an array
- Referring to variables that are in EQUIVALENCE statements when the variables are declared to overlay too much storage
- Referring to storage that's addressed through a pointer whose value isn't properly established

- In a CALL statement or function reference, providing actual arguments that are not consistent with the dummy arguments declared in the subprogram. The actual arguments could be of the wrong type, rank, or have the wrong array bounds. There could be an incorrect number of actual arguments

If you are unable to resolve the problem, seek assistance from your Language Environment support personnel.

System Action: The condition is signaled. If the condition is unhandled, the application is terminated.

Qualifying Data: None

Permissible Resume Actions: None

Chapter 14. PL/I Run-Time Messages

The following messages pertain to PL/I for MVS & VM. Each message is followed by an explanation describing the condition that caused the message, a programmer response suggesting how you might prevent the message from occurring again, and a system action indicating how the system responds to the condition that caused the message.

The messages also contain a symbolic feedback code, which represents the first 8 bytes of a 12-byte condition token. You can think of the symbolic feedback code as the nickname for a condition. As such, the symbolic feedback code can be used in user-written condition handlers to screen for a given condition, even if it occurs at different locations in an application.

The messages in this section contain alphabetic suffixes that have the following meaning:

I Informational message
W Warning message
E Error message
S Severe error message
C Critical error message

IBM0004S The program terminated with user code= *user-code*

Explanation: The program terminated with a user code.

Programmer Response: Check your program documentation or the program source to determine the reason the code was issued.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM004

IBM0005S The number of files, CONTROLLED variables, or fetched procedures exceeded the limit.

Explanation: The total length of the pseudoregister vector for the program was more than 4096 bytes. Four bytes are used for each file constant, controlled variable, and fetched procedure.

Programmer Response: Modify the program so the pseudoregister vector does not exceed 4096 bytes by reducing the number of files or controlled variables used or by restructuring the program into several external procedures.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM005

IBM0006S The program could not be executed because it did not have a main procedure.

Explanation: There are two possible causes for this error:

- An attempt was made to run a program which contained one or more external PL/I procedures. None of the procedures had the MAIN or FETCHABLE option in the PROCEDURE statement.
- An attempt was made to FETCH a load module with entry PLISTART or CEESTART

which contained one or more external PL/I procedures. None of the procedures had the MAIN or FETCHABLE option in the PROCEDURE statement.

Programmer Response: Ensure that the first external PL/I procedure to be invoked has the MAIN or FETCHABLE option in the PROCEDURE statement. When fetching a load module, follow the instructions on "Link-Editing Fetchable Load Modules" in *OS/390 Language Environment Programming Guide*.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM006

IBM0010W An invalid length or address was found in the PLICALLB argument list for ISA, HEAP, or TASKHEAP storage. The length or address was ignored.

Explanation: If the length or address of ISA, HEAP, or TASKHEAP storage is provided, it must be valid and for the length it must be a multiple of 8 bytes and for the address it must be on a double-word boundary.

Programmer Response: Check the provided length and/or address to make sure it is valid and follows the rules.

System Action: Execution continues.

Symbolic Feedback Code: IBM00A

IBM0011W The ISA or HEAP storage provided in the PLICALLB argument list was above the 16M line but the BELOW suboption of the STACK or HEAP run-time option was in effect. The provided storage was ignored.

Explanation: The location of the user-provided ISA or HEAP storage conflicts with the location in effect in the STACK or HEAP run-time option. The provided storage is ignored but the provided length is still used.

Programmer Response: Make sure the location of the provided ISA or HEAP storage agrees with the location in the STACK or HEAP run-time option.

System Action: Execution continues.

Symbolic Feedback Code: IBM00B

IBM0020S ONCODE=600. The CONVERSION condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the CONVERSION condition for which there was no associated ON-unit.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the CONVERSION condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00K

IBM0021S ONCODE=601. The CONVERSION condition was raised because of unknown source attributes on input.

Explanation: The CONVERSION condition was raised within a GET LIST or GET DATA statement with the FILE option. The attributes of the source data could not be determined.

Example:

```
DCL (A,B) CHAR(14);
GET LIST(A,B);
```

where the input stream contained 'PIG'C, 'DOG'. The condition will be raised when the first item is encountered. The value for ONSOURCE would be: "'PIG'C," and value of ONCHAR would be: "C." The ONCODE associated with this message is 601.

Programmer Response: Include a suitable ON-unit in the program to monitor errors in the input data revealed by the CONVERSION condition. Use the ONSOURCE and ONCHAR built-in functions to identify the error and the ONSOURCE and ONCHAR pseudovariables to assign a valid value so the program can continue processing. Also, check the input data for correctness before rerunning the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00L

IBM0022S ONCODE=602. The CONVERSION condition was raised because of unknown source attributes on input after the TRANSMIT condition was detected.

Explanation: The CONVERSION condition was raised after an error caused the TRANSMIT condition to be raised. For an example of the conversion error, refer to the explanation given for message IBM0021. The ONCODE associated with this message is 602.

Programmer Response: Correct the transmit error. If the conversion error recurs after correcting the transmit error, refer to the steps for conversion errors in message IBM0021.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00M

IBM0023S ONCODE=*oncode-value* **The CONVERSION condition was raised because of unknown source attributes.**

Explanation: The CONVERSION condition was raised within a GET LIST STRING or GET DATA STRING statement. For an example of the conversion error, refer to the explanation for message IBM0021.

Programmer Response: Follow the steps given for conversion errors in message IBM0021.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00N

IBM0024S ONCODE=*oncode-value* **The CONVERSION condition was raised because a conversion error occurred using F-format on input.**

Explanation: An invalid character was detected in an F-format input field. The ONCODEs associated with this message are:

- 603 - GET STRING statement
- 604 - GET FILE statement

Programmer Response: Include a suitable ON-unit in the program to monitor errors in the input data that are revealed by the CONVERSION condition. Use the ONSOURCE and ONCHAR built-in functions to identify the error and the ONSOURCE and ONCHAR pseudovariables to assign a valid numeric value so the program can continue processing. Also, ensure all input is in the correct format before running the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00O

IBM0025S ONCODE=605. The CONVERSION condition was raised because a conversion error occurred using F-format on input after the TRANSMIT condition was detected.

Explanation: An invalid character was detected in an F-format input field. A transmission error also occurred and may be the cause of the conversion error. The ONCODE associated with this message is 605.

Programmer Response: Correct the transmit error. If the conversion error recurs after correcting the transmit error, refer to the steps given for message IBM0024.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00P

IBM0027S ONCODE=*oncode-value* The CONVERSION condition was raised because a conversion error occurred using E-format on input.

Explanation: An invalid character was detected in an E-format input field. The ONCODEs associated with this message are:

- 606 - GET STRING statement
- 607 - GET FILE statement

Programmer Response: Refer to the steps for conversion errors in message IBM0024. Use the ONSOURCE and ONCHAR built-in functions to identify the error, and the ONSOURCE and ONCHAR pseudovariables to assign a valid value so the program can continue processing.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00R

IBM0028S ONCODE=608. The CONVERSION condition was raised because a conversion error occurred using E-format on input after the TRANSMIT condition was detected.

Explanation: An invalid character was detected in an E-format input field. A transmission error also occurred and may be the cause of the conversion error. The ONCODE associated with this message is 608.

Programmer Response: Correct the transmission error. If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0024.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00S

IBM0029S ONCODE=*oncode-value* The CONVERSION condition was raised because a conversion error occurred using B-format on input.

Explanation: An invalid character was detected in a B-format input field. The ONCODEs associated with this message are:

- 609 - GET STRING statement
- 610 - GET FILE statement

Programmer Response: Include a suitable ON-unit in the program to monitor errors in the input data that are revealed by the CONVERSION condition. Use the ONSOURCE and ONCHAR built-in functions to identify the error and the ONSOURCE and ONCHAR pseudovariables to assign a valid bit character so the program can continue processing. Also, ensure all input is in the correct format before running the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00T

IBM0031S ONCODE=611. The CONVERSION condition was raised because a conversion error occurred using B-format on input after the TRANSMIT condition was detected.

Explanation: An invalid character was detected in a B-format input field. A transmission error also occurred and may be the cause of the conversion error. The ONCODE associated with this message is 611.

Programmer Response: Correct the transmission error. If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0029.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM00V

IBM0032S ONCODE=612. The CONVERSION condition was raised because a conversion error occurred when converting a character string to an arithmetic value.

Explanation: An invalid character was detected in a character string that was being converted to an arithmetic data type. The ONCODE associated with this message is 612.

Programmer Response: If the error is in the conversion of a PL/I source program constant or in the conversion of a character string created while the program is running, correct the source program. Recompile and rerun the program. Use the ONSOURCE and ONCHAR built-in functions to identify the error, and the ONSOURCE and ONCHAR pseudovariables to assign a valid value so the program can continue processing.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM010

IBM0033S ONCODE=613. The CONVERSION condition was raised because a conversion error occurred when converting character to arithmetic on input or output.

Explanation: A character which is invalid for conversion to an arithmetic form was detected in one of the following:

- An arithmetic constant in a list-directed or data-directed item.
- A character constant being converted to an arithmetic form in a list-directed or data-directed item.
- An A-format input field being converted to an arithmetic form.

The ONCODE associated with this message is 613.

Programmer Response: Refer to the steps for message IBM0024.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM011

IBM0034S ONCODE=614. The CONVERSION condition was raised because a conversion error occurred when converting from character on input after the TRANSMIT condition was detected.

Explanation: A character is invalid for conversion to an arithmetic form was detected in one of the following:

- An arithmetic constant in a list-directed or data-directed input item.
- A character constant being converted to an arithmetic form in a list-directed or data directed input item.
- An A-format input field being converted to an arithmetic form.

A transmission error also occurred and may be the cause of the conversion error. The ONCODE associated with this message is 614.

Programmer Response: Correct the transmission error. If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0024.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM012

IBM0035S ONCODE=615. The CONVERSION condition was raised because a conversion error occurred when converting from character to bit.

Explanation: An invalid character was detected in a character string that was being converted to a bit string. The ONCODE associated with this message is 615.

Programmer Response: If the error is in the conversion of a program constant or in the conversion of a character string created while the program is running, correct the source program. Recompile and rerun the program. Use the ONSOURCE and ONCHAR built-in functions to identify the error, and the ONSOURCE and ONCHAR pseudovariables to assign a valid value so the program can continue processing.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM013

IBM0036S ONCODE=616. The CONVERSION condition was raised because a conversion error occurred when converting character to bit on input or output.

Explanation: A character other than 0 or 1 appeared in one of the following:

- A bit constant in a list-directed or data-directed item
- A character constant being converted to bit form in a list-directed or data-directed item
- An A-format input field being converted to bit form
- A B-format input field (excluding any leading or trailing blanks)

The ONCODE associated with this message is 616.

Programmer Response: Refer to the steps for message IBM0035.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM014

IBM0037S ONCODE=617. The CONVERSION condition was raised because a conversion error occurred when converting character to bit on input after the TRANSMIT condition was detected.

Explanation: A character other than 0 or 1 appeared in one of the following:

- A bit constant in a list-directed or data-directed input item
- A character constant being converted to bit form in a list-directed or data-directed input item
- An A-format input field being converted to bit form
- A B-format input field (excluding any leading or trailing blanks)

A transmission error also occurred and may have caused the conversion error. The ONCODE associated with this message is 617.

Programmer Response: Correct the transmission error. If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0024.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM015

IBM0038S ONCODE=618. The CONVERSION condition was raised because a conversion error occurred when converting to a PICTURE character string.

Explanation: A character that did not match the picture specification was detected in a conversion to a PICTURE character string. The ONCODE associated with this message is 618.

Programmer Response: Ensure the character string to be converted to a PICTURE character string matches the picture string specification. If necessary, use the ONSOURCE and ONCHAR built-in functions to identify the error and the ONSOURCE and ONCHAR pseudovariables to replace an erroneous character with a valid conversion character.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM016

IBM0039S ONCODE=619. The CONVERSION condition was raised because a conversion error occurred when converting to a PICTURE character string on input or output.

Explanation: A character that did not match the picture specification was detected in a STREAM-oriented item that required conversion to a PICTURE character string. The ONCODE associated with this message is 619.

Programmer Response: Either ensure all input data to the program is in the correct format or refer to the steps for message IBM0038. These steps ensure the program has adequate error recovery facilities to process any invalid data found in its input and continue processing.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM017

IBM0040S ONCODE=620. The CONVERSION condition was raised because a conversion error occurred when converting to a PICTURE character string on input after the TRANSMIT condition was detected.

Explanation: A character that did not match the picture specification was detected in a STREAM-oriented input item that required conversion to a PICTURE character string. A transmission error also occurred and may be the source of the conversion error. The ONCODE associated with this message is 620.

Programmer Response: Correct the transmission error. If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0039.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM018

IBM0042S ONCODE=*oncode-value* **The CONVERSION condition was raised because a conversion error occurred when converting from PICTURE format on input.**

Explanation: An edit-directed PICTURE format input item contained a character that did not match the picture specification. The ONCODEs associated with this message are:

- 621 - GET STRING statement
- 622 - GET FILE statement

Programmer Response: Either ensure all input data to the program is in the correct format before running the program or use the program to check the data. If necessary, use the ONSOURCE and ONCHAR built-in functions to identify the error and the ONSOURCE and ONCHAR pseudovariables to replace an erroneous character with a character valid for conversion.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01A

IBM0043S ONCODE=623. The CONVERSION condition was raised because a conversion error occurred when converting from a PICTURE format on input after the TRANSMIT condition was detected.

Explanation: An invalid character was detected in a PICTURE format input field. A transmission error also occurred and may be the cause of conversion error. The ONCODE associated with this message is 623.

Programmer Response: Correct the transmission error.

Programmer Response: If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0042.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01B

IBM0045S ONCODE=625. The CONVERSION condition was raised because a conversion error occurred when converting from PICTURE format on input.

Explanation: An invalid character was detected in a PICTURE format input item. The ONCODE associated with this message is 625.

Programmer Response: Either ensure all input data to the program is in the correct format before running the program or use the program to check the data. If necessary, use the ONSOURCE and ONCHAR built-in functions to identify the error and the ONSOURCE and ONCHAR pseudovariables to replace an erroneous character with a valid conversion character.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01D

IBM0046S ONCODE=626. The CONVERSION condition was raised because a conversion error occurred when converting from PICTURE format on input after the TRANSMIT condition was detected.

Explanation: An invalid character was detected in a PICTURE format input item. A transmission error also occurred and may be the cause of the conversion error. The ONCODE associated with this message is 626.

Programmer Response: Correct the transmission error. If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0045.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01E

IBM0047S ONCODE=627. The CONVERSION condition was raised because a graphic or mixed character string was encountered in a non-graphic environment.

Explanation: A graphic ('G') or mixed ('M') string was used as a data value in the expression for the STRING option of a GET statement. The ONCODE associated with this message is 627.

Programmer Response: Remove the graphic or mixed string from the expression.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01F

IBM0048S ONCODE=628. The CONVERSION condition was raised because a graphic or mixed character string was encountered in a non-graphic environment on input.

Explanation: A graphic ('G') or mixed ('M') string was detected in an input file that was not declared with the GRAPHIC option in the ENVIRONMENT attribute. The ONCODE associated with this message is 628.

Programmer Response: Specify the GRAPHIC option for a file that contains graphic or mixed character strings.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01G

IBM0049S ONCODE=629. The CONVERSION condition was raised because a graphic or mixed character string was encountered in a non-graphic environment on input after the TRANSMIT condition was detected.

Explanation: The CONVERSION condition was raised after an error caused the TRANSMIT condition to be raised. For an example of the conversion error, refer to the explanation for message IBM0048. The ONCODE associated with this message is 629.

Programmer Response: Correct the transmission error. If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0048.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01H

IBM0053S ONCODE=633 The CONVERSION condition was raised because an invalid character was detected in an X, BX, or GX string constant.

Explanation: A character other than a hexadecimal character was detected. Only hexadecimal characters (0-9,a-f,A-F) are allowed in X, BX, and GX string constants. The ONCODE associated with this message is 633.

Programmer Response: Include a suitable ON-unit in the program to monitor errors in the input data that are revealed by the CONVERSION condition. Use the ONSOURCE and ONCHAR built-in functions to identify the error and the ONSOURCE and ONCHAR pseudovariables to assign a valid hexadecimal character so the program can continue processing. Also ensure all input is in the correct format before executing the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01L

IBM0054S ONCODE=634 The CONVERSION condition was raised because an invalid character was detected in an X, BX, or GX string constant on input.

Explanation: A character other than a hexadecimal character was detected. Only hexadecimal characters (0-9,a-f,A-F) are allowed in X, BX, and GX string constants. The ONCODE associated with this message is 634.

Programmer Response: Include a suitable ON-unit in the program to monitor errors in the input data that are revealed by the CONVERSION condition. Use the ONSOURCE and ONCHAR built-in functions to identify the error and the ONSOURCE and ONCHAR pseudovariables to assign a valid hexadecimal character so the program can continue processing. Also, ensure all input is in the correct format before executing the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01M

IBM0055S ONCODE=635 The CONVERSION condition was raised because an invalid character was detected in an X, BX, or GX string constant on input after the TRANSMIT condition was detected.

Explanation: A character other than a hexadecimal character was detected. Only hexadecimal characters (0-9,a-f,A-F) are allowed in X, BX, and GX string constants. A transmission error also occurred and may be the source of the conversion error.

Programmer Response: Correct the transmission error. If the conversion error recurs after correcting the transmission error, refer to the steps for message IBM0054.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01N

IBM0056S ONCODE=636 The CONVERSION condition was raised because a graphic string contained an invalid character.

Explanation: This condition was raised by the GRAPHIC built-in function. The source was a graphic (DBCS) string and a shift character was detected in it.

Programmer Response: Remove the shift characters from the graphic (DBCS) string. ONSOURCE and ONCHAR pseudovariables cannot be used to assign a new value to the string. ERROR is raised if retry is attempted.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01O

IBM0059S ONCODE=639 The CONVERSION condition was raised because a mixed character string contained an invalid character.

Explanation: This condition was raised by the GRAPHIC built-in function. One of the following rules for mixed constants was broken:

- SBCS portions of the constant cannot contain a shift-in.
- Neither byte of a DBCS character can contain a shift code.

Note: In mixed character strings, a shift-in following a DBCS character or following a shift-out causes a transition to single-byte mode. It is impossible for the first byte of a DBCS character in a mixed character string to contain a shift-in.

Programmer Response: Ensure mixed character strings contain balanced, unnested shift-out/shift-in pairs. The MPSTR built-in function can be used to check shift-out/shift-in pairs. ONSOURCE and ONCHAR pseudovariables cannot be used to assign a new value to the string. ERROR is raised if retry is attempted.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01R

IBM0060S ONCODE=667. The CONVERSION condition was raised because there was no SBCS equivalent in the GRAPHIC conversion to character.

Explanation: This condition is raised during an attempt to convert a GRAPHIC string, containing ASCII DBCS characters, that represents a character value. The string contained a DBCS character for which there is no equivalent SBCS character. The ONCODE associated with this message is 667.

Programmer Response: Modify your program to ensure such strings contain only valid ASCII DBCS characters. Use the ONSOURCE pseudovariable to assign a valid GRAPHIC string to the ONSOURCE built-in function to allow the conversion to be retried.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01S

IBM0061S ONCODE=668. The CONVERSION condition was raised because there was no SBCS equivalent in the GRAPHIC conversion to character on input.

Explanation: This condition is raised during an attempt to convert a GRAPHIC string in an input file, containing ASCII DBCS character, that represents a character value. The string contained a DBCS character for which there is no equivalent SBCS character. The ONCODE associated with this message is 668.

Programmer Response: Modify your program to ensure such strings contain only valid ASCII DBCS characters. Use the ONSOURCE pseudovariable to assign a valid GRAPHIC string to the ONSOURCE built-in function to allow the conversion to be retried.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01T

IBM0062S ONCODE=669. The CONVERSION condition was raised because there was no SBCS equivalent in the GRAPHIC conversion to character on input after the TRANSMIT condition was detected.

Explanation: The CONVERSION condition was raised after an error caused the TRANSMIT condition to be raised. For an example of the conversion error, see the explanation given for message IBM0061. The ONCODE associated with this message is 669.

Programmer Response: If the conversion error recurs after eliminating the transmission error, take the steps given for message IBM0061.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM01U

IBM0092I PL/I PLIDUMP was called with Traceback (T) option.

Explanation: PLIDUMP was called with the T option.

Programmer Response: No programmer response is necessary.

System Action: No system action is performed.

Symbolic Feedback Code: IBM02S

IBM0100W ONCODE=*oncode-value* **The NAME condition was raised by a SIGNAL statement (***FILE= or ONFILE= file-name***).**

Explanation: The program contained a SIGNAL statement to raise the NAME condition for which there was no associated ON-unit. The ONCODE associated with this message is 10.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the NAME condition in the program.

System Action: Execution continues with the next sequential statement.

Symbolic Feedback Code: IBM034

IBM0101W ONCODE=*oncode-value* **The NAME condition was raised because an invalid element-variable in a STREAM item was encountered during a GET FILE DATA statement (***FILE= or ONFILE= file-name***).**

Explanation: One of the following conditions was detected:

- An identifier in the input stream had no counterpart in the data list of the GET statement, or the GET statement had no data list and an unknown identifier was encountered in the stream.
- Invalid blank characters were found within an identifier in the input stream.
- The name field or part of a qualified name was omitted.
- There were more than 256 characters in a fully-qualified name.

- Blanks were found within an array subscript other than between the optional sign and the decimal digits.
- An array subscript was missing or indicated too many dimensions.
- A value in a subscript was not a decimal digit.
- The subscript was beyond the declared range of subscripts for a particular array.
- The left-parenthesis was missing after the name of an array.
- A character other than "=" or a blank was found after a right-parenthesis that delimits an array subscript in the input stream.
- The end-of-file or a nonblank delimiter was found before "=" in an item in the input stream.

Programmer Response: Use the DATAFIELD built-in function in a NAME ON-unit to obtain the invalid data item.

System Action: The incorrect data field is ignored and execution of the GET statement continues.

Symbolic Feedback Code: IBM035

IBM0120S ONCODE=*oncode-value* **The RECORD condition was raised by a SIGNAL statement. (***FILE= or ONFILE= file-name***).**

Explanation: The program contained a SIGNAL statement to raise the RECORD condition for which there was no associated ON-unit.

Programmer Response: Supply an ON-unit for the RECORD condition or remove the SIGNAL statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM03O

IBM0121S ONCODE=*oncode-value* **The RECORD condition was raised because the length of the record variable was less than the record length (***FILE= or ONFILE= file-name***).**

Explanation: This message was produced for records that were longer than the associated PL/I variable.

1. For a READ statement, the record was truncated to the length of the variable in the INTO option.
2. For a LOCATE statement (F-format records only), a buffer was not allocated.
3. For a WRITE statement (F-format records only), the record was transmitted with the appropriate number of padding bytes added to equal the length of the record on the data set. The contents of the padding bytes were undefined.
4. For a REWRITE statement, the record was replaced by the shorter record with the appropriate number of padding bytes added to equal the length of the record on the data set. The contents of the padding bytes were undefined.

Programmer Response: Either supply an ON-unit for the RECORD condition so the program can continue running, or modify the program to make the length of the record variable the same as the length of the records on the data set. Refer to the language reference manual for this compiler for details of how such records are handled when the RECORD condition is raised.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM03P

IBM0122S ONCODE= *oncode-value* **The RECORD condition was raised because the length of the record variable was greater than the record length (***FILE= or ONFILE= file-name***).**

Explanation: This message was produced for records that were shorter than the associated PL/I variable.

1. For the READ statement using F-format records and a fixed-length variable in the INTO option, the excess bytes in the variable were undefined.
2. For a LOCATE statement, where the maximum length of the records was less than the length of the PL/I variable, the buffer was not allocated.
3. For a WRITE statement, the variable in the FROM option was longer than the maximum length of the records, and was truncated to the maximum record length.
4. For a REWRITE statement, the variable in the FROM option was longer than the record it was to replace, and was truncated to the length of this record.

Programmer Response: Either supply an ON-unit for the RECORD condition so the program can continue running, or modify the program to make the length of the record variable the same as the length of the records on the data set. Refer to the language reference manual for this compiler for details of how such records are handled when the RECORD condition is raised.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM03Q

IBM0123S ONCODE=*oncode-value* **The RECORD condition was raised because the WRITE or LOCATE variable had a zero length (***FILE= or ONFILE= file-name***).**

Explanation: A WRITE or REWRITE statement attempted to transmit a record variable of zero length, or a LOCATE statement attempted to obtain buffer space for a zero length record variable.

Programmer Response: Ensure the varying-length string used as a record variable is not a null string when the WRITE, REWRITE or LOCATE statement is run.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM03R

IBM0124S ONCODE=24 The RECORD condition was raised because a zero length record was read from a Regional data set (*FILE= or ONFILE= file-name***).**

Explanation: A record of zero length was read from a REGIONAL data set associated with a DIRECT file. A zero-length record on a direct-access device indicates the end of the data set. However, this message is generated only if the data set was created incorrectly. The ONCODE associated with this message is 24.

Programmer Response: Ensure the data set is created correctly as a regional data set. If necessary, recreate the data set and ensure the record is accessed with a valid key.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM03S

IBM0125S ONCODE=*oncode-value* **The RECORD condition was raised because a WRITE or LOCATE area was too short to contain the embedded string (***FILE= or ONFILE=file-name***).**

Explanation: A record variable was too short to contain the data set embedded key. Either a WRITE or REWRITE statement attempted to transmit the record variable or a LOCATE statement attempted to allocate buffer space for the record variable. For a WRITE or REWRITE statement, no transmission takes place. For a LOCATE statement, a buffer is not allocated.

Programmer Response: Ensure the record variable is long enough to contain the data set embedded key and the key is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM03T

IBM0140S ONCODE=40. The TRANSMIT condition was raised by a SIGNAL statement (*FILE= or ONFILE= file-name***).**

Explanation: The program contained a SIGNAL statement to raise the TRANSMIT condition for which there was no associated ON-unit. The ONCODE associated with this message is 40.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the TRANSMIT condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM04C

IBM0141S ONCODE=*oncode-value* **The TRANSMIT condition was raised because of an uncorrectable error in output (***FILE= or ONFILE=file-name***).**

Explanation: Data management routines detected an uncorrectable error while transmitting output data between main storage and an external storage device. The condition was raised on the completion of a WRITE, REWRITE or LOCATE statement. For BUFFERED files, this condition can be raised only after executing several I/O statements following the processing of an OUTPUT file. The outfile can not be associated with a unit record device. Processing of an UPDATE file can continue. For INDEXED data sets, the condition can occur while searching through the indexes or tracing an overflow record. The ONCODEs associated with this message are:

- 41 output data set
- 42 input data set

Programmer Response: If the error recurs, obtain a dump of the input/output buffer areas by using PLIDUMP in a TRANSMIT ON-unit. Refer to *OS/390 Language Environment Programming Guide* for details of PLIDUMP. The resultant output, together with all relevant listings and data sets, should be preserved for later study by IBM.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM04D

IBM0142S ONCODE=42. The TRANSMIT condition was raised because of an uncorrectable error in input (*FILE= or ONFILE= file-name***).**

Explanation: Data management routines detected an uncorrectable error while transmitting input data between main storage and an external storage device. If the block contains VS-format records, the error is raised once only for the block. Otherwise, the condition is raised on the completion of a READ or REWRITE statement for each record in the block that contains the error and for every item transmitted by GET statements from a block that contains the error. The contents of the record or data item are undefined. However, processing of subsequent records in the input file can be continued. For INDEXED data sets, the condition can be raised while searching the indexes or tracing an overflow record. The ONCODE associated with this message is 42.

Programmer Response: If the error recurs, obtain a dump of the input/output buffers by using PLIDUMP in a TRANSMIT ON-unit. Refer to *OS/390 Language Environment Programming Guide* for details of PLIDUMP. Save the PLIDUMP output and all relevant listings and data sets for later study by IBM.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM04E

IBM0143S ONCODE=*oncode-value* **The TRANSMIT condition was raised because of unreadable OMR data (***FILE= or ONFILE= file-name***).**

Explanation: One or more OMR columns contained a marginal mark, weak mark or poor erasure that could not be read. The condition is raised on completion of the READ operation for the document. An X'3F' character is substituted for unreadable characters, and also put in the last byte of the record. The ONCODE associated with this message is 42.

Programmer Response: Replace the document that caused the TRANSMIT condition to be raised. Ensure the data on the document is readable by the OMR.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM04F

IBM0144S ONCODE=*oncode-value* **The TRANSMIT condition was raised because of a write error in the index set (***FILE= or ONFILE=file-name***).**

Explanation: Data management detected a physical error while attempting to write on the index set of a VSAM KSDS. The condition is raised on the completion of a WRITE, REWRITE, LOCATE or DELETE statement. No further processing of an OUTPUT file can occur. Processing of an UPDATE file can continue. The ONCODE associated with this message is 43.

Programmer Response: Check the DASD on which the data set is being written for errors.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM04G

IBM0145S ONCODE=*oncode-value* **The TRANSMIT condition was raised because of a read error in the index set (***FILE= or ONFILE=file-name***).**

Explanation: Data management detected a physical error while attempting to read from the index set of a VSAM KSDS. The condition is raised on the completion of a READ, WRITE, REWRITE, LOCATE or DELETE statement. No further processing of an OUTPUT file can occur. Processing of an UPDATE file can continue. If the error occurs on a READ statement, no data is transferred to the record variable. For sequential access, data set positioning can be lost, causing a subsequent READ without KEY to raise ERROR. Refer to message IBM0831 for information on sequential access errors. The ONCODE associated with this message is 44.

Programmer Response: Check the DASD on which the data set resides for errors. If more research is required, consult with the system programmer.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM04H

IBM0146S ONCODE=*oncode-value* **The TRANSMIT condition was raised because of a write error in the sequence set (***FILE= or ONFILE= file-name***).**

Explanation: Data management detected a physical error while attempting to write on the sequence set of a VSAM KSDS. The condition is raised on the completion of a WRITE, REWRITE, LOCATE or DELETE statement. No further processing of an OUTPUT file can occur. Processing of an UPDATE file can continue. The ONCODE associated with this message is 45.

Programmer Response: Check the DASD on which the data set is being written for error. Also, consult with the system programmer.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM04I

IBM0147S ONCODE=*oncode-value* **The TRANSMIT condition was raised because of a read error in the sequence set (***FILE= or ONFILE= file-name***).**

Explanation: Data management detected a physical error while attempting to read from the sequence set of a VSAM KSDS. The condition is raised on the completion of a READ, WRITE, REWRITE, LOCATE or DELETE statement. No further processing of an OUTPUT file can occur. Processing of an UPDATE file can continue. If the error occurs on a READ statement, no data is transferred to the record variable. For sequential access, data set positioning can be lost, causing a subsequent READ without KEY to raise ERROR. Refer to message IBM0831 for sequential access errors. The ONCODE associated with this message is 46.

Programmer Response: Check the DASD on which the data set resides for errors. Also, consult with the system programmer.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM04J

IBM0160S ONCODE=*oncode-value* **The KEY condition was raised by a SIGNAL statement (***FILE= or ONFILE= file-name***).**

Explanation: The program contained a SIGNAL statement to raise the KEY condition for which there was no associated ON-unit. The ONCODE associated with this message is 50.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the KEY condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM050

IBM0161S ONCODE=*oncode-value* **The KEY condition was raised because the specified key could not be found (***FILE= or ONFILE= file-name***).**

Explanation: A READ, REWRITE or DELETE statement specified a recorded key which could not be found on the data set. In the case of an INDEXED data set, the key in error was either higher than the highest level index or the record was not in the prime area or the overflow areas of the data set. In the case of a DIRECT file associated with a data set with REGIONAL organization, the key in error was not in the specified region or within the search limit defined by the LIMCT subparameter of the DCB parameter. The ONCODE associated with this message is 51.

Programmer Response: Determine why the key was incorrect and modify the program or the data set to correct the error. Use of the ONKEY built-in function in a KEY ON-unit will aid in determining the value of the erroneous key.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM051

IBM0162S ONCODE=*oncode-value* **The KEY condition was raised because the specified key was already in use in data set (***FILE= or ONFILE= file-name***).**

Explanation: In the case of data set with INDEXED organization, an attempt was made to transmit a keyed record to a data set that already held a record with the same key. In the case of a data set with REGIONAL(1) or REGIONAL(2) organization that was being created sequentially, an attempt was made to transmit a record to a region that already contains a record. The ONCODE associated with this message is 52.

Programmer Response: Either check the validity of the data that is being processed before running the program or use the program to check the data. Use of the ONKEY built-in function in a KEY ON-unit can aid in identifying an erroneous key, correcting it, and allowing processing to continue normally.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM052

IBM0163S ONCODE=*oncode-value* **The KEY condition was raised because the specified key was less than the value of the previous key (***FILE= or ONFILE= file-name***).**

Explanation: A key with a value that was less than the value of the preceding key was detected during the creation or extension of an INDEXED or REGIONAL SEQUENTIAL data set. The ONCODE associated with this message is 53.

Programmer Response: Ensure the records written onto an INDEXED or REGIONAL data set that is being created or extended are in the correct ascending key sequence order. Also, use a KEY ON-unit to comment on the error and, where possible, allow processing to continue normally.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM053

IBM0164S ONCODE=*oncode-value* **The KEY condition was raised because the specified key could not be converted to valid data (***FILE= or ONFILE= file-name***).**

Explanation: A WRITE, READ, REWRITE, DELETE or LOCATE statement for a REGIONAL data set specified a key with a invalid character-string value. Invalid values consist entirely of blanks, contain characters other than 0-9, or a have blank as part of the region number. The ONCODE associated with this message is 54.

Programmer Response: Ensure the key is in the correct format. If necessary, use the ONKEY built-in function in a KEY ON-unit to identify the erroneous key. The ON-unit can be used to report any such errors and allow processing to continue. Records associated with the erroneous keys can be transmitted in a subsequent run if the keys have been corrected.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM054

IBM0165S ONCODE=*oncode-value* **The KEY condition was raised because the specified key was invalid (***FILE= or ONFILE= file-name***).**

Explanation: For an INDEXED data set, either the KEY or the KEYFROM expression was a null string or an attempt was made to rewrite a record with the embedded key of the replacement record not equal to the record to be overwritten. For a REGIONAL data set, the key specified was a null string or a string commencing with '11111111'B. The ONCODE associated with this message is 55.

Programmer Response: Refer to the steps for message IBM0165.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM055

IBM0166S ONCODE=*oncode-value* **The KEY condition was raised because the key specifies a position outside the Regional data set (***FILE= or ONFILE= file-name***).**

Explanation: A WRITE, READ, REWRITE or DELETE statement specified a key whose relative record or track value exceeded the number of records or tracks respectively for the REGIONAL data set. The ONCODE associated with this message is 56.

Programmer Response: Refer to the steps for message IBM0164.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM056

IBM0167S ONCODE=*oncode-value* **The KEY condition was raised because space was not available to add a keyed record (***FILE= or ONFILE= file-name***).**

Explanation: For a SEQUENTIAL file associated with an INDEXED data set, an attempt was made to write or locate a record during the creation or extension of such a data set when the space allocated to the data set was full. For a DIRECT file associated with an INDEXED data set, space in overflow areas was unable to accept the overflow record. This was caused by the insertion of a new record by a WRITE statement. For a DIRECT file associated with a REGIONAL data set, space was unavailable to add the record in the specified limit of search as specified in the LIMCT subparameter of the DCB parameter. Note that the data set is not necessarily full. The ONCODE associated with this message is 57.

Programmer Response: Use the ONKEY built-in function to identify the key value that caused the error. If the key is in error, correct it and continue the job from the point reached when the error occurred. If the key is correct, organize the data set so the rejected record can be accessed.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM057

IBM0168S ONCODE=*oncode-value* **The KEY condition was raised because the KEYFROM value was outside the KEYRANGE(s) defined for the data set (***FILE= or ONFILE= file-name***).**

Explanation: A WRITE or LOCATE statement specified a key with a value outside the key ranges defined for the data set (VSAM KSDS). The ONCODE associated with this message is 58.

Programmer Response: Use the ONKEY built-in function to identify the key value that caused the error and correct the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM058

IBM0180S ONCODE=*oncode-value* **The ENDFILE condition was raised by a SIGNAL statement (***FILE= or ONFILE= file-name***).**

Explanation: The program contained a SIGNAL statement to raise the ENDFILE condition for which there was no associated ON-unit. The ONCODE associated with this message is 70.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the ENDFILE condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM05K

IBM0181S ONCODE=*oncode-value* **The ENDFILE condition was raised (***FILE= or ONFILE= file-name***).**

Explanation: The end of an input file was detected. The ONCODE associated with this message is 70.

Programmer Response: Include an ON-unit for the ENDFILE condition for each input file in the program to handle the end-of-file processing.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM05L

IBM0182S ONCODE=*oncode-value* **The ENDFILE condition was raised because an end-of-file was previously encountered in STREAM input (***FILE= or ONFILE= filename***).**

Explanation: The ENDFILE condition was raised when the file mark was encountered but an attempt was made to read beyond the end of the file. Either an ENDFILE ON-unit was run and an attempt was made to read the file or the end-of-file mark was encountered between items in the data list of the current GET statement. The ONCODE associated with this message is 70.

Programmer Response: If the program contains an ENDFILE ON-unit, ensure the program does not attempt to read the file after the ENDFILE condition is raised. If the error occurred while a GET statement with two or more items in the data list is running, ensure the GET statement can complete by providing sufficient data items before the end-of-file mark is encountered.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM05M

IBM0190W The ENDPAGE condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the ENDPAGE condition. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM05U

IBM0191W The ENDPAGE condition was raised.

Explanation: A PUT statement resulted in an attempt to start a new line beyond the limit specified for the current page. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM05V

IBM0195W The PENDING condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the PENDING condition. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM063

IBM0196W The PENDING condition was raised.

Explanation: An attempt was made to read a record for a TRANSIENT INPUT file that was temporarily unavailable. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM064

IBM0200S ONCODE=*oncode-value* The UNDEFINEDFILE condition was raised by a SIGNAL statement (*FILE= or ONFILE= file-name*).

Explanation: The program contained a SIGNAL statement to raise the UNDEFINEDFILE condition for which there was no associated ON-unit. The ONCODE associated with this message is 80.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the UNDEFINEDFILE condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM068

IBM0201S ONCODE=81 The UNDEFINEDFILE condition was raised because of conflicting DECLARE and OPEN attributes (*FILE= or ONFILE= file-name*).

Explanation: An attribute in an OPEN statement conflicted with an attribute in a DECLARE statement. The attributes may have been written explicitly or implied by other attributes. For example, DIRECT implies KEYED. Also, some RECORD input/output statements imply file attributes in an implicit OPEN statement. For example, LOCATE implies RECORD OUTPUT BUFFERED SEQUENTIAL. Conflicting attributes are:

BACKWARDS	STREAM, OUTPUT/UPDATE, DIRECT, KEYED, EXCLUSIVE, PRINT, TRANSIENT
BUFFERED	STREAM, UNBUFFERED, PRINT
DIRECT	STREAM, SEQUENTIAL, BACKWARDS, PRINT, TRANSIENT
EXCLUSIVE	STREAM, INPUT/OUTPUT, SEQUENTIAL, BACKWARDS, PRINT, TRANSIENT
INPUT	OUTPUT/UPDATE, EXCLUSIVE, PRINT
KEYED	STREAM, BACKWARDS, PRINT
OUTPUT	INPUT/UPDATE, EXCLUSIVE, BACKWARDS
PRINT	RECORD, INPUT/UPDATE, DIRECT/SEQUENTIAL, BUFFERED/UNBUFFERED, KEYED, EXCLUSIVE, BACKWARDS, TRANSIENT
RECORD	STREAM, PRINT
SEQUENTIAL	STREAM, DIRECT, EXCLUSIVE, PRINT, TRANSIENT
STREAM	RECORD, UPDATE, DIRECT/SEQUENTIAL, BUFFERED/UNBUFFERED, KEYED, EXCLUSIVE, BACKWARDS, TRANSIENT
TRANSIENT	STREAM, UPDATE, DIRECT/SEQUENTIAL, EXCLUSIVE, BACKWARDS, PRINT
UNBUFFERED	STREAM, BUFFERED, PRINT
UPDATE	STREAM, INPUT/OUTPUT, BACKWARDS, PRINT, TRANSIENT

Programmer Response: Ensure the attributes specified on the DECLARE statement are compatible with the attributes specified on the OPEN statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM069

IBM0202S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the device type conflicted with file attributes (***FILE= or ONFILE= file-name***).**

Explanation: A conflict between the device type and the file attributes was detected. For example, a file with the UPDATE attribute cannot be associated with a paper tape reader, a printer, or a magnetic-tape device. The ONCODE associated with this message is 82.

Programmer Response: Ensure the device type and the file attributes are compatible.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06A

IBM0203S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the BLOCKSIZE was not specified (***FILE= or ONFILE= file-name***).**

Explanation: The blocksize for an output file was not specified. For an output file, the blocksize must be specified in either the ENVIRONMENT attribute or in the DCB parameter of the DD statement or CMS FILEDEF. The ONCODE associated with this message is 83.

Programmer Response: For output files, ensure the block size is specified. For input files, ensure the block size is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06B

IBM0204S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because a DD statement or CMS FILEDEF was not used in (***FILE= or ONFILE=file-name***).**

Explanation: The job stream for a file did not contain either a DD statement or a CMS FILEDEF. The job stream must contain a DD statement or a CMS FILEDEF with a ddname that is either the name of the file (if the TITLE option is not specified) or the name provided by the TITLE option. The ONCODE associated with this message is 84.

Programmer Response: Specify a DD statement or CMS FILEDEF to associate the file with a physical data set.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06C

IBM0205S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because of an I/O error - the Regional data set could not be formatted (***FILE= or ONFILE=file-name***).**

Explanation: An I/O error prevented the data set from being formatted correctly. When a REGIONAL data set is opened for direct output, data management routines format the data set into specified regions by writing dummy or control records into the data set.

Example:

```
TF: PROC;
OPEN FILE(F) DIRECT OUTPUT;
END;
```

The ONCODE associated with this message is 85.

Programmer Response: If the problem recurs, have the direct access device or storage medium checked by a customer engineer.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06D

IBM0206S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because a LINESIZE or PAGESIZE argument was outside the defined limits (***FILE= or ONFILE= file-name***).**

Explanation: The implementation-defined maximum or minimum for the LINESIZE option of the ENVIRONMENT attribute was exceeded. For F-format and U-format records, the maximum is 32,759. For V-format records, the maximum is 32,751. The minimum for V- and F-format records is 1. The minimum for V- format PRINT files is 9. The minimum for V-format non-PRINT files is 10. The ONCODE associated with this message is 86.

Programmer Response: Ensure the argument to the LINESIZE option is within the prescribed limits. If the argument is a variable, verfiy it is a FIXED BINARY (31,0) STATIC variable that was correctly initialized before the file was opened.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06E

IBM0207S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the key length was not specified (***FILE= or ONFILE= file-name***).**

Explanation: A key length was not specified in either the ENVIRONMENT attribute or the DCB parameter of the associated DD statement.

Programmer Response: Specify the key length and rerun the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06F

IBM0208S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the wrong BLOCKSIZE or record length was specified (***FILE= or ONFILE= file-name***).**

Explanation: One of the following conditions was detected:

1. Block size was less than record length.
2. For FB-format records, block size was not a multiple of record length.
3. For VS-format and VBS-format consecutive files:
   - LRECL=X was specified but RECSIZE was not specified or was invalid in the ENVIRONMENT attribute.
   - The file was opened for update with a specified logical record size exceeding 32,756.
4. For VS-format REGIONAL(3) files, logical record size was greater than block size minus four.
5. FUNC=EO was specified with a record length not equal to 80 or FUNC=CO was specified with a record size not equal to 160.
6. Column binary was specified with a record length not equal to 160 on an output file.
7. FUNC=I (punch interpret) was specified with a record length not equal to 80 (or 81 if control characters are in use).

The ONCODE associated with this message is 87.

Programmer Response: The numbered responses below apply to the correspondingly numbered explanations above:

1. Check the block size and record length specified in the BLKSIZE and RECSIZE options of the ENVIRONMENT attribute. If LINESIZE was specified, ensure it is compatible with BLKSIZE.
2. If the argument of either option is a variable, ensure it is FIXED BINARY(31,0) STATIC and has been initialized.

3. To correct this error:
   a. Specify a record size in the ENVIRONMENT attribute or correct its value.
   b. Specify a record size less than 32,757.
4. Specify a record size less than or equal to the block size minus four.
5. If FUNC=EO is specified, ensure the record length is 80. If FUNC=CO is specified, ensure the record length is 160.
6. Ensure the record length is 160 when column binary is specified.
7. If FUNC=I is specified, ensure the record length is 80.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06G

IBM0209S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because of conflicting attributes and file organization specifications (***FILE= or ONFILE= file-name***).**

Explanation: The file organization conflicted with one or more explicit or implicit file attributes. Refer to Table 10 for a list of possible conflicts.

Table 10. File Organization and Conflicting Attributes

Organization	Conflicting Attributes
CONSECUTIVE	DIRECT, EXCLUSIVE, KEYED, TRANSIENT
INDEXED	STREAM, TRANSIENT, DIRECT OUTPUT, OUTPUT without KEYED
REGIONAL	STREAM, TRANSIENT, OUTPUT without KEYED
TP	Non-TRANSIENT
VSAM	STREAM, TRANSIENT, BACKWARDS, DIRECT OUTPUT, OUTPUT without KEYED(KSDS), KEYED(ESDS), DIRECT(ESDS), REUSE for other than OUTPUT file, DIRECT with NON-UNIQUE INDEXES
None	KEYED, TRANSIENT

The ONCODE associated with this message is 82.

Programmer Response: Ensure the file attributes are compatible with the file organization.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06H

IBM0210S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the record format was invalid for this file organization (***FILE= or ONFILE= file-name***).**

Explanation: The following combinations of file organization and record format are valid:

Organization **Record Format**

CONSECUTIVE BUFFERED
All

CONSECUTIVE UNBUFFERED
F, FS, V, D, U

INDEXED F, FB, V, VB

REGIONAL(1) F

REGIONAL(2) F

REGIONAL(3) F, V, VS, U

TP(M), TP(R) None

The ONCODE associated with this message is 87.

Programmer Response: Change the file declaration so the record format is compatible with the file organization.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06I

IBM0211S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the record format was not specified (***FILE= or ONFILE= file-name***).**

Explanation: The record format was not specified. A record format must be supplied for a file with the RECORD attribute in either the ENVIRONMENT attribute or in the data set label. The ONCODE associated with this message is 83.

Programmer Response: Modify the program to include the record format for the file.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06J

IBM0212S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the KEYLENGTH was negative or greater than 255 (***FILE= or ONFILE= file-name***).**

Explanation: The KEYLENGTH option of the ENVIRONMENT attribute for this file had an invalid key length greater than 255 or less than zero.

Programmer Response: Check the argument of the KEYLENGTH option to ensure it is either a constant or a variable with the attributes FIXED BINARY (31,0) STATIC and value between zero and 255 when the file is opened. If the argument is a variable, ensure it is correctly initialized.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06K

IBM0213S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because an invalid KEYLOC value was detected (***FILE= or ONFILE=file-name***).**

Explanation: One of the following conditions was detected:

1. The offset of the key within a record was invalid. The sum of the KEYLOC value and the key length was greater than the record length.
2. For blocked ISAM files, either KEYLOC was not specified or KEYLOC(0) was specified. Both are invalid.

Programmer Response: The two numbered responses below apply to the numbered explanations above.

1. Check the value of the argument to the KEYLOC option. If the argument is a variable, check that it is FIXED BINARY (31,0) STATIC and that it has been correctly initialized.
2. Specify a KEYLOC value that is greater than zero.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06L

IBM0214S ONCODE=*oncode-value***. The UNDEFINEDFILE condition was raised because of conflicting or invalid environment options** *FILE= or ONFILE=file-name***).**

Explanation: There were conflicting environment options.

Programmer Response: Ensure all environment options for the file are compatible. If there are invalid environment options specified, remove or correct them.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06M

IBM0215S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because an invalid BUFOFF value was detected (***FILE= or ONFILE= file-name***). ASCII input data set are in the range 0 thru 99.**

Programmer Response: Ensure the value specified in the BUFOFF option is within the range of valid values. If the argument is a variable, also ensure if is correctly initialized.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06N

IBM0219S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the MODE or FUNC option conflicts with the file attribute (***FILE= or ONFILE= file-name***).**

Explanation: The MODE or FUNC DCB subparameter conflicted with a file attribute. Refer to *OS/390 Language Environment Programming Guide* for details of possible conflicts.

Programmer Response: Remove the conflicting file attribute, or replace it with one that is compatible with the MODE or FUNC option values. For more information on the MODE and FUNC subparameters of the DCB parameter, refer to *OS/390 MVS JCL User's Guide*.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06R

IBM0220S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the MODE or FUNC option conflicted with the record format (***FILE= or ONFILE= file-name***).**

Explanation: OMR or RCE files, IBM 3525 print files, and IBM 3525 associated files can be F-format only. The ONCODE associated with this message is 88.

Programmer Response: Ensure the MODE or FUNC option value is compatible with the record format of the file. For more information on the MODE and FUNC subparameters of the DCB parameter, refer to the *Job Control Language (JCL) User's Guide.*

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06S

IBM0221S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the device type conflicted with the MODE option (***FILE= or ONFILE= file-name***).**

Explanation: OMR can be used only on an IBM 3505 and RCE on an IBM 3525 device. The ONCODE associated with this message is 88.

Programmer Response: Ensure the device type and the MODE option value is compatible.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06T

IBM0222S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the TOTAL option is invalid with an OMR or associated file (***FILE= or ONFILE= file-name***).**

Explanation: Either the OMR (MODE=EO or MODE=CO) was specified on a file with the TOTAL option, or a device association was specified on a file with the TOTAL option. The ONCODE associated with this message is 88.

Programmer Response: Either remove the TOTAL option or modify the MODE option so it is compatible with a file with the TOTAL option.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06U

IBM0223S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because of a conflict between the MODE and FUNC options (***FILE= or ONFILE= file-name***).**

Explanation: Refer to *OS/390 Language Environment Programming Guide* for details of possible conflicts. The ONCODE associated with this message is 88.

Programmer Response: Ensure the values specified for the MODE and FUNC options are compatible. For more information, refer to *OS/390 MVS JCL User's Guide*.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM06V

IBM0225S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the value of the ENV option conflicted with the actual data set value (***FILE= or ONFILE= file-name***).**

Explanation: For VSAM data sets, the values of KEYLOC, KEYLENGTH and RECSIZE are specified when the data set is defined. If values are specified on any file declarations, they must match the defined values. The ONCODE associated with this message is 91.

Programmer Response: Ensure the values of KEYLOC, KEYLENGTH and RECSIZE specified in the program match the defined values.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM071

IBM0226S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the NCP or STRNO value was not 1 (***FILE= or ONFILE= file-name***).**

Explanation: Either an NCP value greater than one was specified in the ENV attribute or a STRNO value greater than one was specified in the AMP parameter in the DD statement. For VSAM files, only one outstanding operation is allowed. An operation with the EVENT option must be processed before another operation is started.

Programmer Response: Ensure the NCP or STRNO value for a VSAM file is one if the EVENT option is involved, or modify the program to use operations without the EVENT option to allow concurrent operations on the data set.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM072

IBM0227S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the TOTAL option is invalid for ESDS (***FILE= or ONFILE= file-name***).**

Explanation: The specification of TOTAL can cause the compiler to generate in-line code for I/O statements for CONSECUTIVE files. If the data set to be accessed is a VSAM Entry Sequenced Data set (ESDS) this code is invalid. The ONCODE associated with this message is 91.

Programmer Response: Remove the TOTAL option from the file declaration.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM073

IBM0228S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the password was invalid or was not specified (***FILE= or ONFILE= file-name***).**

Explanation: For VSAM data sets defined with a password, ENV (PASSWORD) and the password must be specified in the file declaration. If the password is incorrect or is not specified, a number of attempts will be given to specify the correct password. The number of retries allowed is specified when the data set is defined. If these attempts fail, UNDEFINEDFILE is raised.

Note: If the Authorized Program Facility (APF) is being used, the load module must be authorized.

The ONCODE associated with this message is 89.

Programmer Response: Modify the program to include the ENV (PASSWORD) option and the correct password in the file declaration.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM074

IBM0229S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because an entry was not in the VSAM catalog for data set (***FILE= or ONFILE= file-name***).**

Explanation: The ENV(VSAM) was specified for a file, but the data set was not converted from ISAM to VSAM. Before using a VSAM data set, a catalog entry must be created and space allocated for the data set using the access method services DEFINE command. The catalog containing the data set must be specified in a JOBCAT or STEPCAT DD statement (unless it is the master catalog). The ONCODE associated with this message is 92.

Programmer Response: Ensure the data set is catalogued and the right catalog is accessed. Also, ensure the data set is a valid VSAM data set.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM075

IBM0230S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because of an I/O error reading the catalog or the volume label (***FILE= or ONFILE= file-name***).**

Explanation: An I/O error prevented the reading of a VSAM catalog or a volume label. The ONCODE associated with this message is 92.

Programmer Response: Consult with the system programmer.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM076

IBM0231S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because a timestamp mismatch was detected (***FILE= or ONFILE= file-name***).**

Explanation: For VSAM data sets, the index and data can be updated separately and the time of the latest update of each is recorded. If these times do not match, the integrity of the data is uncertain and an OPEN error will occur. Similarly, the timestamp in the data set catalog record might not match the timestamp on the volume containing the data set. This indicates the extent information in the catalog record might not agree with the extents indicated in the VTOC for the volume. Message IEC161 is displayed on the operator's console and will provide more detail. The ONCODE associated with this message is 92.

Programmer Response: Resubmit the job. If the error recurs after resubmitting the job, use PLIDUMP to obtain a storage dump and save all the relevant documentation for study by IBM.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM077

IBM0232S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the requested data set was not available (***FILE= or ONFILE= file-name***).**

Explanation: The data set to be accessed was already being used by another program and could not be shared. Refer to *OS/390 Language Environment Programming Guide* for further information.

Programmer Response: Refer to *OS/390 Language Environment Programming Guide* for more information on sharing data sets.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM078

IBM0233S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the data set was not properly closed (***FILE= or ONFILE= file-name***).**

Explanation: The last time the data set was opened the close operation failed, leaving the data set in an unusable state. The ONCODE associated with this message is 92.

Programmer Response: Use the access method services VERIFY command to restore the data set to a usable state. Refer to the MVS/DFP Access Method Services manual for details.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM079

IBM0234S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the data set was never loaded (***FILE= or ONFILE= file-name***).**

Explanation: A file can not be opened for INPUT or UPDATE to access a VSAM data set until one or more records have been loaded into the data set using a SEQUENTIAL OUTPUT file. Once records are loaded into the data set, records can be added using a DIRECT UPDATE file even after all records have been deleted from the data set. The ONCODE associated with this message is 82.

Programmer Response: Load the empty data set first. Then proceed with further update/input/delete activity.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM07A

IBM0235S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because of an unidentified error during VSAM open (***FILE= or ONFILE= file-name***). Subcode1=***sc1* **Subcode2=***sc2*

Explanation: The VSAM routines detected an error during the open process which PL/I did not recognize. Subcode1 and Subcode2 provide detailed VSAM diagnostic information. See message IBM0811S for an explanation of these fields. VSAM message IEC161 will also be displayed on the operator's console and will provide more detail.

Programmer Response: Use the VSAM diagnostic messages to correct the cause of the error and resubmit the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM07B

IBM0236S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the operating system was unable to OPEN the file Subcode1= sc1 Subcode2=sc2 (***FILE= or ONFILE= file-name***).**

Explanation: The operating system or access method encountered an error during the open process. Subcode1 indicates why the file could not be opened. Subcode2, if not zero, indicates the return code (in hexadecimal) given by the operating system or access method. Subcode2 information is mainly used by IBM support when diagnosing problems. The meaning of the Subcode1 values are as follows:

1. 50 - A non-existent ISAM file is being opened for input.
2. 51 - An unexpected error occurred when opening an ISAM file. Subcode2 gives the return code from ISAM.
3. 52, 53 - An unexpected error occurred when opening a native or REGIONAL(1) file.
4. 54 - A non-existent BTRIEVE file is being opened for input.
5. 55 - An unexpected error occurred when opening a BTRIEVE file. Subcode2 gives the return code from BTRIEVE.
6. 56 - An unexpected error occurred when opening a DDM file.
7. 57,58 - An unexpected error occurred when opening a DDM sequential, DDM relative or DDM indexed file. Subcode2 gives the return code from DDM.
8. 60 - A file of invalid type is being opened. An example of this is opening a VSAM file under Open Edition. VSAM files are not supported under Open Edition.

The ONCODE associated with this message is 93.

Programmer Response: For Subcodes 50 and 54, ensure the input file exists. For Subcode 60, ensure the file being opened has a file type that is supported by the operating system under which the program is being run. For all the other subcodes, call IBM Support for assistance.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM07C

IBM0241S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the REUSE option was specified for a non-reusable data set (***FILE= or ONFILE= file-name***).**

Explanation: The ENVIRONMENT option REUSE can only be specified with VSAM data sets which have been defined as reusable during their creation by access method services. The ONCODE associated with this message is 94.

Programmer Response: Remove the REUSE option.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM07H

IBM0242S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because the alternate index path was empty (***FILE= or ONFILE= file-name***).**

Explanation: An alternate index can be emptied by having all of its pointers deleted. An empty alternate index cannot be opened. The ONCODE associated with this message is 95.

Programmer Response: Ensure the index is defined before it is built and the right alternate index is used.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM07I

IBM0243S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because an attempt to position the file at the last record failed (***FILE= or ONFILE= file-name***). Subcode1=** *sc1* **Subcode2=** *sc2*

Explanation: When the ENVIRONMENT option BKWD is specified for a file open, the file must be positioned at the last record. If an attempt to position at the last record fails, the file is closed and the UNDEFINEDFILE condition is raised with this message. Subcode1 and Subcode2 provide detailed VSAM diagnostic information. See message IBM0811S for an explanation of these fields. This message is also issued if the data set only consists of deleted records. For this case, the subcodes are zero.

Programmer Response: Use the VSAM diagnostic information to correct the cause of the error and resubmit the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM07J

IBM0260S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because of an incorrect environment variable (***FILE= or ONFILE= file-name***).**

Explanation: The DD environment variable defining charactericstics of the data set either was entered incorrectly or contained an invalid option. The ONCODE associated with this message is 96.

Programmer Response: Re-issue the SET DD command (OS/2 and Windows) or the export DD command (AIX and Open Edition) and rerun your program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM084

IBM0265S ONCODE=*oncode-value***. The UNDEFINEDFILE condition was raised because the file could not be opened Subcode1=** *sc1* **Subcode2=***sc2* **(***FILE= or ONFILE= file-name***).**

Explanation: The file could not be opened. Subcode1 indicates why the file could not be opened and Subcode2, if not zero, indicates the return code (in hexadecimal) given by the operating system or DDM. Subcode2 information is mainly used by IBM support when diagnosing problems. The meaning of the Subcode1 values are as follows:

- 1, 2 - no RECCOUNT or RECSIZE values were given via the ENVIRONMENT option or the set DD or export DD enviornment variable.
- 3 - A positioning error occurred for a sequential output file.
- 4 - TYPE(FIXED) was specified for a native file, but the file size was not a multiple of RECSIZE.
- 5, 13 - A positioning error occurred for a regional(1) file.
- 6 to 12 - A positioning error occurred for an output file.

- 21 to 23 - AMTHD(DDM) was specified on the DD environment variable but the DDM loadable component (DUBRUN and DUBLDM on OS/2, or PLI_DDM on AIX) could not be found or could not be accessed on the system.
- 24 - Incorrect extended attribute existed on a DDM file.
- 25 - The ORGANIZATION option of the ENVIRONMENT attribute conflicted with the type of data set (DDM or native).
- 26 - Conflicts exist with the way the file is being used.
- 27 - A composite key was detected with a keyed-opening. Composite keys are acceptable only for non-keyed openings.
- 28 to 30 - A new DDM file could not be created.
- 31 - A positioning error occurred for a DDM file.
- 35 - AMTHD(BTRIEVE) was specified on the DD environment variable but the BTRIEVE loadable component (BTRCALLS) could not be found or could not be accessed on the system.
- 36 - Unexpected error occurred when opening a BTRIEVE file.
- 37 - A new BTRIEVE file could not be created.
- 38 - A positioning error occurred for a BTRIEVE file.
- 40 - AMTHD(ISAM) was specified on the DD environment variable but the ISAM non-multithreading loadable components(IBMOS20F and IBMOS20G on OS/2, or IBMWS20F and IBMWS20G on Windows) or the ISAM mulithreading loadable components(IBMOM20F and IBMOM20G on OS/2, or IBMWM20F and IBMWM20G on Windows) could not be found or could not be accessed on the system.
- 41 - Unexpected error occurred when opening an ISAM file.
- 42 - A new ISAM file could not be created.
- 43 - A positioning error occurred for an ISAM file.

The ONCODE associated with this message is 99.

Programmer Response: Re-issue the DD environment variable and use the information to correct the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM089

IBM0269S ONCODE=*oncode-value***. The UNDEFINEDFILE condition was raied because the file function conflicted with the DDM data set definition (***FILE= or ONFILE= file_name***).**

Explanation: A conflict existed between the I/O functions intended for the file and the functions allowed on the data set. One of the following was detected when attempting to open a file to be accessed by the DDM access method:

- The file was being opened for INPUT but the data set was not **get capable**
- The file was being opened for UPDATE, but the data set was not **insert capable**, **get capable**, **modify capable**, or **delete capable**
- The file was being opened for OUTPUT, but the data set was not **insert capable**

Programmer Response: Ensure the correct data set is being referenced and the data set is re-created with an appropriate set of capabilities.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM08D

IBM0280S The ERROR condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the ERROR condition.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the ERROR condition in the program that transfers control out of the ON-unit with a GO TO statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM08O

IBM0281S A prior condition was promoted to the ERROR condition.

Explanation: This condition was raised by PL/I because the implicit action occurred for a PL/I condition that includes raising the ERROR condition as part of its implicit action.

The message for this condition is never issued, but it can appear in a dump. Note that the message for the prior condition was issued.

Programmer Response: Investigate the prior condition that led to the ERROR condition. Remove the cause of that condition, or include an ON-unit for that condition or an ON-unit for the ERROR condition.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM08P

IBM0290S ONCODE= *oncode-value***. The CONVERSION condition was raised because a conversion from PICTURE format contained an invalid character.**

Explanation: An invalid character was detected in a picture string that was being converted to an arithmetic data type.

Programmer Response: If the error is in the conversion of a PL/I source program constant or in the conversion of a picture character string while the program is running, correct the source program, recompile it, and rerun the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM092

IBM0291S ONCODE= *oncode-value***. The CONVERSION condition was raised because a conversion from PICTURE format contained an invalid character on input or output.**

Explanation: A picture character which was invalid for conversion to an arithmetic form was detected in one of the following:

- An arithmetic constant in a list-directed or data-directed item
- A picture character constant being converted to an arithmetic form in a list-directed or data-directed item
- A PICTURE format input field being converted to an arithmetic form

Programmer Response: Include a suitable ON-unit in the program to nomitor errors in the input data that are revealed by the CONVERSION condition. Use the ONSOURCE and ONCHAR built-in functions to identify the error, and the ONSOURCE and ONCHAR pseudovariables to assign a valid numeric value so the program can continue running normally. Otherwise, ensure all input is in the correct format before running the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM093

IBM0292S ONCODE= *oncode-value***. The CONVERSION condition was raised because a conversion from PICTURE format contained an invalid character on input or output after the TRANSMIT condition was detected.**

Explanation: A picture character which was invalid for conversion to an arithmetic form was detected in one of the following:

- An arithmetic constant in a list-directed or data-directed item
- A picture character constant being converted to an arithmetic form in a list-directed or data-directed item
- A PICTURE format input field being converted to an arithmetic form

A transmission error also occurred and may have caused the conversion error.

Programmer Response: Correct the transmission error. If the conversion error recurs after the transmission error is corrected, refer to the steps for message IBM0291.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM094

IBM0300S ONCODE=320 The ZERODIVIDE condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the ZERODIVIDE condition for which there was no associated ON-unit.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the ZERODIVIDE condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM09C

IBM0301S ONCODE=*oncode-value* **The ZERODIVIDE condition was raised.**

Explanation: The program attempted to execute a statement in which a value of zero was used as the divisor in a division operation. Alternatively, an overflow occurred during a convert to binary operation.

Programmer Response: Either check the data that could produce a zero divisor (or overflow, if doing a convert to binary operation) before running the program or include an ON-unit for the ZERODIVIDE condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM09D

IBM0320W ONCODE=*oncode-value* **The UNDERFLOW condition was raised by a SIGNAL statement.**

Explanation: The program contained a SIGNAL statement to raise the UNDERFLOW condition for which there was no associated ON-unit. The ONCODE associated with this message is 330.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the UNDERFLOW condition in the program.

System Action: Execution continues with the next sequential statement.

Symbolic Feedback Code: IBM0A0

IBM0321W ONCODE=*oncode-value* The UNDERFLOW condition was raised.

Explanation: The magnitude of a floating-point number was smaller than the allowed minimum.

Programmer Response: Either modify the program so that the magnitude of the floating-point number is higher than the minimum allowed, or include an ON-unit for the UNDERFLOW condition in the program.

System Action: Execution continues from the point at which the condition was raised.

Symbolic Feedback Code: IBM0A1

IBM0330W The ATTENTION condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the ATTENTION condition. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM0AA

IBM0340S ONCODE=*oncode-value* The SIZE condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the SIZE condition for which there was no associated ON-unit. The ONCODE associated with this message is 340.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the SIZE condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0AK

IBM0341S ONCODE=*oncode-value* The SIZE condition was raised in an I/O statement.

Explanation: The high-order (leftmost) significant binary or decimal digits were lost in an input/output operation where the size of the value being transmitted exceeded the declared (or default) size of the data item. The ONCODE associated with this message is 341.

Programmer Response: Either modify the program so that the data item is large enough for the value being transmitted or include an ON-unit for the SIZE condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0AL

IBM0342S ONCODE=*oncode-value* The SIZE condition was raised.

Explanation: The high-order (leftmost) significant binary or decimal digits were lost in an assignment to a variable or temporary variable where the size of the value being assigned exceeded the declared (or default) size of the data item. The ONCODE associated with this message is 341.

Programmer Response: Either modify the program so that the data item is large enough for the value being assigned to it or include an ON-unit for the SIZE condition to allow processing to continue when the SIZE condition is raised.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0AM

IBM0360W ONCODE=*oncode-value* The STRINGRANGE condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the STRINGRANGE condition for which there was no associated ON-unit. The ONCODE associated with this message is 350.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the STRINGRANGE condition in the program.

System Action: Execution continues with the next sequential statement.

Symbolic Feedback Code: IBM0B8

IBM0361W ONCODE=*oncode-value* The STRINGRANGE condition was raised.

Explanation: In the expression SUBSTR(S,I,J), the substring represented by starting position I for a length of J does not lie wholly within the string S.

Programmer Response: Ensure that the values used for I and J are neither less than nor greater than the length of S.

System Action: Execution continues with a revised SUBSTR reference. Refer to the Language Reference Manual for details regarding the value of the revised SUBSTR reference.

Symbolic Feedback Code: IBM0B9

IBM0365W The FINISH condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the FINISH condition. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM0BD

IBM0366S The FINISH condition was raised during a STOP statement.

Explanation: The program contained a STOP statement which caused the FINISH condition to be raised. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM0BE

IBM0367S The FINISH condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise during an EXIT statement which caused the FINISH condition to be raised. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM0BF

IBM0368W The FINISH condition was raised due to a RETURN or END statement in the main procedure.

Explanation: The program completed normally, and as a result the FINISH condition was raised. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM0BG

IBM0369S The FINISH condition was raised after the ERROR condition.

Explanation: The FINISH condition was raised as the normal return action or implicit action for the ERROR condition. The message for this condition is never issued by PL/I.

Programmer Response: None.

System Action: None.

Symbolic Feedback Code: IBM0BH

IBM0380S ONCODE=*oncode-value* The AREA condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the AREA condition for which there was no associated ON-unit. The ONCODE associated with this message is 362.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the AREA condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0BS

IBM0381S ONCODE=*oncode-value* The AREA condition was raised because the target area was too small for the AREA assignment.

Explanation: In an assignment of an area variable, the current extent of the area on the right-hand side of the assignment statement was greater than the size of the area to which it was to be assigned. The ONCODE associated with this message is 361.

Programmer Response: Modify the program to ensure that the target area is large enough to contain the source area.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0BT

IBM0382S ONCODE=*oncode-value* The AREA condition was raised because of insufficient contiguous space in the area for allocation.

Explanation: Insufficient space was available in the specified area for the allocation. The ONCODE associated with this message is 360.

Programmer Response: Provide an ON-unit to allow the allocation to be tried again. If necessary, change the value of the pointer qualifying the reference to the inadequate area so that it points to another area in which the allocation can be tried again.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0BU

IBM0400W ONCODE=*oncode-value* The CONDITION condition was raised by a SIGNAL statement and the condition *condition-name* was signaled.

Explanation: The program contained a SIGNAL statement to raise the CONDITION condition for which there was no associated ON-unit. The ONCODE associated with this message is 500.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the CONDITION condition in the program.

System Action: Execution continues with the next sequential statement.

Symbolic Feedback Code: IBM0CG

IBM0420S ONCODE=*oncode-value* The SUBSCRIPTRANGE condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the SUBSCRIPTRANGE condition for which there was no associated ON-unit. The ONCODE associated with this message is 520.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the SUBSCRIPTRANGE condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0D4

IBM0421S ONCODE=*oncode-value*. The SUBSCRIPTRANGE condition was raised.

Explanation: An array subscript exceeded the declared bound for the array.

Programmer Response: In order to ensure that the program can continue processing after encountering a subscript range error, include an ON-unit for this condition which runs a GOTO statement to the appropriate place in the program. Also, recompile the program. Normal return from a SUBSCRIPTRANGE ON-unit will produce this message and raise the error condition. Note that array handling operations are made slower when SUBSCRIPTRANGE is enabled.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0D5

IBM0440W ONCODE=*oncode-value* The STRINGSIZE condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the STRINGSIZE condition for which there was no associated ON-unit. The ONCODE associated with this message is 150.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the STRINGSIZE condition in the program.

System Action: Execution continues with the next sequential statement.

Symbolic Feedback Code: IBM0DO

IBM0441W ONCODE=*oncode-value* The STRINGSIZE condition was raised.

Explanation: A string was assigned to a shorter string, causing right-hand characters or bits in the source string to be truncated.

Programmer Response: Determine whether or not truncation of the right-hand characters or bits in the source string is correct. Use an ON-unit to record the relevant data or modify the program as required. Note that string-handling operations are made slower when STRINGSIZE is enabled.

System Action: Execution continues from the point at which the condition was raised.

Symbolic Feedback Code: IBM0DP

IBM0442W ONCODE=151 The STRINGSIZE condition was raised. The condition was detected during a mixed character string assignment.

Explanation: This condition was raised by one of the CHAR, GRAPHIC, or MPSTR built-in functions. The target was not long enough to contain the result. This target can be the actual target or a temporary target that is created by the program. This condition may have occurred also due to a mixed character assignment with STRINGSIZE enabled and CHARGRAPHIC in effect for the procedure or block. An MPSTR call is generated in this case.

Programmer Response: Determine whether or not truncation of right-hand characters in the result is correct. Use an ON-unit to record the relevant data or modify the program as required.

System Action: Execution continues from the point at which the condition was raised.

Symbolic Feedback Code: IBM0DQ

IBM0450S ONCODE=*oncode-value* **The STORAGE condition was raised by a SIGNAL statement.**

Explanation: The program contained a SIGNAL statement to raise the STORAGE condition for which there was no associated ON-unit.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the STORAGE condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0E2

IBM0451S ONCODE=*oncode-value* **The STORAGE condition was raised.**

Explanation: There was insufficient storage available to satisfy a request for additional storage. For a storage allocation for a BASED variable, the variable was not allocated and its associated pointer will be undefined. For a storage allocation for a CONTROLLED variable, the controlled variable's generation was not allocated. A reference to the controlled variable will result in the access of a previous generation of the controlled variable (if any).

Programmer Response: Attempt to free the allocated storage through a FREE statement or within an ON-unit, or provide necessary steps in the ON-unit to terminate the program without losing pertinent information.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0E3

IBM0460S ONCODE=*oncode-value***. The OVERFLOW was raised by a SIGNAL statement.**

Explanation: The OVERFLOW condition was raised by a SIGNAL statement. :xpl.The program contained a SIGNAL statement to raise the OVERFLOW condition for which there was no associated ON-unit. The ONCODE associated with this message is 300.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the OVERFLOW condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0EC

IBM0461S ONCODE=*oncode-value* The OVERFLOW condition was raised.

Explanation: The magnitude of a floating-point number exceeded the allowed maximum.

Programmer Response: Modify the program to ensure that the condition does not recur or provide an ON-unit to handle the condition.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0ED

IBM0470S ONCODE=*oncode-value* The INVALIDOP condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the INVALIDOP condition for which there was no associated ON-unit.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the INVALIDOP condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0EM

IBM0472S ONCODE=*oncode-value*. The INVALIDOP condition was raised.

Explanation: One of the following types of floating point processor exceptions occurred:

- Invalid floating point operation exceptions, including the following:
  - Subtraction of two infinities
  - Multiplication of infinity by 0
  - Division of two infinities
  - Division of zero by zero
- Floating point processor stack overflow exception
- Floating point processor stack underflow exception
- Denormalized operand exception
- Precision exception
- Other nonspecific floating point processor exceptions

Continuing execution after an INVALIDOP condition, with or without an INVALIDOP ON-unit, can result in further conditions being raised and termination of the program. Generally, the program should be fixed to prevent INVALIDOP conditions from occurring because the occurrence of the INVALIDOP condition indicates the program has fatal or near-fatal errors.

Programmer Response: Either check the data or sequence of floating point instructions which could cause the INVALIDOP condition before running the program or insert an INVALIDOP ON-unit to handle the condition whenever it arises.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0EO

IBM0480S ONCODE=*oncode-value* The FIXEDOVERFLOW condition was raised by a SIGNAL statement.

Explanation: The program contained a SIGNAL statement to raise the FIXEDOVERFLOW condition for which there was no associated ON-unit. The ONCODE associated with this message is 310.

Programmer Response: Either remove the SIGNAL statement or include an ON-unit for the FIXEDOVERFLOW condition in the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0F0

IBM0482S ONCODE=*oncode-value* **The FIXEDOVERFLOW condition was raised.**

Explanation: The length of the result of a fixed-point arithmetic operation exceeded the allowed maximum.

Programmer Response: Modify the program to ensure that the condition does not recur or provide an ON-unit to handle the condition.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0F2

IBM0501S ONCODE= *oncode-value***. Greenwich Mean Time was not available for the RANDOM built-in function.**

Explanation: Greenwich Mean Time was not set on the system. The ONCODE associated with this message is 2101.

Programmer Response: Greenwich Mean Time needs to be set on the system. Use the OS/2 API DosSetDateTime service to set the time. Refer to the OS/2 Control Programming Reference for details.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0FL

IBM0502S ONCODE= *oncode-value***. An invalid seed value was detected in the RANDOM built-in function.**

Explanation: The input seed value was not within the valid range of 0 to 2,147,483,646. The random number was set to —1. The ONCODE associated with this message is 2102.

Programmer Response: Correct the seed value to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0FM

IBM0503S ONCODE= *oncode-value***. Local time was unavailable.**

Explanation: The system clock was not set. The ONCODE associated with this message is 2103.

Programmer Response: Set the system clock using the appropriate OS/2 commands or use a program that uses the OS/2 API DosSetDateTime service. Refer to the OS/2 Control Programming Reference for details.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0FN

IBM0504S ONCODE= *oncode-value* **The value of Y in SECSTODATE(X,Y), DAYS(X,Y), DAYSTODATE(X,Y), or DATETIME(Y) contained an invalid PICTURE.**

Explanation: The character string representing the desired format for the output datetime stamp contained an invalid picture string. The ONCODE associated with this message is 2104.

Programmer Response: Correct the format.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0FO

IBM0505S ONCODE= *oncode-value* **X in DAYS(X,(Y)) contained an invalid day value.**

Explanation: The supplied value for the day parameter was not within the valid range of 15 October 1582 to 31 December 9999. The ONCODE associated with this message is 2105.

Programmer Response: Correct the value for the day parameter to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0FP

IBM0506S ONCODE= *oncode-value* **X in DAYS(X,(Y)) contained an invalid month value.**

Explanation: The supplied value for the month parameter was not within the valid range of October 1582 to December 9999. The ONCODE associated with this message is 2106.

Programmer Response: Correct the value for the month parameter to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBMOFQ

IBM0507S ONCODE= *oncode-value* **X in DAYS(X,(Y)) contained an invalid year value.**

Explanation: The supplied value for the year parameter was not within the valid range of 1582 to 9999. The ONCODE associated with this message is 2107.

Programmer Response: Correct the value for the year parameter to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBMOFR

IBM0508S ONCODE= *oncode-value* **X in DAYSTODATE(X,(Y)) was outside the supported range.**

Explanation: X represents the number of days since 15 October 1582. The valid range is from 1 to 3,074,324. The ONCODE associated with this message is 2108.

Programmer Response: Correct the value for X to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBMOFS

IBM0509S ONCODE= *oncode-value***. X in SECSTODATE(X,(Y)) was outside the supported range.**

Explanation: X represents the number of seconds elapsed since 00:00:00 on 14 October 1582, with 00:00:00.000 15 October 1582 being the first supported date/time, and 23:59:59.999 31 December 9999 being the last supported date/time. The valid range is from 86,400 to 265,621,679,999.999. The ONCODE associated with this message is 2109.

Programmer Response: Correct the value for X to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0FT

IBM0510S ONCODE= *oncode-value*. **X in DAYSTODATE(X,Y) could not be converted to a valid Era.**

Explanation: The picture string indicated that X was to be converted to a Japanese or Republic of China Era, but X was outside the range of supported Eras. The ONCODE associated with this message is 2110.

Programmer Response: Ensure X contains a valid Lilian day number within the range of supported Eras.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0FU

IBM0511S ONCODE= *oncode-value*. **The offset from Greenwich Mean Time was unavailable.**

Explanation: The difference between the current local time and the Greenwich Mean Time was not available from the system. The ONCODE associated with this message is 2111.

Programmer Response: Ensure that both the Greenwich Mean Time and the local time are set on the system. Use the OS/2 API DosSetDateTime service to set the time. Refer to the OS/2 Control Programming Reference for details.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0FV

IBM0512S ONCODE= *oncode-value* **X in SECS(X,Y) or DAYS(X,Y) was outside the supported range.**

Explanation: The input date supplied was earlier than 15 October 1582 or later than 31 December 9999. The ONCODE associated with this message is 2112.

Programmer Response: Correct the input date to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0G0

IBM0513S ONCODE= *oncode-value* **X in SECS(X,Y) contained an invalid seconds value.**

Explanation: The supplied value for the seconds parameter was not within the valid range of 0 to 59. The ONCODE associated with this message is 2113.

Programmer Response: Correct the value for the seconds parameter to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0G1

IBM0514S ONCODE= *oncode-value* **X in SECS(X,Y) contained an inalid minutes value.**

Explanation: The supplied value for the minutes parameter was not within the valid range of 0 to 59. The ONCODE associated with this message is 2114.

Programmer Response: Correct the value for the minutes parameter to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0G2

IBM0515S ONCODE= *oncode-value* **X in SECS(X,Y) contained an inalid hour value.**

Explanation: The valuid range for the hour parameter is 0 to 23. If the "AP" field is present, the valid range is 0 to 12. The ONCODE associated with this message is 2115.

Programmer Response: Correct the value for the hour parameter to be within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0G3

IBM0516S ONCODE= *oncode-value* **X in DAYS(X,Y)did not match the picture specification.**

Explanation: The value of X did not match the format described by the picture specification. For example, non-numeric characters appear where only numeric characters are expected. The ONCODE associated with this message is 2116.

Programmer Response: Verify the format of the input data matches the picture string specification.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBMOG4

IBM0517S ONCODE= *oncode-value* **X in SECS(X,Y) did not match the picture specification.**

Explanation: The value of X did not match the format described by the picture specification. For example, non-numeric characters appear where only numeric characters are expected. The ONCODE associated with this message is 2117.

Programmer Response: Verify the format of the input data matches the picture string specification.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0G5

IBM0518S ONCODE= *oncode-value* **The date string returned by DAYSTODATE(X,Y) was truncated.**

Explanation: The output string was not large enough to contain the formatted date value. The ONCODE associated with this message is 2118.

Programmer Response: Ensure the output string is large enough to contain the entire formatted date.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBMOG6

IBM0519S ONCODE= *oncode-value* **The timestamp string returned by DATETIME(X) or SECSTODATE(X,Y) was truncated.**

Explanation: The output string was not large enough to contain the formatted data value. The ONCODE associated with this message is 2119.

Programmer Response: Ensure the output string is large enough to contain the entire formatted date.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0G7

IBM0520S ONCODE= *oncode-value* **X in SECSTODATE(X,Y) or DATETIME(X) contained an invalid number-of-seconds value.**

Explanation: The picture string indicated that X was to be converted to a Japanese or Republic of China Era, but X lies outside the range of supported Eras. The ONCODE associated with this message is 2120.

Programmer Response: Ensure X contains a valid number-of-seconds value within the range of supported Eras.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0G8

IBM0521S ONCODE= *oncode-value* **Insufficient data was passed to the DAYS or SECS built-in function.**

Explanation: The picture string passed to the DAYS or SECS built-in function did not contain enough information. The minimum information required is either month, day, and year, or year and Julian day. The ONCODE associated with this message is 2121.

Programmer Response: Ensure the input data contains, as a minimum, the year, month, and day, or the year and Julian day.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0G9

IBM0522S ONCODE= *oncode-value* **X in SECS(X,Y) or DAYS(X,Y) contained an invalid Era name.**

Explanation: X did not contain a supported Japanese or Republic of China Era name. The ONCODE associated with this message is 2122.

Programmer Response: Ensure X is a valid DBCS string.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GA

IBM0531S ONCODE= *oncode-value* **Operation exception.**

Explanation: A programmer-related hardware error was detected. The ONCODE associated with this message is 8091.

Programmer Response: It is possible that an error in the program has caused part of the instructions that can be run to be overwritten by data. Other possible causes of an operation exception might be an attempt to invoke an external procedure or other routine that was not incorporated into the running program by the linkage editor, or running a branch instruction that is incorrect because a control block had previously been overwritten. Consequently, it is advisable to check the linkage editor diagnostics to ensure that all requested external procedures and subroutines have in fact been incorporated into the running program, and that any overlay phases do not oeverwrite any phases that are still active.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GJ

IBM0532S ONCODE= *oncode-value* **Privileged operation exception**

Explanation: A programmer-related hardware error was detected. The ONCODE associated with this message is 8092.

Programmer Response: If the error is not in a non-PL/I routine included in the running program, the PL/I program should be checked for an error that could cause the instructions that run to be overwritten by data that matches a privileged operation.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GK

IBM0533S ONCODE= *oncode-value* **EXECUTE exception**

Explanation: A programmer-related hardware error was detected. The ONCODE associated with this message is 8093.

Programmer Response: If the error is not in a non-PL/I routine included in the running program, the PL/I program should be checked for an error that could cause the running instruction to be overwritten by data that matches the operation code for the EXECUTE instruction on.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GL

IBM0534S ONCODE= *oncode-value* **Protection exception**

Explanation: A programmer-related hardware error was detected. The ONCODE associated with this message is 8094.

Programmer Response: If the error is not in a non-PL/I routine included in the running program, the PL/I program should be checked for an error that could cause the address used by the store instruction to be corrupted.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GM

IBM0535S ONCODE= *oncode-value* **Addressing exception**

Explanation: A programmer-related hardware error was detected. The ONCODE associated with this message is 8095.

Programmer Response: If the error is not in a non-PL/I routine included in the running program, the PL/I program should be checked for an error that could cause the address to be corrupted.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GN

IBM0536S ONCODE= *oncode-value* **Specification exception**

Explanation: A programmer-related hardware error was detected. The ONCODE associated with this message is 8096.

Programmer Response: If the error is not in a non-PL/I routine included in the running program, the PL/I program should be checked for an error that could cause the operand to be corrupted by overwriting control blocks or sections of running code.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GO

IBM0537S ONCODE= *oncode-value* **Data exception**

Explanation: A programmer-related hardware error was detected. The ONCODE associated with this message is 8097.

Programmer Response: The PL/I program should be checked for an error such as an operation on a FIXED DECIMAL data item before it has been initialized, or an error which could cause the data item to be overwritten.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GP

IBM0541S ONCODE= *oncode-value* **X in ASIN(X) or ACOS(X) was invalid**

Explanation: One of the following conditions was detected:

- ABS(X) was greater than one.

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1518 Argument greater than one

- For real long floating-point arguments:

  1519 Argument greater than one

- For real extended floating-point arguments:

  1520 Argument greater than one

Programmer Response: Ensure X is a real expression where ABS(X) is less than or equal to one.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GT

IBM0542S ONCODE= *oncode-value* **X in ATAN(X) or ATAND(X) was invalid.**

Explanation: One of the following conditions was detected:

- The real and imaginary parts of X were equal to (0, +1i) or (0, –1i).

The ONCODEs associated with this message are:

- For complex short floating-point arguments:

  1558 Argument equal to (0,+1i) or (0,-1i)

- For complex long floating-point arguments:

  1559 Argument equal to (0,+1i) or (0,-1i)

- For complex extended floating-point arguments:

  1564 Argument equal to (0,+1i) or (0,-1i)

Programmer Response: If X is complex, ensure X is not equal to +1i or –1i.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GU

IBM0543S ONCODE= *oncode-value* **X in ATANH(X) was invalid**

Explanation: One of the following conditions occurred::

- ABS(X) was greater than one.

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1514 Argument greater than one

- For real long floating-point arguments:

  1515 Argument greater than one

- For real extended floating-point arguments:

  1516 Argument greater than one

Programmer Response: If X is real, ensure ABS(X) is less than one. If X is complex, ensure X is not equal to +1i or —1i.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0GV

IBM0544S ONCODE= *oncode-value* **X in SIN(X), COS(X), SIND(X) or COSD(X) was invalid.**

Explanation: One of the following conditions occurred:

- ABS(X) was greater than or equal to K, where K=2**63 for short and long floating-point values, and K=2**64 for extended floating-point values.
- The absolute value of the real part of X was greater than or equal to K, where K=2**63 for complex short and long floating-point values, and K=2**64 for complex extended floating-point values.
- An overflow occurred because the absolute value of the imaginary part of X was greater than K, where K is as follows:
  - 89.76 for complex short floating-point arguments
  - 710.82 for complex long floating-point arguments
  - 11357.56 for complex extended floating-point arguments
- An overflow occurred because the absolute value of the imaginary part of X was greater than I but less than J, and the absolute value of the real part was out of range. The values for I and J are as follows:
  - I = 89.41 and J = 89.76 for complex short floating-point arguments
  - I = 710.47 and J = 710.82 for complex long floating-point arguments
  - I = 11357.21 and J = 11357.56 for complex extended floating-point arguments

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1506 Argument greater than or equal to limit

  2425 Argument equal to plus or minus limit
- For complex short floating-point arguments:

  1529 Absolute value of the real part of argument greater than or equal to limit
- For real long floating-point arguments:

  1507 Argument greater than or equal to limit

  2426 Argument equal to plus or minus limit
- For complex long floating-point arguments:

  1530 Absolute value of the real part of argument greater than or equal to limit
- For real extended floating-point arguments:

  1517 Argument greater than or equal to limit
- For complex extended floating-point arguments:

  1531 Absolute value of the real part of argument greater than or equal to limit

Programmer Response: Ensure X is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0H0

IBM0545S ONCODE= *oncode-value* **X in SINH(X) or COSH(X) was invalid.**

Explanation: One of the following conditions occurred:

- The absolute value of the imaginary part of X was greater than or equal to K, where K=2**63 for complex short and long floating-point values, and K=2**64 for complex extended floating-point values.
- ABS(X) was greater than 89.41 for X represented as a short floating-point value.
- ABS(X) was greater than or equal to K, where K=710.47 for long floating-point values and K=11357.22 for extended floating-point values.
- An overflow occurred because the absolute value of the real part of X was greater than K, where K is as follows:
  - 89.76 for complex short floating-point arguments
  - 710.82 for complex long floating-point arguments
  - 11357.56 for complex extended floating-point arguments
- An overflow occurred because the absolute value of the real part of X was greater than I but less than J, and the absolute value of the imaginary part was out of range. The values for I and J are as follows:
  - I = 89.41 and J = 89.76 for complex short floating-point arguments
  - I = 710.47 and J = 710.82 for complex long floating-point arguments
  - I = 11357.21 and J = 11357.56 for complex extended floating-point arguments

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1523 Absolute value of argument greater than limit
- For complex short floating-point arguments:

  1914 Absolute value of the imaginary part of argument greater than or equal to limit
- For real long floating-point arguments:

  1509 Absolute value of argument greater than or equal to limit

- For complex long floating-point arguments:

  1854 Absolute value of the real part of argument greater than or equal to limit

- For real extended floating-point arguments:

  1522 Absolute value of argument greater than or equal to limit

- For complex extended floating-point arguments:

  1855 Absolute value of the real part of argument greater than or equal to limit

Programmer Response: Ensure X is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0H3

IBM0548S ONCODE= *oncode-value* **X in TANH(X) was invalid.**

Explanation: One of the following conditions occurred:

- The absolute value of the imaginary part of X was greater than or equal to K, where K=2**63 for complex short and long floating-point values, and K=2**64 for complex extended floating-point values.
- An overflow occurred because the absolute value of the real part of X was greater than 11357.56.
- An overflow occurred because the absolute value of the real part of X was greater than 11357.21 but less than 11357.56, and the absolute value of the imaginary part was out of range.

The ONCODEs associated with this message are:

- For complex short floating-point arguments:

  1574 Absolute value of the imaginary part of argument greater than or equal to limit

- For complex long floating-point arguments:

  1575 Absolute value of the imaginary part of argument greater than or equal to limit

- For complex extended floating-point arguments:

  1576 Absolute value of the imaginary part of argument greater than or equal to limit

Programmer Response: Ensure X is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0H4

IBM0549S ONCODE= *oncode-value* **X in ERF(X) was invalid.**

Explanation: X was not a valid number.

The ONCODEs associated with this message are:

2177 Real short floating-point arguments

2178 Real long floating-point arguments

2179 Real extended floating-point arguments

Programmer Response: Ensure X is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0H5

IBM0550S ONCODE= *oncode-value* **X in EXP(X) was invalid.**

Explanation: One of the following conditions occurred:

- X was less than K, where K is as follows:
  - –87.33 for short floating-point arguments
  - –708.39 for long floating-point arguments
  - –11355.13 for extended floating-point arguments
- The absolute value of the imaginary part of X was greater than or equal to K, where K=2**63 for complex short and long floating-point values, and K=2**64 for complex extended floating-point values. :li.An overflow occurred because the real part of X was greater than K, where K is as follows:
  - 89.06 for complex short floating-point arguments
  - 710.12 for complex long floating-point arguments
  - 11356.87 for complex extended floating-point arguments
- An overflow occurred because the real part of X was greater than I but less than J, and the imaginary part was out of range. The values for I and J are as follows:
  - I = 88.73 and J = 89.06 for complex short floating-point arguments
  - I = 709.79 and J = 710.12 for complex long floating-point arguments
  - I = 11357.53 and J = 11356.87 for complex extended floating-point arguments
- X was greater than or equal to K, where K is as follows:
  - 88.73 for short floating-point arguments
  - 709.79 for long floating-point arguments
  - 11356.53 for extended floating-point arguments

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1565 Argument less than limit

  1611 Argument greater than or equal to limit
- For complex short floating-point arguments:

  1568 Absolute value of the imaginary part of argument greater than or equal to limit
- For real long floating-point arguments:

  1566 Argument less than limit

  1612 Argument greater than or equal to limit
- For complex long floating-point arguments:

  1569 Absolute value of the imaginary part of argument greater than or equal to limit
- For real extended floating-point arguments:

  1567 Argument less than limit

  1613 Argument greater than or equal to limit
- For complex extended floating-point arguments:

  1570 Absolute value of the imaginary part of argument greater than or equal to limit

Programmer Response: Ensure X is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0H6

IBM0551S ONCODE= *oncode-value* **X in GAMMA(X) or LOGGAMMA(X) was invalid.**

Explanation: One of the following conditions occurred:

- X was less than K, where K is as follows:
  - for the built-in function GAMMA:
  - 35.04 for short floating-point arguments
  - 171.62 for long floating-point arguments
  - 1755.54 for extended floating-point arguments
  - for the built-in function LOGGAMMA:
  - 4.085E+36 for short floating-point arguments
  - 2.559E+305 for long floating-point arguments
  - 1.048E+4928 for extended floating-point arguments
- For GAMMA(X), X was less than or equal to zero.
- For LOGGAMMA(X), X was less than zero.
- For GAMMA(X), the calculated result was greater in magnitude than the largest finite number representable in the result data type.

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1571 Argument greater than limit

  2165 Argument less than or equal to zero
- For real long floating-point arguments:

  1572 Argument greater than limit

  2166 Argument less than or equal to zero
- For real extended floating-point arguments:

  1573 Argument greater than limit

  2164 Argument less than zero

  2167 Argument equal to zero

  2403 Argument less than or equal to minus zero

  2404 Argument equal to zero

Programmer Response: If X is numeric, ensure X is greater than zero.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0H7

IBM0552S ONCODE=*oncode-value* **X in LOG(X), LOG10(X) or LOG2(X) was invalid.**

Explanation: One of the following conditions occurred:

- X was less than or equal to zero.
- A floating point division by zero occurred because X was equal to (0,0i).

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1504 Argument less than zero

  1577 Argument equal to plur or minus zero

- For complex short floating-point arguments:

  2413 X equal to (0,0i)

- For real long floating-point arguments:

  1505 Argument less than zero

  1578 Argument equal to plus or minus zero

- For complex long floating-point arguments:

  2414 X equal to (0,0i)

Programmer Response: If X is real, ensure X is greater than zero. If X is complex, ensure X is not equal to 0 + 0i.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0H8

IBM0553S ONCODE=*oncode-value* **The ERFC(X) was invalid.**

Explanation: One of the following conditions occurred:

- X was greater than K, where K is as follows:
  - 9.19 for short floating-point arguments
  - 26.54 for long floating-point arguments
  - 106.53 for extended floating-point arguments

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  2171 Argument greater than limit

- For real long floating-point arguments:

  2172 Argument greater than limit

- For real extended floating-point arguments:

  2173 Argument greater than limit

Programmer Response: Ensure X is greater than zero.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0H9

IBM0554S ONCODE=*oncode-value* **X in SQRT(X) was invalid.**

Explanation: One of the following conditions occurred:

- X was less than zero
- X was equal to minus zero.

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1500 Argument less than zero

  1960 Argument equal to limit

- For real long floating-point arguments:

  1501 Argument less than zero

  1962 Argument equal to limit

Programmer Response: Ensure X is greater than zero.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HA

IBM0555S ONCODE=*oncode-value* **X in ABS(X) was invalid.**

Explanation: The calculated result was greater in magnitude than the largest finite number representable in the result data type.

Programmer Response: Ensure X is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HB

IBM0560S ONCODE=*oncode-value* **The EVENT variable, as argument to the COMPLETION pseudovariable, was already in use with file** *file-name***.**

Explanation: The event variable used in this statement was already active and associated with an input/output operation on the named file. The ONCODE associated with this message is 3904.

Programmer Response: Modify the program so that the COMPLETION pseudovariable refers to the event variable when it is inactive.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HG

IBM0561S ONCODE=*oncode-value* **The TASK variable was already in use with entry** *entry-name***.**

Explanation: The task variable specified in a CALL statement is already associated with an active task. The named entry denotes the entry point of the task with which the variable is associated. The ONCODE associated with this message is 3901.

Programmer Response: Modify the program so that the task variable is uniquely associated with each task in the application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HH

IBM0562S ONCODE= *oncode-value* **The EVENT variable, as argument to the COMPLETION pseudovariable, was already in use with a DISPLAY statement.**

Explanation: The event variable used in this statement was already active and associated with a DISPLAY statement.

Programmer Response: Modify the program so that the COMPLETION pseudovariable refers to the event variable when it is inactive.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HI

IBM0563S ONCODE=*oncode-value* **The EVENT variable was already in use with file** *file-name***.**

Explanation: The event variable used in this statement was already active and associated with another input/output operation on the named file. The ONCODE associated with this message is 3907.

Programmer Response: Modify the program so that the input/output operation refers to another event variable, or include a WAIT statement to prevent the statement from running until the active event is complete.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HJ

IBM0564S ONCODE=*oncode-value* The EVENT variable being assigned was already in use with file *file-name*.

Explanation: An attempt was made to assign a value to an event variable while it was still associated with an input/output operation.

Example:

```
DCL X FILE RECORD INPUT UNBUFFERED
ENV(BLKSIZE(80) RECSIZE(80) F);
DCL Y CHAR(80);
DCL (Z,Z1) EVENT;
READ FILE(X) INTO(Y) EVENT(Z);
Z = Z1;
```

The ONCODE associated with this message is 3906.

Programmer Response: Modify the program so that the event variable used as the target in the assignment, or as the argument of the COMPLETION pseudovariable, is not the same event variable associated with an input/output operation. Alternatively, include a WAIT statement to prevent this statement from running until the active event is complete.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HK

IBM0566S ONCODE= *oncode-value* The task was not created because the total number of active tasks would exceed the allowable limit.

Explanation: The request to create a task was not honored because otherwise the total number of concurrently active tasks would exceed the limit set either by the PLITASKCOUNT run-time option or the underlying OpenEdition MVS installation default for the maximum number of threads.

Programmer Response: Increase the number of tasks allowed to be active concurrently or modify the program so that the existing number of tasks is not exceeded.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HM

IBM0567S ONCODE= *oncode-value* A WAIT occurred in the ON-unit for the I/O event required for the current task.

Explanation: A WAIT statement specified an event variable. The completion of the event caused entry to an ON-unit for an I/O condition which contained another WAIT statement for the same event variable as in the original WAIT statement.

Example:

```
DCL F FILE RECORD OUTPUT UNBUFFERED
ENV(BLKSIZE(80) RECSIZE(80) F);
ON RECORD(F) BEGIN;
WAIT(E);
END;
WRITE FILE(F) FROM (X) EVENT(E);
WAIT(E);  (this statement raises the
record condition)
```

The ONCODE associated with this message is 3911.

Programmer Response: Remove the WAIT statement from the ON-unit for the input/output condition.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HN

IBM0568S ONCODE= *oncode-value* **The assigned EVENT variable was already in use with a DISPLAY statement.**

Explanation: The event variable specified as the argument of the COMPLETION built-in function, or used as the target in an assignment, was still associated with a DISPLAY statement.

Example:

```
DCL A CHAR, COMPLETION BUILTIN;
DISPLAY('MESSAGE TO OPERATOR')
REPLY(A) EVENT(E);
COMPLETION(E)='1'B;
```

ONCODEs associated with this message are:

- 3904—event variable as argument to the COMPLETION built-in function
- 3907—event variable is active

Programmer Response: Modify the program so that the event variable used as the target in the assignment or as the argument of the COMPLETION pseudovariable is not the same event variable associated with the DISPLAY statement. Or include a WAIT statement to prevent this statement from running until the active event is complete.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HO

IBM0569S ONCODE= *oncode-value* **The assigned EVENT variable was already active and was used with entry** *entry-name***.**

Explanation: An active event variable was specified as the target of an event variable assignment.

Example:

```
DCL (E,E1) EVENT;
CALL P EVENT(E);
E=E1;
P:  PROC;
END;
```

ONCODEs associated with this message are:

3906 event assignment
3907 event variable is active

Programmer Response: Either use another inactive event variable, or include a WAIT statement to ensure that this statement is not run until the active event is complete.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HP

IBM0570S ONCODE= *oncode-value* **The EVENT variable was active and was used with entry** *entry-name***.**

Explanation: An active event variable was specified in the EVENT option of an input/output statement.

Programmer Response: Either insert a WAIT statement to ensure the event in question is inactive when this statement is run, or if the statement can be run correctly before the currently active event is complete, use another inactive event variable.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HQ

IBM0571S ONCODE= *oncode-value* **The EVENT variable was already used with a DISPLAY statement.**

Explanation: The event variable specified in the statement was already associated with a DISPLAY statement. The ONCODE associated with this message is 3907.

Programmer Response: Either use a different event variable or insert a WAIT statement so that the DISPLAY statement is complete before this statement is run.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HR

IBM0572S ONCODE= *oncode-value* **A CALL statement with the TASK, EVENT, or PRIORITY option was found in a PUT FILE (SYSPRINT) statement.**

Explanation: A tasking CALL statement is not allowed from a PUT FILE (SYSPRINT) statement because no programs in the attempted new task via the tasking CALL statement can produce output on SYSPRINT while a PUT statement is running, and task interlock is likely to occur.

Example:

```
DCL X FIXED BIN(15);
PUT LIST(F(X));
F:  PROC(X);
CALL E TASK;
X=5;
RETURN (X);
END F;
E:  PROC;
END E;
```

The ONCODE associated with this message is 3912.

Programmer Response: Remove the tasking CALL statement from the PUT FILE (SYSPRINT) statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HS

IBM0573S ONCODE= *oncode-value* **The EVENT variable, as argument to the COMPLETION pseudovariable, was already used with entry** *entry-name***.**

Explanation: An active event variable was used as the argument to the COMPLETION pseudovariable. Event variables used as arguments to the COMPLETION pseudovariable must be inactive.

Programmer Response: Either use a different event variable for the COMPLETION pseudovariable, or modify the program so that the COMPLETION pseudovariable refers to the event variable when it is inactive.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HT

IBM0575S ONCODE= *oncode-value* **An attempt was made to invoke a Fortran or COBOL program while another active task had invoked a program of the same language.**

Explanation: If a Fortran or COBOL program has been invoked in a task, a program of the same language can not execute in any other task until the task used to invoke the Fortran or COBOL program terminates. The ONCODE associated with this message is 3914.

Programmer Response: Make sure all Fortran or COBOL programs are invoked in one task or control the invocation sequence in such a way that the second Fortran or COBOL

program invoked from a task waits until another task which has already invoked a program of the same language terminates.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0HV

IBM0576S ONCODE= *oncode-value* **An attempt to use a CALL statement with the TASK, EVENT, or PRIORITY option was found in a non-tasking environment.**

Explanation: An attempt was made to create a task when the application was not linked with the multitasking library. The ONCODE associated with this message is 3915.

Programmer Response: Remove the tasking option from the CALL statement, or if this is a multitasking application, relink it with the multitasking library.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0I0

IBM0577I A PL/I multitasking application was found under CICS, IMS, DB2, CMS, pre-initialized environment, or a nested enclave.

Explanation: PL/I Multitasking Facility is not supported under CICS, IMS, DB2, CMS, pre-initialized environment (both LE-defined and PL/I-defined pre-initialized environment), and a nested enclave.

Programmer Response: Do not use the PL/I Multitasking Facility in the above environment, or run the multitasking application under MVS with OpenEdition.

System Action: The application is terminated with the 4093-12 Abend.

Symbolic Feedback Code: IBM0I1

IBM0578I The OpenEdition feature was not available on the underlying operating system for a PL/I multitasking application.

Explanation: The OpenEdition Release 2 or later must be installed and activated when a PL/I multitasking application is running.

Programmer Response: Make sure the application is running under MVS/ESA Version 5 Release 1 or later and OpenEdition Release 2 or later. Check with your system programmer.

System Action: The application is terminated with the 4093-52 Abend.

Symbolic Feedback Code: IBM0I2

IBM0579I ONCODE=*oncode-value* **The OpenEdition callable service BPX1SYC for the installation default of the maximum number of threads was unsuccessful. The system return code was** *return_code***; the reason code was** *reason_code***.**

Explanation: The OpenEdition callable service BPX1SYC used to query the installation default of the maximum number of threads failed. The system return code and reason code were returned.

Programmer Response: Look up the return code and reason code in the OpenEdition MVS Assembler Callable Services book, and take the appropriate action. Consult with your OpenEdition system support personnel if necessary.

System Action: The application is abnormally terminated with 4093-152 Abend.

Symbolic Feedback Code: IBM0I3

IBM0580S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because an attempt was made to OPEN the MSGFILE(SYSPRINT) file after a subtask had been created.**

Explanation: When the MSGFILE(SYSPRINT) run-time option is specified, you must ensure that the standard SYSPRINT file is opened in the major PL/I task before any subtask is ever created.

Programmer Response: Ensure that the above rule has not been violated. One method is to add an OPEN statement for the SYSPRINT file at the start of the major PL/I task before an subtasks are created.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0I4

IBM0581I The POSIX(ON) run-time option was in effect for a PL/I multitasking application.

Explanation: The POSIX(ON) run-time option is not supported for a PL/I multitasking application.

Programmer Response: Specify the POSIX(OFF) run-time option for a PL/I multitasking environment.

System Action: The application is terminated with the 4093-52 Abend.

Symbolic Feedback Code: IBM0I5

IBM0583S ONCODE=*oncode-value* **The OpenEdition callable service BPX1MPI (mvspauseinit) was unsuccessful. The return code was** *return_code* **and the reason code was** *reason_code***.**

Explanation: The OpenEdition callable service BPX1MPI (mvspauseinit) was called to initialize a wait for a PL/I WAIT or DISPLAY statement for a PL/I multi-tasking program. This service failed with the return code and reason code shown in the message text.

Programmer Response: Look up the return code and reason code in the OpenEdition MVS Assembler Callable Services book, and take the appropriate action. Consult with your OpenEdition system support personnel if necessary.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0I7

IBM0584S ONCODE=*oncode-value* **The OpenEdition callable service BPX1MP (mvspause) was unsuccessful. The return code was** *return_code* **and the reason code was** *reason_code***.**

Explanation: The OpenEdition callable service BPX1MP (mvspause) was called to perform a wait for a PL/I WAIT or DISPLAY statement for a PL/I multi-tasking program. This service failed with the return code and reason code shown in the message text.

Programmer Response: Look up the return code and reason code in the OpenEdition MVS Assembler Callable Services book and take the appropriate action. Consult with your OpenEdition system support personnel if necessary.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0I8

IBM0585S ONCODE=*oncode-value* **The OpenEdition callable service BPX1PTB for cancelling a PL/I subtask was unsuccessful. The system return code was** *return_code***, the reason code was** *reason_code***.**

Explanation: The OpenEdition callable service BPX1PTB used to cancel a PL/I subtask during abnormal termination failed. The system return code and reason code were returned.

Programmer Response: Look up the return code and reason code in the OpenEdition MVS Assembler Callable Services book, and take the appropriate action. Consult with your OpenEdition system support personnel if necessary.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0I9

IBM0586S ONCODE= *oncode-value* **The OpenEdition callable service BPX1ENV for supporting PL/I EXCLUSIVE files was unsuccessful. The system return code was** *return_code***, the reason code was** *reason_code***.**

Explanation: The OpenEdition callable service BPX1ENV used to support the PL/I EXCLUSIVE files failed. The system return code and reason code were returned.

Programmer Response: Look up the return code and reason code in the OpenEditon MVS Assembler Callable Services book, and take the appropriate action. Consult with your OpenEdition system support personnel if necessary.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IA

IBM0590S ONCODE= *oncode-value* **The fetchable procedure with entry** *entry-name* **could not be found.**

Explanation: The libraries available when the program was run did not contain a member with a name or alias matching that used in the FETCH statement. The ONCODE associated with this message is 9250.

Programmer Response: Ensure that the load module that is to be fetched is accessible at run-time, and that it is stored with the same name or alias as that used in the FETCH statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IE

IBM0591S ONCODE=*oncode-value* **There was a permanent I/O error while fetching procedure with entry** *entry-name***.**

Explanation: A permanent I/O error occurred while trying to load the module named in the FETCH statement. The ONCODE associated with this message is 9251.

Programmer Response: Ensure that the required load module has been incorporated into the appropriate library with proper data set/file attributes, and then rerun the job. If the problem recurs, inform your installation system programmer, who will take the appropriate action.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IF

IBM0592S ONCODE= *oncode-value* **FETCH/RELEASE is not supported in CMS.**

Explanation: An attempt was made to FETCH or RELEASE another program from a PL/I module that was linked with PL/I Version 2 Release 3 or earlier. The FETCH/RELEASE facility under CMS is only available with LE/370 PL/I. The ERROR condition has been raised. The ONCODE associated with this message is 9252.

Programmer Response: Remove the FETCH or RELEASE statement from the application and use the CALL statement instead. Or relink the program with LE/370 PL/I.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IG

IBM0593W ONCODE= *oncode-value* **The CALL PLITEST statement failed because the NOTEST compiler option was in effect.**

Explanation: An attempt was made to execute a CALL PLITEST statement in a program that was compiled with the NOTEST option. The debugger can not be invoked when the NOTEST compiler option is in effect.

Programmer Response: Re-compile the program with the TEST option, or remove the CALL PLITEST statement(s) from the program.

System Action: Processing continues with the next sequential statement. The debugger is not invoked.

Symbolic Feedback Code: IBM0IH

IBM0594S ONCODE= *oncode-value* **Under CICS, an attempt was made to FETCH a main procedure from a PL/I routine.**

Explanation: Under CICS, using FETCH to dynamically load a PL/I main procedure from a PL/I routine is not supported. The ONCODE associated with this message is 9254.

Programmer Response: Remove the FETCH statement and use the EXEC CICS LINK command to create a nested enclave.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0II

IBM0595S ONCODE=9255 An attempt was made to release a load module containing non-PL/I high level language programs.

Explanation: A load module containing non-PL/I high level language programs, such as C, COBOL, or FORTRAN, could not be released by a PL/I RELEASE statement. The load module will be released automatically during the enclave termination. A load module containing PL/I programs and/or Assembler programs only can be released by a PL/I RELEASE statement. The associated ONCODE is 9255.

Programmer Response: Remove the RELEASE statement from the program as the load module will be released automatically during the enclave termination.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IJ

IBM0596S ONCODE=9256 The fetchable procedure could not be released.

Explanation: Either the routine was not previously fetched, or the fetched part containing the routine was no longer in use but could not be released. The ONCODE associated with this message is 9256.

Programmer Response: Ensure the name used in the RELEASE statement is correct, and that the routine has been previously fetched. Also, ensure the fetched part containing the routine to be released is accessible at run-time.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IK

IBM0597S ONCODE= *oncode-value* **A subroutine load module using the PLICALLA entry point was fetched.**

Explanation: The PLICALLA entry point can only be used for a load module with a PL/I main routine. The ONCODE associated with this message is 9257.

Programmer Response: Either Specify OPTIONS(MAIN) and recompile or don't use the PLICALLA entry point.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IL

IBM0600S ONCODE= *oncode-value* **An E-format specification contained incorrect values in fields W, D, and S.**

Explanation: An edit-directed input/output operation for an E-format item was specified incorrectly. The ONCODE associated with this message is 3000.

Programmer Response: Correct the E-format item according to the language rules.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IO

IBM0601S ONCODE= *oncode-value* **The value of a W field in an F-format specification was too small.**

Explanation: An edit-directed input/output operation for an F-format item was specified with a W-specification that was too small to allow room for the decimal-point when the number of fractional digits was specified as zero. The ONCODE associated with this message is 3001.

Programmer Response: Correct the F-format item according to the language rules.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IP

IBM0604S ONCODE= *oncode-value* **An invalid assignment was made to a pictured character string.**

Explanation: An attempt was made to assign an invalid data item to a pictured string. A data item which is not a character string cannot be assigned to a pictured character string because it does not match the declared characteristics of the pictured target variable. The ONCODE associated with this message is 3006.

Programmer Response: Alter the characteristics either of the source variable or of the target variable so the data item assignment is possible.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0IS

IBM0611S ONCODE= *oncode-value* **The F-factor in the PICTURE specification was outside the range of -128 to 127.**

Explanation: The picture character F specifies a picture scaling factor for fixed-point decimal numbers. The number of digits following the V picture character minus the integer specified with F was required to be between -128 and 127.

Programmer Response: Correct the integer specified with the picture scaling factor F.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0J3

IBM0612S ONCODE= *oncode-value* **The PICTURE specification contained an invalid character.**

Explanation: The PICTURE specification can contain only A X 9 for character data and only 9 V Z * , . / B S + - $ CR DB Y K E F < > for numeric data. The characters between the insertion characters < > are not affected by this rule.

Programmer Response: Ensure the PICTURE specification contains valid data.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0J4

IBM0613S ONCODE= *oncode-value* **An invalid character(s) appeared in the F scaling factor.**

Explanation: .The picture character F specifies a picture scaling factor for fixed-point decimal numbers. The format is F(#) where # can be any signed integer between -128 and 127 inclusively.

Programmer Response: Ensure the value specified for the scaling factor is a valid fixed-point decimal number that is within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0J5

IBM0614S ONCODE= *oncode-value* **An invalid character PICTURE specification was used.**

Explanation: The PICTURE specification can contain only A X 9 for character data. Other characters are not permitted.

Programmer Response: Ensure the PICTURE specification contains valid data.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0J6

IBM0615S ONCODE= *oncode-value* **An invalid precision value was specified. The length was corrected automatically.**

Explanation: The number of digits for the precision field within a numeric data PICTURE specification must be between one and fifteen digits. The invalid precision specification is corrected automatically.

Programmer Response: Ensure the value specified for the precision is within the supported range.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0J7

IBM0616S ONCODE= *oncode-value* **The characters T, I or R appeared too often in the PICTURE specification.**

Explanation: T, I, R are the overpunch characters in a PICTURE specification. Only one overpunch character can appear in the specification for a fixed point number. A floating-point specification can contain two overpunch characters, one in the mantissa field and one in the exponent field.

Programmer Response: Ensure the above restrictions are followed.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0J8

IBM0617S ONCODE= *oncode-value* **The precision in the numeric PICTURE specification was less than 1.**

Explanation: The number of digits for the precision field within a numeric data PICTURE specification must be between one and fifteen digits.

Programmer Response: Check the precision and modify the program accordingly.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0J9

IBM0618S ONCODE= *oncode-value* **The precision in the fixed decimal PICTURE specification exceeded the limit.**

Explanation: The precision in the fixed decimal PICTURE specification must not exceed the specified value in the LIMITS compiler option. The default maximum is 15.

Programmer Response: Use the LIMITS compiler option to specify a maximum value of 29 or 31.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JA

IBM0619S ONCODE= *oncode-value* **The value specified for the precision in the float decimal PICTURE specification exceeded the limit.**

Explanation: The precision in the float decimal PICTURE specification is limited by the hardware to 18 digits.

Programmer Response: Check and correct the precision.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JB

IBM0620S ONCODE= *oncode-value* **The PICTURE specification did not contain picture characters for character or numeric data.**

Explanation: The PICTURE specification must contain picture characters for either character or numeric data.

Programmer Response: Check the PICTURE specification string.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JC

IBM0621S ONCODE= *oncode-value* **The exponent in the float PICTURE specification exceeded the 4-digit limit.**

Explanation: The number of digits in the exponent of the float decimal PICTURE specification is limited to 4 digits.

Programmer Response: Ensure that the exponent does not exceed 4 digits.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JD

IBM0622S ONCODE= *oncode-value* **The exponent in the float PICTURE specification was missing.**

Explanation: The exponent in the float decimal PICTURE specification was missing. A value must be entered, even if it is zero.

Programmer Response: Enter the missing exponent value.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JE

IBM0623S ONCODE= *oncode-value* **The exponent in the PICTURE specification contained a V character.**

Explanation: The character V was specified in the PICTURE specification. The character V specifies an implicit decimal point and is not permitted in the exponent field.

Programmer Response: Remove the character V from the exponent field.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JF

IBM0624S ONCODE= *oncode-value* **The float PICTURE specification contained invalid characters CR, DB or F.**

Explanation: The float PICTURE specification contained invalid characters CR, DB or F. Credit (CR), Debit (DB), and Scale Factor (F) are only allowed in the fixed PICTURE specification.

Programmer Response: Remove the invalid characters from the float PICTURE specification.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JG

IBM0625S ONCODE= *oncode-value***The PICTURE specification exceeded the limit. Excessive characters were truncated on the right.**

Explanation: The compiler restricts the length of the PICTURE specification to:

- Fixed Decimal: 254
- Float Decimal: 253
- Character Data: 511

Programmer Response: Correct the PICTURE specification length.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JH

IBM0626S ONCODE= *oncode-value* **The PICTURE specification contained an invalid delimiter.**

Explanation: The floating insertion string is delimited by < > characters. The string can contain any character with the exception of the delimiters themselves. In order to include the characters < and > in the floating insertion string, angle brackets must be used in an "escaped" format. << denotes character < in the floating insertion string. <> denotes character > in the floating insertion string. The leading < and ending > characters are delimiters.

Example

```
<aaa<<bbb<>ccc>  denotes the FIS  aaa<bbb>ccc
```

Programmer Response: Correct the floating insertion string.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JI

IBM0630S ONCODE=3009 A mixed character string ended incorrectly.

Explanation: A mixed character string contained a shift-out character but did not contain a matching shift-in character.

Programmer Response: Ensure that mixed character strings contain unnested pairs of shift-out/shift-in characters.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JM

IBM0631S ONCODE=3010 A mixed character string contained an invalid character.

Explanation: One of the following rules for mixed constants was broken:

- SBCS portions of the constant cannot contain a shift-in
- DBCS portions of the constant cannot contain a shift-out (Either byte of a DBCS character cannot contain a shift-out.)
- The second byte of a DBCS character cannot contain a shift-in

Programmer Response: Ensure the mixed character string contains balanced, unnested pairs of shift-out/shift-in characters.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JN

IBM0632S ONCODE=3011 An invalid function string was specified for the MPSTR built-in function.

Explanation: For the MPSTR built-in function, a function string is invalid if it is null, contains only blanks, or contains characters other than 'V', 'v', 'S', 's', or a blank.

Programmer Response: Ensure the function string is valid.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JO

IBM0633S ONCODE=3012 A retry was attempted after a graphic conversion error.

Explanation: The use of the ONSOURCE or ONCHAR pseudovariable to attempt a conversion retry for a graphic (DBCS) conversion error is not allowed.

Programmer Response: Remove the retry attempt from your program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JP

IBM0634S ONCODE=3013 An invalid graphic variable assignment was attempted.

Explanation: A graphic (DBCS) target of length greater than 16,383 was encountered. This target could have been an actual target or a temporary target created by the program. This condition was raised by the GRAPHIC built-in function. The maximum length of a graphic (DBCS) string is 16,383 characters (32,766 bytes).

Programmer Response: Ensure that graphic (DBCS) strings are less than the maximum allowed length of 16,383.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JQ

IBM0635S ONCODE=3014 An invalid use of a shift code occurred.

Explanation: There are two possible errors:

- The STREAM input record could not be scanned due to an unmatched or nested shift code.
- A graphic (DBCS) constant in STREAM input contained a shift code or used shift codes improperly.

Programmer Response: Verify that shift code pairs are matched and unnested, continuation rules are followed, and graphic (DBCS) constants are in one of the allowable forms.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JR

IBM0636S ONCODE=3015 An invalid number of digits was used in a X or GX constant.

Explanation: X constants must be specified in pairs. GX constants must be specified in groups of four.

Programmer Response: Change the STREAM input data so that all X constants are specified in pairs and all GX constants are specified in groups of four.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JS

IBM0637S ONCODE=3016 A double-byte character was used incorrectly.

Explanation: A non-EBCDIC double-byte character was used incorrectly. These characters are only valid in DBCS names, graphic (DBCS) constants, and mixed character constants.

Programmer Response: Verify that a bit, character or hexadecimal constant does not contain a non-EBCDIC double-byte character, or that such a character is not present outside a constant unless it is part of a name for a GET DATA statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JT

IBM0638S ONCODE= *oncode-value* **A STREAM output record could not be written correctly.**

Explanation: A record could not be written out because there was not enough room for a valid DBCS continuation sequence. As a consequence, the record cannot be read correctly as STREAM input. The ONCODE associated with this message is 3017.

Programmer Response: Define the STREAM I/O data set to contain V- or U-type record formats.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0JU

IBM0648S ONCODE=3797 The assignment of a graphic character string caused an error.

Explanation: STREAM I/O issued this message because LIST, DATA, or EDIT input/output was attempted for a graphic (DBCS) string and the corresponding source or target string or file did not have the necessary graphic attribute. This error could also be issued when a null graphic constant appears as an element in the data list of a PUT for LIST or EDIT. Null graphic constants are restricted as elements in the data list of a PUT for LIST or EDIT.

Programmer Response: Ensure that the source or target string in the data list is a valid graphic (DBCS) string and that it has been declared with the GRAPHIC attribute. If a null

graphic constant caused the error, remove the null graphic constant from the data list of the PUT statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0K8

IBM0650S ONCODE=3799 The source was not modified in the CONVERSION ON-unit. Retry was not attempted.

Explanation: The CONVERSION condition was raised by the presence of an invalid character in the string to be converted. The character was not corrected in an ON-unit using the ONCHAR or ONSOURCE pseudovariable.

Programmer Response: Use either the ONCHAR or the ONSOURCE pseudovariable in the CONVERSION ON-unit to assign a valid character to replace the invalid character in the source string.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0KA

IBM0670S ONCODE= *oncode-value* **X was less than 0 in SQRT(X).**

Explanation: The built-in function SQRT was invoked with an argument that is less than zero. ONCODEs associated with this message are:

- 1500 Short floating-point argument
- 1501 Long floating-point argument
- 1502 Extended floating-point argument

Programmer Response: Modify the program so that the argument of the SQRT built-in function is never less than zero.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0KU

IBM0671S ONCODE= *oncode-value* **X was less than or equal to 0 in LOG(X), LOG2(X) or LOG10(X).**

Explanation: One of the built-in functions LOG, LOG2, or LOG10 was invoked with an argument less than or equal to zero. The invocation may have been direct or as part of the evaluation of an exponentiation calculation. ONCODEs associated with this message are:

- 1503 Extended floating-point argument
- 1504 Short floating-point argument
- 1505 Long floating-point argument

Programmer Response: If the invocation is direct, modify the program so that the argument of the LOG, LOG2, or LOG10 built-in function is greater than zero. If the invocation is part of an exponentiation calculation, ensure that the argument is greater than zero.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0KV

IBM0672S ONCODE= *oncode-value* **ABS(X) was too large in SIN(X), COS(X), SIND(X), COSD(X), TAN(X) or TAND(X).**

Explanation: The error occurred during one of the following:

- The evaluation of SIN, SIND, COS, COSD, TAN, or TAND when invoked implicitly
- The evaluation of TAN, when invoked during the evaluation of TAN or TANH with a complex argument
- The evaluation of SIN or COS, when invoked during the evaluation of EXP, SIN, SINH, COS, COSH, TAN, or TANH with a complex argument

- The evaluation of a general exponentiation function with complex arguments

The argument passed to TAN, TAND, SIN, SIND, COS, or COSD exceeded the limit specified below.

Floating-Point Precision	*Limit*	
Binary p ≤ 21 Decimal p ≤ 6	x<(2**18)*K	where K = pi for x in radians (SIN, COS, or TAN)
Binary 21 < p ≤ 53 Decimal 6 < p ≤ 16	x<(2**50)*K	where K = 180 for x in degrees (SIND, COSD, TAND)
Binary 53 < p ≤ 109 Decimal 6 < p ≤ 33	x<(2**100)*K/pi	

ONCODEs associated with this message are:

- 1506 Short floating-point argument involving SIN, COS, SIND or COSD
- 1507 Long floating-point argument involving SIN, COS, SIND or COSD
- 1508 Short floating-point argument involving TAN or TAND
- 1509 Long floating-point argument involving TAN or TAND
- 1517 Extended floating-point argument involving SIN, COS, SIND or COSD
- 1522 Extended floating-point argument involving TAN or TAND

Programmer Response: Ensure that X does not violate the limits as described above. If X is an expression, simplify X for easier problem diagnosis.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0L0

IBM0674S ONCODE= *oncode-value* **Both X and Y were 0 in ATAN(Y,X) or ATAND(Y,X).**

Explanation: Two arguments, both of value zero, were given for the ATAN or ATAND built-in function. ATAN or ATAND was invoked either directly with a real argument or indirectly in the evaluation of the LOG built-in function with a complex argument. ONCODEs associated with this message are:

- 1510 Short floating-point arguments
- 1511 Long floating-point arguments
- 1521 Extended floating-point arguments

Programmer Response: Change the arguments of ATAN or ATAND to nonzero values.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0L2

IBM0675S ONCODE= *oncode-value* **ABS(X) was greater than or equal to 1 in ATANH(X).**

Explanation: The ATANH built-in function had a floating-point argument with an absolute value that equaled or exceeded 1. ONCODEs associated with this message are:

- 1514 Short floating-point argument
- 1515 Long floating-point argument
- 1516 Extended floating-point argument

Programmer Response: Modify the ATANH built-in function so that the absolute value of a floating-point assignment does not equal or exceed 1.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0L3

IBM0676S ONCODE= *oncode-value* **ABS(X) was greater than 1 in ASIN(X) or ACOS(X).**

Explanation: The absolute value of the floating-point argument of the ASIN or ACOS built-in function exceeded 1. ONCODEs associated with this message are:

- 1518 Short floating-point argument
- 1519 Long floating-point argument
- 1520 Extended floating-point argument

Programmer Response: Modify the program so that the ASIN or ACOS built-in function is never invoked with a floating-point argument whose absolute value exceeds 1.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0L4

IBM0682S ONCODE= *oncode-value* **X in EXPONENT(X) was invalid.**

Explanation: One of the following conditions occurred:

- For X**Y where X and Y are integers, X was equal to zero and Y was less than or equal to zero.
- For X**Y where X is a real value and Y is an integer, X was equal to zero and Y was less than or equal to zero.
- For X**Y where X and Y are integers, X was not equal to plus or minus one and Y was less than zero.
- For X**Y where X and Y are complex values, X was (0,0i) and Y was less than or equal to zero.
- For X**Y where X and Y are complex values, X exceeded the limit K, where K=2**63 for complex short and long arguments, and K=2**55 for complex extended arguments.
- For X**Y where X and Y are complex values, X was equal to (0,0i).
- For X**Y where X and Y are real values, X was equal to zero and Y was not an integer-float greater than zero.
- For X**Y where X and Y are real values, X was less than zero and Y was not an integer-float.

The ONCODEs associated with this message are:

- For integer base and integer exponent

  1673 X equal to zero and Y less than or equal to zero

  1674 X not equal to plus or minus one and less than zero
- For real short floating-point base with integer exponent

  1550 X equal to zero and Y less than or equal to zero
- For real long floating-point base with integer exponent

  1551 X equal to zero and Y less than or equal to zero
- For real extended floating-point base with integer exponent

  1560 X equal to zero and Y less than or equal to zero
- For complex short floating-point base with integer exponent

  1554 X equal to (0,0i) and Y less than or equal to zero
- For complex long floating-point base with integer exponent

  1555 X equal to (0,0i) and Y less than or equal to zero
- For complex extended floating-point base with integer exponent

  1562 X equal to (0,0i) and Y less than or equal to zero

- For real short floating-point base with real short floating-point exponent

  1552 X equal to zero and Y not a positive integer-float, or X less than zero and Y not an integer-float

  1729 X equal to (0,0i) and Y less than or equal to zero

- For real long floating-point base with real long floating-point exponent

  1553 X equal to zero and Y not a positive integer-float, or X less than zero and Y not an integer-float

  1730 X equal to (0,0i) and Y less than or equal to zero

- For real extended floating-point base with real extended floating-point exponent

  1561 X equal to zero and Y not a positive integer-float, or X less than zero and Y not an integer-float

- For complex short floating-point base with complex short floating-point exponent

  1556 Argument equal to (0,0i)

  1754 Argument exceeded limit

- For complex long floating-point base with complex long floating-point exponent

  1557 Argument equal to (0,0i)

  1755 Argument exceeded limit

- For complex extended floating-point base with complex extended floating-point exponent

  1563 Argument equal to (0,0i)

  1756 Argument exceeded limit

Programmer Response: Ensure X is a valid floating-point number.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0LA

IBM0683S ONCODE= *oncode-value* **X or Y in ATAN(X,Y) or ATAND(X,Y) was invalid.**

Explanation: One of the following conditions occurred:

- X and Y were invalid.

The ONCODEs associated with this message are:

- For real short floating-point arguments:

  1510 Both arguments were invalid

- For real long floating-point arguments:

  1511 Both arguments were invalid

- For real extended floating-point arguments:

  1521 Both arguments were invalid

Programmer Response: Ensure X and Y are both real values and that Y is not equal to zero.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0LB

IBM0700S ONCODE= *oncode-value* **An attempt to assign data to an unallocated CONTROLLED variable occurred during GET DATA for file** *file-name***.**

Explanation: A CONTROLLED variable in the stream was accessed by a GET FILE DATA statement, but there was no current allocation for the variable.

Example:

```
DCL X CONTROLLED FIXED BIN;
GET DATA(X);

(Input stream contains
X=5,.....)
```

The ONCODE associated with this message is 4001.

Programmer Response: Either remove the data item from the input stream or insert an ALLOCATE statement for the variable before the GET FILE DATA statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0LS

IBM0701S ONCODE= *oncode-value* **An attempt to assign data to an unallocated CONTROLLED variable occurred on a GET DATA statement.**

Explanation: A CONTROLLED variable in the stream was accessed by a GET FILE DATA statement, but there was no current allocation for the variable.

Example:

```
DCL STR CHAR(4) INIT('X=5'),
X CONTROLLED FIXED BIN;
GET STRING(STR) DATA(X);
```

The ONCODE associated with this message is 4001.

Programmer Response: Either remove the data item from the string or insert an ALLOCATE statement for the variable before the GET STRING DATA statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0LT

IBM0702S ONCODE= *oncode-value* **An attempt to to output an unallocated CONTROLLED variable occurred on a PUT DATA statement.**

Explanation: A CONTROLLED variable was being output to a file by a PUT FILE DATA statement, but there was no current allocation for the variable. The ONCODE associated with this message is 4002.

Programmer Response: Insert an ALLOCATE statement for the variable before the PUT FILE DATA statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0LU

IBM0703S ONCODE= *oncode-value***An attempt to assign from an unallocated CONTROLLED variable occurred on a PUT DATA statement with the STRING option.**

Explanation: A CONTROLLED variable was being accessed by a PUT STRING DATA statement, but there was no current allocation for the variable. The ONCODE associated with this message is 4003.

Programmer Response: Ensure the CONTROLLED variable is allocated and initialized before the PUT DATA statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0LV

IBM0722S ONCODE= *oncode-value* **X was assigned a value of 0 and Y was not assigned the value of a positive real number in X**Y.**

Explanation: In an exponentiation operation the floating-point base was zero and the exponent was not a positive real number. ONCODEs associated with this message are:

- 1550 Real short floating-point base with an integer exponent
- 1551 Real long floating-point base with an integer exponent
- 1552 Real short floating-point base with a floating-point or non-integer exponent
- 1553 Real long floating-point base with a floating-point or non-integer exponent
- 1554 Complex short floating-point base with an integer exponent
- 1555 Complex long floating-point base with an integer exponent
- 1556 Complex short floating-point base with a floating-point or non-integer exponent
- 1557 Complex long floating-point base with a floating-point or non-integer exponent
- 1560 Real extended floating-point base with an integer exponent
- 1561 Real extended floating-point base with a floating-point or non-integer exponent
- 1562 Complex extended floating-point base with an integer exponent
- 1563 Complex extended floating-point base with a floating-point or non-integer exponent

Programmer Response: Modify the program so that the exponentiation operation involves a nonzero floating-point base or a positive real exponent.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0MI

IBM0724S ONCODE= *oncode-value* **Z=+1i or Z=-1i in ATAN(Z) or Z=+1 or Z=-1 in ATANH(Z).**

Explanation: Either the complex floating-point argument of the ATAN built-in function had the value of +1i or -1i, or the complex floating-point argument of the ATANH built-in function has the value +1 or -1. ONCODEs associated with this message are:

- 1558 Complex short floating-point argument
- 1559 Complex long floating-point argument
- 1564 Complex extended floating-point argument

Programmer Response: Modify the program so the complex floating-point argument of ATAN never has the value of +1i or -1i, or the complex floating-point argument of the ATANH built-in function never has the value +1 or -1.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0MK

IBM0750S ONCODE= *oncode-value* **A GOTO to an invalid block was attempted.**

Explanation: A GOTO statement that transfers control to a label variable was invalid. The possible causes are:

- The generation of the block that was active when the label variable was assigned was no longer active when the GOTO statement was run.
- The label variable was uninitialized.
- The element of the label array, to which control is to be transferred, does not exist in the program.
- An attempt has been made to transfer control to a block that is not within the scope of this task.

Example:

```
DCL L LABEL;
BEGIN;
A:  L = A;
END;
GOTO L;
```

The ONCODE associated with this message is 9002.

Programmer Response: Modify the program so that the GOTO statement transfers control to a label in an active block.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0NE

IBM0751S ONCODE= *oncode-value* **A GOTO was attempted to an element of a label constant array, but the subscripts for the element were not those of any label in that array.**

Explanation: The subscripts of an element in a GOTO statement must match the label in the specified array. This error occurs in the following code if n is 1, 3, 5 or 7:

Example:

```
dcl n fixed bin;
⋮
goto x(n);
⋮
x(0):
⋮
x(2):
⋮
x(4):
⋮
x(6):
⋮
x(8):
```

Note: This error will not occur if n is less than the lower bound for x or greater than the upper bound.

Programmer Response: Correct your program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0NF

IBM0752S ONCODE= *oncode-value* **A RETURN without an expression was attempted from a procedure that had been entered at an ENTRY that specified the RETURNS attribute.**

Explanation: A procedure can contain ENTRYs some of which have the RETURNS attribute and some of which do not, but if it is entered at an ENTRY that has the RETURNS attribute, it must be exited with a RETURN statement that specifies a return value.

Programmer Response: Correct your program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0NG

IBM0753S ONCODE= *oncode-value* **A RETURN without an expression was attempted from a procedure that had been entered at an ENTRY that does not specify the RETURNS attribute.**

Explanation: A procedure can contain ENTRYs some of which have the RETURNS attribute and some of which do not, but if it is entered at an ENTRY that has the RETURNS attribute, it must be exited with a RETURN statement that does not specify a return value.

Programmer Response: Correct your program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0NH

IBM0780S ONCODE= *oncode-value* **No WHEN clauses were satisfied and no OTHERWISE clause was available.**

Explanation: No WHEN clauses of a SELECT statement were selected and no OTHERWISE clause was present. The ONCODE associated with this message is 3.

Programmer Response: Add an OTHERWISE clause to the SELECT group.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0OC

IBM0802S ONCODE= *oncode-value* **The GET/PUT STRING exceeded the source string size.**

Explanation: For input, a GET statement attempted to access data that exceeded the length of the source string. For output, a PUT statement attempted to assign data that exceeded the target string. The ONCODE associated with this message is 1002.

Programmer Response: For input, either extend the length attribute of the source string, or correct the data so that the length does not exceed the declared length of the source string. For output, either extend the length attribute of the target string, or correct the data so that the length does not exceed the declared length of the target string.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0P2

IBM0803S ONCODE= *oncode-value* **A prior condition on file** *file-name* **prevented further output.**

Explanation: A PL/I WRITE, LOCATE, or PUT statement was issued for a file to which a previous attempt to transmit a record caused the TRANSMIT condition to be raised immediately. If the EVENT option was specified to be stacked until the event was waited on, the data set was not a unit-record device and no further processing of the file was possible. The ONCODE associated with this message is 1003.

Programmer Response: Correct the error that caused the TRANSMIT condition to be raised and rerun the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0P3

IBM0804S ONCODE=*oncode-value* **The PRINT option/format item was used with non-PRINT file** *file-name***.**

Explanation: An attempt was made to use one of the options PAGE or LINE for a file that was not a print file. The ONCODE associated with this message is 1004.

Programmer Response: Either remove the PRINT option/format item from the non-print file, or specify the PRINT option for the print file.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0P4

IBM0805S ONCODE= *oncode-value* **A DISPLAY with REPLY option had a zero-length string.**

Explanation: The current length of the character string to be displayed, or the maximum length of the character string to which the reply was assigned, was zero. The ONCODE associated with this message is 1005.

Programmer Response: Change length of the character string to be displayed, or to which the reply is to be assigned, to greater than zero.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0P5

IBM0807S ONCODE= *oncode-value* **The REWRITE or DELETE on file** *file-name* **occurred without a preceding READ SET or READ INTO statement.**

Explanation: A REWRITE or DELETE statement without the KEY option was run. The last input/output operation on the file was not a READ statement with the SET or INTO option or was a READ statement with the IGNORE option. The ONCODE associated with this message is 1007.

Programmer Response: Modify the program so that the REWRITE or DELETE statement is either preceded by a READ statement or, in the case of a REWRITE statement, replaced by a WRITE statement, according to the requirements of the program. A preceding READ statement with the IGNORE option will also cause the message to be issued.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0P7

IBM0808S ONCODE= *oncode-value* **An invalid element was present in the string for a GET STRING DATA statement.**

Explanation: The identifier in the string named in the STRING option of a GET STRING DATA statement did not match the identifier in the data specification. Note that the DATAFIELD built-in function does not return a value in this case. The ONCODE associated with this message is 1008.

Programmer Response: Modify the program so that the string contains the identifier in the data specification.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0P8

IBM0809S ONCODE=*oncode-value* **An invalid file operation was attempted on file** *file-name***.**

Explanation: An attempt was made to perform an invalid operation on a file. For example, it is not possible to run a REWRITE statement on a STREAM file, read an output file, or write an input file. Refer to Table 11 on page 692 for a list of operations and conflicting file organizations.

Table 11. Operations and Conflicting File Organizations

Statement/Option	File Organization
Any record I/O statement	STREAM
Any stream I/O statement	RECORD
READ	OUTPUT
READ SET	UNBUFFERED
READ EVENT	UNBUFFERED
READ KEY	REGIONAL SEQUENTIAL or CONSECUTIVE
READ IGNORE	DIRECT
READ NOLOCK	SEQUENTIAL or INPUT
WRITE	INPUT SEQUENTIAL UPDATE, INDEXED DIRECT NOWRITE, REGIONAL (not KEYED)
WRITE EVENT	BUFFERED
REWRITE	INPUT or OUTPUT
REWRITE (without FROM)	UNBUFFERED or DIRECT
REWRITE KEY	SEQUENTIAL
REWRITE EVENT	BUFFERED
LOCATE	INPUT or UPDATE, UNBUFFERED, DIRECT
LOCATE KEYFROM	INDEXED or REGIONAL (without KEYED)
DELETE	INPUT or OUTPUT, CONSECUTIVE, REGIONAL SEQUENTIAL, RKP=0 (blocked records), OPTCD=L not specified
DELETE KEY	SEQUENTIAL
UNLOCK	INPUT or OUTPUT, SEQUENTIAL
GET	OUTPUT
PUT	INPUT

The ONCODE associated with this message is 1009.

Programmer Response: Ensure the file declaration and the input/output statements for the named file are compatible.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0P9

IBM0810S ONCODE= *oncode-value* **A built-in function or pseudovariable referenced an unopened file or referenced a file with a contradicting attribute.**

Explanation: An I/O built-in function or pseudovariable referenced a file that was not opened or referenced a file with an attribute that contradicted the function or pseudovariable. The functions/pseudovariables are :

- PAGENO - file not open or does not have the PRINT attribute
- SAMEKEY - file does not have the RECORD attribute
- ENDFILE - file not open
- FILEREAD - file not open or is not a TYPE(U) file
- FILEWRITE - file not open or is not a TYPE(U) file
- FILESEEK - file not open or is not a TYPE(U) file
- FILETELL - file not open or is not a TYPE(U) file
- FILEDDTEST - file not open or:

  - AMTHD - file not a native file
  - BKWD - file not a record file
  - DESCENDKEY - file not a record file
  - GENKEY - file not a record file
  - PRINT - file not a stream output file
- FILEDDINT - file not open or:
  - BUFSIZE - file not a native file
  - DELAY - file not a DDM, BTRIEVE or ISAM file
  - RETRY - file not a DDM, BTRIEVE or ISAM file
  - FILESIZE - file not a native file
  - KEYLEN - file not an indexed or a relative keyed file
  - KEYLOC - file not an indexed or a relative keyed file
- FILEDDWORD - file not open or:
  - TYPEF - file not a native file

Programmer Response: Correct your program to use the built-in function or pseudovariable correctly.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PA

IBM0811S ONCODE= *oncode-value* **An I/O error occurred. Subcode1=** *sc1* **Subcode2=** *sc2*

Explanation: The data management routines detected an error during an input/output operation, which PL/I did not recognize. Subcode1 and Subcode2 provide VSAM diagnostic information; otherwise, they contain zeros. See the VSAM Macro Instruction manual for a description of the errors. Subcode1 indicates the I/O function involved:

- 0 - I/O function not identified
- 1 - GET
- 2 - PUT
- 3 - CHECK
- 4 - POINT
- 5 - ENDREQ
- 6 - ERASE
- 64 - OPEN
- 130 - GENCB of ACB
- 131 - GENCB of RPL
- 138 - SHOWCB of ACB
- 142 - TESTCB of ACB
- 146 - SHOWCB of block lengths

Subcode2 consists of 8 hexadecimal digits (xxxxyyyy). The meaning of Subcode2 varies depending on the PL/I product used.

For MVS and VM, the value of subcode1 determines the type of VSAM return code information provided.

- Subcode1 0: VSAM return code information is not provided.

- Subcode1 1-63: VSAM Request Parameter List Feedback Word (RPLFDBWD) = xxxxyyyy.
- Subcode1 64: Open register 15 = xxxx. Open reason code = yyyy.
- Subcode1 128-192: Register 15 = xxxx. Register 0 = yyyy.

For VisualAge PL/I, Subcode2 gives the following information:

- Register 15 = xxxx. Reason code = yyyy.

Note that PL/I terminology translates to VSAM terms as follows:

- PL/I UPDATE OPEN is equivalent to VSAM IN and OUT OPEN.
- PL/I OUTPUT OPEN is equivalent to VSAM OUT OPEN, but only inserts or additions are allowed.
- PL/I READ results in VSAM POINT to key, if specified, followed by VSAM GET.
- PL/I WRITE or LOCATE results in VSAM PUT NUP. For PL/I LOCATE, the associated VSAM PUT NUP occurs on the next PL/I I/O request.
- PL/I REWRITE results in implied read, if needed, followed by VSAM PUT UPD.
- PL/I DELETE results in implied read, if needed, followed by VSAM ERASE.
- PL/I WAIT EVENT I/O results in VSAM CHECK.

Programmer Response: Use the VSAM diagnostic information to correct the cause of the error and resubmit the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PB

IBM0812S ONCODE= *oncode-value* **A READ SET or READ INTO statement did not precede a REWRITE request.**

Explanation: A REWRITE statement with the INTO or SET option ran without a preceding READ statement. The ONCODE associated with this message is 1012.

Programmer Response: Modify the program so that the REWRITE statement is either preceded by a READ statement or replaced by a WRITE statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PC

IBM0813S ONCODE= *oncode-value* **The last READ statement before the last REWRITE or DELETE was incomplete.**

Explanation: An attempt was made to run a REWRITE or DELETE statement before a preceding READ statement (with the EVENT option) for a file that had completed. The ONCODE associated with this message is 1013.

Programmer Response: Insert a WAIT statement for the given event variable into the flow of control between the REWRITE or DELETE and READ statements. The REWRITE or DELETE statement should run after completion of the READ statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PD

IBM0814S ONCODE=*oncode-value* **Excessive incomplete I/O operations occurred for file** *file-name***.**

Explanation: An attempt was made to initiate an input/output operation beyond the limit imposed by the NCP (number of channel programs) subparameter of the DCB parameter or option of the ENVIRONMENT attribute. For a file with the attributes SEQUENTIAL and UNBUFFERED, the default for NCP is one. The limit, for VSAM files, is specified either by the NCP option of the ENVIRONMENT attribute or by the STRNC sub-parameter of the AMP parameter in the DD statement. The limit is one for both SEQUENTIAL and DIRECT UNBUFFERED files except when using the ISAM compatibility interface. The ONCODE associated with this message is 1014.

Programmer Response: Modify the program so that the input/output operation is not initiated until an incomplete input/output operation completes.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PE

IBM0816S ONCODE=*oncode-value* **The implicit OPEN was unsuccessful for file** *file-name***.**

Explanation: An error occurred during the implicit opening of a file. The UNDEFINEDFILE condition was raised and a normal return was made from the associated ON-unit, but the file was still unopened. The ONCODE associated with this message is 1016.

Programmer Response: Ensure that the file has been completely and correctly declared, and that the input/output statement that implicitly opens the file is not in conflict with the file declaration.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PG

IBM0818S ONCODE= *oncode-value* **An unexpected end of file/string was detected in the STREAM input.**

Explanation: The end of the file was detected before the completion of a GET FILE statement. The ONCODE associated with this message is 1018.

Programmer Response: For edit-directed input, ensure that the last item of data in the stream has the same number of characters as specified in the associated format item. If the error occurs while an X-format is running, ensure that the same number of characters to be skipped are present before the last data item in the stream. For list-directed and data-directed input, ensure the last item of data in the data set that precedes the end-of-file character is terminated by a quote character for a string or a 'B' character for a bit-string.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PI

IBM0819S ONCODE= *oncode-value* **An attempt was made to close a file in the wrong task.**

Explanation: A file can only be closed by the task that opened it.

Programmer Response: Change your program to insure the close is issued in the same task that opened the file.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PJ

IBM0820S ONCODE= *oncode-value* **An attempt was made to access a locked record.**

Explanation: In an exclusive environment, an attempt was made to read, rewrite, or delete a record when either the record or the data set was locked by another file in this task. The ONCODE associated with this message is 1021.

Programmer Response: Ensure that all files accessing the data set have the EXCLUSIVE attribute. If a READ statement is involved, specify the NOLOCK option to suppress the locking mechanism.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PK

IBM0821S ONCODE= *oncode-value* **An I/O statement occurred before a WAIT statement completed a previous READ.**

Explanation: While an indexed sequential file was open for direct updating, an input/output statement was attempted before the completion of a previous READ statement with the EVENT option. The ONCODE associated with this message is 1020.

Programmer Response: Include a WAIT statement so that the erroneous input/output statement cannot be run until the completion of the previous READ statement with the EVENT option.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PL

IBM0822S ONCODE= *oncode-value* **Insufficient space was available for a record in the sequential output data set.**

Explanation: The space allocated for the sequential output data set was full. The ONCODE associated with this message is 1040.

Programmer Response: Increase the size of the data set, or check the logic of the application for possible looping.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PM

IBM0823S ONCODE= *oncode-value* **An invalid control format item was detected during a GET/PUT STRING.**

Explanation: An invalid control format item (PAGE, LINE, SKIP, or COL) was detected in a remote format list for a GET or PUT STRING statement.

Example:

```
DCL(A,B) CHAR(10),
C CHAR(80);
F:  FORMAT(A(10), SKIP,A(10));
A='FRED'; B='HARRY';
PUT STRING(C) EDIT(A,B) (R(F));
```

The ONCODE associated with this message is 1004.

Programmer Response: Modify the source program so that GET or PUT STRING statements do not use the control format items PAGE, LINE, SKIP or COL.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PN

IBM0824S ONCODE= *oncode-value* **Records were still locked in a subtask while attempting to close EXCLUSIVE file** *file-name***.**

Explanation: When an EXCLUSIVE file is closed by a task, no records should be locked by any subtasks.

Programmer Response: Change your program to insure that the subtasks free any record locks before the file is closed.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PO

IBM0825S ONCODE= *oncode-value* **The EVENT variable was already used.**

Explanation: An input/output statement with an EVENT option was attempted while a previous input/output statement with an EVENT option that used the same event variable was still incomplete. The ONCODE associated with this message is 1015.

Programmer Response: Either change the event variable used in the second EVENT option or insert a WAIT statement for the event variable between the two input/output statements.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PP

IBM0826S ONCODE= *oncode-value* **The EVENT variable was already used with a DISPLAY statement.**

Explanation: An input/output statement with an EVENT option was attempted while a previous DISPLAY statement with an EVENT option that used the same event variable was still incomplete.

Programmer Response: Either change the event variable used in the second EVENT option or insert a WAIT statement for the event variable between the DISPLAY statement and the input/output statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PQ

IBM0827S ONCODE=*oncode-value* **The EVENT variable was already active and was used with entry** *entry-name***.**

Explanation: An event variable that was already used in the EVENT option in a CALL statement was still active when used again in the EVENT option of an input/output statement.

Programmer Response: Either use a different event variable or insert a WAIT statement so that the input/output statement is not run until the event variable becomes inactive.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PR

IBM0828S ONCODE= *oncode-value* **An incorrect sequence of I/O operations was performed on an associated file.**

Explanation: Operations on a set of associated files were not carried out in the correct sequence, as follows:

1. Appropriate I/O operations were not carried out in the sequence Read-Punch-Print. Only the Print operation can be omitted or repeated.
2. An attempt was made to print more than the maximum number of lines on a card, using a print file that was associated with a read or punch file.

The ONCODE associated with this message is 1024.

Programmer Response: Ensure that the above rules have not been violated.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PS

IBM0829S ONCODE= *oncode-value* **Insufficient virtual storage was available to VSAM.**

Explanation: During an OPEN/CLOSE or any other operation on a VSAM data set, insufficient storage was available for workspace and control blocks. The ONCODE associated with this message is 1025.

Programmer Response: Increase the REGION size for the VSAM application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PT

IBM0830S ONCODE= *oncode-value* **An I/O error occurred during a CLOSE operation.**

Explanation: An I/O error occurred while a VSAM close routine was either reading or writing a catalog record, or completing an outstanding I/O request.

Programmer Response: If the problem is related to an insufficient amount of virtual storage available to VSAM, try running the job with a larger REGION size. The access method services VERIFY command can be used to obtain more information pertaining to the error. Refer to the MVS/DFP Access Method Services manual for details.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PU

IBM0831S ONCODE= *oncode-value* **A position was not established for a sequential READ statement.**

Explanation: A READ statement without the KEY option was attempted on a VSAM data set. This occurred after sequential positioning was lost as the result of a previous error during sequential processing (for example, read error on index set or failure to position to next highest key after a “key not found” condition). The ONCODE associated with this message is 1026.

Programmer Response: Use the KEYTO option of the READ statement to obtain the keys of records read. Use this information to reposition a file for subsequent retrieval when positioning is lost.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0PV

IBM0832S ONCODE=*oncode-value* **Insufficient space was available for VSAM file** *filename***.**

Explanation: VSAM was unable to allocate additional DASD space for the data set (ESDS or KSDS). This condition was raised during an attempt to write or locate a record during the sequential creation or extension of a data set and the space allocated to the data set was full. For a KSDS, the condition may have occurred when the associated PL/I file was opened for update and an attempt was made to write new records to the file or to increase the size of existing records using the WRITE and REWRITE statements respectively. An attempt to increase the size of a data set while processing with SHROPT=4 and DISP=SHR may also have raised this condition. The ONCODE associated with this message is 1022.

Programmer Response: Use the access method services ALTER command to extend a data set provided secondary allocation was specified during data set definition. Refer to the MVS/DFP Access Method Services manual for details.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q0

IBM0833S ONCODE= *oncode-value* **A requested record was held in exclusive control.**

Explanation: The VSAM data set control interval containing the requested record was in the process of being updated by another file which used the same DD statement. The ONCODE associated with this message is 1027.

Programmer Response: Retry the update after completion of the other file's data transmission, or avoid having two files associated with the same data set at one time.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q1

IBM0834S ONCODE= *oncode-value* **The requested record was stored on a non-mounted volume.**

Explanation: The requested record was stored on a non-mounted volume of a VSAM data set spanning several volumes. The ONCODE associated with this message is 1028.

Programmer Response: Ensure that all volumes on which a VSAM data set resides are accessible at the time the application is run.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q2

IBM0835S ONCODE= *oncode-value* **An attempt to position the file for a sequential READ failed. Subcode1=** *sc1* **Subcode2=** *sc2*

Explanation: An attempt to reposition to the next highest key for subsequent sequential retrieval, after the 'key not found' condition, failed. If file processing is continued, the next I/O statement should specify the KEY option to effect positioning. Otherwise message IBM0831 may result. Subcode1 and Subcode2 provide detailed VSAM diagnostic information. See message IBM0811S for an explanation of these fields.

Programmer Response: Use the VSAM diagnostic information to correct the cause of the error and resubmit the program. Alternatively, use the KEYTO option of the READ statement to obtain the keys of the records read, so that you can reposition the file yourself for sequential retrieval.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q3

IBM0836S ONCODE= *oncode-value* **The number of concurrent operations on a data set exceeded STRNO.**

Explanation: Several files accessed a VSAM data set by means of the same DD statement (that is, using the same title). The STRNO subparameter of the DD statement that specified the total number of operations on all files that can be active at the same time was less than the number of concurrent operations. The ONCODE associated with this message is 1014.

Programmer Response: Ensure the concurrent operations are valid. Or, modify the STRNO parameter to reflect the correct number of allowed concurrent operations. A read-rewrite pair of operations on a sequential file counts as one operation. For example, if three sequential files are to update the same data set at the same time, 'STRNO=3' should be specified in the DD statement.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q4

IBM0837S ONCODE= *oncode-value* **An error occurred during an index upgrade. Subcode1=** *sc1* **Subcode2=** *sc2*

Explanation: A change to a base cluster could not be reflected in one of the indexes of the cluster's upgrade set. Subcode1 and Subcode2 provide detailed VSAM diagnostic information. See message IBM0811S for an explanation of these fields.

Programmer Response: Run the job with a larger REGION size. The problem might be related to an insufficient amount of virtual storage available to VSAM.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q5

IBM0838S ONCODE= *oncode-value* **The maximum number of alternate index pointers was exceeded.**

Explanation: The maximum number of alternate index pointers exceeded 32767. The maximum number of pointers allowed in an alternate index for any given key is 32767. This message will also be issued when the RECORDSIZE specified for a VSAM alternate index, defined with NONUNIQUEKEY, is not large enough to hold all the base cluster key pointers for a given non-unique alternate key.

Programmer Response: For alternate indices with non-unique keys, ensure the RECORDSIZE specified during the creation of the alternate index is large enough. For non-unique alternate indices, each alternate index record contains pointers to all the records that have the associated alternate index key. As a result, the index record can be quite large. If the number of alternate index pointers exceed the allowed maximum, then a different alternate key would need to be used. Refer to *DFSMS/MVS Access Method Services for VSAM* for more information regarding the use of alternate index paths.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q6

IBM0839S ONCODE= *oncode-value* **An invalid alternate index pointer was used.**

Explanation: A pointer in the alternate index was invalid. This may have been caused by incorrect use of the alternate index as a Key Sequenced Data Set (KSDS).

Programmer Response: Refer to *OS/390 Language Environment Programming Guide* regarding a general description on the use of alternate index. For more information, refer to *DFSMS/MVS Access Method Services for VSAM*.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q7

IBM0840S ONCODE= *oncode-value* **An invalid sequential WRITE was attempted.**

Explanation: A WRITE statement on a file associated with a Relative Record Data Set (RRDS) did not specify a relative record number. This resulted in an attempt to write in a slot already containing a record. The ONCODE associated with this message is 1031.

Programmer Response: Modify the WRITE statement to include a relative record number (or key) by specifying the KEYFROM option. If a relative record number is used, ensure the record number is valid. For error diagnosis, the KEYTO option can be used to obtain the number of the key for each record written if previous sequential WRITE statements did not have the KEYFROM option specified.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q8

IBM0841S ONCODE= *oncode-value* **A data set, open for output, used all available space.**

Explanation: No more space on the disk. The ONCODE associated with this message is 1040.

Programmer Response: Increase the size of the data set or check the logic of the program for possible looping.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q9

IBM0842S ONCODE= *oncode-value* **An attempt was made to write a record containing record delimiter.**

Explanation: An attempt was made to write a record containing a record delimiter (line feed character or carriage control and line feed character combination) to a native data set with the type(lf) or type(crlf) option applied.

Programmer Response: Either change your program to let PL/I write the delimiter or use the type(fixed) option.

System Action: The record is not transmitted to the data set.

Symbolic Feedback Code: IBM0QA

IBM0843S ONCODE= *oncode-value* **A record in the data set was not properly delimited.**

Explanation: While reading a native data set with TYPE(CRLF) applied, a record delimiter (carriage control and line feed character combination) was not found before the number of bytes specified by RECSIZE were read.

Programmer Response: Increase the value of RECSIZE appropriately and re-run your program.

System Action: The record is not assigned to the record variable.

Symbolic Feedback Code: IBM0QB

IBM0850S ONCODE= *oncode-value* **The aggregate length exceeded the limit of 2**24 bytes.**

Explanation: The length of the structure or array to be mapped was greater than 2^{24}, thus exceeding the limits of addressability. The program was compiled with CMPAT(V1). The ONCODE associated with this message is 3800.

Programmer Response: Reduce the size of the array or structure to a size that can be accommodated within the main storage available. If a variable is used to specify the dimension or length, check that it has been correctly initialized before the storage is allocated to the aggregate. Or, compile the program with the CMPAT(V2) option.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QI

IBM0851S ONCODE= *oncode-value* **The array structure element could not be mapped.**

Explanation: The program was compiled with CMPAT(V1). Either the program contained a structure with:

- An adjustable element and an array element with extents that cause the relative virtual origin to exceed $2^{32}-1$.
- A structure with an adjustable element and an array with a lower bound greater than the upper bound.

Example:

```
DCL 1 A CTL,
2 B CHAR(N),
2 C (15000:15001, 15000:15001,
15000:15001) CHAR(32700);
N=2;
ALLOCATE A;
```

The ONCODE associated with this message is 3801.

Programmer Response: If possible, compile the program with the CMPAT(V2) option. If recompiling is not possible:

- Ensure aggregates with array elements remain within the limit of addressability (2^{32} -1), or
- Ensure the lower bound is not greater than the upper bound.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QJ

IBM0852S ONCODE= *oncode-value* **The mapping of an aggregate to a COBOL form failed.**

Explanation: An attempt was made to pass to or obtain from a COBOL program a structure with more than three dimensions. The ONCODE associated with this message is 3808.

Programmer Response: Ensure PL/I aggregates that are passed to or from COBOL programs are within the limits described above.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QK

IBM0854S ONCODE= *oncode-value* **The maximum depth of iteration exceeded the limits during an array initialization.**

Explanation: The depth of iteration within the initial attribute on an AUTOMATIC array exceeded 12.

Programmer Response: Change the depth of iteration to less than 12.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QM

IBM0855S ONCODE=3809 The length of a data aggregate exceeded the maximum limit.

Explanation: The length of the structure to be mapped was greater than the allowable limit. Structures that do not contain any unaligned bit elements have a maximum size of 2**31-1 bytes. Structures with one or more unaligned bit elements have a maximum size of 2**28-1 bytes.

Programmer Response: Reduce the size of the structure to less than the maximum allowed. If a variable is used to specify the dimension or length of an element, ensure the variable is correctly initialized before the storage is allocated to the aggregate.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QN

IBM0856S ONCODE=3810 An extent of an array exceeded the maximum limit.

Explanation: During structure mapping, an array with an extent greater than the allowed maximum was encountered. The largest allowable extent (upper bound minus lower bound) of any dimension in an array is 2**31-1.

Programmer Response: Reduce the extent of the array to less than the maximum allowed. If a variable is used to specify a bound, ensure the variable is correctly initialized.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QO

IBM0860S ONCODE= *oncode-value* **The UNDEFINEDFILE condition was raised because the VSAM server was not available to perform the OPEN (***FILE= or ONFILE= file-name***).**

Explanation: VSAM Record Level Sharing (RLS) is supported by a VSAM server address space and data space. The VSAM server has failed and is unavailable for PL/I to complete the open function.

Programmer Response: When the VSAM server becomes available, resubmit the program. See the VSAM publications for additional information.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QS

IBM0861S ONCODE=*oncode-value* **The UNDEFINEDFILE condition was raised because an attempt to position the file at the first record failed** *FILE= or ONFILE= file-name***). Subcode1=***sc1* **Subcode2=***sc2*

Explanation: For SEQUENTIAL INPUT or UPDATE, the file must be positioned at the first record. If an attempt to position at the first record fails, the file is closed and the UNDEFINEDFILE condition is raised with this message. Subcode1 and Subcode2 provide detailed VSAM diagnostic information. See message IBM0811S for an explanation of these fields.

Programmer Response: Use the VSAM diagnostic information to correct the cause of the error and resubmit the program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QT

IBM0862S ONCODE= *oncode-value* **The VSAM server was not available to execute a VSAM I/O request**

Explanation: VSAM Record Level Sharing (RLS) is supported by a VSAM server address space and data space. The VSAM server has failed and is unavailable to perform VSAM I/O requests. The failing file must be CLOSEd, if an attempt is made to reopen the file and continue processing.

Programmer Response: When the VSAM server becomes available, resubmit the program. See *DFSMS/MVS Access Method Services for VSAM* for additional information.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QU

IBM0863S ONCODE= *oncode-value* **A deadlock was detected while attempting to lock a record.**

Explanation: The program has attempted to lock a record using VSAM Record Level Sharing (RLS). However, VSAM RLS processing has detected that a deadlock condition exists within its sysplex-wide set of lock owners and lock waiters. This program has been selected to receive the deadlock error so that the deadlock can be broken.

Programmer Response: This program was found to be in deadlock with other programs. The system programmer will have SMSVSAM diagnostic tools and diagnostic information is availble from CICS to determine what programs encountered the deadlock. The action for this error is to avoid running the same mix of programs. The program may also attempt to retry the PL/I request which encountered the deadlock error some number of times. However, depending of the mix of programs, this may or may not be successful.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0QV

IBM0865S ONCODE= *oncode-value* **A retained lock reject has occurred while attempting to lock a record.**

Explanation: This program has attempted to lock a record using VSAM Record Level Sharing (RLS). However, VSAM RLS has rejected this request for the lock because of its retained lock status. That is, the lock is held by a failed CICS and until that CICS restarts and completes its backout of the record, the record is not available.

Programmer Response: This error can occur on a READ statement for a file opened for INPUT when RLS=CR is used, but not if RLS=NRI is used. For sequential read, the program may wish to proceed to read the next available record. Or, the program can be resubmitted when the CICS restart is complete. See *DFSMS/MVS Access Method Services for VSAM* for additional information about this failure.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0Q1

IBM0870S ONCODE= *oncode-value* **The OS/VS COBOL program is not supported for interlanguage communication in IBM SAA AD/Cycle LE/370.**

Explanation: The OS/VS COBOL program is not supported for interlanguage communication in IBM SAA AD/Cycle LE/370.

Programmer Response: Compile the OS/VS COBOL program with IBM SAA AD/Cycle COBOL/370 or don't run the application with IBM SAA AD/Cycle LE/370.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0R6

IBM0880S ONCODE= *oncode-value* **A program check occurred in the SORT/MERGE program.**

Explanation: An error occurred while the SORT/MERGE program was running after it was invoked from a PL/I program by use of the PL/I SORT interface facilities. As a result, the SORT program was unable to continue and control was passed to the PL/I error-handler. The ONCODE associated with this message is 9200.

Programmer Response: Because the problem occurred while the SORT/MERGE program was running, refer to the appropriate SORT/MERGE program manual for an explanation of any SORT program messages and any other information that might be necessary to correct the error.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0RG

IBM0882S ONCODE= *oncode-value* **The string RECORD TYPE was missing in the second argument of the call PLISRTx statement.**

Explanation: The RECORD TYPE string must be given in the RECORD statement for calls to PLISRTx. It is used to specify the type of records in the file.

Programmer Response: Ensure the RECORD TYPE is coded correctly in the RECORD statement and rerun the application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0RI

IBM0883S ONCODE= *oncode-value* **Incorrect record type was specified in the second argument of the call PLISRTx statement.**

Explanation: The RECORD TYPE in the RECORD statement of PLISRTx takes F for fixed length and V for varying length EBCDIC. Characters other than F and V are invalid.

Programmer Response: Code the correct record type in the RECORD statement and rerun the application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0RJ

IBM0884S ONCODE= *oncode-value* **The LENGTH= was not specified in the second argument of the call PLISRTx statement.**

Explanation: The LENGTH specifier must be given for calls to PLISRTB, and PLISRTD. Use this specifier to indicate the length of the record to be sorted.

Programmer Response: Ensure the LENGTH specifier is coded in the RECORD statement and rerun the application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0RK

IBM0885S ONCODE= *oncode-value* **The length specified in the LENGTH= parameter in the second argument of the call PLISRTx statement was not numeric.**

Explanation: The length coded for LENGTH= in the RECORD statement of the PLISRTx call must be numerical.

Programmer Response: Ensure numerical data is coded for LENGTH= in the RECORD statement and rerun the application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0RL

IBM0886S ONCODE= *oncode-value* **Incorrect return code** *rc* **received from user's E15 or E35 handling routine.**

Explanation: The allowed return code from the E15 input handling routine are 8, 12, and 16. The allowed return code from the E35 output handling routine are 4 and 16.

Programmer Response: Ensure the return code returned by the PLIRETC built-in function is correct and rerun the application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0RM

IBM0887S ONCODE= *oncode-value* **dfsort failed with a return code of** *rc***.**

Explanation: The sort program returns an unsuccessful return code. For the explanation of the return code, refer to the message in the JES log.

Programmer Response: Correct the program based on the information from the return code and the message and rerun the application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0RN

IBM0888S ONCODE= *oncode-value* **PLISRTx not supported in environments other than ADMVS.**

Explanation: The PL/I program calling the PLISRTx function must have the ADMVS running.

Programmer Response: Take out the PLISRTx call and rerun the application.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0RO

IBM0900S ONCODE= *oncode-value* **The WAIT statement would cause a permanent wait. The program has been terminated.**

Explanation: A WAIT statement that could never have been completed was encountered.

Example:

```
COMPLETION (E1) = '0'B;
WAIT(E1);
```

The event E1 is inactive and incomplete.

Programmer Response: Modify the program so that the WAIT statement can never wait for an inactive or incomplete event.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0S4

IBM0913S ONCODE= *oncode-value* **An error occurred on a FREE statement.**

Explanation: PL/I storage management detected an error during the processing of either a FREE statement or the PLIFREE built-in function.

Programmer Response: Ensure the variable specified on the FREE statement is a controlled variable that has been allocated. Another suggestion is to acquire a storage report to check on the program's use of storage. A PLIDUMP should be obtained for later study by IBM.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0SH

IBM0914S ONCODE= *oncode-value* **An abnormal termination has occurred in a linked PL/I program while running a CICS transaction.**

Explanation: A PL/I program called through EXEC LINK or EXEC XCTL terminated abnormally.

Programmer Response: Examine the linked PL/I program unit and correct the error that caused error.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0SI

IBM0915S ONCODE= *oncode-value* **An internal error occurred in PL/I library.**

Explanation: An error occurred within the PL/I library. The ONCODE associated with this message is 1104.

Programmer Response: A PLIDUMP should be obtained for later study by IBM.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0SJ

IBM0916S ONCODE= *oncode-value* **An object window was unable to be created.**

Explanation: The Presentation Manager returned an error when an attempt was made to create an object window during the execution of a DISPLAY statement or I/O to a Presentation Manager Terminal (PMT).

Programmer Response: The problem may be that too many windows have been created. Reduce the number of windows and re-run your program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0SK

IBM0917S ONCODE= *oncode-value* **An internal error occurred in PL/I storage management.**

Explanation: There was insufficient space available to satisfy a storage allocation request within PL/I storage management. The ONCODE associated with this message is 1106.

Programmer Response: Acquire a storage report to check on the program's use of storage. A PLIDUMP should be obtained for later study by IBM.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0SL

IBM0924W Closing a file in the ON-unit caused errors in this statement.

Explanation: An ON-unit for an I/O condition was entered and the file associated with the ON-unit was closed in the ON-unit. A GOTO statement should have been used to exit from the ON-unit. The result of a normal return from an ON-unit is undefined.

Programmer Response: Use a GOTO statement to exit from the ON-unit, or close the file outside of the ON-unit.

System Action: No system action is performed.

Symbolic Feedback Code: IBM0SS

IBM0925W The PLIRETC value was reduced to 999.

Explanation: The value passed to the PLIRETC built-in procedure was greater than 999. 999 is the maximum allowed user value.

Programmer Response: Ensure all PLIRETC values are below 999.

System Action: Processing continues with the next sequential statement.

Symbolic Feedback Code: IBM0ST

IBM0926S The CHECKPOINT/RESTART facility is not supported in a CMS environment.

Explanation: An attempt was made to call the CHECKPOINT/RESTART facility from PL/I. CHECKPOINT/RESTART is not supported under CMS. The ERROR condition was raised.

Programmer Response: Remove the call to the CHECKPOINT/RESTART facility. If this facility needs to be used, run the application under OS/390.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0SU

IBM0930S ONCODE= *oncode-value* **An attempt was made to call a Checkout-compiled program in the LE/370 environment.**

Explanation: Checkout-compiled programs are not supported in the LE/370 environment.

Programmer Response: Remove the call to the Checkout-compiled program.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0T2

IBM0950S ONCODE= *oncode-value* **A system error occurred in PL/I multithreading support for the WAIT statement.**

Explanation: An uninitialized task variable may have been specified in the THREAD option. Another reason why an error may have occurred in WAIT is that the operating system may have run out of resources to satisfy the request or may have timed out.

Programmer Response: Ensure that the tasking variable has been initialized to a valid value. The ATTACH statement with the THREAD option must be used to give a tasking variable a starting value. Ensure that there are enough resources for the operating system to acquire.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0TM

IBM0951S ONCODE= *oncode-value* **A system error occurred in PL/I multithreading support for the DETACH statement.**

Explanation: An uninitialized task variable may have been specified in the THREAD option.

Programmer Response: Ensure that the tasking variable has been initialized to a valid value. The ATTACH statement with the THREAD option must be used to give a tasking variable a starting value.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0TN

IBM0952S ONCODE= *oncode-value* **A system error occurred in PL/I multithreading support for the ATTACH statement.**

Explanation: The operating system may have run out of resources (not enough memory, too many handles) to satisfy the request.

Programmer Response: Ensure that there are enough resources for the operating system to acquire.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0TO

IBM0953S ONCODE= *oncode-value* **A system error occurred in PL/I multithreading support for the STOP statement.**

Explanation: An uninitialized task variable may have been specified in the THREAD option.

Programmer Response: Ensure that the tasking variable has been initialized to a valid value. The ATTACH statement with the THREAD option must be used to give a tasking variable a starting value.

System Action: The ERROR condition is raised.

Symbolic Feedback Code: IBM0TP

Chapter 15. COBOL Run-Time Messages

The following messages pertain to COBOL. Each message is followed by an explanation describing the condition that caused the message, a programmer response suggesting how you might prevent the message from occurring again, and a system action indicating how the system responds to the condition that caused the message.

The messages also contain a symbolic feedback code, which represents the first 8 bytes of a 12-byte condition token. You can think of the symbolic feedback code as the nickname for a condition. As such, the symbolic feedback code can be used in user-written condition handlers to screen for a given condition, even if it occurs at different locations in an application.

The messages in this section contain alphabetic suffixes that have the following meaning:

I Informational message
W Warning message
E Error message
S Severe error message
C Critical error message

IGZ0002S *debugging-information*

Explanation: A SYNAD error has occurred on a QSAM file. The text was supplied by the system SYNADAF routine. Since the debugging information supplied in this message is system specific, the message format differs between CMS and MVS environments. The message issued under MVS consists of the following:

```
IGZ0002S job name, step name, unit address, device
         type, ddname, operation attempted, error
         description, actual track address and
         block number, access method.
```

The message issued under CMS is as follows:

```
IGZ0002S 120S operation
type ERROR nnn ON ddname,
```

Definitions requiring further explanation for the above message formats are:

120S	is the CMS message number for SYNAD errors
operation type	INPUT or OUTPUT
device type	UR for unit record device
	TA for magnetic tape device
	DA for direct access device
nnn	is the associated error code
ddname	is the DDNAME of the related file
operation attempted	actual operation

Programmer Response: For more information regarding the CMS message number 120S and related error codes, see *VM/SP System Messages and Codes*. For information on the MVS text of this SYNADAF message, see *DFSMS/MVS Macro Instructions for Data Sets*, SC26-4913, and *DFSMS/MVS Using Data Sets*, SC26-4922.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ002

IGZ0003W A logic error occurred for file *file-name* **in program** *program-name* **at relative location** *relative-location***.**

Explanation: This error is usually caused by an I/O operation request that is not valid for the file—for example, a WRITE into a file opened for INPUT, or a START to a VSAM ESDS.

A file status clause was specified or an error declarative statement was active for the file.

Programmer Response: Check the operation request and modify the program.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ003

IGZ0005S OS/VS COBOL programs in the application were found in multiple enclaves.

Explanation: OS/VS COBOL programs are restricted to one enclave within an application.

Programmer Response: Modify the application so that the OS/VS COBOL programs appear in one enclave only.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ005

IGZ0006S The reference to table *table-name* **by verb number** *verb-number* **on line** *line-number* **addressed an area outside the region of the table.**

Explanation: When the SSRANGE option is in effect, this message is issued to indicate that a fixed-length table has been subscripted in a way that exceeds the defined size of the table, or, for variable-length tables, the maximum size of the table.

The range check was performed on the composite of the subscripts and resulted in an address outside the region of the table. For variable-length tables, the address is outside the region of the table defined when all OCCURS DEPENDING ON objects are at their maximum values; the ODO object's current value is not considered. The check was not performed on individual subscripts.

Programmer Response: Ensure that the value of literal subscripts and/or the value of variable subscripts as evaluated at run-time do not exceed the subscripted dimensions for subscripted data in the failing statement.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ006

IGZ0007S The size of variable length group *group-name* **exceeded the maximum defined length of the group at the time of reference by verb number** *verb-number* **on line** *line-number***.**

Explanation: When the SSRANGE option is in effect, this message is issued to indicate that a variable-length group generated by OCCURS DEPENDING ON has a length that is less than zero, or is greater than the limits defined in the OCCURS DEPENDING ON clauses.

The range check was performed on the composite length of the group, and not on the individual OCCURS DEPENDING ON objects.

Programmer Response: Ensure that OCCURS DEPENDING ON objects as evaluated at run-time do not exceed the maximum number of occurrences of the dimension for tables within the referenced group item.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ007

IGZ0009C A delete of module *module-name* was unsuccessful.

Explanation: An attempt to delete a module failed.

Programmer Response: See your IBM service representative.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ009

IGZ0011C *module-name* was not a proper module for this system environment.

Explanation: A library subroutine that is system sensitive is inappropriate for the current system environment. For example, an OS environment specific module has been loaded under CICS. The likely causes are:

- Improper concatenation sequence of partitioned data sets that contain the subroutine library, either during run-time or during link-edit of the COBPAC.
- An attempt to use a function unsupported on the current system (for example, ACCEPT on CICS).

Programmer Response: Check for the conditions stated above, and modify the environment or the application as needed.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00B

IGZ0012S There was an invalid attempt to end a sort or merge.

Explanation: A sort or merge initiated by a COBOL program was in progress and one of the following was attempted:

1. A STOP RUN was issued.
2. A GOBACK or an EXIT PROGRAM was issued within the input procedure or the output procedure of the COBOL program that initiated the sort or merge. Note that the GOBACK and EXIT PROGRAM statements are allowed in a program called by an input procedure or an output procedure.
3. A user handler associated with the program that initiated the sort or merge moved the condition handler resume cursor and resumed the application.

Programmer Response: Change the application so that it does not use one of the above methods to end the sort or merge.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00C

IGZ0013S An error return code *return-code* came from a CICS command *CICS-command* issued by library subroutine *library-subroutine*.

Explanation: An error was encountered when a run-time routine issued a CICS command. The error return code is from the field EIBRESP in the CICS EIB. For more information about the values for the field EIBRESP, see the *CICS/ESA Application Programmer's Reference*, SC33-0676.

Programmer Response: Modify your application as required.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00D

IGZ0014W *module-name* **is no longer supported. Its content was ignored.**

Explanation: This message is issued when the run-time detects that IGZETUN or IGZEOPT is linked with the application. IGZETUN and IGZEOPT are ignored when running with LE/370. CEEUOPT may be used in place of IGZETUN and IGZEOPT.

Programmer Response: Remove the explicit INCLUDE of IGZEOPT or IGZETUN during the link-edit step.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ00E

IGZ0015S A recursive call was attempted to a program that was already active. The program name is *program-name***.**

Explanation: An illegal recursive entry to an active program is detected. For example, Program A has CALLed Program B, and Program B is CALLing Program A.

Programmer Response: Remove the recursive call to *program-name* or specify the IS RECURSIVE phrase on the PROGRAM-ID statement for the recursively CALLed program. Additionally, if the recursive program is called dynamically, link-edit it with REUS.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00F

IGZ0016W Program *program-name* **could not be deactivated by non-return exit of a routine. Subsequent reentry is not supported.**

Explanation: A COBOL program cannot normally be recursively entered. When non-return style procedure collapse processing is being performed for a COBOL program, an attempt is made to reset the program to a state where it can be recursively entered. This is not supported for certain combinations of function used within the program. After this message is issued, any attempt to reenter the program will result in message IGZ0015S and termination of the enclave.

Programmer Response: Do not reenter the program or modify the program to allow it to be successfully reset.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ00G

IGZ0017S The open of DISPLAY or ACCEPT file with environment name *environment-name* **was unsuccessful.**

Explanation: An error occurred while opening the DISPLAY/ACCEPT file.

Programmer Response: Check to make sure a ddname has been defined for the file.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00H

IGZ0018S On CICS, an attempt was made to run a COBOL program which is not reentrant. The program name is *program-name***.**

Explanation: COBOL programs running on CICS must be reentrant.

Programmer Response: In order to make a COBOL program reentrant, compile the COBOL program with the RENT compile-time option.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00I

IGZ0019W A FUNCTION result used as a DELIMITED BY operand is larger than the UNSTRING object in program *program-name* **at displacement** *displacement***. The DELIMITED BY phrase is ignored.**

Explanation: A FUNCTION used as a DELIMITED BY operand was larger than the UNSTRING object.

Programmer Response: Check the FUNCTION arguments to ensure that they are not larger than the UNSTRING object.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ00J

IGZ0020S A logic error occurred. Neither FILE STATUS nor a declarative was specified for file *file-name* **in program** *program-name* **at relative location** *relative-location***. The status code was** *status-code***.**

Explanation: This error is an I/O error, usually caused by an operation request that is not valid for the file, for example, a WRITE into a file opened for INPUT, or a START to a VSAM ESDS.

No file status clause was specified, and no error declarative was in effect.

Programmer Response: Check operation request for the file.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00K

IGZ0021C *macro-name* **was unsuccessful for file** *file-name***.**

Explanation: The execution of an ENDREQ, GENCB, MODCB, SHOWCB, or TESTCB macro failed. This is the result of system or VSAM problems.

Programmer Response: See your IBM service representative.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00L

IGZ0022W File *file-name* **in program** *program-name* **will return the maximum record length when read.**

Explanation: A VSAM RRDS with a varying record length has been opened for input. The maximum record length will be returned.

Programmer Response: None

System Action: No system action was taken.

Symbolic Feedback Code: IGZ00M

IGZ0023S The dynamic allocation of file *file-name* **was unsuccessful. The return code was** *return-code***. The reason code was** *reason-code***.**

Explanation: An attempt to dynamically allocate a file using DYNALLOC failed, resulting in the indicated return and reason codes.

Programmer Response: Review the job stream or filedef to see if any DDNAMES are missing or misspelled. If you can not find any errors, resubmitt the job with the CBLQDA(OFF) run-time option and check for any access method messages.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00N

IGZ0024S An invalid separate sign character was detected in *program-name* **at displacement** *displacement***.**

Explanation: An operation was attempted on data defined with a separate sign. The value in the sign position was not a plus (+) or a minus (-).

Programmer Response: This error might have occurred because of a REDEFINES clause involving the sign position or a group move involving the sign position, or the position was never initialized. Check for these cases. The compiler formatting option TEST(), or equivalent, along with the ABTERMENC() run-time option, can be used to generate a formatted dump of the user data. This dump can then be used to identify the unacceptable data item contents.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00O

IGZ0026W The SORT-RETURN special register was never referenced, but the current content indicated the sort or merge operation in program *program-name* **on line number** *line-number* **was unsuccessful.**

Explanation: The COBOL source does not contain any references to the sort-return register. The compiler generates a test after each sort or merge verb. A nonzero return code has been passed back to the program by Sort/Merge.

Programmer Response: Determine why the Sort/Merge was unsuccessful and fix the problem. Possible reasons why the Sort/Merge was unsuccessful include:

- There was an error detected by DFSORT. See the DFSORT messages for the reason for the error.
- The SORT-RETURN special register was set to a non-zero value by the application program while in an input procedure or an output procedure.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ00Q

IGZ0027W The sort control file could not be opened.

Explanation: An attempt to open the sort control file has failed. Possible reasons for the open failure include:

- A ddname for the sort control file was not provided.
- The IGZSRTCD ddname was provided, but the file associated with the ddname could not be found.

When the sort control file cannot be opened, user-supplied sort control cards will not be passed to Sort/Merge.

The sort control file is optional. On MVS, if you did not provide a ddname for the sort control file (the sort control file name is IGZSRTCD unless it is overridden by changing the value of the SORT-CONTROL special register) you will also get this message: IEC130I 'IGZSRTCD DD STATEMENT MISSING'. This message is informational only.

Programmer Response: If you want to pass in sort control cards from the sort control file, verify that the ddname is specified and the file is available.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ00R

IGZ0028S An I/O error occurred in sort control file *file-name***.**

Explanation: An I/O error was encountered while trying to read the sort control file. Some or all of the user-supplied sort control cards will not be passed to Sort/Merge.

Programmer Response: For more information, look at the previous system message you received relating to this I/O error.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00S

IGZ0029S Argument-1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than zero.**

Explanation: An illegal value for argument-1 was used.

Programmer Response: Ensure that argument-1 is greater than or equal to zero.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00T

IGZ0030S Argument-2 for function *function-name* **in program** *program* **at line** *line-number* **was not a positive integer.**

Explanation: An illegal value for argument-2 was used.

Programmer Response: Ensure that argument-2 is a positive integer.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00U

IGZ0031S A restart was not possible since the checkpoint record *record-name* **was taken while a sort or merge was in progress.**

Explanation: An attempt was made to use the restart facility of checkpoint/restart to resume execution of a job from a checkpoint taken by a COBOL program because of a rerun clause during a Sort/Merge operation. Only checkpoints taken by the sort product can be used to restart from a point within the Sort/Merge operation.

The checkpoint record cannot be used for restart.

Programmer Response: Use a different checkpoint record. If no other checkpoint records exist, the job cannot be restarted.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ00V

IGZ0032S A CANCEL was attempted on active program *program-name***.**

Explanation: An attempt was made to cancel an active program. For example, program A called program B; program B is trying to cancel program A.

Programmer Response: Remove the failing CANCEL statement. In order to locate the failing CANCEL statement, rerun the application with TERMTHDACT(TRACE) or (ABEND). Review the traceback information to identify the program that issued the CANCEL.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ010

IGZ0033S An attempt was made to pass a parameter address above 16 megabytes to AMODE(24) program *program-name***.**

Explanation: An attempt was made to pass a parameter located above the 16-megabyte storage line to a program in AMODE(24). The called program will not be able to address the parameter.

Programmer Response: If the calling program is compiled with the RENT option, the DATA(24) option may be used in the calling program to make sure that its data is located in storage accessible to an AMODE(24) program. If the calling program is compiled with the NORENT option, the RMODE(24) option may be used in the calling program to make sure that its data is located in storage accessible to an AMODE(24) program. Verify that no linkedit, binder or genmod overrides are responsible for this error.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ011

IGZ0034W The file with system-name *system-name* **could not be extended. Secondary extents were not specified or were not available. The last WRITE was at offset** *offset* **in program** *program-name***.**

Explanation: There is insufficient space available for an output file. There is no invalid key clause, file status, or user error declarative. This corresponds to the MVS X37 ABEND.

Programmer Response: Check the file attributes and if necessary, reallocate the file. Also check data set allocations.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ012

IGZ0035S There was an unsuccessful OPEN or CLOSE of file *file-name* **in program** *program-name* **at relative location** *location***. Neither FILE STATUS nor an ERROR declarative were specified. The status code was** *status-code***.**

Explanation: An error has occurred while opening or closing the named file. No file status or user error declarative was specified.

Programmer Response: Check to make sure there is a ddname defined for the indicated file.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ013

IGZ0036W Truncation of high order digit positions occurred in program *program-name* **on line number** *line-number***.**

Explanation: The generated code has truncated an intermediate result (that is, temporary storage used during an arithmetic calculation) to 30 digits; some of the truncated digits were not 0.

Programmer Response: See *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide* for a description of intermediate results.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ014

IGZ0037S The flow of control in program *program-name* **proceeded beyond the last line of the program.**

Explanation: The program did not have a terminator (STOP, GOBACK, or EXIT), and control fell through the last instruction.

Programmer Response: Check the logic of the program. Sometimes this error occurs because of one of the following logic errors:

- The last paragraph in the program was only supposed to receive control as the result of a PERFORM statement, but due to a logic error it was branched to by a GO TO statement.
- The last paragraph in the program was executed as the result of a "fall-through" path, and there was no statement at the end of the paragraph to end the program.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ015

IGZ0038S A reference modification length value of *reference-modification-value* **on line** *line-number* **which was not equal to 1 was found in a reference to data item** *data-item* **which was passed by value.**

Explanation: The length value in a reference modification specification was not equal to 1. The length value must be equal to 1.

Programmer Response: Check the indicated line number in the program to ensure that any reference modified length values are (or will resolve to) 1.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ016

IGZ0039S An invalid overpunched sign was detected in program *program-name* **on line** *line-number***.**

Explanation: An operation was attempted on data defined with an overpunched sign. The value in the sign was not valid.

Programmer Response: This error might have occurred because of a REDEFINES clause involving the sign position or a group move involving the sign position, or the position was never initialized. Check for the above cases.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ017

IGZ0040S An invalid separate sign was detected in program *program-name* **on line** *line-number***.**

Explanation: An operation was attempted on data defined with a separate sign. The value in the sign position was not a plus (+) or a minus (-).

Programmer Response: This error might have occurred because of a REDEFINES clause involving the sign position or a group move involving the sign position, or the position was never initialized. Check for the above cases.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ018

IGZ0041W The warning message limit was exceeded. Further warning messages were suppressed.

Explanation: The limit on warning messages is 256. This constraint on the number of warning messages prevents a looping program from flooding the system buffers.

Programmer Response: Correct the situations causing the warning messages or correct the looping problem.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ019

IGZ0042C There was an attempt to use the IGZBRDGE macro, but the calling program was not COBOL.

Explanation: A non-COBOL program attempted to call a COBOL program using the IGZBRDGE interface. COBOL/370 could not find a COBOL environment.

Programmer Response: Do not call an entry point specified via the IGZBRDGE macro from a non-COBOL program.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01A

IGZ0044S There was an attempt to call the COBOL main program *program-name* **that was not in initial state.**

Explanation: You will receive this message if you attempt to enter a NONREENTRANT COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM main program more than once. This is a nonstandard entry attempt.

Programmer Response: Modify the application so that the non-reentrant COBOL main program won't be called more than once.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01C

IGZ0045S Unable to invoke method *method-name* **on line number** *line number* **in COBOL program** *program-name***.**

Explanation: The specific method is not supported for the class of the current object reference.

Programmer Response: Check the indicated line number in the program to ensure that the class of the current object reference supports the method being invoked.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01D

IGZ0046W The value specified in the program for the *special-register* **special register was overridden by the corresponding value in the sort control file.**

Explanation: A nondefault value for the SORT special register specified in the message was used in a program, but a value in the SORT control file which corresponds to that SORT special register was found. The value in the SORT control file was used, and the value in the SORT special register was ignored.

Programmer Response: See *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide* for a description of SORT special registers and the SORT control file.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ01E

IGZ0047S Unable to invoke method *method-name* **on line number** *line number* **in COBOL class** *class-name***.**

Explanation: The specific method is not supported for the class of the current object reference.

Programmer Response: Check the indicated line number in the class to ensure that the class of the current object reference supports the method being invoked.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01F

IGZ0048W A negative base was raised to a fractional power in an exponentiation expression in program *program-name* **at displacement** *displacement***. The absolute value of the base was used.**

Explanation: A negative number raised to a fractional power occurred in a library routine.

The value of a negative number raised to a fractional power is undefined in COBOL. If a SIZE ERROR clause had appeared on the statement in question, the SIZE ERROR imperative would have been used. However, no SIZE ERROR clause was present, so the absolute value of the base was used in the exponentiation.

Programmer Response: Ensure that the program variables in the failing statement have been set correctly.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ01G

IGZ0049W A zero base was raised to a zero power in an exponentiation expression in program *program-name* **at displacement** *displacement***. The result was set to one.**

Explanation: The value of zero raised to the power zero occurred in a library routine.

The value of zero raised to the power zero is undefined in COBOL. If a SIZE ERROR clause had appeared on the statement in question, the SIZE ERROR imperative would have been used. However, no SIZE ERROR clause was present, so the value returned was one.

Programmer Response: Ensure that the program variables in the failing statement have been set correctly.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ01H

IGZ0050S A zero base was raised to a negative power in an exponentiation expression in program *program-name* **at displacement** *displacement***.**

Explanation: The value of zero raised to a negative power occurred in a library routine.

The value of zero raised to a negative number is not defined. If a SIZE ERROR clause had appeared on the statement in question, the SIZE ERROR imperative would have been used. However, no SIZE ERROR clause was present.

Programmer Response: Ensure that the program variables in the failing statement have been set correctly.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01I

IGZ0051S An invalid EBCDIC digit string was detected on conversion to floating point in *program-name* **at displacement** *displacement***.**

Explanation: The input to the conversion routine contained invalid EBCDIC data.

Programmer Response: Ensure that the program variables in the failing statement have been set correctly.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01J

IGZ0052C An internal error or invalid parameters were detected in the floating point conversion routine called from *program-name* **at displacement** *displacement***.**

Explanation: None

Programmer Response: See your IBM service representative.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01K

IGZ0053S An overflow occurred on conversion to floating point in *program-name* **at displacement** *displacement***.**

Explanation: A number was generated in the program that is too large to be represented in floating point.

Programmer Response: You need to modify the program appropriately to avoid an overflow.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01L

IGZ0054W An overflow occurred on conversion from floating point to fixed point in *program-name* **at displacement** *displacement***. The result was truncated.**

Explanation: The result of a conversion to fixed point from floating point contains more digits than will fit in the fixed point receiver. The high order digits were truncated.

Programmer Response: No action is necessary, although you may want to modify the program to avoid an overflow.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ01M

IGZ0055W An underflow occurred on conversion to floating point in *program-name* **at displacement** *displacement***. The result was set to zero.**

Explanation: On conversion to floating point, the negative exponent exceeded the limit of the hardware. The floating point value was set to zero.

Programmer Response: No action is necessary, although you may want to modify the program to avoid an underflow.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ01N

IGZ0056W One or more files were not closed by program *program-name* **prior to program termination.**

Explanation: The specified program has finished but has not closed all of the files it opened. COBOL attempts to clean up storage and closes any open files.

Programmer Response: Check that all files are closed before the program terminates.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ01O

IGZ0057S There was an attempt to initialize a reusable environment through ILBOSTP0, but either the enclave was not the first enclave or COBOL was not the main program of the already established enclave.

Explanation: A request to establish a reusable environment through ILBOSTP0 can only occur at the beginning of the application. Examples when this error can occur:

- PL/I program calls ASSEMBLE program which calls ILBOSTP0.
- Language Environment enabled ASSEMBLER program calls ILBOSTP0.

Programmer Response: Only invoke ILBOSTP0 prior to calling any program within the application that brings up Language Environment.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01P

IGZ0058S Exponent overflow occurred in program *program-name* **at displacement** *displacement***.**

Explanation: Floating point exponent overflow occurred in a library routine.

Programmer Response: Ensure that the program variables in the failing statement have been set correctly.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01Q

IGZ0059W An exponent with more than nine digits was truncated in program *program-name* **at displacement** *displacement***.**

Explanation: Exponents in fixed point exponentiations may not contain more than nine digits. The exponent was truncated back to nine digits; some of the truncated digits were not 0.

Programmer Response: No action is necessary, although you may want to adjust the exponent in the failing statement.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ01R

IGZ0060W Truncation of high order digit positions occurred in program *program-name* **at displacement** *displacement***.**

Explanation: Code in a library routine has truncated an intermediate result (that is, temporary storage used during an arithmetic calculation) back to 30 digits; some of the truncated digits were not 0.

Programmer Response: See *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide* for a description of intermediate results.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ01S

IGZ0061S Division by zero occurred in program *program-name* **at displacement** *displacement***.**

Explanation: Division by zero occurred in a library routine. Division by zero is not defined. If a SIZE ERROR clause had appeared on the statement in question, the SIZE ERROR imperative would have been used. However, no SIZE ERROR clause was present.

Programmer Response: Ensure that the program variables in the failing statement have been set correctly.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01T

IGZ0063S An invalid sign was detected in a numeric edited sending field in *program-name* **on line number** *line-number***.**

Explanation: An attempt has been made to move a signed numeric edited field to a signed numeric or numeric edited receiving field in a MOVE statement. However, the sign position in the sending field contained a character that was not a valid sign character for the corresponding PICTURE.

Programmer Response: Ensure that the program variables in the failing statement have been set correctly.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ01V

IGZ0064S A recursive call to active program *program-name* **in compilation unit** *compilation-unit* **was attempted.**

Explanation: COBOL does not allow reinvocation of an internal program which has begun execution, but has not yet terminated. For example, if internal programs A and B are siblings of a containing program, and A calls B and B calls A, this message will be issued.

Programmer Response: Examine your program to eliminate calls to active internal programs.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ020

IGZ0065S A CANCEL of active program *program-name* **in compilation unit** *compilation-unit* **was attempted.**

Explanation: An attempt was made to cancel an active internal program. For example, if internal programs A and B are siblings in a containing program and A calls B and B cancels A, this message will be issued.

Programmer Response: Examine your program to eliminate cancellation of active internal programs.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ021

IGZ0066S The length of external data record *data-record* **in program** *program-name* **did not match the existing length of the record.**

Explanation: While processing External data records during program initialization, it was determined that an External data record was previously defined in another program in the run-unit, and the length of the record as specified in the current program was not the same as the previously defined length.

Programmer Response: Examine the current file and ensure the External data records are specified correctly.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ022

IGZ0067S The NOEQUALS keyword in the sort control file *file-name* **conflicted with the specifications of the DUPLICATES phrase on the SORT statement.**

Explanation: A sort control file with an OPTION card specifying the NOEQUALS keyword was used for a SORT which had the DUPLICATES IN ORDER phrase specified. The NOEQUALS keyword and the DUPLICATES phrase conflict.

Programmer Response: Either remove the NOEQUALS keyword from the sort control file or remove the DUPLICATES IN ORDER phrase from the SORT statement.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ023

IGZ0068W Duplicate characters were ignored in an INSPECT CONVERTING statement in program *program-name* **at displacement** *displacement***.**

Explanation: The same character appeared more than once in the identifier that contained the characters to be converted in an INSPECT CONVERTING statement. The first occurrence of the character, and the corresponding character in the replacement field, are used, and subsequent occurrences are not used.

Programmer Response: Duplicate characters in the indicated INSPECT statement may be deleted; programmer action is not required.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ024

IGZ0069S On VM, file *file-name* **in program** *program-name* **attempted to use VSAM in XA or ESA mode. Using VSAM while in XA or ESA mode is not supported under the installed level of VM. The program was terminated.**

Explanation: VSAM can only operate in S/370 mode virtual machines on VM/SP XA and VM/ESA Release 1 ESA feature. The job was cancelled. Only on VM/ESA Release 1.1 (CMS8), and higher releases, can VSAM and VS COBOL II be used in XA-mode and XC-mode virtual machines.

Programmer Response: See your systems programmer for assistance.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ025

IGZ0070S The FILEDEF command "FILEDEF *ddname* **DISK FILE** *ddname* **A4" was unsuccessful.**

Explanation: An attempt at dynamic allocation for CMS file *ddname* using the FILEDEF command has failed.

Programmer Response: See your systems programmer for assistance.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ026

IGZ0071S ALL subscripted table reference to table *table-name* **by verb number** *verb-number* **on line** *line-number* **had an ALL subscript specified for an OCCURS DEPENDING ON dimension, and the object was less than or equal to 0.**

Explanation: When the SSRANGE option is in effect, this message is issued to indicate that there are 0 occurrences of dimension subscripted by ALL.

The check is performed against the current value of the OCCURS DEPENDING ON OBJECT.

Programmer Response: Ensure that ODO object(s) of ALL-subscripted dimensions of any subscripted items in the indicated statement are positive.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ027

IGZ0072S A reference modification start position value of *reference-modification-value* **on line** *line-number* **referenced an area outside the region of data item** *data-item***.**

Explanation: The value of the starting position in a reference modification specification was less than 1, or was greater than the current length of the data item that was being reference modified. The starting position value must be a positive integer less than or equal to the number of characters in the reference modified data item.

Programmer Response: Check the value of the starting position in the reference modification specification.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ028

IGZ0073S A non-positive reference modification length value of *reference-modification-value* **on line** *line-number* **was found in a reference to data item** *data-item***.**

Explanation: The length value in a reference modification specification was less than or equal to 0. The length value must be a positive integer.

Programmer Response: Check the indicated line number in the program to ensure that any reference modified length values are (or will resolve to) positive integers.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ029

IGZ0074S A reference modification start position value of *reference-modification-value* **and length value of** *length* **on line** *line-number* **caused reference to be made beyond the rightmost character of data item** *data-item***.**

Explanation: The starting position and length value in a reference modification specification combine to address an area beyond the end of the reference modified data item. The sum of the starting position and length value minus one must be less than or equal to the number of characters in the reference modified data item.

Programmer Response: Check the indicated line number in the program to ensure that any reference modified start and length values are set such that a reference is not made beyond the rightmost character of the data item.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ02A

IGZ0075S Inconsistencies were found in EXTERNAL file *file-name* **in program** *program-name***. The following file attributes did not match those of the established external file:** *attribute-1 attribute-2 attribute-3 attribute-4 attribute-5 attribute-6 attribute-7*

Explanation: One or more attributes of an external file did not match between two programs that defined it.

Programmer Response: Correct the external file. For a summary of file attributes which must match between definitions of the same external file, see *IBM COBOL Language Reference*

System Action: The application was terminated.

Symbolic Feedback Code: IGZ02B

IGZ0076W The number of characters in the INSPECT REPLACING CHARACTERS BY data-name in program *program-name* **at displacement** *displacement* **was not equal to one. The first character was used.**

Explanation: A data item which appears in a CHARACTERS phrase within a REPLACING phrase in an INSPECT statement must be defined as being one character in length. Because of a reference modification specification for this data item, the resultant length value was not equal to one. The length value is assumed to be one.

Programmer Response: You may correct the reference modification specifications in the failing INSPECT statement to ensure that the reference modification length is (or will resolve to) 1; programmer action is not required.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ02C

IGZ0077W The lengths of the *data-item* **items in program** *program-name* **at displacement** *displacement* **were not equal. The shorter length was used.**

Explanation: The two data items which appear in a REPLACING or CONVERTING phrase in an INSPECT statement must have equal lengths, except when the second such item is a figurative constant. Because of the reference modification for one or both of these data items, the resultant length values were not equal. The shorter length value is applied to both items, and execution proceeds.

Programmer Response: You may adjust the operands of unequal length in the failing INSPECT statement; programmer action is not required.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ02D

IGZ0078S ALL subscripted table reference to table *table-name* **by verb number** *verb-number* **on line** *line-number* **will exceed the upper bound of the table.**

Explanation: When the SSRANGE option is in effect, this message is issued to indicate that a multi-dimension table with ALL specified as one or more of the subscripts will result in a reference beyond the upper limit of the table.

The range check was performed on the composite of the subscripts and the maximum occurrences for the ALL subscripted dimensions. For variable-length tables the address is outside the region of the table defined when all OCCURS DEPENDING ON objects are at their maximum values; the ODO object's current value is not considered. The check was not performed on individual subscripts.

Programmer Response: Ensure that OCCURS DEPENDING ON objects as evaluated at run-time do not exceed the maximum number of occurrences of the dimension for table items referenced in the failing statement.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ02E

IGZ0079S On CICS, *program-lang* program *program-name* attempted to call OS/VS COBOL program *program-name*.

Explanation: On CICS, a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program attempted to call an OS/VS COBOL program with the CALL statement. Using the CALL statement to perform calls between the following are not not supported on CICS:

- COBOL for OS/390 & VM programs and OS/VS COBOL programs
- COBOL for MVS & VM programs and OS/VS COBOL programs
- COBOL/370 programs and OS/VS COBOL programs
- VS COBOL II programs and OS/VS COBOL programs

Programmer Response: If you need to invoke an OS/VS COBOL program from a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM programuse EXEC CICS LINK.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ02F

IGZ0080S A dynamic call to *module-name* failed because the program entry name *program-name* does not match.

Explanation: If a program compiled with the PGMNAME(LONGUPPER) or the PGMNAME(LONGMIXED) option is dynamically called, the program name must be identical to the name of the module that contains it. If an alternate entry name is called, the entry name must be identical to the ALIAS name representing that entry point. Note that the program entry name can not exceed 8 bytes and must be entirely upper-case.

Programmer Response: The name of the program failing the dynamic call, must be modified to comply with the rules state aboved. Otherwise, only static calls to the program are permitted.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ02G

IGZ0096C A load of module *module-name* was unsuccessful.

Explanation: An attempt to load a module failed. The module was not available or a system load failure occurred.

Programmer Response: See your systems programmer for assistance.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ030

IGZ0097S Argument-1 for function *function-name* in program *program-name* at displacement *displacement* contained no digits.

Explanation: Argument-1 for the indicated function must contain at least 1 digit.

Programmer Response: Adjust the number of digits in Argument-1 in the failing statement.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ031

IGZ0098C The message text for message *message-number* **was inaccessible to IGZCWTO.**

Explanation: The message text module used by IGZCWTO did not contain message text for the indicated message number.

Programmer Response: See your IBM service representative.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ032

IGZ0099C Internal error *error-number* **was detected in module** *module-name***.**

Explanation: An unrecoverable error was detected in run-time module *module-name*.

When the module name in the message is IGZCXCC, the error-number indicates the error as described below:

Error-number	Description
1	The COBOL environment is not initialized. The COBOL environment must be initialized before calling IGZCXCC.
2	An invalid function code was passed to IGZCXCC.
3	An invalid name length was passed to IGZCXCC.
4	IGZCXCC detected that a nested enclave should be created.
5	IGZCXCC cannot be called when running on CICS or VM.

When the module name in the message is IGZCLNC, IGZCLNK, or IGZCFCC, the error-number indicates the error as described below:

Error-number	Description
9	IGZCXCC is being used and an invalid cancel was attempted.

When the module name in the message is IGZEINI, the error-number indicates the error as described below:

Error-number	Description
101	There was an attempt to initialize a VS COBOL II or OS/VS COBOL program as a subprogram before the main program has run.
102	An OS/VS COBOL program is being initialized but the TGT address was not passed.

Programmer Response: See your IBM service representative.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ033

IGZ0100S Argument-1 for function *function* **in program** *program* **at displacement** *displacement* **was less than or equal to -1.**

Explanation: An illegal value was used for Argument-1.

Programmer Response: Ensure that argument-1 is greater than -1.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ034

IGZ0108S The cancel of program *program-name* failed because the module load point address was not provided when the program was loaded.

Explanation: In a Language Environment/370preinitialized environment users may specify their own load service routine. If this routine fails to provide the module load point address as an output parameter when loading a COBOL program, that program can not be cancelled using COBOL'S CANCEL statement.

Programmer Response: Modify the user load service to provide the module load point address.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ03C

IGZ0151S Argument-1 for function *function-name* in program *program-name* at displacement *displacement* contained more than 18 digits.

Explanation: The total number of digits in argument-1 of the indicated function exceeded 18 digits.

Programmer Response: Adjust the number of digits in argument-1 in the failing statement.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ04N

IGZ0152S Invalid character *character* was found in column *column-number* in argument-1 for function *function-name* in program *program-name* at displacement *program-displacement*.

Explanation: A non-digit character other than a decimal point, comma, space or sign (+,-,CR,DB) was found in argument-1 for NUMVAL/NUMVAL-C function.

Programmer Response: Correct argument-1 for NUMVAL or NUMVAL-C in the indicated statement.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ04O

IGZ0154S A procedure pointer was set to nested program *nested-program-name* in program *program-name* at displacement *displacement*.

Explanation: Procedure pointers can not be set to a nested program.

Programmer Response: Make sure that the procedure program is set to an external program.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ04Q

IGZ0155S Invalid character *character* was found in column *column-number* in argument-2 for function *function-name* in program *program-name* at displacement *program-displacement*.

Explanation: Illegal character was found in argument-2 for NUMVAL-C function.

Programmer Response: Check that the function argument does follow the syntax rules.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ04R

IGZ0156S Argument-1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than zero or greater than 28.**

Explanation: Input argument to function FACTORIAL is greater than 28 or less than 0.

Programmer Response: Check that the function argument is only one byte long.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ04S

IGZ0157S The length of Argument-1 for function *function-name* **in program** *program-name* **at line** *line-number* **was not equal to 1.**

Explanation: The length of input argument to ORD function is not 1.

Programmer Response: Check that the function argument is only one byte long.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ04T

IGZ0158S The length of Argument-1 for function *function-name* **in program** *program-name* **at displacement** *displacement* **was zero.**

Explanation: The length of the argument of the REVERSE, the UPPER-CASE or the LOWER-CASE function is zero.

Programmer Response: Make sure that the length of the argument is greater than zero.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ04U

IGZ0159S Argument-1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than 1 or greater than 3067671.**

Explanation: The input argument to DATE-OF-INTEGER or DAY-OF-INTEGER function is less than 1 or greater than 3067671.

Programmer Response: Check that the function argument is in the valid range.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ04V

IGZ0160S Argument-1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than 16010101 or greater than 99991231.**

Explanation: The input argument to function INTEGER-OF-DATE is less than 16010101 or greater than 99991231.

Programmer Response: Check that the function argument is in the valid range.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ050

IGZ0161S Argument-1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than 1601001 or greater than 9999365.**

Explanation: The input argument to function INTEGER-OF-DAY is less than 1601001 or greater than 9999365.

Programmer Response: Check that the function argument is in the valid range.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ051

IGZ0162S Argument-1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than 1 or greater than the number of positions in the program collating sequence.**

Explanation: The input argument to function CHAR is less than 1 or greater than the highest ordinal position in the program collating sequence.

Programmer Response: Check that the function argument is in the valid range.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ052

IGZ0163S Argument-1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than zero.**

Explanation: The input argument to function RANDOM is less than 0.

Programmer Response: Correct the argument for function RANDOM in the failing statement.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ053

IGZ0164C *module-name* **was unable to get HEAP storage.**

Explanation: The request made to obtain heap storage failed.

Programmer Response: See your IBM service representative.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ054

IGZ0165S A reference modification start position value of *start-position-value* **on line** *line* **referenced an area outside the region of the function result of** *function-result***.**

Explanation: The value of the starting position in a reference modification specification was less than 1, or was greater than the current length of the function result that was being reference modified. The starting position value must be a positive integer less than or equal to the number of characters in the reference modified function result.

Programmer Response: Check the value of the starting position in the reference modification specification and the length of the actual function result.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ055

IGZ0166S A non-positive reference modification length value of *length* **on line** *line-number* **was found in a reference to the function result of** *function-result***.**

Explanation: The length value in a reference modification specification for a function result was less than or equal to 0. The length value must be a positive integer.

Programmer Response: Check the length value and make appropriate correction.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ056

IGZ0167S A reference modification start position value of *start-position* **and length value of** *length* **on line** *line-number* **caused reference to be made beyond the rightmost character of the function result of** *function-result***.**

Explanation: The starting position and length value in a reference modification specification combine to address an area beyond the end of the reference modified function result. The sum of the starting position and length value minus one must be less than or equal to the number of characters in the reference modified function result.

Programmer Response: Check the length of the reference modification specification against the actual length of the function result and make appropriate corrections.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ057

IGZ0168S The creation of a second enclave within a reusable environment was attempted. The first program of the second enclave was *program-name***.**

Explanation: Reusable environment support is limited to a single enclave. The enclave must be the first enclave.

Programmer Response: Modify the application so that it can run within a single enclave with the COBOL reusable environment. If the program name printed is "????????" then the first program of the second enclave is not COBOL.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ058

IGZ0169W External data *data-record* **was allocated within the 31-bit address range. The called program** *program-name* **contained a definition for this external data, and it was compiled with the DATA(24) option.**

Explanation: External data was allocated ANYWHERE within the 31-bit addressing range by a program. But a subsequently called program containing a definition for that same external data was compiled with the DATA(24) option. This was discovered while processing external data records during program initialization.

Programmer Response: Re-compile program with the DATA(31) option if appropriate. If the external data needs to be allocated below 16M, then the FIRST program in the rununit that contains a definition of the external data must be compiled with the DATA(24) option.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ059

IGZ0170S One or more files were not closed by NORENT program *program-name* **and the program cannot be found in storage.**

Explanation: The specified NORENT program has not closed all of the files it opened and the program cannot be found in storage. COBOL is unable to close the files because the required control blocks which reside in the program are no longer available. Unpredictable results will occur when the system attempts to close the files. This error can occur if the application has an assembler program that loads and deletes the specified NORENT program.

Programmer Response: Ensure that all files are closed by the NORENT program.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ05A

IGZ0172W RTEREUS was specified, but ignored. A reusable run-time environment was not established because the first program in the application was not COBOL.

Explanation: A reusable environment can be established only when the main program of the first enclave is COBOL.

Programmer Response: Ensure that RTEREUS is off. The performance benefits of using RTEREUS are available without the run-time option when the application is running under Language Environment.

System Action: No system action is taken.

Symbolic Feedback Code: IGZ05C

IGZ0173S There was an invalid attempt to start a sort or merge.

Explanation: A sort or merge initiated by a COBOL program was already in progress when another sort or merge was attempted by another COBOL program. Only one sort or merge can be active at a time.

Programmer Response: Change the application so that it does not initiate another sort or merge from within the COBOL sort exits.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ05D

IGZ0174S A dynamic call to *module-name* failed because the load module is a DLL.

Explanation: A COBOL dynamic call cannot be made to a load module that is a DLL. A load module that is a DLL contains one or more of the following:

- A COBOL for OS/390 & VM program compiled with the DLL option and the EXPORTALL option.
- A C routine compiled with the DLL option that exports functions or variables.
- A C++ routine that exports functions or variables.

Programmer Response: Change the dynamically called load module so that it does not contain routines that export functions or variables. If the load module contains COBOL for OS/390 & VM programs compiled with the DLL and the EXPORTALL options, recompile the programs with NOEXPORTALL.

System Action: The application was terminated.

IGZ0175S A dynamic call to *module-name* failed because the entry point is a COBOL program compiled with the DLL compiler option.

Explanation: A COBOL dynamic call cannot be made to a COBOL for OS/390 & VM program that is compiled with the DLL compiler option.

Programmer Response: Compile the COBOL for OS/390 & VM program with the NODLL compiler option.

System Action: The application was terminated.

IGZ0176S A call from a COBOL program compiled with the DLL compiler option failed because the program *program-name* was previously dynamically called by a COBOL program compiled without the DLL compiler option.

Explanation: When dynamically calling a COBOL program, insure that the DLL compiler option is consistent between calling and called programs.

Programmer Response: Compile both the calling and called COBOL for OS/390 & VM programs with either the DLL or the NODLL compiler option.

System Action: The application was terminated.

IGZ0177S A CANCEL of DLL *program-name* is not allowed.

Explanation: The program was called with a CALL identifier statement from a COBOL program compiled with the DLL option. This caused the called program to be identified as a DLL. A DLL cannot be cancelled.

Programmer Response: Do not request that a DLL be cancelled.

System Action: The application was terminated.

IGZ0178S An attempt to find program *program-name* in DLL *module-name* was unsuccessful.

Explanation: An error during the load of a DLL or during a query DLL function request prevented an entry point address from being returned.

Programmer Response: See the corresponding CEEnnnnI message for additional information and the details of the problem. If the CEEnnnn message is not found in the MSGFILE insure that the runtime option INFOMSGFILTER is OFF.

System Action: The application was terminated.

IGZ0180S An attempt was made to run a VS COBOL II or OS/VS COBOL program in a OS/390 UNIX process. The program name is *program-name*.

Explanation: VS COBOL II and OS/VS COBOL programs cannot be run in a OS/390 UNIX process.

Programmer Response: Compile the program with COBOL for MVS & VM or COBOL for OS/390 & VM.

System Action: The application was terminated.

IGZ0181S An attempt was made to run a COBOL program that is not reentrant in a OS/390 UNIX process. The program name is *program-name*.

Explanation: COBOL programs running in a OS/390 UNIX process must be reentrant.

Programmer Response: In order to make a COBOL program reentrant, compile the COBOL program with the RENT compile-time option.

System Action: The application was terminated.

IGZ0182W A fork() is not allowed when a COBOL reusable environment is active.

Explanation: A COBOL reusable environment is active and the fork() function was called. A COBOL reusable environment is established by doing one of the following:

- Using the RTEREUS run-time option
- Calling ILBOSTP0
- Calling IGZERRE

Programmer Response: Change the application so that a COBOL reusable environment is not used.

System Action: The fork() function is not performed.

IGZ0183W A fork() is not allowed when an OS/VS COBOL program or a VS COBOL II program is in the environment.

Explanation: At least one OS/VS COBOL program or VS COBOL II program is in the environment and the fork() function was called.

Programmer Response: Compile all OS/VS COBOL programs and the VS COBOL II programs with COBOL for MVS & VM or COBOL for OS/390 & VM.

System Action: The fork() function is not performed.

IGZ0184W A fork() is not allowed when a sort or merge is in progress.

Explanation: A SORT or MERGE statement is in progress and the fork() function was called.

Programmer Response: Change the application to call fork() when sort or merge is not active.

System Action: The fork() function is not performed.

IGZ0185W A fork() is not allowed when a declarative in a COBOL program is active.

Explanation: A declarative in a COBOL program is active and the fork() function was called.

Programmer Response: Change the application to call fork() when a declarative is not active.

System Action: The fork() function is not performed.

IGZ0200W A file attribute mismatch was detected. File *file-name* **in program** *program-name* **was defined as a physical sequential file and the file specified in the ASSIGN clause was a VSAM data set.**

Explanation: The program file description specified that the file was a physical sequential file and the data set associated with the ASSIGN clause was found to be a VSAM file. The OPEN statement failed.

Programmer Response: Check that the file description and the DD parameter associated with the ASSIGN clause are for the correct data set.

System Action: If a file status was specified, no system action is performed. If a file status field was not specified, the program is terminated and message IGZ0035S is generated.

Symbolic Feedback Code: IGZ068

IGZ0201W A file attribute mismatch was detected. File *file-name* **in program** *program-name* **had a record length of** *record-length-1* **and the file specified in the ASSIGN clause had a record length of** *record-length-2***.**

Explanation: The program file description specified a record length that did not match the record length of the data set associated with the ASSIGN clause. The OPEN statement failed.

Programmer Response: For Format-V and Format-S files the maximum record length specified in your program must be exactly 4 bytes smaller than the length attribute of the data set. For Format-F files, the record length specified in your program must exactly match the length attribute of the data set. For Format-U files, the maximum record length specified in your program must exactly match the length attribute of the data set. If your file is a printer file, the compiler may add one byte to the file description for carriage control character, depending on the ADV compiler option and the COBOL statements used in your program. In which case, the added byte must be included in the data set length attribute. For VSAM files, the record length must not be greater than the maximum length attribute of the data set. For VSAM simulated RRDS (SIMVRD run-time option) the record length specified in the ASSIGN clause is incremented by 4 bytes prior to comparison with the length attribute of the data set.

System Action: If a file status was specified, no system action is performed. If a file status field was not specified, the program is terminated and message IGZ0035S is generated.

Symbolic Feedback Code: IGZ069

IGZ0202W A file attribute mismatch was detected. File *file-name* **in program** *program-name* **specified ASCII data and the file specified in the ASSIGN clause did not contain the ASCII data attribute.**

Explanation: The CODE-SET clause was specified in the program file description and the data set associated with the ASSIGN clause did not contain ASCII data. The OPEN statement failed.

Programmer Response: Check that the data set associated with the ASSIGN clause is the correct one, and if it is, check the data set for the ASCII attribute.

System Action: If a file status was specified, no system action is performed. If a file status field was not specified, the program is terminated and message IGZ0035S is generated.

Symbolic Feedback Code: IGZ06A

IGZ0203W A file attribute mismatch was detected. File *file-name* **in program** *program-name* **specified non-ASCII data and the file specified in the ASSIGN clause contained the ASCII data attribute.**

Explanation: The data set associated with the ASSIGN clause contained ASCII type data and the file description in the program did not contain ASCII data. The OPEN statement failed.

Programmer Response: Check that the data set associated with the ASSIGN clause is the correct one, and if it is, check the data set for the ASCII attribute.

System Action: If a file status was specified, no system action is performed. If a file status field was not specified, the program is terminated and message IGZ0035S is generated.

Symbolic Feedback Code: IGZ06B

IGZ0204W A file attribute mismatch was detected. File *file-name* **in program** *program-name* **was defined as RECORDING MODE** *recording-mode* **and the file specified in the ASSIGN clause did not contain the same attribute.**

Explanation: The RECORDING MODE specified in the program file description did not match the data control block fields of the data set associated with the ASSIGN clause. The OPEN statement failed.

Programmer Response: Check the data control block fields of the actual data set to verify that the RECORDING MODE matches. The most common cause of this error is conflicting fixed and variable record length data set attributes.

System Action: If a file status was specified, no system action is performed. If a file status field was not specified, the program is terminated and message IGZ0035S is generated.

Symbolic Feedback Code: IGZ06C

IGZ0205W An OPEN failure occurred for file *file-name* **in program** *program-name* **because the SMSVSAM server was not available. The file was closed.**

Explanation: COBOL encountered a SMSVSAM server not available error return while performing OPEN, I/O, or control block testing of a VSAM data set in RLS mode. For this error condition VSAM requires that the file be closed, opened, and positioned prior to resubmitting requests. Look for possible VSAM error messages in the job log.

Programmer Response: COBOL only performs a close of the file. Resolve the SMSVSAM server not available condition and resubmit the run or remove the RLS keyword specification from the DD statement.

System Action: No system action is performed.

Symbolic Feedback Code: IGZ06D

IGZ0206W The AIXBLD run-time option was invalid for file *file-name* **in program** *program-name* **because the file was opened in RLS mode. The file was closed.**

Explanation: The AIXBLD option is only supported for VSAM data sets opened without RLS mode. VSAM data sets opened in RLS mode can be empty, but upgrades to empty paths are not supported. The alternate index path must be built prior to using RLS mode. The alternate index was not built and the file was closed.

Programmer Response: If AIXBLD option is required, remove the RLS keyword specification from the DD statement for this file and resubmit the run.

System Action: No system action is performed.

Symbolic Feedback Code: IGZ06E

IGZ0207W The SIMVRD run-time option was invalid for file *file-name* **in program** *program-name* **because the file was opened in RLS mode. The file was closed.**

Explanation: The SIMVRD option is not supported for VSAM data sets in RLS mode. The file was closed.

Programmer Response: If SIMVRD option is required, remove the RLS keyword specification from the DD statement for this file and resubmit the run.

System Action: No system action is performed.

Symbolic Feedback Code: IGZ06F

IGZ0210S There was an attempt to run an OS/VS COBOL program *program-name* **in a non-initial thread.**

Explanation: OS/VS COBOL programs can only run in the initial thread. For example, OS/VS COBOL programs can not run in a subtask created by a PL/I CALL statement with the TASK, EVENT, or PRIORITY option.

Programmer Response: Compile the COBOL program with the COBOL for MVS & VM or COBOL for OS/390 & VM compiler.

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06I

IGZ0211S There was an attempt to run COBOL programs in more than one thread. The name of the program that was invoked is *program-name***.**

Explanation: COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM programs can only be run in one thread at a time. This condition can occur when PL/I multitasking is used or when POSIX(ON) is in effect.

If PLI multitasking is used, here are examples that can cause this condition:

- If a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program has been invoked in the main task, then any attempts to invoke a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program in a subtask created by a PL/I statement with the TASK, EVENT or the PRIORITY option will cause this condition to be signalled.
- If a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program has been invoked in a subtask, then any attempts to invoke a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program in any other thread will cause this condition to be signalled until the subthread is terminated.

If POSIX(ON) is in effect, here are examples that can cause this condition:

- If a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program has been invoked in the initial thread, then any attempts to invoke a

COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program in a non-initial thread will cause this condition to be signalled.

- If a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program has been invoked in a non-initial thread, then any attempts to invoke a COBOL/370, VS COBOL II, COBOL for MVS & VM, or COBOL for OS/390 & VM program in another thread will cause this condition to be signalled until the non-initial thread in which a COBOL program was invoked is terminated.

Programmer Response: Change the application so that COBOL programs are used in only one task at a time if they are running in the PL/I Multitasking environment or in one thread at a time if they are running with POSIX(ON).

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06J

IGZ0212S There was an attempt to run an OS/VS COBOL program with the run-time option RTLS(ON). The name of the program that was invoked is *program-name***.**

Explanation: OS/VS COBOL programs cannot run with the run-time option RTLS(ON).

Programmer Response: Set the RTLS run-time option to OFF.

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06K

IGZ0213S There was an attempt to establish a COBOL reusable environment with the run-time option RTLS(ON).

Explanation: A COBOL reusable environment cannot be established when the RTLS(ON) run-time option is specified. A COBOL reusable environment is established by doing one of the following:

- Using the RTEREUS run-time option
- Calling ILBOSTPO
- Calling IGZERRE

Programmer Response: Set the RTLS run-time option to OFF.

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06L

IGZ0214C A run time level mismatch was detected.

Explanation: The run-time option RTLS(ON) is specified and the run-time routines loaded from the SCEERTLS library is not at the same release level of the run-time routines loaded from RTLS.

Programmer Response: Set the RTLS run-time option to OFF or use the SCEERTLS library at the same release level specified using RTLS.

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06M

IGZ0215S Argument —1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than 0 or greater than 99.**

Explanation: An illegal value was used for Argument-1.

Programmer Response: Ensure that argument-1 is greater than, or equal to 0, and less than 100.

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06N

IGZ0216S Argument —1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than 0 or greater than 99366.**

Explanation: An illegal value was used for Argument-1.

Programmer Response: Ensure that argument-1 is greater than, or equal to 0, and less than 99367.

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06O

IGZ0217S Argument —1 for function *function-name* **in program** *program-name* **at line** *line-number* **was less than 0 or greater than 991231.**

Explanation: An illegal value was used for Argument-1.

Programmer Response: Ensure that argument-1 is greater than, or equal to 0, and less than 991231.

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06P

IGZ0218S The sum of the year at the time of execution and the value of argument —2 was less than 1700 or greater than 10000 for function *function-name* **in program** *program-name* **at line** *line-number***.**

Explanation: An illegal value was used for Argument-2.

Programmer Response: Ensure that the sum of the year at the time of execution and the value of argument-2 is less than 1700 or greater than 10000.

System Action: The application is terminated.

Symbolic Feedback Code: IGZ06Q

IGZ0219S The base year for program *program-name* **was outside the valid range of 1900 through 1999. The sliding window value** *window-value* **resulted in a base year of** *base-year***.**

Explanation: When the 100-year window was computed using the current year and the sliding window value specified with the YEARWINDOW compiler option, the base year of the 100-year window was outside the valid range of 1900 through 1999.

For example, if a COBOL program had been compiled with YEARWINDOW(-99) and the COBOL program was run in the year 1998 this message would occur because the base year of the 100-year window would be 1899 (1998-99).

Programmer Response: Examine the application design to determine if it will support a change to the YEARWINDOW option value. If the application can run with a change to the YEARWINDOW option value, then compile the program with an appropriate YEARWINDOW option value. If the application cannot run with a change to the YEARWINDOW option value, then convert all date fields to expanded dates and compile the program with NODATEPROC.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ06R

IGZ0220S The current year was outside the 100-year window, *year-start* **through** *year-end* **for program** *program***.**

Explanation: The current year was outside the 100-year fixed window specified by the YEARWINDOW compiler option value.

For example, if a COBOL program is compiled with YEARWINDOW(1920), the 100-year window for the program is 1920 through 2019. When the program is run in the year 2020, this error message would occur since the current year is not within the 100 year window.

Programmer Response: Examine the application design to determine if it will support a change to the YEARWINDOW option value. If the application can run with a change to the YEARWINDOW option value, then compile the program with an apporpriate YEARWINDOW option value. If the application cannot run with a change to the YEARWINDOW option value, then convert all date fields to expanded dates and compile the program with NODATEPROC.

System Action: The application was terminated.

Symbolic Feedback Code: IGZ06S

IGZ0221W The Y2PAST= *y2past-value* **SORT option (from the YEARWINDOW compiler option) was overridden by the Y2PAST value in the sort control file.**

Explanation: A windowed date field was specified as a KEY in a SORT or MERGE, which resulted in the YEARWINDOW compiler option being converted into a SORT option Y2PAST value, but Y2PAST was also specified in the sort control file.

The value in the sort control file was used, and the Y2PAST value from the program was ignored.

Programmer Response: See *COBOL for OS/390 & VM Programming Guide* or *COBOL for MVS & VM Programming Guide* for a description of using windowed date fields with SORT and MERGE.

System Action: No system action was taken.

Symbolic Feedback Code: IGZ06T

Chapter 16. Language Environment Abend Codes

This chapter lists the Language Environment abend codes with descriptions and programmer responses. The hexadecimal equivalent of the abend code is shown in parentheses. *Reason codes* are shown in hexadecimal with the decimal equivalent in parentheses.

UXXXX (≤ 4000)

Explanation: The assembler user exit could have forced an abend for an unhandled condition. These are user-specified abend codes.

Programmer Response: Check the Language Environment message file for message output. This will tell you what the original abend was.

System Action: Task terminated.

U4034 (X'FC2')

Explanation: Language Environment condition handling was bypassed. This could result from an error condition being raised while Language Environment was dormant.

Programmer Response: Follow appropriate problem determination procedures.

System Action: Task terminated.

U4036 (X'FC4')

Explanation: A program check occurred and Language Environment determined that it could not turn the program check into a condition.

Reason codes:

X'01' (1) A program check was detected when Language Environment condition handling was disabled. One cause for this abend is a program check during an Information Management System (IMS) call such as CEETDLI. The address of the EPIE is loaded into register 2 prior to the abend being issued. Another cause for this abend is a program check during a SORT or MERGE that has been initiated by a SORT or MERGE statement in an OS/VS COBOL program.

X'02' (2) A program check was detected and Language Environment could not determine if the program check occurred in the current enclave. The address of the EPIE is loaded into register 2 prior to the abend being issued.

X'03' (3) A program check was detected and the Language Environment run-time option for the enclave is TRAP(OFF). The address of the EPIE is loaded into register 2 prior to the abend being issued.

X'04' (4) A program check was detected and the Language Environment run-time option for the enclave is TRAP(OFF) or TRAP(ON,NOSPIE). Language Environment expected to recover from this program check but was unable to do so. The address of the EPIE is not loaded into register 2 for this case.

Programmer Response: For reason codes 1–3:

- Use the contents of register 2 at the abend to find the EPIE. The EPIE is a system control block that has the value of the registers and the PSW at the time of the program check. The values in the EPIE can be used to start the problem determination process.

For reason code 4:

- This may be a secondary error. Check any messages and/or CEEDUMPs to diagnose the original error. If this program check is the only error then run the program with the run-time option TRAP(ON) (or TRAP(ON,SPIE)) to diagnose the original program check.

The EPIE has the following format:

Offset	Content
0	Eyecatcher: EPIE
8	Value of R0
C	Value of R1
10	Value of R2
14	Value of R3
18	Value of R4
1C	Value of R5
20	Value of R6
24	Value of R7
28	Value of R8
2C	Value of R9
30	Value of R10
34	Value of R11
38	Value of R12
3C	Value of R13
40	Value of R14
44	Value of R15
48	PSW bits 0–31
4C	PSW bits 32–63
50	Program interruption information: • ILC (Instruction Length Code) • Interruption code
54	Translation exception address if interruption code is a page fault interrupt code

System Action: Task terminated.

U4038 (X'FC6')

Explanation: The enclave ended with an unhandled Language Environment software-raised or user-raised condition of severity 2 or greater, and the run-time option ABTERMENC(ABEND) was specified.

Programmer Response: Check the Language Environment message file for message output.

System Action: Enclave terminated.

U4039 (X'FC7')

Explanation: Language Environment is requesting a system abend dump due to an unhandled severity 2, 3, or 4 condition. This does not necessarily indicate an error condition.

Programmer Response: Refer to the original unhandled condition.

System Action: Language Environment continues with termination.

U4041 (X'FC9')

Explanation: Language Environment message processing tried to issue a dynamic allocation for a data set. The *return code* used by the ABEND macro is the same return code from SVC 99. For an explanation of SVC 99, see *TSO Extensions Version 2 Programming Services.*

Programmer Response: Follow appropriate problem determination procedures.

System Action: Enclave terminated.

U4042 (X'FCA')

Explanation: User HEAP damage was found by the HEAPCHK run-time option.

Programmer Response: Examine the Language Environment message file, looking for HEAPCHK messages that identify where the damage is located.

System Action: The routine terminates.

U4081 (X'FF1')

Explanation: An error occurred when Language Environment tried to issue the CSVRTLS service. The reason code describes which CSVRTLS function failed.

Reason codes:

X'01' (1) The MVS Run-Time Library Services (RTLS) is not available.

The MVS CVT indicates that the Language Environment cannot use the CSVRTLS functions to load the required library routines.

X'02' (2) Storage required to initialize Language Environment is not available.

The number of bytes needed (in subpool 1) is saved in register 3 at the time of the ABEND. The return code from GETMAIN is saved in register 2.

X'03' (3) Language Environment is unable to free storage obtained earlier.

The number of bytes being freed (below the line, in subpool 1) is in register 3 at the time of the ABEND. The address of the storage beging freed is in register 4 at the time of the ABEND. The return code from FREEMAIN is saved in register 2.

X'04' (4) During Language Environment initialization, CSVRTLS REQUEST=CONNECT failed.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND. The 8-byte name of the logical library being connected to is loaded into registers 3 and 4. The 8-byte logical library version is loaded into registers 5 and 6 at the time of the ABEND.

X'05' (5) During Language Environment initialization, CSVRTLS REQUEST=LOAD failed.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND.The module being loaded from the RTLS logical Library is 'CEEBINSS'. The 8-byte logical library name is loaded into registers 3 and 4. The 8-byte logical library version is loaded into registers 5 and 6 at the time of the ABEND. Register 7 contains the output EP address from CSVRTLS, which is actually extended diagnostic information for the LOAD error.

X'06' (6) During Language Environment termination, CSVRTLS REQUEST=DELETE failed.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND. The module being loaded from the RTLS logical library is 'CEEBINSS'.

X'07' (7) During Language Environment termination, CSVRTLS REQUEST=DISCONNECT failed.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND.

X'08' (8) During Language Environment initialization, CSVRTLS REQUEST=CONNECT failed with reason code X'0804'. This reason code indicates that the user is not authorized to connect to RTLS or to the specified RTLS logical library or version.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND. The 8-byte name of the logical library being connected to is loaded into registers 3 and 4. The 8-byte logical library version is loaded into registers 5 and 6 at the time of the ABEND.

X'09' (9) During Language Environment initialization, CSVRTLS REQUEST=CONNECT failed with reason code X'0810'. This reason code indicates that the specified RTLS logical library or version is not available.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND. The 8-byte name of the logical library being connected to is loaded into registers 3 and 4. The 8-byte logical library version is loaded into registers 5 and 6 at the time of the ABEND.

X'0A' (10)

During Language Environment initialization, CSVRTLS REQUEST=CONNECT failed with reason code X'0C02'. This reason code indicates that the maximum number of RTLS connections already exist in this address space. No more RTLS connections can start in this address space.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND. The 8-byte name of the logical library being connected to is loaded into registers 3 and 4. The 8-byte logical library version is loaded into registers 5 and 6 at the time of the ABEND.

X'0B' (11)

During Language Environment initialization, CSVRTLS REQUEST=LOAD failed with reason code X'0804'. This reason code indicates that the user is not authorized to load CEEBINSS from the specified RTLS logical library.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND. The module being loaded from the RTLS logical Library is 'CEEBINSS'. The 8-byte logical library name is loaded into registers 3 and 4. The 8-byte logical library version is loaded into registers 5 and 6 at the time of the ABEND. Register 7 contains the output EP address from CSVRTLS, which is actually extended diagnostic information for the LOAD error.

X'0C' (12)

During Language Environment initialization, CSVRTLS REQUEST=LOAD failed with reason code X'082D'. This reason code indicates that module CEEBINSS could not be found in the specified RTLS logical library.

The reason code from CSVRTLS is saved in register 2 at the time of the ABEND. The module being loaded from the RTLS logical Library is 'CEEBINSS'. The 8-byte logical library name is loaded into registers 3 and 4. The 8-byte logical library version is loaded into registers 5 and 6 at the time of the ABEND. Register 7 contains the output EP address from CSVRTLS, which is actually extended diagnostic information for the LOAD error.

Programmer Response: Do not specify the RTLS(ON) run-time option unless RTLS is operational. Make sure that the LIBRARY run-time option specifies a valid RTLS logical library name. Make sure that the VERSION run-time option specifies a valid RTLS logical library version. Make sure that there is enough storage in the address space to initialize Language Environment. Make sure that the user is authorized to access RTLS and the logical LIBRARY and VERSION. For some ABEND reason codes, register 2 contains the error reason code from the CSVRTLS service. The contents of register 2 may appear in the

ABEND message. See *OS/390 MVS Programming: Assembler Services Reference* for more information about the error reason codes from CSVRTLS.

System Action: Enclave terminated.

U4082 (X'FF2')

Explanation: A second malfunction occurred while handling a condition.

Reason codes:

X'01' (1) A second malfunction occurred while trying to initialize a second math save area.

X'02' (2) A condition was raised prior to the point where a second condition could be recorded.

X'03' (3) A condition was raised while Language Environment was processing a current condition under CICS.

Programmer Response: This condition can be fixed by correcting the initial condition.

System Action: Enclave terminated.

U4083 (X'FF3')

Explanation: The back chain was found in error. The reason code describes the most likely cause of the abend.

Reason codes:

X'01' (1) A save area loop exists. The save area points to itself or another save area incorrectly points to a higher save area.

X'02' (2) Traversal of the back chain resulted in a program check.

X'03' (3) Under normal conditions, all save area chains should end with a save area pointed to by CEECAADDSA. In this case, the save area chain terminated with a back chain pointer of 0.

X'04' (4) Under normal conditions, all save areas are presumed to be word-aligned. Either a linkage stack has been encountered with the character string of "F1SA' (X'C6F1E2C1') in a backward pointer field of the save area chain, or a misaligned (non-word) boundary save area is in the chain. Examine the save area chain to determine which is the case.

X'05' (5) A condition was raised prior to the allocation of the main stack frame, or after the main routine terminated.

X'0F' (15) The save area chain is not intact.

Programmer Response: For applications that generate their own save areas, ensure the save areas are chained together correctly; all save areas must be addressable in AMODE(31). It may be helpful to generate a system dump of the original error by using run-time options TERMTHDACT(UAIMM) and TRAP(ON,NOSPIE).

For other types of applications, a storage overlay problem has probably occurred.

System Action: Enclave terminated.

U4084 (X'FF4')

Explanation: Thread terminated abnormally.

Reason code:

X'01' (1) A shared resource associated with a member library-held mutex might have been corrupted.

Programmer Response: This is an internal problem. Contact your service representative.

System Action: Enclave terminated.

U4085 (X'FF5')

Explanation: The GOTO routine encountered an error.

Reason code:

X'01' (1) GOTO is already active.

X'02' (2) The address of the stack frame could not be found on the save area chain, and no feedback code was provided.

Programmer Response: Ensure the save areas are active.

System Action: Enclave terminated.

U4086 (X'FF6')

Explanation: A library routine could not be loaded.

Reason codes:

X'01' (1) Not enough storage to load module.

X'02' (2) Module not found.

X'03' (3) Module not loaded.

Programmer Response: System installation error.

System Action: Process terminated.

U4087 (X'FF7')

Explanation: A recursive error was detected. A condition was raised, causing the number of nested conditions to exceed the limit set by the DEPTHCONDLMT option. The reason code indicates which subcomponent or process was active when the exception was detected.

Reason codes:

X'00' (0) Language Environment condition manager was in control at the time of the condition.

X'01'(1) While enabling the language specific condition handlers a subsequent condition was raised.

X'02' (2) A user handler routine (CEEHDLR) was processing a condition when a subsequent condition was raised.

X'03' (3) A language-specific condition handler was processing a condition when a subsequent condition was raised.

X'04' (4) During the Language Environment condition manager's processing of the stack frame that precedes the stack frame for the first routine, a subsequent condition was raised.

X'05' (5) While a language-specific event handling was being processed, a subsequent condition was raised.

X'06' (6) A malfunction occurred while the Debug Tool was in control.

X'07' (7) While Language Environment was trying to output a message, a subsequent condition was raised.

X'08' (8) While attempting to output a dump, a subsequent condition was raised.

X'0A' (10)

An abnormal termination exit was in control and Language Environment detected one of the following:

- A program check
- An ABEND
- A call to CEESGL to signal a condition

- Invalid DCT under CICS

Programmer Response: In the case of CEEHDLR routine, recursion can occur when you use the DEPTHCONDLMT run-time option. It may be helpful to generate a system dump of the original error by using run-time options TERMTHDACT(UAIMM) and TRAP(ON,NOSPIE).

For reason code 10, determine the error in the abnormal termination exit.

System Action: Enclave terminated.

U4088 (X'FF8')

Explanation: A storage condition occurred during the processing of a storage condition. The reason code indicates the request type.

Reason codes:

X'5B' (91)
Stack pointer corrupted at location 1.

X'5C' (92)
Stack pointer corrupted at location 2.

X'5D' (93)
Stack pointer corrupted at location 3.

X'5E' (94)
Stack pointer corrupted at location 4.

X'5F' (95) Stack pointer corrupted at location 5.

X'61' (97) DSA not found in stack

X'62' (98) Previous NAB not in stack

X'63' (99) Stack segment owning the next-available-byte (NAB) could not be found or a DSA backchain pointer did not contain a valid 31-bit addressable address. DSA backchain pointers must contain valid addresses that can be accessed as is while in 31-bit addressing mode. For instance, a 24-bit address that was obtained by using the BAL or BALR assembler instruction will contain the ILC, CC, and Program Mask in the uppermost byte of this address, thus making it an invalid address in 31-bit mode.

X'64' — X'74' (10x)
First free storage request terminated with return code x.

X'C8' — X'D8' (20x)
Second free storage request terminated with return code x.

X'3E8' — X'3F8' (100x)
First get storage terminated with return code x, and reserve stack segment already in use. This indicates a storage condition was raised while handling the storage condition.

X'BB8' — X'BC2' (3000-3010x)
Debug Tool storage manager control blocks corrupted.

nnn Critical condition nnn was signaled, but CEESGL returned control to the signaller. The signaller does not support a retry of the operation, so the module terminated.

Programmer Response: For reason codes 91–20x, probable internal malfunction or storage corruption. For code 1001 or 1004, increase region size or check for infinite recursion. Using the STORAGE run-time option to increase the size of the reserve stack segment can also help.

System Action: Enclave terminated.

U4089 (X'FF9')

Explanation: During attention processing, a request to end the task was made.

Reason code:

X'01' (1) A debugging tool was asked to interrupt the code sequence and process the CEE3250 condition.

Programmer Response: Continue debugging the application using a debugging tool.

System Action: Process terminated.

U4091 (X'FFB')

Explanation: An unexpected condition occurred during the running of Language Environment condition management.

Reason codes:

X'01' (1) A GOTO was made by an enablement routine.

X'02' (2) Invalid return code from a language-specific event handler was received during enablement processing.

X'03' (3) Language Environment condition management detected an implicit movement of the resume cursor. Either a GOTO or move resume cursor should have been used for resumption in a different stack frame.

X'04' (4) Invalid return code from a language-specific event handler was received.

X'05' (5) A program check was detected while Language Environment condition manager was in control.

X'06' (6) A request to resume the application was not accepted. The Language Environment condition manager does not accept resumption requests with conditions, such as abends.

X'07' (7) Invalid return code from a language-specific event handler was received during stack frame processing.

X'08' (8) CEESGL callable service was attempting to signal a new condition. A control information block could not be allocated for that condition.

X'09' (9) The CEEHDLR routine returned with an invalid feedback code.

X'0A' (10)
The Language Environment library was unable to find a free control information block for a new condition. This is a critical error.

X'0B' (11)
The error count specified in the ERRCOUNT run-time option has been exceeded.

X'0C' (12)
Language Environment signaled a condition that could not be resumed. After a resume took place, Language Environment again attempted to terminate by signalling an imminent termination. Another resume was attempted and caused an abend.

X'0D' (13)
An invalid return code from the Debug Tool was received.

X'0E' (14)
An invalid attempt to populate an ISI with qualifying data was detected.

X'0F' (15) A condition token other than CEE000 was returned from a member event handler. The feedback token resulted from a new condition being raised.

X'10' (16) A request to extend stack storage could not be honored. A fixed-size stack might currently be in use.

X'11' (17) A request for library stack storage could not be completed.

X'12' (18) Stack storage was requested when storage management services were not available.

X'13' (19) A request to extend stack storage could not be honored.

X'14' (20) After being informed of a new condition, the condition handler indicated an unrecoverable error.

X'15' (21) The maximum depth of condition nesting specified in the DEPTHCONDLMT runtime option was exceeded.

X'16' (22) The resume point was invalid.

X'17' (23) BXITA requested ABEND.

X'18' (24) ABEND without LIBVEC layer.

X'19' (25) A CIBH pointer was expected in HCOM_CIBH=0, but the field contained 0.

X'1A' (26)
A PCQ pointer was expected in HCOM_PCQ=0, but the field contained 0.

X'1B' (27)
No matching PCIBH was found because there was a logic error or the language environment is corrupted.

X'1C' (28)
No storage was available for PCIBH.

X'1D' (29)
No storage was available for QDATA.

X'1E' (30)
No storage was available for SigRetData.

X'1F' (31) An internal call to the MVS function BPX1SPM was not successful.

X'20' (32) An internal call to the MVS function BPX1PTR was not successful.

X'21' (33) An internal call to the MVS function BPX1SPB was not successful.

X'22' (34) CSRL16J tried unsuccessfully to return to the interrupt point for the signal delivery.

X'23' (35) There was a logic error in Sig safing or the language environment is corrupted.

X'24' (36) There was an internal logic error or the language environment is corrupted.

X'25' (37) The alternate signal stack supplied by the application is full. Automatic expansion is not available for alternal signal stacks.

X'26' (38) CEERSN_EMTYCIBH. No Language Environment condition information block (CIB) was found to be in use.

X'28' (40) CEERSN_NOCIBH. The chain of Language Environment condition information blocks (CIB) is empty.

Programmer Response: If this abend was caused by a user-written condition handler, check the return codes provided to Language Environment condition manager.

Another source of this problem can be the use of CEEMRCR with a `type_of_move '1'` done for a condition handler that is invoked for another condition handler.

System Action: Enclave terminated.

U4092 (X'FFC')

Explanation: ESPIE or ESTAE issued this abend because control storage was overlaid. Language Environment condition manager could not proceed.

Reason codes:

X'00' (0) SPIE/ESPIE routine was detected.

X'01' (1) STAE/ESTAE routine was detected.

X'02' (2) A CICS interface routine was detected.

Programmer Response: Determine why storage was overlaid.

System Action: Enclave terminated.

U4093 (X'FFD')

Explanation: Abend issued during initialization when errors were detected.

Reason codes:

X'04' (4) Storage management could not properly allocate the initial storage area.

X'08' (8) Language Environment control blocks could not be set up properly.

X'0C' (12) System not supported.

X'10' (16) The application's parameter list could not be processed correctly. The parameter list might be invalid.

X'14' (20) Hardware not supported.

X'18' (24) An error occurred when attempting to process the options specified in the application.

X'1C' (28) Stack management could not allocate stack and/or heap storage.

X'20' (32) Program management could not find a module that was to be loaded.

X'24' (36) When trying to load a module, program management encountered a storage condition.

X'28' (40) Program management could not be initialized properly.

X'2C' (44) The Language Environment math library could not be initialized properly.

X'30' (48) Condition management could not be initialized properly.

X'34' (52) A language-specific event handler returned to initialization with a feedback code, causing immediate termination.

X'38' (56) Vector initialization did not succeed.

X'3C' (60) The initial fixed-size stack overflowed.

X'40' (64) Process level ran out of storage.

X'44' (68) Enclave level ran out of storage.

X'48' (72) Thread level ran out of storage.

X'4C' (76) CAA pointer became corrupted.

X'50' (80) PCB pointer became corrupted.

X'54' (84) Assembler user exit malfunctioned.

X'58' (88) Get heap malfunctioned during initialization.

X'5C' (92) Anchor setup malfunctioned.

X'60' (96) The PLIST run-time option conflicts with the operating system type.

X'64' (100) The Language Environment anchor support was unavailable.

X'6C' (108) The routine was compiled with an unsupported release of a compiler.

X'70' (112) A load module did not contain a main procedure/function and was invoked without Language Environment having been previously initialized.

X'74' (116) The primary entry point routine of the root load module was found with Language Environment V1R2 CEESTART, but the rest of the routines in the load module were not linked with Language Environment V1R2 (or later) library.

X'7C' (124) An unsupported parameter style was detected.

X'80' (128) Too many files, fetched procedures, controlled variables in a PL/I routine, or assembler use of external dummy sections caused the total length of the PRV to exceed the maximum limit of 4096 bytes.

X'84' (132) Library routines required for CICS support are not defined in the CICS CSD. See *OS/390 Language Environment Customization* for the library routines required for CICS support. If running a PL/I application with the shared library, see *PL/I for MVS & VM Compiler and Run-Time Migration Guide* for instructions on enabling shared library support under Language Environment.

X'88' (136) Reinitialization feature is not supported in PL/I-defined preinitialization support.

X'8C' (140) MVS has not installed an anchor pointer; therefore, no anchor support is available.

X'90' (144) Condition management for MVS could not be initialized.

X'94' (148) A language-specific event handler returned to thread initialization with a return code, causing immediate termination.

X'98' (152) A bad return code was received from the member thread initialization exit, causing immediate termination.

X'A0' (160) Re-entry at the top of an existing Language Environment run-time environment from a non-Language Environment-conforming driver is attempted at a different Link Level than that in effect when the Language Environment run-time environment was first created. Link level is the count of Link or CMSCALL SVCs currently active within the task. Following is an example of when this can happen:

1. An assembler program calls IGZERRE with the initialization call.
2. The assembler program calls a COBOL program using LOAD and BALR.
3. The assembler program calls a COBOL program using a LINK SVC. When the LINK SVC is done to the COBOL program, abend U4093 will occur.

This abend can also happen when the RTEREUS run-time option, or calls to ILBOSTP0 or IGZERRE , are used in an IMS message processing region and all of the programs that receive control from IMS are not pre-loaded.

X'A4' (164) The service routine vector address was non-zero when using request modifier value 4 in the Extended Parameter List (EPL) for the INIT function of the Pre-Init Compatibility Interface (PICI). This is not supported.

X'A8' (168) Pre-Init Compatibility Interface (PICI) initialization was attempted while a Unix System Services medium weight process was in effect. This is not supported.

X'AC' (172) POSIX(ON) run-time option in a nested enclave is not supported.

X'3E8'–X'4E7' (1000–1255)
Unable to load event handler for a *high-level language*. The last 3 digits indicate the facility ID of the component that did not load correctly.

X'7D0' (2000) For a Fortran application, a call to CEEARLU that the Language Environment CAA does not exist.

Programmer Response: See system programmer.

System Action: Enclave terminated.

U4094 (X'FFE')

Explanation: An abend was issued during termination, when errors were detected.

Reason codes:

X'04' (4) An invalid parameter to termination services was discovered.

X'08' (8) A language-specific event handler returned an invalid return code.

X'0C' (12)
A language-specific event handler returned to termination with a return code, causing immediate termination.

X'10' (16) Condition management could not properly terminate.

X'14' (20) Program management could not properly terminate.

X'18' (24) Storage management could not properly free stack and/or heap storage. This might be due to writing beyond storage.

X'1C' (28)
Storage management could not properly free the initial storage allocation.

X'20' (32) The user stack was unable to be collapsed using GOTO.

X'24' (36) The fixed-size termination stack overflowed.

X'28' (40) An unhandled condition of severity 2 or greater occurred in a created enclave with TRAP(OFF) set in the creating enclave. Under CMS, this abend is issued when a severity 2 or greater condition is unhandled in a nested enclave, or a debugging tool has terminated the enclave at the user's request.

In addition to TRAP(OFF), this abend can also result when a parent enclave save area chain cannot be located, even though two enclaves existed, thus causing an attempt to propagate the failing condition. When the parent enclave received control, the save area chain was not intact, and the ABEND was percolated.

An example of this is a COBOL program that is invoked without a LINK SVC and with a reusable run-time environment. On return from the COBOL program, the Language Environment enclave still exists, because of the reusable environment. When a second COBOL program is invoked by a LINK SVC, any Language Environment attempt to create a second enclave does not succeed. In an attempt to propagate this error condition to the parent enclave, Language Environment issues an abend. When the first enclave is not in the current save area chain, Language Environment percolates this abend. See *OS/390 Language Environment Programming Guide* for information about nested enclaves.

X'2C' (44)
Termination requested during termination.

X'30' (48) Condition management for MVS could not properly terminate.

X'34' (52) The MVS environment could not properly terminate.

X'38' (56) A language-specific event handler returned to thread termination with a return code, causing immediate termination.

X'3C' (60)
An internal logic error occurred during recursive termination handling.

X'40' (64) An internal logic error occurred during forced thread termination handling.

X'44' (68) An internal logic error occurred because termination was not expected.

X'48' (72) During termination, library latches were being held and could not be released, causing immediate termination.

X'4C' (76)
Library latch services have received an unrecognized latch request, causing immediate termination.

X'4E' (78)
A language-specific event handler returned to thread termination with a return code, causing immediate termination.

Programmer Response: See system programmer.

System Action: Enclave terminated.

U4095 (X'FFF')

Explanation: An abend was issued as a response to the fatal return code of a Language Environment-conforming language.

Reason codes:

<X'12C' (<300)
The reason code is set to the Language Environment-conforming language ID.

X'12C' (300)
The condition was provoked from a user handler attention routine.

X'12D' (301)
The condition was provoked from a user handler routine.

Programmer Response: See system programmer.

System Action: Enclave terminated.

Chapter 17. C Abend and Reason Codes

This chapter is divided into two sections. The first section lists the C System Programming abend codes and explanations. The hexadecimal equivalents of the abend codes are shown in parentheses. The next section lists the System Programming reason codes and explanations. Reason codes are shown in hexadecimal with the decimal equivalent in parentheses.

C System Programming Abend Codes

2100 (X'834')

Explanation: An internal request for more storage was unsuccessful.

Programmer Response: Enlarge the *address space* to provide more storage.

System Action: The routine terminates.

2101 (X'835')

Explanation: An internal request to free storage was unsuccessful, probably as a result of corrupted storage.

Programmer Response: Search for possible causes of corrupted storage.

System Action: The routine terminates.

2102 (X'836')

Explanation: The stack's home segment could not be found, indicating a corrupted stack.

Programmer Response: Search for the cause of the corrupted storage in the user routine.

System Action: The routine terminates.

2103 (X'837')

Explanation: An error occurred when attempting to load the C library.

Programmer Response: Ensure the AD/Cycle C library is available to your routine. Make sure that the modules CEEEV003 or EDCZV2 are available for the routine. The system programmer or the person who installed the product should be able to provide the location of the library and your routine can access it.

System Action: The routine terminates and on MVS, a CSV code and message appears in the job. Check the message to see which C library module was not available.

2104 (X'838')

Explanation: An error occurred during heap allocation. Using EDCXSTRX, a heap was supplied with a size smaller than the specified minimum.

Programmer Response: Correct the heap size in the calling routine.

System Action: The routine terminates.

2105 (X'839')

Explanation: An error occurred when CMSCALL or SVC 202 was issued.

Programmer Response: Consult with your system programmer and correct the problem as a VM/CMS or System Programming Facilities problem.

System Action: The routine terminates.

2106 (X'83A')

Explanation: A routine used with EDCXSTRT was compiled with the RENT option, but EDCRCINT was not included in the load module. Initialization of writable static was unsuccessful.

System Action: The routine terminates.

2107 (X'83B')

Explanation: TRAP(ON) was requested through `#pragma runopts` but EDCXABRT was not included in the load module.

Programmer Response: Rebuild the load module with EDCXABRT.

System Action: The routine terminates.

2108 (X'83C')

Explanation: A routine built with EDCXSTRX attempted to terminate normally, but the termination routines discovered the heap needed to be extended earlier. All heap storage needs to be supplied by the caller of EDCXSTRX.

Programmer Response: Correct the calling routine to provide sufficient heap storage to EDCXSTRX.

System Action: The routine terminates.

2052 (X'804')

Explanation: The system programming application that is accessing the C run-time library is running AMODE=24. However, the C run-time library was installed above the 16M line, which the application cannot address.

Programmer Response: Ensure that the AMODE of the application matches that of the C run-time library. If you must run AMODE=24, the C run-time library must be installed below the line. Otherwise, relink your application to be AMODE=31.

System Action: The application terminates.

4000 (X'FA0')

Explanation: An abend occurred during the handling of a prior abend.

Programmer Response: Specify TRAP(OFF) in `#pragma runopts`, recompile and rerun the routine to isolate the cause of the original abend, and correct the cause of the original abend.

System Action: The routine terminates.

C System Programming Reason Codes

X'7011' (28689)

Explanation: A failure occurred during the CMS PIPE command issued to initialize the environment variables from GLOBALV. This is most likely caused because the application being initialized was invoked by a stage of the CMS PIPE command and illegal recursion occurred.

X'7012' (28690)

Explanation: An error occurred while initializing the environment variables from GLOBALV. This may have occurred because the array of environment variable pointers was corrupted.

X'7201' (29185)

Explanation: An error occurred during initialization.

X'7202' (29186)

Explanation: An error occurred during termination.

X'7203' (29187)

Explanation: An error occurred while extending the stack.

X'7204' (29188)

Explanation: An error occurred during longjmp/setjmp.

X'7205' (29189)

Explanation: Initialization of writable static had not been performed. The routine EDCRCINT must be included in your module if you use the RENT compiler option.

X'7206' (29190)

Explanation: The EDCXABRT module was not explicitly included at link-edit time.

X'7207' (29191)

Explanation: A heap was required, but the initialization had been requested without initial heap.

Chapter 18. Return Codes to CICS

When Language Environment detects an error and Language Environment is not fully initialized or unable to generate a message, the component of Language Environment in charge generates a return code. The return code passes from the Language Environment component to CICS. CICS returns the return code to the system console. The COBOL component also sends a message that precedes the return code to the system console.

Language Environment Return Codes

11000

Explanation: Invalid parameters passed from CICS to Language Environment for the partition (region) initialization call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues system initialization with Language Environment inactive.

11010

Explanation: Storage could not be acquired by Language Environment to initialize in the CICS region.

Programmer Response: Increase the size of the CICS region using the DSASIZE SIT parameter.

System Action: CICS continues system initialization with Language Environment inactive.

11020

Explanation: Unable to load Language Environment modules in order to initialize Language Environment for the CICS region.

Programmer Response: Make sure the CSD definitions are correct for Language Environment. Also, make sure that the CICS region size is large enough to run Language Environment.

System Action: CICS continues system initialization with Language Environment inactive.

11030

Explanation: Language Environment partition initialization did not succeed in a language support module.

Programmer Response: Language Environment can write other messages to the operators console explaining the cause of the malfunction. If there are none, this is more than likely an internal error in Language Environment.

System Action: CICS continues system initialization with Language Environment inactive.

11040

Explanation: An internal abend has occurred during Language Environment initialization for the CICS region.

Programmer Response: There should be a CEE1000S message written to the operators console describing the abend code and reason code for the abend. See Chapter 16, “Language Environment Abend Codes” on page 743 for more information.

System Action: CICS continues system initialization with Language Environment inactive.

11100

Explanation: Invalid parameters passed from CICS to Language Environment for the partition (region) termination call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues system termination.

11110

Explanation: Unable to release Language Environment modules during partition (region) termination.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues system termination.

11120

Explanation: Unable to free storage acquired at partition (region) initialization during partition (region) termination.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues system termination.

11130

Explanation: Partition termination did not succeed in a language support module.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues system termination.

11140

Explanation: Language Environment could not release a CEEEVnnn module during partition (region) termination.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues system termination.

Explanation: Invalid anchor vector.

Programmer Response: Most likely an internal error in CICS or Language Environment.

System Action: CICS initialization will fail.

11150

Explanation: An internal abend occurred during Language Environment termination for the CICS region.

Programmer Response: There should be a CEE1000S message in the operators console describing the abend code and reason code for the abend. See Chapter 16, “Language Environment Abend Codes” on page 743 for more information.

System Action: CICS continues system termination.

12000

Explanation: Invalid parameters passed from CICS to Language Environment for the thread initialization call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC7.

12020

Explanation: Preallocated storage was expected by Language Environment from CICS for the thread work area, but was not supplied.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC7.

12030

Explanation: Thread initialization did not succeed in a language support module.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC7.

12100

Explanation: Invalid parameters passed from CICS to Language Environment for the thread termination call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues with termination of the transaction.

12110

Explanation: Thread termination was called before all run units in the thread were terminated by calls to run unit termination.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues with termination of the transaction.

12120

Explanation: An error occurred while trying to free storage for language thread work areas during thread termination.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues with termination of the transaction.

12130

Explanation: Thread termination did not succeed in a language support module.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues with termination of the transaction.

13000

Explanation: Invalid parameters passed from CICS to Language Environment for the run unit initialization call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC8.

13010

Explanation: There was not enough preallocated storage by CICS to Language Environment to complete initialization for all languages in the application routine.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC8.

13020

Explanation: The mix of languages in the application load module is not supported by this release of Language Environment.

Programmer Response: See *OS/390 Language Environment Programming Guide* for information on supported languages and ILC.

System Action: CICS abnormally terminates the transaction with abend code AEC8.

13030

Explanation: Run unit initialization did not succeed in a language support module.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC8.

13040

Explanation: An invalid application routine argument list passed by CICS to Language Environment during run unit initialization.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC8.

13050

Explanation: A member language support module is not available for a language in the application. Initialization cannot be performed.

Programmer Response: Make sure the CEEEVnnn language support modules of Language Environment are defined in the CSD for all languages in the application programs.

System Action: CICS abnormally terminates the transaction with abend code AEC8.

13060

Explanation: Allocation of storage for a language thread work area did not succeed.

Programmer Response: Increase the size of the CICS region using the DSASIZE SIT parameter.

System Action: CICS abnormally terminates the transaction with abend code AEC8.

13100

Explanation: Invalid parameters passed from CICS to Language Environment for the run unit termination call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues with termination of the application.

13110

Explanation: The thread token passed by CICS to Language Environment for run unit termination is invalid.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues with termination of the application.

13130

Explanation: Run unit termination did not succeed in a language support module.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues with termination of the application.

13140

Explanation: Unable to free storage for Language Environment control blocks.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues with termination of the application.

13200

Explanation: Invalid parameters passed from CICS to Language Environment for the run unit invocation call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC9.

13210

Explanation: Preallocated storage was expected by Language Environment from CICS for the run unit work area, but was not supplied.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC9.

13220

Explanation: Spool files for standard in, standard out, and standard error could not be opened.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC9.

13230

Explanation: Run unit invocation did not succeed in a language support module.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC9.

13240

Explanation: An invalid application routine argument list passed by CICS during run unit invocation.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code AEC9.

13250

Explanation: A language support module was not available in order to invoke the application.

Programmer Response: Make sure the CEEEVnnn language support modules of Language Environment are defined in the CSD for all languages in the application routines.

System Action: CICS abnormally terminates the transaction with abend code AEC9.

13300

Explanation: Invalid parameters passed from CICS to Language Environment for the run unit end invocation call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues with termination of the application.

13310

Explanation: CICS passed an invalid thread token during run unit end invocation.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues with termination of the application.

13320

Explanation: CICS passed an invalid routine termination block during run unit end invocation.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues with termination of the application.

13330

Explanation: Unable to close spool files for standard in, standard out, and standard error.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues with termination of the application.

15000

Explanation: Invalid parameters passed from CICS to Language Environment for the establish ownership call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code APCS.

15010

Explanation: Initialization could not be performed for a routine because the language-specific initialization routines of Language Environment were not available for the language.

Programmer Response: Make sure the CEEEVnnn language support modules of Language Environment are defined in the CSD for all languages in the application routines.

System Action: CICS abnormally terminates the transaction with abend code APCS.

15020

Explanation: The language of the main routine could not be determined. Initialization could not be performed for the routine.

Programmer Response: The routine is probably link-edited incorrectly.

System Action: CICS abnormally terminates the transaction with abend code APCS.

15030

Explanation: Language Environment establish ownership did not succeed in a language support module.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code APCS.

15040

Explanation: The application load module does not contain a main routine.

Programmer Response: Make sure there is a main routine in the application load module.

System Action: CICS abnormally terminates the transaction with abend code APCS.

15050

Explanation: The AMODE of the routine is 24, but the routine contains C routines that must run with AMODE(31).

Programmer Response: Relink-edit the routine AMODE(31).

System Action: CICS abnormally terminates the transaction with the abend code APCS.

15060

Explanation: The application provided is a program object with deferred classes which can not be supported with the current level of CICS.

Programmer Response: Build the application using the Language Environment Prelinker Utility.

System Action: CICS abnormally terminates the transaction with the abend code APCS.

16000

Explanation: Invalid parameters passed from CICS to Language Environment for the determine working storage call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues running the transaction under Execution Diagnostic Facility (EDF).

16030

Explanation: Determine working storage call did not succeed in a language support module.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues running the transaction under Execution Diagnostic Facility (EDF).

16040

Explanation: Language Environment could not determine the working storage address and length for a routine.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS continues running the transaction under Execution Diagnostic Facility (EDF).

17000

Explanation: Invalid parameters passed from CICS to Language Environment for the perform goto call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS abnormally terminates the transaction with abend code APC2.

17030

Explanation: Perform goto cannot be completed because a goto-out-of-block is not supported for the language.

The application routine is a mix of languages. One routine is performing an EXEC CICS HANDLE with the LABEL option and calling another routine that is written in a language that does not support EXEC CICS HANDLE with LABEL. A condition occurred that caused CICS to try to branch to the handle label in the caller.

Programmer Response: Change the logic of the routine. Try using EXEC CICS HANDLE with the PROGRAM option instead of EXEC CICS HANDLE with the LABEL option.

System Action: CICS abnormally terminates the transaction with abend code APC2.

17040

Explanation: Errors occurred while trying to perform the goto-out-of-block on behalf of the perform goto call by CICS.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS abnormally terminates the transaction with abend code APC2.

17060

Explanation: An invalid stack frame chain was detected while trying to perform a goto-out-of-block on behalf of the perform goto call by CICS.

Programmer Response: This is most likely an internal error in Language Environment.

System Action: CICS abnormally terminates the transaction with abend code APC2.

18000

Explanation: Invalid parameters passed from CICS to Language Environment for the short on storage alert call.

Programmer Response: This is most likely an internal error in CICS or Language Environment.

System Action: CICS continues to attempt to free storage in response to the short of storage condition.

C Return Codes

31923

Explanation: Run units terminated out of sequence.

Programmer Response: If this problem persists, it is most likely an internal error. Contact IBM service personnel.

System Action: CICS abnormally terminates the transaction.

32112

Explanation: All run units have not been terminated before process termination.

Programmer Response: If this problem persists, it is most likely an internal error. Contact IBM service personnel.

System Action: CICS abnormally terminates the transaction.

32820

Explanation: Mixed-language module unsupported for pre-Language Environment C applications.

Programmer Response: Recompile using IBM C compiler.

System Action: CICS abnormally terminates the transaction.

32821

Explanation: C not present in language signature.

Programmer Response: Recompile using IBM C compiler.

System Action: CICS abnormally terminates the transaction.

32822

Explanation: Identify module entry point (event 28) was issued for a Language Environment conforming entry point when a non-Language Environment conforming entry point was expected.

Programmer Response: If this problem persists, it is most likely an internal error. Contact IBM service personnel.

System Action: CICS abnormally terminates the transaction.

COBOL Return Codes

51401

Explanation: Control returned from the application to the COBOL interface routine.

Programmer Response: Contact IBM service personnel.

System Action: CICS continues with termination of the application.

52801

Explanation: A VS COBOL II program does not have the required CSECTs link-edited with the load module.

Programmer Response: Make sure that the VS COBOL II program has been link-edited correctly with no unresolved references for IGZEBST. Additionally, if the VS COBOL II program was link-edited with Language Environment, there must be no unresolved references for CEESTART or CEEBETBL.

System Action: CICS abnormally terminates the transaction.

PL/I Return Codes

101010

Explanation: CICS GETMAIN command did not succeed during PL/I partition initialization.

Programmer Response: Contact IBM service personnel.

System Action: CICS continues system initialization with Language Environment PL/I inactive.

101020

Explanation: CICS LOAD for IBMRSAP did not succeed during PL/I partition initialization.

Programmer Response: Make sure the module IBMRSAP is defined in CSD. Make sure the module IBMRSAP is located in DFHRPL.

System Action: CICS continues system initialization with Language Environment PL/I inactive.

101030

Explanation: CICS LOAD did not succeed when loading one of the following shared library modules, IBMBPSMA or IBMBPSLA.

Programmer Response: If the shared library compatibility support is requested, both IBMBPSMA and IBMBPSLA should be defined in CSD and located in DFHRPL.

System Action: CICS continues system initialization with Language Environment PL/I inactive.

101110

Explanation: CICS FREEMAIN command did not succeed during PL/I partition termination.

Programmer Response: Contact IBM service personnel.

System Action: CICS continues system termination.

101120

Explanation: CICS RELEASE for IBMRSAP did not succeed during PL/I partition termination.

Programmer Response: This is most likely an internal error in CICS or Language Environment. Contact IBM service personnel.

System Action: CICS continues system termination.

105210

Explanation: Total length of PRV exceeded the specified maximum 4096 bytes.

Programmer Response: Too many files, fetched procedures, CONTROLLED variables, or assembler use of PRV caused the total length of PRV to exceed the maximum limit of 4096 bytes. Try to reduce PRV usage.

System Action: CICS abnormally terminates the transaction with abend code APCS.

Part 4. Appendixes

Appendix A. Diagnosing Problems with Language Environment

This appendix provides information for diagnosing problems in the Language Environment product. It helps you determine if a correction for a product failure similar to yours has been previously documented. If the problem has not been previously reported, it tells you how to open a Problem Management Record (PMR) to report the problem to IBM, and if the problem is with an IBM product, what documentation you need for an Authorized Program Analysis Report (APAR).

Diagnosis Checklist

Step through each of the items in the diagnosis checklist below to see if they apply to your problem. The checklist is designed to either solve your problem or help you gather the diagnostic information required for determining the source of the error. It can also help you confirm that the suspected failure is not a user error; that is, it was not caused by incorrect usage of the Language Environment product or by an error in the logic of the routine.

1. If your failing application contains programs that were changed since they last ran successfully, review the output of the compile or assembly (listings) for any unresolved errors.
2. If there have not been any changes in your applications, check the output (job or console logs, CICS transient (CESE) queues) for any messages from the failing run.
3. Check the message prefix to identify the system or subsystem that issued the message. This can help you determine the cause of the problem. Following are some of the prefixes and their respective origins.

   EDC The prefix for C/C++ messages. The following series of messages are from the C/C++ run-time component of Language Environment: 5000 (except for 5500, which are from the DSECT utility), 6000, and 7000.

   IGZ The prefix for messages from the COBOL run-time component of Language Environment.

   FOR The prefix for messages from the Fortran run-time component of Language Environment.

   IBM The prefix for messages from the PL/I run-time component of Language Environment.

   CEE The prefix for messages from the common run-time component of Language Environment.
4. For any messages received, check for recommendations in the “Programmer Response” sections of the messages in this manual.
5. Verify that abends are caused by product failures and not by program errors. See the appropriate chapters in this manual for a list of Language Environment-related abend codes.
6. Your installation may have received an IBM Program Temporary Fix (PTF) for the problem. Verify that you have received all issued PTFs and have installed them, so that your installation is at the most current maintenance level.

7. The preventive service planning (PSP) bucket, an online database available to IBM customers through IBM service channels, gives information about product installation problems and other problems. Check to see whether it contains information related to your problem.
8. Narrow the source of the error. If a Language Environment dump is available, check the traceback in the Language Environment dump for the source of the problem. Refer to Chapter 3, “Using Language Environment Debugging Facilities” on page 33 for information on how to generate and use a Language Environment or system dump to isolate the cause of the error.

   If a system dump is taken, follow the save area chain to find out the name of the failing module and whether IBM owns it. See “Locating the Name of the Failing Routine in a System Dump” for information on finding the routine name.
9. After you identify the failure, consider writing a small test case that re-creates the problem. The test case could help you determine whether the error is in a user routine or in the Language Environment product. Do not make the test case larger than 75 lines of code. The test case is not required, but it could expedite the process of finding the problem.

   If the error is not a Language Environment failure, refer to the diagnosis procedures for the product that failed.
10. Record the conditions and options in effect at the time the problem occurred. Compile your program with the appropriate options to obtain an assembler listing and data map. If possible, obtain the linkage editor output listing, or the binder if running on MVS, or the LOAD/GENMOD map if running on VM. Note any changes from the previous successful compilation or run. For an explanation of compiler options, refer to the compiler-specific programming guide.
11. If you are experiencing a no-response problem, try to force a dump. Under VM in the CP mode, enter the DUMP command. Under other systems, CANCEL the program with the dump option.
12. Record the sequence of events that led to the error condition and any related programs or files. It is also helpful to record the service level of the compiler associated with the failing program.

Locating the Name of the Failing Routine in a System Dump

If a system dump is taken, follow the save area chain to find out the name of the failing routine and whether IBM owns it. Following are the procedures for locating the name of the failing routine, which is the primary entry point name.

1. Find the entry point associated with the current save area. The entry point address (EPA), located in the previous save area at displacement X'10', decimal 16, points to it.
2. Determine the entry point type, of which there are four:

Entry point type is...	If...
Language Environment conforming	The entry point plus 4 is X'00C3C5C5'.
Language Environment conforming OPLINK	The entry point plus 4 is X'01C3C5C5'. OPLINK linkage conventions are used.
C/C++	The entry point plus 5 is X'CE'.
Nonconforming	The entry point is neither of the above. Nonconforming entry points are for routines that follow the linking convention in which the name is at the beginning of the routine. X'47F0Fxxx' is the instruction to branch around the routine name.

For routines with Language Environment-conforming and C/C++ entry points, Language Environment provides program prolog areas (PPAs). PPA1 contains the entry point name and the address of the PPA2; PPA2 contains pointers to the timestamp, where release level keyword information is found, and to the PPA1 associated with the primary entry point of the routine.

If the entry point type of the failing routine is Language Environment-conforming, go to step 3.

If the entry point type is C/C++, go to step 5 on page 778.

If the entry point type is nonconforming, go to step 6 on page 779.

3. If the entry point type is Language Environment-conforming, find the entry point name for the Language Environment or COBOL program.
   a. Use an offset of X'C' from the entry point to locate the address of the PPA1.
   b. In the PPA1, locate the offset to the length of the name. If OPLINK, then multiply the offset by 2 to locate the actual offset to the length of the name.
   c. Add this offset to the PPA1 address to find the halfword containing the length of the name, followed by the entry point name.

      The entry point name appears in EBCDIC, with the translated version in the right-hand margin of the system dump.
4. Find the Language Environment or COBOL program name.
   a. Find the address of the PPA2 at X'04' from the start of the PPA1.
   b. Find the address of the compilation unit's primary entry point at X'10' in the PPA2.
   c. Find the entry point name associated with the primary entry point as described above. The primary entry point name is the routine name.

Figure 101 on page 778 illustrates the Language Environment-conforming PPA1.

PPA1: Entry Point Block

00	Offset to the length of name	X'C5C5' (Language Environment signature)	Language Environment flags	member flags Member flags
04	A(PPA2)			
08	Offset to Block Debugging Information (BDI) from entry point or zero			
0C	Reserved			
10	Reserved			
	: : :			
	Length of name	Untruncated entry/label name		

Figure 101. Language Environment PPA1

Figure 102 illustrates the Language Environment PPA2.

PPA2: Compile Unit Block

00	Member Identifier	Member Subid	Member Defined	Control Level (= 1)
04	V(CEESTART) for load module			
08	Offset from PPA2 to Compile Debugging Information (CDI) or zero			
0C	Offset from PPA2 to timestamp/version information or zero			
10	A(PEP) - address to the compilation unit's Primary Entry Point			
	: : :			

Figure 102. Compile Unit Block

5. If the entry point type is C/C++, find the C/C++ routine name.
   a. Use the entry point plus 4 to locate the offset to the entry point name in the PPA1.
   b. Use this offset to find the length-of-name byte followed by the routine name.

      The routine name appears in EBCDIC, with the translated version in the right-hand margin.

Figure 103 on page 779 illustrates the C PPA1.

C Routine Layout Entry and PPA1

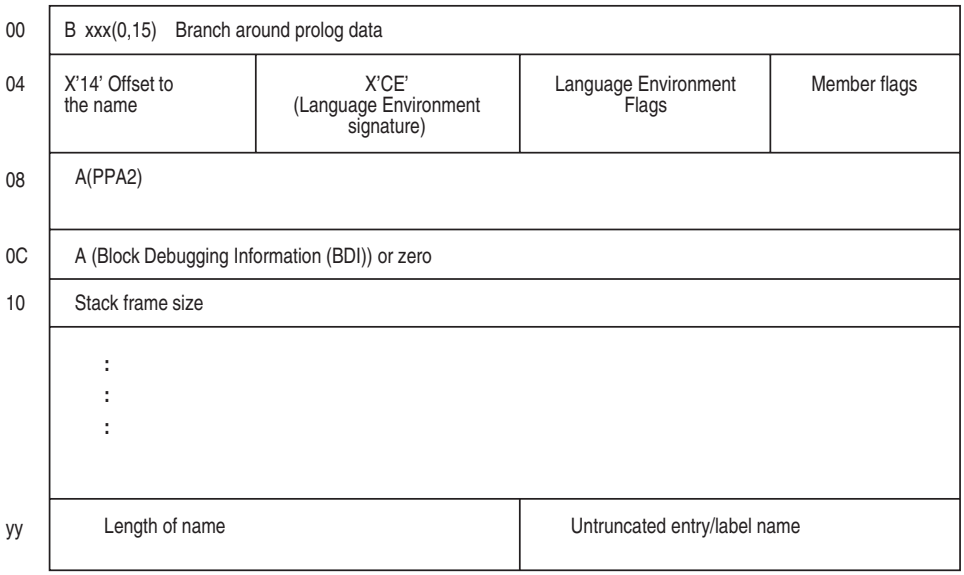

Figure 103. C PPA1

6. If the entry point type is nonconforming, find the PL/I routine name.
   a. Find the one byte length immediately preceding the entry point. This is the length of the routine name.
   b. Go back the number of bytes specified in the name length. This is the beginning of the routine name.
7. If the entry point type is nonconforming, find the name of the routine other than PL/I.
   a. Use the entry point plus 4 as the location of the entry point name.
   b. Use the next byte as the length of the name. The name directly follows the length of name byte. The entry point name appears in EBCDIC with the translated version in the right-hand margin.

   Figure 104 illustrates a nonconforming entry point type.

   Nonconforming entry points that can appear do not necessarily follow this linking convention. The location of data in these save areas can be unpredictable.

```

Searching the IBM Software Support Database

Failures in the Language Environment product can be described through the use of keywords. A keyword is a descriptive word or abbreviation assigned to describe one aspect of a product failure. A set of keywords, called a keyword string, describes the failure in detail. You can use a keyword or keyword string as a search argument against an IBM software support database, such as the Service Information Search (SIS). The database contains keyword and text information describing all current problems reported through APARs and associated PTFs. IBM Support Center personnel have access to the software support database and are responsible for storing and retrieving the information. Using keywords or a keyword string, they will search the database to retrieve records that describe similar known problems.

If you have IBMLink or some other connection to the IBM databases, you can do your own search for previously recorded product failures before calling the IBM Support Center.

If your keyword or keyword string matches an entry in the software support database, the search may yield a more complete description of the problem and possibly identify a correction or circumvention. Such a search may yield several matches to previously reported problems. Review each error description carefully to determine if the problem description in the database matches the failure.

If a match is not found, go to “Preparing Documentation for an Authorized Program Analysis Report (APAR).”

Preparing Documentation for an Authorized Program Analysis Report (APAR)

Prepare documentation for an APAR only after you have done the following:

- Eliminated user errors as a possible cause of the problem.
- Followed the diagnostic procedures.
- You or your local IBM Support Center has been unsuccessful with the keyword search.

Having met these criteria, follow the instructions below.

1. Report the problem to IBM.

   If you have not already done so, report the problem to IBM by opening a Program Management Record (PMR).

   If you have IBMLink or some other connection to IBM databases, you can open a PMR yourself. Or, the IBM Software Support Center can open the PMR after consulting with you on the phone. The PMR is used to document your problem and to record the work that the Support Center does on the problem. Be prepared to supply the following information:

   - Customer number
   - PMR number
   - Operating system
   - Operating system release level

- Your current Language Environment maintenance level (PTF list and list of APAR fixes applied)
- Keyword strings you used to search the IBM software support database
- Processor number (model and serial)
- A description of how reproducible the error is. Can it be reproduced each time? Can it be reproduced only sometimes? Have you been unable to reproduce it? Supply source files, test cases, macros, subroutines, and input files required to re-create the problem. Test cases are not required, but can often speed the response time for your problem.

If the IBM Support Center concludes that the problem described in the PMR is a problem with the Language Environment product, they will work with you to open an APAR, so the problem can be fixed.

2. Provide APAR documentation. When you submit an APAR, you will need to supply information that describes the failure. Table 12 describes how to produce documentation required for submission with the APAR.

Table 12 (Page 1 of 2). Problem Resolution Documentation Requirements

Item	Materials Required	How to Obtain Materials
1	Machine-readable source program, including macros, subroutines, input files, and any other data that might help to reproduce the problem.	IBM-supplied system utility program
2	Compiler listings: Source listing Object listing Storage map Traceback Cross-reference listing JCL listing and linkage editor listing Assembler-language expansion	Use appropriate compiler options
3	Dumps Language Environment dump System dump	See instructions in Chapter 3, “Using Language Environment Debugging Facilities” on page 33 (as directed by IBM support personnel).
4	Partition/region size/virtual storage size	
5	List of applied PTFs	System programmer
6	Operating instructions or console log	Application programmer
7	JCL statements used, or the VM commands used, to invoke and run the routine, including all run-time options, in machine-readable form	Application programmer
8	System output associated with the MSGFILE run-time option.	Specify MSGFILE(SYSOUT)

Table 12 (Page 2 of 2). Problem Resolution Documentation Requirements

Item	Materials Required	How to Obtain Materials
9	Contents of the applicable catalog	
10	A hardcopy log of the events leading up to the failure.	On MVS, print out each display. On VM, spool the console

3. Submit the APAR documentation.

   When submitting material for an APAR to IBM, carefully pack and clearly identify any media containing source programs, job stream data, interactive environment information, data sets, or libraries.

   All magnetic media submitted must have the following information attached and visible:

   - The APAR number assigned by IBM.
   - A list of data sets on the tape (such as source program, JCL, data).
   - A description of how the tape was made, including:
     - The exact JCL listing or the list of commands used to produce the machine-readable source. Include the block size, LRECL, and format of each file. If the file was unloaded from a partitioned data set, include the block size, LRECL, and number of directory blocks in the original data set.
     - Labeling information used for the volume and its data sets.
     - The recording mode and density.
     - The name of the utility program that created each data set.
     - The record format and block size used for each data set.

   Any printed materials must show the corresponding APAR number.

   The IBM service personnel will inform you of the mailing address of the service center nearest you.

   If an electronic link with IBM Service is available, use this link to send diagnostic information to IBM Service.

After the APAR is opened and the fix is produced, the description of the problem and the fix will be in the software support database in SIS, accessible through ServiceLink.

Appendix B. Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
USA

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation
Licensing
2-31 Roppongi 3-chome, Minato-ku
Tokyo 106, Japan

Communicating Your Comments to IBM

OS/390
Language Environment for OS/390 & VM
Debugging Guide and
Run-Time Messages

Publication No. SC28-1942-08

If you especially like or dislike anything about this book, please use one of the methods listed below to send your comments to IBM. Whichever method you choose, make sure you send your name, address, and telephone number if you would like a reply.

Feel free to comment on specific errors or omissions, accuracy, organization, subject matter, or completeness of this book. However, the comments you send should pertain to only the information in this manual and the way in which the information is presented. To request additional publications, or to ask questions or make comments about the functions of IBM products or systems, you should talk to your IBM representative or to your IBM authorized remarketer.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute your comments in any way it believes appropriate without incurring any obligation to you.

If you are mailing a readers' comment form (RCF) from a country other than the United States, you can give the RCF to the local IBM branch office or IBM representative for postage-paid mailing.

- If you prefer to send comments by mail, use the RCF at the back of this book.
- If you prefer to send comments by FAX, use this number:

  1-914-432-9405
- If you prefer to send comments electronically, use this network ID:

  mhvrcfs@us.ibm.com

Make sure to include the following in your note:

- Title and publication number of this book
- Page number or topic to which your comment applies.
