MVS System Messages Volume 3 (ASB - BPX)

Version 2 Release 2
## Contents

### About this document
- Who should use documentation for MVS System Messages
- How to use these documents
- Where to find more information
  - Where to find the most current message information

### How to send your comments to IBM
If you have a technical problem.

### Summary of changes for z/OS MVS System Messages, Vol 3 (ASB-BPX)
- Summary of message changes for z/OS MVS System Messages, Vol 3 (ASB-BPX) for Version 2 Release 2 (V2R2) and its updates
- z/OS Version 2 Release 1 summary of changes

### Chapter 1. ASB messages

### Chapter 2. ATB messages

### Chapter 3. ATR messages

### Chapter 4. ATRH messages

### Chapter 5. AVM messages

### Chapter 6. AXR messages

### Chapter 7. BCD messages

### Chapter 8. BHI messages

### Chapter 9. BLS messages
- Additional BLS Messages

### Chapter 10. BLW messages

### Chapter 11. BLWH messages

### Chapter 12. BPX messages

### Chapter 13. BPXH messages

### Appendix. Accessibility
- Accessibility features
- Consult assistive technologies
- Keyboard navigation of the user interface
- Dotted decimal syntax diagrams

### Notices
- Policy for unsupported hardware
- Minimum supported hardware
- Trademarks

### Index
About this document

This information supports z/OS® (5650-ZOS).

MVS™ System Messages primarily describe messages that are issued to the system operator at the system console and system messages that are logged. These include the following messages:

- Operator messages issued by the BCP and DFSMS.
- Log messages issued by the BCP and DFSMS.
- Some SYSOUT messages issued by the BCP and DFSMS. SYSOUT messages are issued by utilities that normally run in batch, such as SPZAP.
- Batch job messages issued by the BCP. Messages issued by JES2 or JES3 for batch jobs are in the JES messages documents.

For the most part, messages issued at interactive terminals (like TSO/E and CICS® terminals) are documented by the specific elements and products that support those terminals.

The titles of the MVS System Messages indicate the range of message prefixes in the documents:

- z/OS MVS System Messages, Vol 1 (ABA-AOM)
- z/OS MVS System Messages, Vol 2 (ARC-ASA)
- z/OS MVS System Messages, Vol 3 (ASB-BPX)
- z/OS MVS System Messages, Vol 4 (CBD-DMO)
- z/OS MVS System Messages, Vol 5 (EDG-GFS)
- z/OS MVS System Messages, Vol 6 (GOS-IEA)
- z/OS MVS System Messages, Vol 7 (IEB-IEE)
- z/OS MVS System Messages, Vol 8 (IEF-IGD)
- z/OS MVS System Messages, Vol 9 (IGF-IWM)
- z/OS MVS System Messages, Vol 10 (IXC-IZP)

Here are some of the other types of messages on that bookshelf:

- z/OS MVS Dump Output Messages
- z/OS MVS System Codes
- z/OS and z/VM HCD Messages
- z/OS JES3 Messages
- z/OS TSO/E Messages
- z/OS UNIX System Services Messages and Codes

This document also contains the routing and descriptor codes that IBM® assigns to the messages that z/OS components, subsystems, and products issue. Routing and descriptor codes are specified by the ROUTCDE and DESC keyword parameters on WTO and WTOR macros, which are the primary methods that programs use to issue messages. The routing code identifies where a message will be displayed. The descriptor code identifies the significance of the message and the color of the message on operator consoles with color.
Who should use documentation for MVS System Messages

The system messages documents are for people who receive messages from the system. Usually, these people are system operators, system programmers, and application programmers who do any of the following tasks:

- Initialize the operating system and its subsystems
- Monitor system activity
- Keep the system running correctly
- Diagnose and correct system problems
- Diagnose and correct errors in problem programs

How to use these documents

The system messages contain descriptions of messages. See z/OS MVS System Messages, Vol 1 (ABA-AOM) for details about z/OS message formats and descriptions.

Where to find more information

Where necessary, the message documents reference information in other books, using shortened versions of the book title. For complete titles and order numbers of the books for all products that are part of z/OS, see z/OS V2R2 Information Roadmap.

Many message descriptions refer to the following terms. You need to consult the reference listed below for more information:

- **Data areas and control blocks**: See z/OS MVS Data Areas in the z/OS Internet library (http://www.ibm.com/systems/z/os/zos/bkserv/)
- **Dumps**: For examples of ABEND, stand-alone, and SVC dumps and how to read them, see z/OS MVS Diagnosis: Tools and Service Aids. For examples of component output from dumps and how to read and request it, see z/OS MVS Diagnosis: Reference.
- **Identification of a component, subsystem, or product**: See the z/OS MVS Diagnosis: Reference to identify the component, subsystem, or product from the name of an IBM module or for a macro. The module prefix and macro tables give the program identifier to be used in a PIDS symptom in a search argument.
- **System completion and wait state codes**: See z/OS MVS System Codes.
- **Logrec data set error records**: For the formatted records, see z/OS MVS Diagnosis: Reference.
- **Trace output**: For the formats and the meaning of the information in the generalized trace facility (GTF) trace, instruction address trace, master trace, system trace, and component trace, see z/OS MVS Diagnosis: Tools and Service Aids.
- **hardware**: Use the appropriate Principles of Operation document for the hardware you have installed.

IBM Health Checker for z/OS User’s Guide

SDSF also provides functions to simplify the management of checks. See z/OS SDSF Operation and Customization for additional information.
Where to find the most current message information

The MVS System Messages documents are cumulative. As messages are added to the system they are added to the documents. Similarly, when messages are changed on the system, they are changed in the documents. However, when a message is deleted from the system (no longer issued), the message is not deleted from the document. This means that users can look in the most recent message documents for the most current descriptions of system messages.

To find the most current edition of a document, go to the [z/OS Internet library](http://www.ibm.com/systems/z/os/zos/bkserv/) and use the messages and codes database to search for the message ID you are interested in.
How to send your comments to IBM

We appreciate your input on this publication. Feel free to comment on the clarity, accuracy, and completeness of the information or provide any other feedback that you have.

Use one of the following methods to send your comments:
1. Send an email to mhvrcfs@us.ibm.com.
2. Send an email from the Contact z/OS.

Include the following information:
• Your name and address.
• Your email address.
• Your telephone or fax number.
• The publication title and order number:
  z/OS V2R2 MVS System Messages, Vol 3 (ASB-BPX)
  SA38-0670-03
• The topic and page number that is related to your comment.
• The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute the comments in any way appropriate without incurring any obligation to you.

IBM or any other organizations use the personal information that you supply to contact you only about the issues that you submit.

If you have a technical problem

Do not use the feedback methods that are listed for sending comments. Instead, take one of the following actions:
• Contact your IBM service representative.
• Call IBM technical support.
• Visit the IBM Support Portal at [IBM support portal]
Summary of changes for z/OS MVS System Messages, Vol 3 (ASB-BPX)

This information includes terminology, maintenance, and editorial changes. Technical changes or additions to the text and illustrations for the current edition are indicated by a vertical line to the left of the change.

Summary of message changes for z/OS MVS System Messages, Vol 3 (ASB-BPX) for Version 2 Release 2 (V2R2) and its updates

The following lists indicate the messages that are new, changed, or no longer issued in z/OS V2R2 and its updates. Messages that have been added, updated, or that are no longer issued in an updated edition of V2R2 are identified by the quarter and year that the message was updated, in parentheses. For example, (4Q2015) indicates that a message was updated in the fourth quarter of 2015.

New

The following messages are new.
  AXR0208I (1Q2016)
  AXR0209I (1Q2016)
  AXR0210I (1Q2016)
  AXR0211I (1Q2016)
  AXR0212I (1Q2016)
  AXR0213I (1Q2016)
  AXR0214I (1Q2016)
  BPXF270I (1Q2016)
  BPXH073I
  BPXH074I
  BPXH075I
  BPXH076I
  BPXH077E
  BPXH078I
  BPXI089I
  BPXP029I
  BPXTF016I
  BPXTF017I
  BPXTF018I
  BPXW0005I

Changed

The following messages are changed.
  ATR250E
  AXR0200I (1Q2016)
  BPXF269I
BPXH072E
BPXI039I
BPXM059I
BPXO068I
BPXO042I
BPXO075I
BPXP014I (1Q2016)
BPXP018I
BPXP029I
BPXTF018I
BPXTF012I
BPXTF107I
BPXW0006I

**Deleted**

The following messages are no longer issued.
None.

---

**z/OS Version 2 Release 1 summary of changes**

See the following publications for all enhancements to z/OS Version 2 Release 1 (V2R1):

- [z/OS Migration](#)
- [z/OS Planning for Installation](#)
- [z/OS Summary of Message and Interface Changes](#)
- [z/OS Introduction and Release Guide](#)
Chapter 1. ASB messages

**ASB002I** CLASS **class-name** CANNOT BE ADDED.

**Explanation:** The system cannot add an APPC/MVS transaction scheduler class to the current parmlib configuration because an error occurred while processing an ASCHPMx parmlib member.

In the message text:

- **class-name**
  - The APPC/MVS transaction scheduler class.

**System action:** The system rejects any requests from transaction programs (TP) that run under the APPC/MVS transaction scheduler class.

**Operator response:** Notify the system programmer.

**System programmer response:** Check the lines in the parmlib member for syntax errors. Correct the error(s).

**Module:** ASBSCHAD

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 3

---

**ASB004I** CLASS **class-name** DOES NOT EXIST. IT CANNOT BE DELETED.

**Explanation:** The system cannot delete an APPC/MVS transaction scheduler class because the class was never added to the current parmlib configuration.

In the message text:

- **class-name**
  - The APPC/MVS transaction scheduler class.

**System action:** The system continues processing.

**System programmer response:** Check the ASCHPMx parmlib member for the correct class name. Enter the correct class name.

**Module:** ASBSCHAD

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 3

---

**ASB006I** DEFAULT CLASS **class-name** DOES NOT EXIST. NO DEFAULT CLASS IS DEFINED.

**Explanation:** The default APPC/MVS transaction scheduler class does not exist in the current parmlib configuration.

In the message text:

- **class-name**
  - The default APPC/MVS transaction scheduler class.

**System action:** The system does not define a default scheduler class. The system continues processing.

**System programmer response:** Specify a default class on the OPTIONS keyword in the current parmlib configuration.

**Module:** ASBSCHAD

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2
ASB008I • ASB012I

Descriptor Code: 3

**ASB008I**  DEFAULT CLASS class-name WAS DELETED. NO DEFAULT CLASS IS DEFINED.

Explanation: The default APPC/MVS transaction scheduler class was deleted by a SET command. No default class is defined to the system.

In the message text:

*class-name*

The default APPC/MVS transaction scheduler class.

**System action:** The system continues processing. The system rejects transaction programs (TP) that do not have a specific class.

**System programmer response:** Specify a default class on the OPTIONS keyword in the current parmlib configuration.

**Module:** ASBSCHAD

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2M

**Descriptor Code:** 3

**ASB010I**  THE SUBSYSTEM subsystem EXISTS BUT IT IS NOT ACTIVE.

Explanation: When the system tried to start a transaction initiator, the system found that the subsystem specified on the SUBSYS keyword in the current parmlib configuration, but is not currently active. The subsystem must be active in order to start an initiator.

In the message text:

*subsystem*

The subsystem specified on the SUBSYS keyword in the current parmlib configuration.

**System action:** The system stops processing until one of the following occurs:

- The subsystem is activated
- The SUBSYS keyword is changed

**Operator response:** Do one of the following:

- Activate the subsystem.
- Ensure that an automated operation will activate the subsystem.

**System programmer response:** Change the value of the SUBSYS keyword in the current parmlib configuration to the name of an active subsystem.

**Module:** ASBSCHVS

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 11

**ASB012I**  THE SUBSYSTEM subsystem DOES NOT EXIST.

Explanation: The subsystem specified on the SUBSYS keyword in the current parmlib configuration is not defined to the system.

In the message text:

*subsystem*

The specified subsystem.

**System action:** The system stops processing until the SUBSYS keyword indicates a valid subsystem.
**Operator response:** Notify the system programmer. After the system programmer corrects the problem, enter a SET command to process the current parmlib configuration.

**System programmer response:** Check the IEFSSN:xx parmlib member for a correct subsystem name. Enter a correct subsystem name in the current parmlib configuration.

**Module:** ASBSCHVS  
**Source:** Advanced Program-to-Program Communication (APPC/MVS)  
**Routing Code:** 2  
**Descriptor Code:** 11

---

**ASB025I**  
**IN Correct characters specified for ASCH parmlib member value.**

**Explanation:** On a START ASCH command or a SET ASCH command, the operator specified an incorrect suffix on one or more ASCH parmlib members.

**System action:** The system stops processing the incorrect ASCH parmlib member(s). The system continues other processing.

**Operator response:** Enter the START ASCH or SET ASCH command again, specifying a valid ASCH parmlib member suffix. Correct suffix values are alphanumeric characters or national characters.

**Module:** ASBSCPX  
**Source:** Advanced Program-to-Program Communication (APPC/MVS)  
**Routing Code:** 2  
**Descriptor Code:** 5

---

**ASB026I**  
**ASCHPM:xx IGNORED. MEMBER IS EMPTY.**

**Explanation:** The parmlib member specified on a START ASCH or SET ASCH command is empty.

In the message text:

**ASCHPM:xx**  
The empty parmlib member, with the suffix xx.

**System action:** The system stops processing the empty parmlib member. The system processes the next ASCH parmlib member, if one was specified in the current configuration.

**Operator response:** Notify the system programmer. After the system programmer has corrected the problem, enter the SET ASCH command to process the parmlib member.

**System programmer response:** Enter valid data in the ASCH parmlib member.

**Module:** ASBSCPA  
**Source:** Advanced Program-to-Program Communication (APPC/MVS)  
**Routing Code:** 2  
**Descriptor Code:** 5

---

**ASB027I**  
**ASCHPM:xx : LINE num1 - num2 IGNORED. UNBALANCED COMMENT DETECTED.**

**Explanation:** In an ASCHPM:xx parmlib member, the system found one of the following:

- A starting comment delimiter (/*) with no matching ending comment delimiter (*/)  
- An ending comment delimiter with no starting comment delimiter

In the message text:

**ASCHPM:xx**  
The parmlib member, with the suffix xx. 

**num1**  
The line number in the ASCHPM:xx parmlib member where the unbalanced comment began.
num2  The line number in the ASCHPMxx parmlib member where the unbalanced comment ended.

**System action:** The system does not process the statement with the unbalanced comment. The system processes the next statement in the parmlib member, if one exists.

**Operator response:** Notify the system programmer. After the system programmer has corrected the problem, enter the SET ASCH command to process the ASCHPMxx parmlib member.

**System programmer response:** Do the following:
- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

**Module:** ASBS CPA

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 5

---

**ASB028I**  ASCHPMxx : LINE num stmt STATEMENT IGNORED. STATEMENT TYPE NOT RECOGNIZED.

**Explanation:** The system found an incorrect statement type in an ASCHPMxx parmlib member.

In the message text:

- **ASCHPMxx**
  - The parmlib member, with the suffix xx.
- **num**  The line number in the parmlib member where the incorrect statement began.
- **stmt**  The name of the incorrect statement.

**System action:** The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

**Operator response:** Notify the system programmer. After the system programmer corrects the problem, enter the SET ASCH command to process the parmlib member.

**System programmer response:** Do the following:
- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

**Module:** ASBS CPA

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 5

---

**ASB029I**  ASCHPMxx : LINE num {CLASSADD | CLASSDEL} STATEMENT IGNORED. NO OPERANDS SPECIFIED.

**Explanation:** In the ASCHPMxx parmlib member, the system found a CLASSADD or CLASSDEL statement that contains no operands.

In the message text:

- **ASCHPMxx**
  - The parmlib member, with the suffix xx.
- **num**  The line number in the ASCHPMxx parmlib member where the incorrect statement began.

**CLASSADD**
- The system found an error in a CLASSADD statement.

**CLASSDEL**
- The system found an error in a CLASSDEL statement.
**System action:** The system does not process the statement with no operands. The system processes the next statement in the parmlib member, if one exists.

**Operator response:** Notify the system programmer. After the system programmer corrects the problem, enter the SET ASCH command to process the parmlib member.

**System programmer response:** Do the following:
- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

**Module:** ASBSCCA

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 5

---

**ASB030I**

**ASCHPM**: LINE *num* {CLASSADD | CLASSDEL} STATEMENT IGNORED. NO CLASSNAME KEYWORD SPECIFIED.

**Explanation:** A statement in the specified parmlib member does not contain a required keyword.

In the message text:

ASCHPM:
- The parmlib member, with the suffix *xx*.
- *num* The line number in the ASCHPM:*xx* parmlib member where the incorrect statement began.

CLASSADD
- The system found an error in a CLASSADD statement.

CLASSDEL
- The system found an error in a CLASSDEL statement.

**keyword** The missing keyword.

**System action:** The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

**Operator response:** Notify the system programmer. After the system programmer corrects the problem, enter the SET ASCH command to process the parmlib member.

**System programmer response:** Do the following:
- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

**Module:** ASBSCCA

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 5

---

**ASB031I**

**ASCHPM**: LINE *num* *stmt* STATEMENT IGNORED. DUPLICATE KEYWORD *keyword* SPECIFIED.

**Explanation:** The system found a statement with a duplicate keyword.

In the message text:

ASCHPM:
- The parmlib member, with the suffix *xx*.
- *num* The line number in the ASCHPM:*xx* parmlib member where the incorrect statement began.

**stmt** The name of the statement in error, which is one of the following:
- CLASSADD
The duplicate keyword, which is one of the following:

- CLASSNAME
- DEFAULT
- MAX
- MIN
- MSGLEVEL
- MSGLIMIT
- OUTCLASS
- REGION
- RESPGOAL
- SUBSYS
- TIME

**System action:** The system rejects the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

**Operator response:** Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

**System programmer response:** Do the following:

- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

**Module:** ASBSCCA

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 5

```
ASB032I ASCHP\textit{xx} : \textit{LINE num stmt} STATEMENT IGNORED. VALUE SPECIFIED FOR KEYWORD \textit{keyword} IS NOT VALID.
```

**Explanation:** The system found a statement with an incorrect keyword value.

In the message text:

- \textit{ASCHP\textit{xx}}: The parmlib member, with the suffix \textit{xx}.
- \textit{num}: The line number in the \textit{ASCHP\textit{xx}} parmlib member where the bad statement began.
- \textit{stmt}: The name of the statement in error, which is one of the following:
  - CLASSADD
  - CLASSDEL
  - OPTIONS
  - TPDEFAULT
- \textit{keyword}: The keyword that contains an incorrect value, which is one of the following:
  - CLASSNAME
  - DEFAULT
  - MAX
  - MIN
  - MSGLEVEL
System action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System programmer response: Do the following:
- Check the keyword for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

Module: ASBSCCA, ASBSCOP
Source: Advanced Program-to-Program Communication (APPC/MVS)
Routing Code: 2
Descriptor Code: 5

---

ASCHPMxx : LINE num stmt STATEMENT IGNORED. UNRECOGNIZED KEYWORD: keyword.

Explanation: The system found a statement with an unrecognized keyword.

In the message text:

ASCHPMxx
  The parmlib member, with the suffix xx.
num
  The line number in the ASCHPMxx parmlib member where the incorrect statement began.
stmt
  The name of the incorrect statement, which is one of the following:
  - CLASSADD
  - CLASSDEL
  - OPTIONS
  - TPDEFAULT

keyword
  The unrecognized keyword.

System action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if any exists.

Operator response: Notify the system programmer. After the system programmer corrects the problem, enter the SET ASCH command to process the parmlib member.

System programmer response: Do the following:
- Check the keyword for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

Module: ASBSCCA, ASBSCOP
Source: Advanced Program-to-Program Communication (APPC/MVS)
Routing Code: 2M
Descriptor Code: 5

---
ASB034I • ASB035I

ASB034I  ASCHPMxx : LINE num stmt STATEMENT IGNORED. MISSING RIGHT PARENTHESES FOR A KEYWORD VALUE SPECIFIED IN THE STATEMENT.

Explanation: The system found a statement with a keyword value that had no right parenthesis. The keyword was followed by another keyword.

In the message text:

ASCHPMxx
The parmlib member, with the suffix xx.
num The line number in the ASCHPMxx parmlib member where the incorrect statement began.
stmt The name of the incorrect statement, which is one of the following:
  • CLASSADD
  • CLASSDEL
  • OPTIONS
  • TPDEFAULT

System action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System programmer response: Do the following:
  • Check the lines in the parmlib member for unbalanced parentheses. Correct the error(s).
  • Determine if a new parmlib member is necessary to contain only the corrected statement(s).

Module: ASBSCCA, ASBSOP
Source: Advanced Program-to-Program Communication (APPC/MVS)
Routing Code: 2
Descriptor Code: 5

--

ASB035I  ASCHPMxx : LINE num stmt STATEMENT IGNORED. NO VALUE SPECIFIED FOR KEYWORD keyword.

Explanation: The system found one of the following:
  • A keyword with an incorrect value, or no left parenthesis.
  • A syntax error

In the message text:

ASCHPMxx
The parmlib member, with the suffix xx.
num The line number in the ASCHPMxx parmlib member where the incorrect statement began.
stmt The name of the statement containing the incorrect keyword value or no left parenthesis, which is one of the following:
  • CLASSADD
  • CLASSDEL
  • OPTIONS
  • TPDEFAULT

keyword The incorrect keyword, which is one of the following:
  • CLASSNAME
  • DEFAULT
  • MAX
  • MIN
System action: The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

Operator response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System programmer response: Do the following:

- Check the lines in the parmlib member for syntax errors. Correct the error(s).
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

Module: ASBSCCA, ASBSCOP

Source: Advanced Program-to-Program Communication (APPC/MVS)

Routing Code: 2

Descriptor Code: 5

---

ASB036I ASCHPM\(xx\) : STARTING LINE \(num\) MEMBER IGNORED. \(stmt\) STATEMENT TEXT EXCEEDS 4096 CHARACTERS.

Explanation: One of the following conditions exists in the ASCHPM\(xx\) parmlib member:

- A statement is too long
- A statement contains a syntax error

In the message text:

ASCHPM\(xx\)

The parmlib member, with the suffix \(xx\).

\(num\)

The line number in the ASCHPM\(xx\) parmlib member where the incorrect statement began.

\(stmt\)

The name of the incorrect statement, which is one of the following:

- CLASSADD
- CLASSDEL
- OPTIONS
- TPDEFAULT

System action: The system does not process the incorrect member. The system processes the next ASCH\(xx\) parmlib member, if one exists.

Operator response: Notify the system programmer. After the system programmer has corrected the problem, enter a SET ASCH command to process the parmlib member.

System programmer response: Do the following:

- Check the lines in the parmlib member for statements that exceed 4096 characters.
- Determine if a new parmlib member is necessary to contain only the corrected statement(s).

Module: ASBSCPA

Source: Advanced Program-to-Program Communication (APPC/MVS)

Routing Code: 2

Descriptor Code: 5
ASB038I • ASB040I

ASB038I ASCHPM:xx : stmtrec
Explanation: This message displays the ASCH parmlib member and the statement that the system is processing in that parmlib member.
In the message text:

ASCHPM:xx
The parmlib member, with the suffix xx.
stmtrec The statement record that the system is currently processing.
System action: The system continues processing.
Module: ASBSCPA
Source: Advanced Program-to-Program Communication (APPC/MVS)
Routing Code: 2
Descriptor Code: 5

ASB039I SET ASCH COMMAND IGNORED. ASCH NOT ACTIVE.
Explanation: The operator entered the SET ASCH command when ASCH was:
• Not started
• Initializing
• Ending
System action: The system rejects the SET ASCH command.
Operator response: Enter a DISPLAY ASCH command to check the ASCH component status. Determine when you can enter the SET ASCH command again.
Module: ASBSCEPS
Source: Advanced Program-to-Program Communication (APPC/MVS)
Routing Code: 2
Descriptor Code: 5

ASB040I SYSTEM ERROR ENCOUNTERED IN ASCH PARMLIB PROCESSING.
Explanation: The system found unexpected errors when processing the Advanced Program-to-Program Communication scheduler (ASCH) parmlib member(s).
A temporary loss of system storage may have caused this problem.
System action: The system writes an SVC dump to the SYS1.DUMP:xx data set. The system continues processing.
Processing of the parmlib member may be incomplete.
Operator response: Enter a DISPLAY ASCH command to check the ASCH configuration status. Determine if you should enter a SET ASCH command to update the current parmlib configuration.
System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.
Module: ASBSCEPS, ASBSCEPX, ASBSCEPA, ASBSCEAD, ASBSCEOP, ASBSCECK
Source: Advanced Program-to-Program Communication (APPC/MVS)
Routing Code: 2
Descriptor Code: 5
ASB050I ASCH IS RESTARTING. FAILURE CODE = failcde

**Explanation:** The Advanced Program-to-Program Communication scheduler (ASCH) abended while initializing or processing ASCH work.

In the message text:

`failcde` A hex reason code that explains the error, as follows:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000001</td>
<td>The failure occurred during ASCH processing.</td>
</tr>
</tbody>
</table>

**System action:** The system does the following:
1. Ends the APPC/MVS transaction scheduler temporarily
2. Writes an SVC dump, if an abend occurred
3. Tries to restart the APPC/MVS transaction scheduler
4. Issues message ASB052I when the APPC/MVS transaction scheduler returns to active state
5. Does not process work that was in progress when the abend occurred
6. Notifies the requestor of work that was not completed

**Operator response:** After the system issues message ASB052I, enter commands that were not processed, as desired.

**System programmer response:** Identify the problem using the SVC dump and any APPC trace records. Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:** ASBSCSM, ASBSCIN

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 4

ASB051I ASCH IS TERMINATING. FAILURE CODE = failcde

**Explanation:** The APPC/MVS transaction scheduler abended while initializing or processing ASCH work.

In the message text:

`failcde` The hex reason code that explains the error, as follows:

<table>
<thead>
<tr>
<th>Reason Code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000001</td>
<td>Restrictions for allowing a restart were not met. The abend is the second non-recoverable error to occur within one hour.</td>
</tr>
<tr>
<td>0000002</td>
<td>An internal error occurred while the system was initializing the APPC scheduler.</td>
</tr>
</tbody>
</table>

**System action:** The system does the following:
1. Ends the APPC/MVS transaction scheduler
2. Writes a dump to the SYS1.DUMP data set, if an abend occurred
3. Makes the trace records available in the dump, if a trace was active for APPC
4. Issues message ASB050I after issuing the first abend
5. Does not process the work sent to the APPC/MVS transaction scheduler
6. Issues message ASB053I when the APPC/MVS transaction scheduler ends.

**Operator response:** Enter the START ASCH command to start a new APPC/MVS transaction scheduler. See **MVS System Commands** for details on starting the APPC/MVS transaction scheduler. If the problem recurs, notify the system programmer.
**ASB052I • ASB054I**

**System programmer response:** Identify the problem using the system dump and the APPC trace records.

**Descriptor Code:** 1

---

**ASB052I**  
**ASCH IS ACTIVE.**

**Explanation:** The Advanced Program-to-Program Communication scheduler (ASCH) is ready to process work requests.

**System action:** The system continues processing.

**Module:** ASBSCSM

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** 2

**Descriptor Code:** 1

---

**ASB053I**  
**ASCH HAS TERMINATED.**

**Explanation:** The APPC/MVS transaction scheduler ended.

**System action:** The APPC/MVS transaction scheduler ends.

**Operator response:** Enter the START ASCH command to start the APPC/MVS transaction scheduler. See [z/OS MVS System Commands](http://www.ibm.com) for details on starting the APPC/MVS transaction scheduler.

**System programmer response:** If a CANCEL or FORCE command did not cause the APPC/MVS transaction scheduler to end, look in the SVC dump to determine the problem. Identify the problem using the system dump. If CTRACE was turned on, analyze the component trace records. The reason code issued with message ASB051I may be helpful in determining the error.

**Module:** ASBSCSM

Descriptor Code: 4

ASB058I  SUB=MSTR NOT SPECIFIED ON START ASCH. COMMAND IGNORED.
Explanation: The START ASCH command did not specify SUB=MSTR. The SUB=MSTR parameter must be specified.
System action: The APPC/MVS transaction scheduler is not available.
Operator response: Enter the START ASCH command again, specifying SUB=MSTR. See [z/OS MVS System Commands](https://www.ibm.com) for the correct syntax.
Module: ASBSCIN
Source: Advanced Program-to-Program Communication (APPC/MVS)
Routing Code: 2
Descriptor Code: 5
ASB059I  ASCH IS TERMINATING DUE TO OPERATOR [CANCEL | FORCE]

Explanation: The APPC/MVS transaction scheduler is ending because the operator entered a CANCEL or FORCE command.

System action: The system makes all ASCH address space services unavailable. The system ends all conversations associated with the APPC/MVS transaction scheduler. The idle initiator ends when the system tries to obtain more work from the APPC/MVS transaction scheduler. When the APPC/MVS transaction scheduler ends, the system issues message ASB053I.

Operator response: To start a new APPC/MVS transaction scheduler, enter a START ASCH command after the system issues message ASB053I. See z/OS MVS System Commands for the START ASCH command syntax.

Module: ASBSCRE, ASBSCST

Source: Advanced Program-to-Program Communication (APPC/MVS)

Routing Code: 2

Descriptor Code: 1

ASB060I  ASCH FAILED TO START CLASS classname INITIATORS.

Explanation: The APPC/MVS transaction scheduler failed to start initiators for the class classname. Possible causes of this error are:

- The ASCHINT procedure is missing from SYS1.PROCLIB
- The ASCHINT procedure contains JCL errors.

System action: The system continues processing. No initiators are started until the problem is corrected.

Operator response: Notify the system programmer. At the request of the system programmer, issue the SET ASCH=xx command to resume attempts to start initiators. If necessary, see z/OS MVS System Commands for the SET ASCH command syntax.

System programmer response: Make sure that the ASCHINT procedure is in SYS1.PROCLIB. If it is, check for any JCL errors and correct them. Then, ask the operator to restart initiators through a SET ASCH=xx operator command, specifying an ASCHPMxx parmlib member that contains one CLASSADD statement for each class that needs to be restarted.

Descriptor Code: 4

ASB080I  MSGLIMIT HAS BEEN EXCEEDED. START OF MESSAGE WRAP.

Explanation: The number of messages written to the TP message log by a multi-trans transaction program (TP) exceeds the limit specified in MSGLIMIT field in the current parmlib configuration.

System action: The system issues this message to the TP message log. When the number of messages exceeds the value of MSGLIMIT, the messages wrap in the following manner:

- The first message overwritten will immediately follow the messages that were written before the first Get_Transaction was issued.
- The initial messages will not be overwritten.
- The system writes message ASB080I to the TP message log before the first message where the wrapping begins.

Module: ASBSCMG

Source: Advanced Program-to-Program Communication (APPC/MVS)

Routing Code: Note 22

Descriptor Code: -
**ASB081I**  MSGLIMIT HAS BEEN EXCEEDED. END OF MESSAGE WRAP.

**Explanation:** The number of messages written to the TP message log by a multi-trans transaction program (TP) exceeds the limit specified in MSGLIMIT in the current parmlib configuration.

**System action:** The system ends processing for the TP. If the messages in the job/message log were wrapping, the system issues this message to the TP message log to mark where the wrapping ends. The system continues other processing.

**Module:** ASBSCMG

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** Note 22

**Descriptor Code:** -

**ASB082I**  MSGLIMIT HAS BEEN EXCEEDED. MESSAGE PROCESSING TERMINATED.

**Explanation:** The number of messages written to the job/message log exceeds the limit specified in the MSGLIMIT field of the current parmlib configuration.

**System action:** For a transaction program (TP) with a schedule type of standard, the system issues this message to the job/message log and stops message processing.

For a multi-trans TP, if the MSGLIMIT is reached before the first Get_Transaction, the messages will not wrap. The system writes this message to the job/message log and stops message processing.

**System programmer response:** Increase the value of MSGLIMIT in the current parmlib configuration.

**User response:** After the system programmer increases the value of MSGLIMIT, submit the TP again.

**Module:** ASBSCMG

**Source:** Advanced Program-to-Program Communication (APPC/MVS)

**Routing Code:** Note 22

**Descriptor Code:** -

**ASB083I**  JOBLOG PROCESSING ENDED DUE TO ALLOCATION FAILURE. REASON CODE = reason-code, DSN = dsname

**Explanation:** The system encountered an error while trying to allocate a dataset for the TP message log. The reason code explains the error.

In the message text:

`reason-code`

- The hexadecimal reason code explaining the error is one of the following:
  - 0  Internal error.
  - Non-zero  The SVC 99 decimal error code from the request block field. S99ERROR. See z/OS MVS Programming: Authorized Assembler Services Guide for an explanation of the error code.

`DSN = dsname`

- The name of the dataset that the system could not allocate.

**System action:** Processing continues, but APPC does not write messages to the TP Message log.

**Operator response:** Notify the system programmer.

**System programmer response:** Make sure that the MESSAGE_DATA_SET keyword in the TP profile is correct. Try using a different dataset name for the TP message log if necessary.

If the error persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:** ASBSCAL

**ASB101I**  hh.mm.ss  ASCH DISPLAY [id] text

**Explanation:** Where *text* is:

<table>
<thead>
<tr>
<th>CLASSES</th>
<th>ACTIVE TRANS</th>
<th>QUEUED TRANS</th>
<th>IDLE INITS</th>
<th>TOTAL INITS</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccccc</td>
<td>aaaaa</td>
<td>qqqqq</td>
<td>iiii</td>
<td>ttttt</td>
</tr>
</tbody>
</table>

[REGION TIME MSGLEVEL OUTCLASS SUBSYS]

[CLASS=class STATUS=status ACTIVE TRANS=aaaaa MIN=minim RESPGOAL=rrrrrrrr QUEUED TRANS=qqqqq MAX=maxim DEFAULT={YES|NO} IDLE INITS=iiiii]

[LTPN=tpname|X'hh'ccc STATUS=status WUID=workid ASID=asid TPST=tp_sched_type USERID=userid QT=nnnnnnnn JOBNAME=jobname]]

This message appears when the operator enters a DISPLAY ASCH command.

The variables in the first line are:

- **hh.mm.ss**
  Hour, minute, and second (or 00.00.00 if the time of day (TOD) clock is not working).

- **id**  A 3-digit decimal identifier, used with the CONTROL C,D command to cancel status displays being written on typewriter or printer consoles or being displayed inline (that is, not in a display area) on a display console. This identifier does not appear when the display is presented in a display area on a display console.

If any keyword filters were entered on the command, the numbers reflect only data that meets the specified criteria.

**CLASSES**

<table>
<thead>
<tr>
<th>ccccc</th>
</tr>
</thead>
</table>
The number of Advanced Program-to-Program Communication (APPC/MVS) transaction scheduler classes currently defined. This count includes both ACTIVE and TERMINATING classes. TERMINATING means the class has been removed from the system with a SET command, but the system allows the transaction programs already running or queued to complete.

**ACTIVE TRANS**

| aaaaa |
The total number of active transaction programs. The following TPs are considered active and are included in the count:
Multi-trans TPs that are waiting for more work
TPs that are “in transition” (the system is still preparing the transaction initiator and has not yet invoked the TP); JOBNAME=*NONE* is displayed in the message text for TPs that are in transition.

**QUEUED TRANS**

The total number of queued transaction program attach requests.

**IDLE INITS**

The number of transaction initiators that are not currently running a transaction program. This count includes all idle initiators for each class, as well as idle initiators that are not assigned to any class. These initiators are available to be assigned to any class that may need them.

**TOTAL INITS**

The total number of transaction initiators that are managed by the APPC/MVS transaction scheduler. This count includes both the active initiators (one for each ACTIVE TRANS), and the IDLE INITS.

The SUBSYS and TPDEFAULT information, as specified in parmlib, is:

**REGION**

The TPDEFAULT region size. *region* has a value range of one through 9999 kilobytes, and one through 2047 megabytes.

**TIME**

The TPDEFAULT time limit. *mmmm,ss* is the time limit in minutes (from one to 1440) and in seconds (from one to 59).

**MSGLEVEL**

The TPDEFAULT message level. *s,m* has a possible value of 0, 1, or 2. *m* has a possible value of 0 or 1.

**OUTCLASS**

The TPDEFAULT output class. *oc* has a possible value of A through Z and 0 through 9.

**SUBSYS**

The name of the JES subsystem that all APPC/MVS transaction initiators are assigned. *subsys* is a 1- to 4-character string.

If the command includes the LIST parameter, lines six through eight (which describe an APPC/MVS transaction scheduler class) appear. They are repeated for each APPC/MVS transaction scheduler class, or for each APPC/MVS transaction scheduler class selected by the optional keyword parameters. The information given for each APPC/MVS scheduler class is:

**CLASS=class**

The name of the APPC/MVS transaction scheduler class. *class* is a string eight characters long or less.

**STATUS=status**

Status of the CLASS. Possible values of *status* are:

- **ACTIVE**
  The APPC/MVS transaction scheduler class is active.

- **TERMINATING**
  The APPC/MVS transaction scheduler class is ending.

**ACTIVE TRANS=aaaaa**

The number of active transaction programs in this class. The following TPs are considered active and are included in the count:

- Multi-trans TPs that are waiting for more work
- TPs that are “in transition” (the system is still preparing the transaction initiator and has not yet invoked the TP); JOBNAME=*NONE* is displayed in the message text for TPs that are in transition.
Each of these active transaction programs is running in an active transaction initiator. $aaaaa$ is a decimal number with a maximum value of 99999.

MIN=$minim$
The minimum number of initiators as defined in parmlib. $minim$ is a decimal number with a maximum value of 99999.

RESPGOAL=$rrrrrrrr$
The RESPGOAL specified in parmlib for transactions running in this APPC/MVS transaction scheduler class.

$rrrrrrrr$ has one of these formats:

- $r.rrrr$
  When time is less than 10 seconds.
- $rrr.rrr$
  When time is at least 10 seconds and less than 10000 seconds.
- $rrrrrrrr$
  When time is at least 10000 seconds and less than or equal to 31536000 seconds (1 year).

QUEUED TRANS=$qqqqq$
The number of queued transactions attach requests for this APPC/MVS transaction scheduler class. $qqqqq$ is a decimal number with a maximum value of 99999.

MAX=$maxim$
The maximum number of initiators defined in parmlib. $maxim$ is a decimal number with a maximum value of 99999.

DEFAULT=(YES|NO)
YES if the APPC/MVS transaction scheduler class is the default class. NO if the APPC/MVS transaction scheduler class is not the default class. The default class is the class designated to be used by any transaction program that does not contain a class name in the transaction program profile.

IDLE INITS=$iiiii$
The number of transaction initiators that are currently assigned to this class but are not running transaction programs.

If the DISPLAY command includes the ALL parameter, each APPC/MVS scheduler class description may be followed by several occurrences of lines nine through 12. Lines nine through 12 describe each active transaction program and each queued transaction program attach request for the preceding class. Lines 9 through 12 might only be displayed for transaction programs and transaction program attach requests that meet criteria specified on optional parameters. The variables in lines nine through 12 are:

- LTPN=$tpname|X'hh'ccc$
The local TP name or the SNA service TP name:
  - $tpname$ The local TP name. $tpname$ is a string 1 to 64 characters long.
  - $X'hh'ccc$ The SNA service TP name:
    - $hh$ The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.
    - $ccc$ A character string, with a maximum length of 3.

- STATUS=$status$
Status of the transaction program or the transaction program attach request. Possible values for $status$ are:

  - QUEUED
    The transaction program attach request is queued.
  - ACTIVE
    The transaction program is active.
  - ACTIVE(W)
    The transaction program is a multi-trans transaction program that is waiting for more work.

- WUID=$workid$
Work unit identifier. For APPC/MVS transactions running in transaction initiators, this has the format $xxxxxxx$, where $xxxxxxx$ is a numeric character string.
**ASID=asid**
The address space identifier (ASID) of the transaction initiator. When displaying a queued transaction, this will be the ASID of the APPC/MVS of the APPC/MVS transaction scheduler. *asid* is a hexadecimal value with a maximum length of four characters.

**TPST=tp_sched_type**
The transaction program schedule type for this transaction program. *tp_sched_type* has possible values of STANDARD or MULTITRANS.

**USERID=userid**
The userid of the transaction program or transaction program attach request. This may have one of the following values:
- ***NONE***
  if the conversation is a SECURITY=NONE conversation.
- The generic *userid* defined in the TP profile
  if the transaction program is a multi-trans transaction program which is waiting for more work (STATUS=ACTIVE(W)), or is running under the generic shell environment (during initialization or ending of the multi-trans TP).
- The userid of the user who issued the transaction request

**QT=nnnnnnnn**
The queue time for a queued transaction program attach request. *nnnnnnnn* has one of these formats, where *tti* is milliseconds, *sss* or *ss* is seconds, *mm* is minutes, and *hh* or *hhhh* is hours:
- **sss.ttt**
  when time is less than 1000 seconds.
- **hh.mm.ss**
  when time is at least 1000 seconds, but less than 100 hours.
- **hhhh.mm**
  when time is at least 100 hours.
- ***********
  when time exceeds 99999 hours.
- **NOTA VAIL**
  when TOD clock is not working.
- ***NONE***
  for an active transaction or transaction program.

**JOBNAME=jobname**
The job name of an active transaction program. *jobname* is a string with a maximum length of eight characters.
For a queued transaction program attach request, this value is *NONE*. For an active TP that is “in transition” (the system is still preparing the transaction initiator and has not yet invoked the TP), this value is *NONE*.

**System action:** The system continues processing.

Chapter 2. ATB messages

Note

This section does not contain explanations for the following types of messages:

- **ASB7xxxI** messages - Error log information messages that the APPC transaction scheduler or an alternate scheduler returns to an APPC transaction program (TP).
- **ATB6xxxxI** messages - Error messages that the application program interface (API) trace facility returns to the issuer of an ATBTRACE request, or writes to the trace data set.
- **ATB7xxxxI** messages - Error log information messages that the Error_Extract service returns to an APPC TP.
- **ATB8xxxxI** messages - Error messages that the Error_Extract service returns to an APPC TP.

See [z/OS MVS Programming: Writing Transaction Programs for APPC/MVS](https://www.ibm.com) for descriptions of those types of messages.

---

**ATB001I**  
**APP C IS INITIALIZING.**

**Explanation:** Advanced Program-to-Program Communication (APPC) has begun its initialization process.

**System action:** The system continues processing.

**Module:** ATBINSM

**Source:** APPC/MVS

**Routing Code:** 2

**Descriptor Code:** 5

---

**ATB002I**  
**APP C HAS TERMINATED.**

**Explanation:** Advanced Program-to-Program Communication (APPC) has ended.

**System action:** APPC services are unavailable. The system issued message ATB006I, ATB012I, or ATB010I prior to this one indicating why APPC was ending. The system may issue an SVC dump.

**Operator response:** Enter the START APPC command to start the APPC address space again. See [z/OS MVS System Commands](https://www.ibm.com) for more information.

**System programmer response:** If the system previously issued message ATB0006I or ATB012I indicating that APPC ended because of an unrecoverable error, see the system programmer response for the preceding message.

**ATB003I**  
**START APPC SYNTAX IS INCORRECT. COMMAND IGNORED.**

**Explanation:** The value assigned to the APPC keyword on the START APPC command did not have the correct syntax.

**System action:** The system rejects the START command.
ATB004I • ATB005I

Operator response: Correct the syntax and enter the START command again. See z/OS MVS System Commands for more information.

Module: ATBINIT
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 5

ATB004I APPC ALREADY STARTED. SUBSEQUENT REQUEST WAS IGNORED.

Explanation: An attempt was made to start Advanced Program-to-Program Communication (APPC) while an APPC address space was already active.

System action: The system rejects the subsequent START command. The APPC address space already active continues processing.

Operator response: If you do not want the existing APPC address space, cancel it with the CANCEL command. See z/OS MVS System Commands for more information.

Once APPC has ended (indicated by message ATB002I), a new APPC address space can be started using the START APPC command.

Module: ATBINIT
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 5

ATB005I APPC IS RESTARTING. FAILURE CODE = reason-code

Explanation: Advanced Program-to-Program Communication (APPC) abnormally ended while initializing or while processing APPC work. The failure required the APPC address space to end, but APPC will attempt to restart itself.

An SVC dump was produced at the time of the abend, and records are available if a trace was active for APPC.

In the message text, reason-code is one of the following:

Reason Code (hex)
Explanation

0004-000C
Internal error.

System action: APPC services are temporarily unavailable. The system issues message ATB007I when APPC becomes active again. The system rejects any work that has not completed and notifies the requestor (for example, the system rejects SET commands that were not processed before the abend, and notifies the issuing operator). Additionally, if the operator had started a trace on APPC before the abend, the trace will not be active following the restart. Excluding the commands that were rejected and system trace activity, APPC will restart with the same environment as existed before the abend.

Operator response: After APPC becomes active (indicated by message ATB007I), reenter any commands that were rejected, if you still want the system to process them. If component trace was active before APPC abnormally ended, it will no longer be active following restart. See z/OS V2R2 Problem Management for information about restarting component trace.

System programmer response: Identify the problem, using the system dump and the APPC trace records. APPC might have abnormally ended because of the frequency of abends (two abends within one hour). If so, an SVC dump was taken for each abend. This message was issued following the first abend. The abends might be unrelated.

Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the reason code issued by this message.

Source: APPC/MVS
Routing Code: 2
ATB006I • ATB008E

ATB006I • APPC IS TERMINATING. RESTART CRITERIA NOT MET. FAILURE CODE = return-code

Explanation: Advanced Program-to-Program Communication (APPC) abnormally ended while initializing or while processing APPC work. APPC will not attempt to restart itself.

In the message text:

Reason Code (hex)
Explanation

0001-000C
Internal error.

System action: APPC services are unavailable. The system rejects all incoming APPC work. Work already running on the system completes or ends. When APPC has ended, normally or abnormally, the system issues message ATB002I. The system writes an SVC dump.

Operator response: Do not send any new work to APPC. To start a new APPC address space, do the following:

- Wait until the system issues message ATB002I and then enter the START APPC command.
- If the system does not issue message ATB002I, APPC has hung in the process of ending. Try entering the FORCE command.
- If the system still does not issue message ATB002I after you enter the FORCE command, the only way to start APPC is to reIPL the system.

System programmer response: Identify the problem, using the SVC dump and the APPC component trace records. APPC might have abnormally ended because of the frequency of abends (two abends within one hour). If so, an SVC dump was taken for each abend. The system issues message ATB005I following the first abend. The abends might be unrelated.

If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the reason code issued by this message.

ATB007I • APPC IS ACTIVE.

Explanation: Advanced Program-to-Program Communication (APPC) is ready to process work.

System action: The system continues processing.

Module: ATBINSM
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 4

ATB008E • APPC SYSTEM INITIALIZATION FAILED

Explanation: A failure occurred during initialization of Advanced Program-to-Program Communication (APPC) resources. The problem could be due to an APPC/cross-system coupling services (XCF) group error.

System action: System initialization continues without APPC resources established. APPC will not perform correctly if started. The system issues an SVC dump.

Operator response: Do not enter the START APPC command. APPC will not perform correctly if it is started. Notify the system programmer. When the system programmer has fixed the problem, reIPL the system.

System programmer response: XCF is a prerequisite for APPC, so make sure that the APPC/XCF group is correctly established. See "z/OS MVS Setting Up a Sysplex" for information on XCF groups.

If the APPC/XCF group was correct when the system issued this message, this is an internal error. Search problem
reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC
dump.

Routing Code: 2
Descriptor Code: 5

ATB013E • SYNTAX ERROR IN APPC INITIALIZATION INPUT PARAMETERS. START APPC COMMAND Ignored.

Explanation: The system was unable to initialize Advanced Program-to-Program Communication (APPC) because of a syntax error in one of the following places:
• The APPC keyword specified in the START APPC command
• The subparameters specified in the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB

System action: The system continues processing without APPC.

Operator response: Check the syntax of the APPC keyword value specified in the START APPC command. The value should be one of the following:
• A single two-character parmlib suffix
• A list of parmlib suffixes separated by commas and optionally ended by an L. You must enclose the list in parentheses.

See z/OS MVS System Commands for the syntax of the START APPC command.

System programmer response: In the APPC member of SYS1.PROCLIB, check the syntax of the subparameters specified in the PARM parameter of the EXEC statement that invokes the APPC initialization routine.

The syntax must follow these rules:
• The required APPC subparameter must be a symbolic parameter corresponding to the one in the PROC statement. For example, if the parameter in the PROC statement is APPC=00, then the APPC subparameter should be APPC=&APPC.
• The optional BUFSTOR subparameter must be a 1- to 4-digit numeric value. Examples are BUFSTOR=1024 or BUFSTOR=88.
• The optional CONVBUF subparameter must be a 1- to 7-digit numeric value. Examples are CONVBUF=1000 or the maximum value of CONVBUF=2097152.
• If you specify the APPC, BUFSTOR, and CONVBUF subparameters (or any two of those three subparameters), you can specify them in any order, but you must separate each with a comma.
• You cannot specify the APPC, BUFSTOR, or CONVBUF parameter more than once.

For more information about the APPC initialization subparameters, see the section on improving performance through system changes in z/OS MVS Planning: APPC/MVS Management.

---

**ATB014I  THE BUFFER STORAGE LIMIT HAS BEEN SET TO number MEGABYTES**

**Explanation:** The system issues this message whenever Advanced Program-to-Program Communication (APPC) is started to display the storage limit for the transaction program (TP) send/receive buffer. The storage limit is the maximum amount of storage defined for the TP send/receive buffer.

You can define the storage limit for the TP send/receive buffer on the BUFSTOR subparameter of the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB. If you specify BUFSTOR=0, the system uses 2048 megabytes for the storage limit for the TP send/receive buffers. 2048 megabytes is the maximum storage available in an address space. If you don't specify a value on BUFSTOR, the system uses the default, which is approximately one third of the auxiliary storage that was free when APPC was started.

For recommendations about how to define the storage limit for the TP send/receive buffers, see [z/OS MVS Planning: APPC/MVS Management](#).

In the message text:

number The number of megabytes defined for the maximum amount of storage allowed for TP send/receive buffers (in decimal).

**System action:** The system continues processing.

**Module:** ATBVSIT  
**Source:** APPC/MVS  
**Routing Code:** Hardcopy only  
**Descriptor Code:** 4

---

**ATB015I  APPC IS STARTING AFTER A FAILED RESTART. SPECIFIED PARMLIB MEMBER(S) ARE IGNORED.**

**Explanation:** Advanced Program-to-Program Communication (APPC) is starting after an attempt to internally restart failed. Message ATB005I was issued prior to the issuance of this message to record that internal restart processing was being initiated. APPC will restart with the same environment that existed prior to the internal restart attempt. Any specified APPC parmlib members will be ignored. If the installation desires to change the APPC configuration to something other than what existed prior to the failed internal restart, APPC must be canceled and started again.

**System action:** APPC initialization processing continues to restore the logical unit configuration that existed prior to the failed internal restart. The system issues message ATB007I when APPC becomes active again.

**System programmer response:** Identify the problem that prevented APPC from internally restarting successfully. The reason for the failure may have been recorded by a symptom record written to the logrec data set or a message issued to the system log data set. Keep the symptom record or system log information for future reference as it may be needed for problem determination.

**Module:** ATBINIT  
**Source:** APPC/MVS  
**Routing Code:** 2  
**Descriptor Code:** 4

---

**ATB016I  THE AMOUNT OF BUFFER STORAGE AVAILABLE TO ONE CONVERSATION IS number KILOBYTES.**

**Explanation:** Advanced Program-to-Program Communication (APPC) is started with the indicated amount of buffer space available to any one conversation. This message is issued to hardcopy only.

You can define the buffer space amount for a conversation on the CONVBUFF subparameter of the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB. The CONVBUFF value is a 1- to 7-digit number.
indicating, in kilobytes, the amount of buffer storage available to one conversation.

- If you specify a value between 1 and 39 on the CONVBUFF parameter, the system uses a value of 40 (because 40 kilobytes is the minimum buffer storage requirement per conversation).
- If you specify a value that is not a multiple of four kilobytes (decimal), the system rounds the value of CONVBUFF up to the next highest multiple of four. For example, if you specify CONVBUFF=1023, the system makes 1024 kilobytes of buffer storage available to one conversation.
- If you specify a value that is greater than the total amount of buffer storage (which is specified on the BUFSTOR subparameter of the START APPC command), the system issues message ATB017I to the console, and allows a single conversation to have access to all of the APPC buffers.

The maximum possible value is CONVBUFF=2097152. If you do not specify a value for CONVBUFF, or if you specify a value of zero, the system uses a default of 1000 kilobytes.

In the message text:

**number**  The amount of buffer space, in kilobytes, that is available to any one conversation. The number is displayed in decimal.

**System action:** The system continues processing.

**Module:** ATBVSIT

**Source:** APPC/MVS

**Routing Code:** 2

**Descriptor Code:** 4

---

**ATB017I** CONVBUFF PARAMETER VALUE EXCEEDS BUFFER STORAGE LIMIT. DEFAULTING TO BUFFER STORAGE LIMIT.

**Explanation:** Advanced Program-to-Program Communication (APPC) was started. The value specified on the CONVBUFF parameter on the START APPC command is greater than the total amount of buffer storage available to APPC (which is either specified on the BUFSTOR parameter, or calculated by APPC). The amount of storage that each conversation is allowed is set to the total amount of buffer storage, which disables conversation level pacing.

**System action:** The system continues processing.

**Operator response:** No action is necessary if you do not want to enable conversation level pacing, which controls the amount of buffer space that any one conversation can obtain, so one conversation cannot obtain so much storage that it creates a shortage for other conversations. If you do want to enable conversation level pacing, see the section on “Improving Performance through System Changes” in "z/OS MVS Planning: APPC/MVS Management" for information about how to specify a value on the CONVBUFF parameter in the APPC member of SYS1.PROCLIB.

**Module:** ATBVSIT

**ATB018E** CRITICAL APPC/MVS ERROR. APPC SHOULD BE CANCELLED AND RESTARTED TO RESUME NORMAL INCOMING APPC WORK.

**Explanation:** APPC/MVS has encountered a number of critical errors. As a result, processing of new inbound FMH-5 attach requests is severely hampered or completely disabled.

**System action:** APPC/MVS processing of new inbound FMH-5 attach requests is severely hampered or totally disabled. This message will likely be accompanied by ATB500E messages and APPC SVC dumps.

**Operator response:** Contact the system programmer. At the request of the system programmer, cancel and restart the APPC address space.

**System programmer response:** Evaluate the current APPC/MVS workload running. If critical transaction programs are currently running, wait until they complete. Then, cancel the APPC address space and restart APPC again. Since this problem has resulted from a severe APPC/MVS internal error, search the problem reporting data bases for a fix.
for the problem. If no fix exists, contact the IBM Support Center with the dump that was taken when the error occurred.

Module: ATBFMFP  
Source: APPC/MVS  
Routing Code: 2  
Descriptor Code: 7,11

ATB019I  
THE APPC ACTIVE CONVERSATION THRESHOLD FOR ONE ADDRESS SPACE IS *number*

Explanation: Advanced Program-to-Program Communication (APPC) is started with the APPC active conversation threshold indicated for one address space. This message is issued to hardcopy only.

For each APPC active conversation on the system, APPC reserves a certain amount of system storage. A runaway transaction program, which creates many conversations but never deallocates them, could potentially exhaust the fixed amount of system storage that APPC has obtained. To inform the installation of such a program and optionally to prevent any conversation from being started in the affected address space, APPC allows the installation to specify a threshold that will cause notification of such a problem.

You can define the APPC active conversation threshold on the CONVMAX subparameter of the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB. The CONVMAX value is a 1- to 5-digit number indicating the maximum APPC active conversations a single address space can have before APPC intervenes and takes actions. See the CMACTION parameter description to determine what actions APPC takes when this limit has been reached.

The minimum possible value is CONVMAX=100. If you specify a value between 1 and 99 on the CONVMAX parameter, the system sets the maximum APPC conversions threshold to 100.

The maximum possible value is CONVMAX=20000. If you do not specify a value for CONVMAX, the system uses a default of 2000.

If you specify a value greater than 20000, the system sets the maximum APPC active conversations threshold to 20000.

If you specify a value of 0 (zero) then the system will not monitor the total number of conversations for an address space, regardless of the quantity.

In the message text:

*number*  The total number of conversations for one address space.

System action: The system continues processing.

Module: ATBVST  
Source: APPC/MVS  
Routing Code: 2  
Descriptor Code: 4

ATB020E  
THE NUMBER OF APPC ACTIVE CONVERSATIONS FOR ASID *num1* HAS CROSSED THE PRE-ESTABLISHED THRESHOLD. NUMBER OF ACTIVE CONVERSATIONS: *num2* APPC ACTIVE CONVERSATION THRESHOLD: *num3*.

Explanation: The APPC active conversations threshold specified by the CONVMAX parameter has been exceeded. This message is displayed either when CMACTION is set to MSGONLY on the APPC PROC statement, or when the CMACTION keyword is omitted from the APPC PROC statement.

For each APPC active conversation on the system, APPC reserves a certain amount of system storage. A runaway transaction program, which creates many conversations but never deallocates them, could potentially exhaust the fixed amount of system storage that APPC has obtained. To inform the installation of such a program, APPC allows the installation to specify a threshold which will cause notification of such a problem.

You can define the APPC active conversation threshold on the CONVMAX subparameter of the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB. The CONVMAX value is a 1- to 5-digit number indicating the maximum APPC active conversations a single address space can have before a critical action console
message is issued for operator intervention, if CMACTION is set to be MSGONLY or the CMACTION is omitted from the APPC PROC statement.

The minimum possible value is CONVMAX=100. If you specify a value between 1 and 99 on the CONVMAX parameter, the system sets the maximum APPC conversions threshold to 100.

The maximum possible value is CONVMAX=20000. If you do not specify a value for CONVMAX, the system uses a default of 2000.

If you specify a value greater than 20000, the system sets the maximum APPC active conversations threshold to 20000.

If you specify a value of 0 (zero) then the system will not monitor the total number of conversations for an address space, regardless of the quantity.

In the message text:

\textit{num1} Address space identifier.

\textit{num2} Number of active conversations.

\textit{num3} APPC active conversations threshold.

\textbf{System action:} The system continues processing.

\textbf{Operator response:} Contact the system programmer to determine further action.

\textbf{System programmer response:} Investigate whether the critical action console message is due to a programming error in an APPC transaction program or due to some APPC stress workload for this address space. (A transaction program which allocates conversations but fails to deallocate the same results in many dangling conversations, which could exhaust APPC storage.) If it is a programming error then cancel the problematic transaction program, fix it, and re-run it. If it is not a problem with the transaction program and also if it is normal for the number of conversations to exceed the conversation threshold limit for that transaction program, then consider changing the CONVMAX parameter to a reasonably higher value such that this message will not appear on a regular basis and re-run the transaction program.

ATB022I • ATB023I

ATB022I  APPC COULD NOT INITIALIZE DUE TO XCF NOTIFICATION FAILURE. APPC HAS RECEIVED
RETURN CODE=xxxxxxxx, REASON CODE=yyyyyyyy FROM THE servname SERVICE.

Explanation:  APPC/MVS was attempting to send the members of the APPC/MVS group notification that APPC has
been activated. This notification attempt has failed due to a failure of an XCF macro. The return and reason codes
from the specified XCF macro are supplied in the message.

In the message text:

xxxxxxx
   is the return code and

yyyyyyyy
   is the reason code from the specified XCF macro.

servname
   is the failing XCF service.

System action:  APPC/MVS terminates but may attempt to restart. APPC issues ATB007I or ATB002I
   to indicate whether the restart was successful.

Operator response: If APPC does not successfully restart, notify the system programmer. At the request of
   the system programmer, restart the APPC address space.

System programmer response:  If APPC does not successfully restart, determine the reason for the XCF failure. The
   service return and reason codes explain the error.

Module:  ATBINSM
Source:  APPC/MVS
Routing Code:  2
Descriptor Code:  1

ATB023I  FAILED TO JOIN the APPC/XCF GROUP. IXCJOIN RETURN CODE = xxxxxxxx, REASON CODE =
yyyyyyyy.

Explanation:  The APPC address space failed to join the Advanced Program-to-Program Communication
(APPC)/cross-system coupling facility (XCF) group during initialization processing due to an environment error.

In the message text:

xxxxxxx
   The return code from IXCJOIN (in hexadecimal).

yyyyyyyy
   The reason code from IXCJOIN (in hexadecimal).

System action:  The system continues processing without APPC.

Operator response: Notify the system programmer. At the request of the system programmer, restart the APPC
   address space.

System programmer response:  The IXCJOIN return and reason codes explain the error. If, for example, the message
   shows a return code of 4 and a reason code of C, the maximum number of groups already exists.

For the other IXCJOIN return and reason codes, see z/OS MVS Programming: Sysplex Services Reference. When
you have corrected the problem, notify the operator to restart the APPC address space.

**Explanation:** On a START APPC or SET APPC command, the operator specified an incorrect suffix for one or more parmlib members.

**System action:** The system stops processing the APPC parmlib member(s). The system continues processing.

**Operator response:** Enter the START APPC or the SET APPC command again with a valid APPC parmlib member suffix. Correct suffix values are alphanumeric characters or national characters.

**Module:** ATBPLPX

**Source:** APPC/MVS

**Routing Code:** 2

**Descriptor Code:** 5

<table>
<thead>
<tr>
<th>ATB026I</th>
<th>APPCPMxx IGNORED. MEMBER IS EMPTY.</th>
</tr>
</thead>
</table>

**Explanation:** The parmlib member specified on the START APPC or SET APPC command is empty.

In the message text:

APPCPMxx
   The parmlib member, with suffix xx.

**System action:** The system stops processing the parmlib member. The system continues processing the next parmlib member specified on the command, if one exists.

**Operator response:** Notify the system programmer. After the system programmer corrects the problem, enter the SET APPC command to process the parmlib member.

**System programmer response:** Correct the APPCPMxx parmlib member.
**Explanation:**

In the APPCPMxx parmlib member, the system found one of the following:

- A starting comment delimiter (/*) with no matching ending comment delimiter (*/)
- An ending comment delimiter with no starting comment delimiter

In the message text:

**APPCPMxx**

The parmlib member, with the suffix xx.

`num1` The line number in APPCPMxx where the unbalanced comment began.

`num2` The line number in APPCPMxx where the unbalanced comment ended.

**System action:** The system does not process the statement containing the unbalanced comment. The system processes the next statement in the parmlib member, if one exists.

**Operator response:** Notify the system programmer.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

**System programmer response:** Check lines `num1` through `num2` in the APPCPMxx parmlib member for syntax errors. Then do one of the following:

- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

---

**Explanation:** The system found an incorrect statement in an APPCPMxx parmlib member.

In the message text:

**APPCPMxx**

The parmlib member, with the suffix xx.

`num` The line number in APPCPMxx where the incorrect statement began.

`statement` The incorrect statement.

**System action:** The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

**Operator response:** Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

**System programmer response:** Check line number `num` in the APPCPMxx parmlib member for syntax errors. Then do one of the following:
- Correct the syntax error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

**SET APPC COMMAND IGNORED. APPC NOT ACTIVE.**

**Explanation:** The operator entered a SET APPC command, but Advanced Program-to-Program Communication (APPC) is not active. You cannot enter the SET APPC command when one of the following is true:

- APPC is not started.
- APPC is initializing.
- APPC is ending.

**System action:** The system rejects the SET APPC command.

**Operator response:** Enter a DISPLAY APPC command to check APPC system status and to determine when you can enter the SET APPC command.

---

**ATB040I**  
**SYSTEM ERROR ENCOUNTERED IN APPC PARMLIB PROCESSING.**

**Explanation:** The system found unexpected system error(s) while processing the Advanced Program-to-Program Communication (APPC) parmlib member(s). START APPC or SET APPC command processing may be incomplete.

This problem might be due to either a temporary system storage shortage, or loss of some APPC parmlib statements.

**System action:** Command processing may be incomplete. The system writes an SVC dump and continues processing.

**Operator response:** Notify the system programmer.

**System programmer response:** Enter the DISPLAY APPC command to verify the APPC system configuration. Determine whether you should enter a SET APPC command to update current configuration.

If the problem recurs, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

**ATB041I**  
**APPCPMxx: LINE num statement STATEMENT IGNORED. keyword1 AND keyword2 ARE MUTUALLY EXCLUSIVE.**

**Explanation:** In the specified parmlib member, a statement was found to contain keywords or keyword values that are mutually exclusive.

In the message text:

- **APPCPMxx**  
  The parmlib member, with suffix **xx**.
- **num**  
  The line number in APPCPMxx where the incorrect statement began.
- **statement**  
  The name of the statement containing the error. The **statement** is as follows:
The keywords or values that are mutually exclusive. They can be one of the following pairs:

- SCHED and NOSCHED
- NOSCHED and TPLEVEL(GROUP)
- NOSCHED and TPLEVEL(USER)
- NQN and NONQN
- PERSIST and NOPERSIST

**System action:** The system does not process the incorrect statement. The system processes the next statement in the parmlib member, if one exists.

**Operator response:** Ask the system programmer to find the syntax error in the APPCPMxx parmlib member.

At the request of the system programmer, enter the SET APPC command to process either the corrected parmlib member or a new one.

**System programmer response:** Check line number `num` in the APPCPMxx parmlib member for the mutually exclusive keywords or keyword values. Then do one of the following:

- Correct the error in the existing parmlib member and have the operator enter the SET APPC command to process it.
- Create a new parmlib member with only the corrected statement(s) needed to modify the APPC system configuration. Then ask the operator to enter a SET APPC command to process the new parmlib member.

**ATB044I**  
THE APPC LOGGING OPTION IS keyword

Explanation: Advanced Program-to-Program Communication (APPC) is started with the APPC logging option indicated. This message is issued to hardcopy only.

APPC uses a System Logger log stream whenever a synchronization level of SYNCPT is selected by a transaction program, and when an LU has been made syncpt-capable. This log stream is used to store persistent data needed in support of the two-phase commit protocol.

An installation can choose to have the log stream name contain the RRS GNAME (RRS logging group) as one of the log stream name qualifiers. This allows installations to have more than one APPC log stream in the same sysplex. To select this option, the installation would define a value of RRSGNAME on the LOGGING subparameter of the PARM parameter of the EXEC statement in the APPC member of SYS1.PROCLIB. See z/OS MVS Programming: Resource Recovery for more information concerning the RRS GNAME parameter.

If an installation chooses to have just one APPC log stream in the sysplex, it can specify a value of LEGACY on the LOGGING subparameter or it can omit the LOGGING subparameter entirely.

In the message text:

keyword  
The LOGGING option preferred. The valid keyword values are: RRSGNAME or LEGACY.

System action: The system continues processing.

Operator response: None.

System programmer response: None.
ATB047I  THE APPC ACTIVE CONVERSATION THRESHOLD ACTION IS \textit{value}.

Explanation: Advanced Program-to-Program Communication (APPC) is started with the APPC active conversation threshold action indicated. This message is issued to hardcopy only.

For each APPC active conversation on the system, APPC reserves a certain amount of system storage. A runaway transaction program, which creates many conversations but never deallocates them, could potentially exhaust the fixed amount of system storage that APPC has obtained. To inform the installation of such a program, and to optionally halt all new conversations in a particular address space when that address space has reached or exceeded that limit, APPC allows the installation to specify the action required when a single address space exceeds this maximum value.

You can define the APPC active conversation threshold action using the CMACTION subparameter of the PARM parameter on the EXEC statement in the APPC member of SYS1.PROCLIB. The CMACTION value can either be MSGONLY (default) or HALTNEW:

- If MSGONLY is selected, when the CONVMAX limit has been exceeded, APPC issues a critical action console message to inform the installation of the potential problem in the affected address space.
- If HALTNEW is selected, when the CONVMAX limit has been reached, APPC prevents any new conversations from being started in the address space, and issues a different critical action message to the console to inform the installation that the CONVMAX limit has been reached.

In the message text:
\textit{value}  MSGONLY or HALTNEW

System action: The system continues processing.

Operator response: None.

System programmer response: None.

Module: ATBVSIT
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 4

ATB048E  THE MAXIMUM NUMBER OF APPC ACTIVE CONVERSATIONS FOR ASID \textit{num1} HAS BEEN REACHED. APPC ACTIVE CONVERSATION THRESHOLD: \textit{num2}.

Explanation: The APPC active conversations threshold specified by the CONVMAX parameter has been reached. No new conversations will be allowed to start in this address space until conversations have been deallocated or cleaned up.

For each APPC active conversation on the system, APPC reserves a certain amount of system storage. A runaway transaction program, which creates many conversations but never deallocates them, could potentially exhaust the fixed amount of this system storage that APPC has obtained. To inform the installation of such a program and to optionally prevent new conversations from being started up until the problem is solved, APPC allows the installation to specify a threshold that will cause APPC to take actions when this problem in encountered.

You can define the APPC active conversation threshold limit on the CONVMAX subparameter of the PARM parameter on the EXEC statement in the APPC member of SYS1.PROCLIB. The CONVMAX value is a 1- to 5-digit number indicating the maximum number of APPC active conversations a single address space can have before APPC prevents new conversations from starting in the address space, if CMACTION has been set to HALTNEW.

In the message text:
The address space identifier.

num2

The APPC active conversation threshold.

**System action:** The system prohibits new conversations from starting in the address space identified in the message.

**Operator response:** Contact the system programmer.

**System programmer response:** Investigate whether the critical action console message is caused by a programming error in an APPC transaction program or by some APPC stress workload for this address space. A transaction program that allocates conversations but fails to deallocate them results in many dangling conversations, which could exhaust APPC storage.

- If it is a programming error, cancel the problem transaction program, fix it and rerun it.
- If it is not programming error, and the required number of conversations exceeds the conversation threshold limit for that transaction program, you can change the CONVMAX parameter to a reasonably higher value, and then rerun the transaction program.

When conversations have been deallocated from the address space, this condition goes away and the message is ended.

**ATB050I • ATB051I**

**ATB050I**

LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* HAS BEEN ADDED TO THE APPC CONFIGURATION.

**Explanation:** The specified logical unit (LU) was added to the Advanced Program-to-Program Communication (APPC) configuration and is ready for communication.

In the message text:

- *luname* The LU that has been added.
- *schedname* The scheduler that will use this LU.

**System action:** The system continues processing.

**Module:** ATBLUPR

**Source:** APPC/MVS

**Routing Code:** Hardcopy only

**Descriptor Code:** 4

---

**ATB051I**

LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* HAS BEEN DELETED FROM THE APPC CONFIGURATION.

**Explanation:** A logical unit (LU) has been deleted from the Advanced Program-to-Program Communication (APPC) configuration in response to a SET APPC=xx command.

In the message text:

- *luname* The LU that has been deleted.
- *schedname* The scheduler that was using this LU.

**System action:** The system continues processing.

**Module:** ATBLUEX

**Source:** APPC/MVS
**ATB052E**  LOGICAL UNIT *luname* FOR TRANSACTION SCHEDULER *schedname* NOT ACTIVATED IN THE APPC CONFIGURATION. REASON CODE = *error-field-value*.

**Explanation:** A START APPC,SUB=MSTR,APPC=xx command or a SET APPC=xx command was issued to specify an APPCPMxx parmlib member that activates a logical unit (LU) in the Advanced Program-to-Program Communication (APPC) configuration. However, the system could not open the Virtual Telecommunications Access Method (VTAM) access method control block (ACB) for the specified LU. This LU is in pending state. Some of the return codes returned from OPEN can be a temporary condition which gets resolved. For example, this message may be encountered when APPC/MVS is activated, but VTAM is not active or completely initialized. To determine if the problem has been resolved, check the status of the LU by issuing the DISPLAY APPC,LU,ALL command. If the LU is now active then the condition has been resolved and no further actions are required.

In the message text:

*luame*  The pending LU.

*schedname*  The transaction scheduler that will use this LU.

*error-field-value*  The value of the VTAM OPEN macro ERROR field (in hexadecimal).

**System action:** The system continues processing.

**Operator response:** Ask the system programmer to correct the problem. If the pending LU is not needed, enter the SET APPC command to delete it.

**System programmer response:** *error-field-value* is the value of the ERROR field returned by the VTAM OPEN macro. For more information, see ERROR field meanings for the OPEN macro in z/OS Communications Server: SNA Programming. When you correct the problem, the system will activate the LU.

**Module:** ATBLUPR

Descriptor Code: 4

ATB056I LOGICAL UNIT luname FOR TRANSACTION SCHEDULER schedname NOT ADDED DUE TO A SYSTEM ERROR. REASON CODE = reason-code.

Explanation: An operator entered a SET APPC=xx command to change the applicable APPCPMxx parmlib member and to change the logical unit (LU) Advanced Program-to-Program Communication (APPC) configuration. The system could not add the LU to the configuration because of a system error.

In the message text:

luname The LU that could not be added to the APPC configuration.
schedname The scheduler that will use this LU.
reason-code The failure reason code.

System action: The system continues processing.
Operator response: Try entering the SET command again to add the LU to the APPC configuration. If you still cannot add the LU, notify the system programmer.

System programmer response: If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the reason code issued by this message.

**ATB057I** LOGICAL UNIT *luname* NOT DELETED DUE TO A SYSTEM ERROR. REASON CODE = *reason-code*.

Explanation: The operator entered a SET APPC=xx command to specify an APPCPMxx parmlib member that deletes a logical unit (LU) from the Advanced Program-to-Program Communication (APPC) configuration, but the system could not delete the LU because of a system error.

In the message text:

*luname* The logical unit that could not be deleted.

*reason-code* The failure reason code.

System action: The system continues processing.

Operator response: Enter the SET command to delete the LU again. If you still cannot add the LU, notify the system programmer.

System programmer response: If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the reason code issued by this message.

**ATB058I** SESSION VALUES NOT DEFINED FOR LOGICAL UNIT *luname*.

Explanation: The operator entered a SET command to define session values, but the logical unit (LU) for which the session values are being defined is not in the Advanced Program-to-Program Communication (APPC) configuration. The LMADD and LMDEL statements in the APPCPMxx member are no longer valid. Session-limit values can be changed by entering the VTAM MODIFY CNOS and MODIFY DEFINE operator commands, or by modifying the VTAM APPL definition statement and then restarting APPC/MVS. The VTAM MODIFY CNOS and MODIFY DEFINE operator commands are available in VTAM Version 3 Release 4 for MVS/ESA.

In the message text:

*luname* The undefined LU.

System action: The system continues processing.

Operator response: Enter the DISPLAY APPC command to display the active LUs. Then enter the SET command to define session values for a defined LU.

System programmer response: Check the LMADD statement in the APPCPMxx parmlib member to make sure that the ACBNAME specified is already in the APPC configuration.

Module: ATBLUAMA

<tr>
<td>09</td>
<td>The user tried to dynamically change from NONQN to NQN.</td>
</tr>
</tbody>
</table>

System action: The system continues processing.

Operator response: Report this problem to the system programmer.

System programmer response: To modify the LU, use the SET APPC command to first delete the LU and then add it again with the new attribute.

Source: APPC/MVS

Routing Code: 2

Descriptor Code: 4

LOGICAL UNIT **lname** FOR TRANSACTION SCHEDULER **schedname** HAS BEEN TERMINATED DUE TO ALTERNATE APPLICATION TAKEOVER.

Explanation: An application outside of Advanced Program-to-Program Communication (APPC) tried to open an access method control block (ACB) that was originally opened by APPC. This causes the system to close the logical unit (LU) associated with the ACB.

The fields in the message text are:

**lname** The name of the logical unit that the system closed.

**schedname** The name of the transaction scheduler that was using this logical unit.

System action: The system continues processing.

Operator response: Notify the system programmer. Enter the SET APPC command to re-activate this logical unit if necessary.

System programmer response: This problem may be due to a security violation. Only authorized programs defined to RACF can open an ACB that was originally opened by APPC.

Module: ATBLUPR

**Descriptor Code:** 4

---

**ATB064I** LOGICAL UNIT luname FOR TRANSACTION SCHEDULER NOT ACTIVE. REASON CODE=reason-code.

**Explanation:** A logical unit is not functioning properly. The reason code indicates the type of error.

In the message text:

luname The name of the logical unit that is not active.

reason-code The reason code explaining the error is the following:

- **01** The level of VTAM in the system does not support cross-memory applications program interface (API) functions.
- **02** The APPL name does not match the ACB name for the logical unit.
- **03** The VTAM APPL definition statement must specify both SYNCLVL=SYNCPT and ATNLOSS=ALL, to enable the LU for protected conversations support.

**System action:** The LU is placed in pending state. APPC/MVS continues processing.

**Operator response:** Notify the system programmer.

**System programmer response:** Depending on the reason code, do one of the following:

- For reason code X'01', make sure that VTAM/ESA 3.3+SPE, or a later release of VTAM, is installed on your system.
- For reason code X'02', you must make sure that the ACB name and the APPL name for the logical unit are the same for APPC to function properly. Specify the same name for the logical unit in the following places:
  - Specify the ACB name on the LUADD parmlib statement
  - Specify the APPL name on the APPL statement in SYS1.VTAMLST.
- For reason code X'03', make sure that the APPL definition statement contains the appropriate value for the SYNCLVL keyword. The SYNCLVL keyword value should be SYNCPT only if you want the LU to be enabled for protected conversations support; in this case, you must specify ATNLOSS=ALL on the APPL statement as well.

**Descriptor Code:** 4

---

**ATB065I** GRNAME PARAMETER FOR LOGICAL UNIT luname IS IGNORED. APPC/MVS GENERIC RESOURCE SUPPORT REQUIRES VTAM V4R4.

**Explanation:** An LUADD statement in an APPCPMxx parmlib member specified the GRNAME keyword, which requests that the logical unit (LU) be registered with VTAM as a generic resource, with the specified generic resource name. APPC/MVS requires VTAM Version 4 Release 4 or higher for generic resource support, but the VTAM level on this system is not VTAM V4R4 or higher.
In the message text:

`luname`  The name of the logical unit that APPC/MVS is activating.

**System action:** The system ignores the GRNAME parameter, and continues to activate the LU without the generic resource name, and without registering the LU with VTAM as a member of the generic resource group.

**Operator response:** Notify the system programmer.

**Programmer response:** If you want to define APPC/MVS LUs as VTAM generic resources:
1. Install VTAM V4R4.
2. Use the SET APPC command to delete the LU.
3. Use the SET APPC command again to add the LU with a generic resource name.

Otherwise, no action is necessary.

**Module:** ATBLUPR  
**Source:** APPC/MVS

**Descriptor Code:** 4

---

**Explanation:** An LUADD statement in an APPCPMxx parmlib member specified the GRNAME keyword, which requests that the logical unit (LU) be registered with VTAM as a generic resource, with the specified generic resource name. When APPC/MVS attempted to register the LU with VTAM, VTAM rejected the request.

In the message text:

`luname`  The name of the logical unit that APPC/MVS was attempting to activate.

`grname`  The generic resource name that APPC/MVS was attempting to associate with the logical unit. This is the value that was specified in the APPCPMxx parmlib member.

`vtam-return-code`  VTAM feedback information (in hexadecimal) that indicates the recovery action return code.

`fdb2`  VTAM feedback information (in hexadecimal) that indicates the specific error return code.

**System action:** APPC/MVS deletes the LU. The system continues processing.

**Operator response:** Notify the system programmer. At the request of the system programmer, enter the SET APPC command to add the logical unit.

**System programmer response:** Refer to the information about fields RTNCD and FDB2 in [z/OS Communications Server: SNA Programmer's LU 6.2 Guide](https://www.ibm.com) to determine the meaning of the `vtam-return-code` and `fdb2` values and the actions necessary to correct the problem.

When the problem has been corrected, ask the operator to enter a SET APPC command to process the parmlib member.

**Module:** ATBLUPR  
**Source:** APPC/MVS  
**Routing Code:** 2  
**Descriptor Code:** 4

---

**Explanation:** An LUADD statement in an APPCPMxx parmlib member specified the GRNAME keyword, which requests that the logical unit (LU) be registered with VTAM as a generic resource, with the specified generic resource name. When APPC/MVS attempted to register the LU with VTAM, VTAM rejected the request.
In the message text:

- `luname` The name of the logical unit that APPC/MVS was attempting to activate.
- `grname` The generic resource name that APPC/MVS was attempting to associate with the logical unit. This is the value that was specified in the APPCPMxx parmlib member.
- `vtam-return-code` VTAM feedback information (in hexadecimal) that indicates the recovery action return code.
- `fdb2` VTAM feedback information (in hexadecimal) that indicates the specific error return code.

**System action:** APPC/MVS deletes the LU. A dump is taken. The system continues processing.

**Operator response:** Notify the system programmer. At the request of the system programmer, enter the SET APPC command to add the logical unit.

**System programmer response:** Refer to the information about fields RTNCD and FDB2 in [z/OS Communications Server: SNA Programmer’s LU 6.2 Guide](https://www.ibm.com/servers/zseries/zos/bkserv/commgtr/sp62/index.html) to determine the meaning of the `vtam-return-code` and `fdb2` values and the actions necessary to correct the problem.

**ATB068I**

NQN PARAMETER FOR LOGICAL UNIT `luname` IS IGNORED. APPC/MVS NETWORK-QUALIFIED NAME SUPPORT REQUIRES VTAM V4R4.

**Explanation:** The NQN keyword on an LUADD statement for the specified logical unit requested that the LU be defined as capable of supporting network-qualified names. APPC/MVS requires VTAM Version 4 Release 4 or higher for network-qualified name support, but the VTAM level on this system is not VTAM V4R4 or higher.

In the message text:

- `luname` The name of the logical unit that APPC/MVS is activating.

**System action:** The system ignores the NQN parameter, and continues to activate the LU without the ability to handle network-qualified names.

**Operator response:** Notify the system programmer.

**Programmer response:** If you want to define APPC/MVS LUs as capable of handling network-qualified names, IBM recommends that you do the following:

1. Install VTAM V4R4.
2. Use the SET APPC command to delete the LU.
3. Use the SET APPC command again to add the LU with NQN capability.

If you do not follow these steps, the LU might be able to handle outbound Allocate requests that use network-qualified names to identify partner LUs, but the results might be unpredictable.

**Automation:** Trap the return and reason code from *servname* and translate it into text. Notify the system programmer.
ATB071I  PERSIST PARAMETER ON LUDEL FOR LOGICAL UNIT luname IS IGNORED. THE LU WAS NOT ENABLED FOR PERSISTENT SESSIONS.

Explanation: The PERSIST keyword on an LUDEL statement for the specified logical unit requested that APPC/MVS should not deactivate any persistent sessions between the LU and its partners. However, the value of the PSTIMER keyword on the LUADD for this LU was NONE at the time of the LUDEL, meaning that the LU was not enabled for persistent sessions.

In the message text:

luname  The name of the logical unit that APPC/MVS is deactivating.

System action: The system ignores the PERSIST parameter and continues to deactivate the LU. When the LU is terminated, no sessions between the LU and its partners will be active.

Operator response: Notify the system programmer.

Programmer response: If you want to keep sessions active after an LUDEL has been performed for an LU, IBM recommends that you do the following:

- Enable the LU to support persistent sessions. For more information on persistent sessions, see z/OS MVS Planning: APPC/MVS Management. For details on the PSTIMER keyword, see z/OS MVS Initialization and Tuning Reference.
- Use the SET APPC command to delete the LU, specifying the PERSIST keyword.

RCVA ISS=hh:mm:ss RCVA RET=hh:mm:ss]]

The operator entered the DISPLAY APPC,SERVER command to display information about allocate queues and their servers.

The first three lines of the message always appear.

In the first three lines of the message text:

hh:mm:ss

The hour, minute, and second at which the system processed the DISPLAY command.
ATB100I

**id** A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on printer consoles or displayed inline on a console. This identifier does not appear when the display appears in a display area on a console.

**nnnnn** The number of allocate queues. This number is equal to the total number of unique Register_for_Allocate calls that are currently in effect.

**sssss** The total number of APPC/MVS servers. These servers are address spaces that are currently registered to serve inbound allocate requests.

**qqqqq** The total number of inbound allocates currently queued on allocate queues.

If the command includes the LIST parameter, lines 4 through 8 appear for each allocate queue that is currently active, or that is selected by optional keyword parameters.

In lines 4 through 8 of the message text:

**STPN=stpname1-\^Xhh\'ccc**

The served TP name. It is 1 to 64 characters long.

*stpname* The served TP name. *stpname* is a string 1 to 64 characters long.

\^Xhh\'ccc

The system network architecture (SNA) service TP name:

*hh* The first character of the SNA service TP name, in hexadecimal. This character is non-displayable in non-hexadecimal form.

*ccc* A character string, with a maximum length of 3.

**LLUN=lluname**

The name of the logical unit (LU) at which the APPC/MVS server resides.

**PLUN=pluname**

The name of the LU from which the allocate request originated. A value of * indicates that allocate requests from any partner LU are accepted.

**USERID=userid**

The userid that flowed in with the allocate request. A value of * indicates that allocate requests from any userid are accepted.

**PROFILE=profile**

The name of the security profile from which inbound allocates are to be accepted. A value of * indicates that allocate requests with any profile are to be accepted.

**REGTIME=mm/dd/yyyy hh:mm:ss**

The time at which the Register_for_Allocates call that created the allocate queue was processed. *mm/dd/yyyy* represents the month, day, and year. *hh:mm:ss* represents the hour, minute, and second, based on the time of day (TOD) clock.

**QUEUED=nnnnn**

The number of inbound allocates currently residing on the queue.

**OLDEST=nnnnnnnn**

The amount of time that the oldest inbound allocate has been on the allocate queue. Depending on the amount of time, *tttttttt* has one of the following formats:

*sssstttt S* The time is less than 1000 seconds.

*hh:mm:ss* The time is at least 1000 seconds, but less than 100 hours.

*hhhhhh:mm* The time is at least 100 hours.

****** The time is greater than 99999 hours.

*NONE* There are no allocate requests on the allocate queue.
In the variable text:

- **ttt** The number of milliseconds.
- **sss or ss** The number of seconds.
- **mm** The number of minutes.
- **hh or hhhh** The number of hours.

**LAST RCVD=tttttttt**

The amount of time since an inbound allocate was last received (and thus removed from the allocate queue) through the Receive_Allocate service. Depending on the amount of time, tttttttt has one of the following formats:

- **sss.ttt** S The time is less than 1000 seconds.
- **hh.mm.ss** The time is at least 1000 seconds, but less than 100 hours.
- **hhhh.mm** The time is at least 100 hours.
- ************ The time is greater than 99999 hours.
- ***NONE* No inbound allocates have been received from the queue.

In the variable text:

- **ttt** The number of milliseconds.
- **sss or ss** The number of seconds.
- **mm** The number of minutes.
- **hh or hhhh** The number of hours.

**TOT ALLOCS=nnnnnnnn**

This is the number of allocate requests waiting to be received from the allocate queue, plus the number of allocate requests that have already been received.

**SERVERS=nnnnn**

The number of servers processing requests on the allocate queue.

**KEEP TIME=nnnn.**

The amount of time, in seconds, that the allocate queue is to remain active after all of its servers unregister (as specified through the Set_Allocate_Queue_Attributes service).

**TIME LEFT=nnnn.**

The amount of time, in seconds, remaining before the allocate queue will be purged. This field is only valid when there are no servers processing the served TP (that is, SERVERS=0). When SERVERS does not equal zero, TIME LEFT contains a value of *N/A*.

If the DISPLAY APPC,SERVER command includes the ALL parameter, the following lines appear in the message text:

- One occurrence of lines 4 through 8 for all active allocate queues, or a subset of active allocate queues that is selected by optional keyword parameters.
- For each queue:
  - One occurrence of lines 9 through 11 for each address space serving the queue.

In lines 9 through 11 of the message text:
**ATB101I**

**ASNAME=asname**

The address space name of the server. This field will contain *UNKNOWN* if the address space name cannot be determined.

**ASID=asid**

The address space identifier (ASID) of the server. This field is set to *UNKNOWN* if the ASID cannot be determined.

**REGTIME=mm/dd/yyyy hh:mm:ss**

The time at which the last Register_For_Allocates service was processed for this server. *mm/dd/yyyy* represents the month, day, and year. *hh:mm:ss* represents the hour, minute, and second, based on the time of day (TOD) clock.

**TOT RCVD=nnnnnnnn**

Total number of allocates that the server has received from the allocate queue during the current IPL.

**RCVA ISS=hh:mm:ss**

The time (hour, minute, and second) at which the server last issued the Receive_Allocate service. This time is based on the time of day (TOD) clock. A value of *NONE* indicates that the server has not yet issued the Receive_Allocate service.

**RCVA RET=hh:mm:ss**

The time (hour, minute, and second) at which the Receive_Allocate service last returned to the caller (after attempting to return an allocate request). This time is based on the time of day (TOD) clock.

The Receive_Allocate call might or might not have returned an allocate request to the caller. A value of *NONE* indicates that no allocate requests have yet been returned.

**System action:** The system continues processing.

**Source:** APPC/MVS

**Routing Code:** 2

**Descriptor Code:** 5

---

**ATB101I hh:mm:ss APPC DISPLAY [id]**

**Explanation:** In the message, the following appears:

- **ACTIVE LU'S**
- **OUTBOUND LU'S**
- **PENDING LU'S**
- **TERMINATING LU'S**

- **aaaa**
- **0ooo00**
- **pppppppp**
- **tttttttt**

- **SIDEINFO=side_dsetname**

- **[LLUN=unitname SCHED=schdname BASE=xxx]**
- **STAT=stat PARTNERS=nnnn TPLEVEL=tplvel**
- **TPDATA=dsetname**
- **[ PLUN=luname]**

The operator entered a DISPLAY APPC,LU command to display information about local and partner LUs.

The first four lines of the message always appear.

In the first four lines of the message text:

- **hh:mm:ss**
  The hour, minute, and second at which the system processed the DISPLAY command. 00.00.00 appears in this field if the time-of-day (TOD) clock is not working.

- **id**
  A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display is presented in a display area on a display console.

- **ACTIVE LU'S nnnn**
  The number of APPC/MVS logical units (LU) with ACTIVE status. An LU is active when it is fully initialized and capable of processing both inbound and outbound requests.
OUTBOUND LU'S

The number of APPC/MVS LUs with OUTBOUND status. An LU is OUTBOUND when the transaction scheduler that owns the LU halts all transaction requests to the LU.

PENDING LU'S

The number of APPC/MVS LUs with PENDING status. An LU is pending when the system is initializing the LU.

TERMINATING LU'S

The number of APPC/MVS LUs with TERMINATING status. A logical unit is ending when a SET command removes it from the system and the system allows active conversations on the LUs sessions to complete.

SIDEINFO=

The name of the currently active side information file. The side information file is a Virtual Storage Access Method (VSAM) key sequenced data set containing the side information. If no side information file was specified in the APPCPMxx parmlib member this value will be "NONE".

Lines 5-7 of the message text:

Lines 5-7 appear in the message text if the DISPLAY APPC,LU command includes the LIST parameter. Lines 5-7 are repeated for each local LU that is defined to APPC/MVS or selected by optional keyword parameters.

LLUN=
luname

The local logical unit name.

SCHED=
schedname

The name of the APPC/MVS transaction scheduler that schedules transactions for this LU. It is specified on the SCHED keyword in the current parmlib configuration. If there is no scheduler associated with the LU (because the NOSCHED option was specified for the LU in the APPCPMxx parmlib member), this value is "NONE".

BASE=

xxx

xxx is one of the following:

YES  The logical unit is a base logical unit.
NO   The logical unit is not the base logical unit.

STATUS=

stat

The status of the logical unit, which is one of the following:

ACTIVE  The logical unit is active.
OUTBOUND  The logical unit is outbound.
PENDING  The logical unit is pending.
TERMINATING  The logical unit is ending.

PARTNERS=

The number of LUs for which session limits are established with LU luname. The maximum value is 99999.

TPLEVEL=

tplvel

The transaction program (TP) level specified in parmlib for this LU, which is one of the following:

SYSTEM  The TP is available to all users defined to LU unitname. This is the default level.
GROUP   The TP is available to a group defined to LU unitname.
USER    The TP is available to an individual user defined to LU unitname.

TPDATA=
dsetname

A 1 to 44 character name for a data set that contains the TP profile for LU luname.
Atb1021

Line 8 of the message text:

Line 8 appears if the DISPLAY APPC,LU command includes the ALL parameter. Line 8 appears once for either:

- Each partner LU for which session limits are established with LU unitname
- The partner LUs specified on the PLUN keyword

PLUN=luname

The partner LU name.

System action: The system continues processing.

Source: APPC/MVS

Routing Code: 2

Descriptor Code: 5

ATB1021  hh.mm.ss  APPC DISPLAY [id]

Explanation: In the message, the following appears:

LOCAL TP'S  INBOUND CONVERSATIONS  OUTBOUND CONVERSATIONS

[TPN=tpname] cccc  oooo

[LTPN=tpname] | X'hh'ccc | [STPN=tpname] | -X'hh'ccc

LLUN=luname  WUID=workid  CONVERSATIONS=mmmm  ASID=asid

SCHED=schdname  ASNAME=adspname  TPID=tpid

[PTPN=tpname] X'hh'ccc

PLUN=luname  USERID=userid  DIRECTION=dir

VERBS=verbs  IT=nnnnnnnn  LCID=lclid

MODE=mode  VTAMCID=cid]

The operator entered the DISPLAY APPC,TP command to display information about local transaction programs (TPs) and their conversations.

The first three lines of the message always appear.

In the first three lines of the message text:

hh.mm.ss

The hour, minute, and second at which the system processed the DISPLAY command. 00.00.00 appears in this field if the time of day (TOD) clock is not working.

id

A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display appears in a display area on a display console.

LOCAL TP'S nnnnn

The number of APPC/MVS TPs that the system is currently processing, or that were selected by optional keyword parameters. This value includes the number of TPs that are being processed by APPC/MVS servers (served TPs) and TPs that have been scheduled by APPC/MVS transaction schedulers. This later group of TPs is called scheduled TPs.

INBOUND CONVERSATIONS nnnnn

The number of inbound conversations that are currently allocated, or that were selected by optional keyword parameters.

OUTBOUND CONVERSATIONS nnnnn

The number of outbound conversations currently allocated, or that are selected by optional keyword parameters.

Note: If the partner TP is another local APPC/MVS TP, the conversation is considered local. Unless one or both ends of a local conversation are suppressed from the display by keyword filter parameters, the system displays all local conversations twice, as follows:

- The TP that did the allocate is shown as the local TP. The allocated TP is shown as the partner.
- The allocated TP is shown as the local TP. The TP that did the allocate is shown as the partner.
If the command includes the LIST parameter, lines 4 through 6 appear for each local TP that is currently active, or a subset of these TPs, depending on whether the operator specified one or more optional filter keyword parameters on the command.

The TPs are grouped by address space, with lines 4 through 6 repeated for each local TP running in an address space. Information about TPs processed by APPC/MVS servers (served TPs) is separate from information about TPs scheduled by an APPC/MVS transaction scheduler.

Lines 4-6 appear first for a local scheduled TP, if one is running in the address space. The LTPN= variable indicates local scheduled TPs. Lines 4 through 6 appear for each served TP running in an address space, if any. The STPN= variable indicates local served TPs.

An address space can contain, at most, one local inbound scheduled TP, together with TP. An address space can, however, contain any number of served local TPs.

In lines 4 through 6 of the message text:

**LTPN=tpname | X'hhed'ccc** or **STPN=tpname | X'hhed'ccc**

In the message text:

`tpname` The local TP name. If the TP is scheduled by a transaction scheduler, LTPN= precedes the name. If the TP is served by an APPC/MVS server, STPN= precedes the name. The TP name is 1 to 64 characters long.

`-X'hhed'ccc` The systems network architecture (SNA) service TP name. In the variable text:

`hh` The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.

`ccc` A character string, with a maximum length of 3.

For outbound conversations, *UNKNOWN* appears in this field.

**LLUN=luname**

The logical unit (LU) name.

**WUID=workid**

The work unit identifier, which the transaction scheduler assigns to a program instance using the Unit_of_Work_ID. The value in this field is *UNKNOWN* if:

- The transaction scheduler does not use the associate service
- The transaction scheduler does not use the Unit_of_Work_ID parameter on the associate service
- The TP is not scheduled by a transaction scheduler

**CONVERSATIONS=nnnnn**

The number of conversations in which the TP is involved. The maximum value is 99999.

**ASID=asid**

The address space identifier (ASID) to which the TP is associated.

**SCHED=schedname**

The name of the transaction scheduler that scheduled the TP. It is the value of a SCHED keyword in the APPCPMxx parmlib member. If the TP is a batch job, started task, or TSO/E user, or if the TP is running under an LU that is not associated with a transaction scheduler (NOSCHED LU), *NONE* appears in this field.

**ASNAME=adsname**

The name of the address space with which the TP is currently associated. If the local TP is running as a batch job, the job name appears in this field. If the local TP is running under TSO/E, the TSO/E userid appears in this field. If the local TP is running in a transaction initiator, a value from the TP profile appears in this field.

**TPID=tpid**

The TP identifier. It is a 16-digit hexadecimal value. The field (including TPID=) does not appear for served TPs.
ATB102I

If the DISPLAY APPC,TP command includes the ALL parameter, the following lines appear in the message text:

- Lines 4 through 6
- One occurrence of lines 7 through 10 for each conversation in which the local transaction program is involved.

In lines 7 through 10 of the message text:

**PTPN=tpname\(\textendash\)hh\(\textendash\)ccc**

In the message text:

- **tpname** The partner TP name. It is 1 to 64 characters long. For inbound conversations, *UNKNOWN* appears in this field.
- **hh** The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.
- **ccc** A character string, with a maximum length of 3.

For inbound conversations, *UNKNOWN* appears in this field.

**PLUN=unitname**

The partner LU name.

**USERID=userid**

The userid that flowed into or out of APPC/MVS on an ALLOCATE request for this conversation. For an inbound conversation, it is the userid of the local system TP. For an outbound conversation, it is the userid of the partner TP. If a userid was not specified, *NONE* appears in this field.

**DIRECTION=dir**

The direction of the conversation, which is one of the following:

- **INBOUND**
  The conversation is inbound. It was allocated by the partner TP.

- **OUTBOUND**
  The conversation is outbound. It was allocated by the local TP.

**VERBS=nnnnnnnn**

The number of APPC callable services issued by the local TP on this conversation. The maximum value is 99999999.

**IT=nnnnnnnn**

The amount of time that the local TP has been waiting for data or a confirmation from the partner TP. Depending on the amount of time, *nnnnnnnn* has one of the following formats:

- **sss.ttt** S The time is less than 1000 seconds.
- **hh:mm:ss** The time is at least 1000 seconds, but less than 100 hours.
- **hhhh:mm** The time is at least 100 hours.
- *********** The time is greater than 99999 hours.
- **NOTA V AIL**
  The time-of-day (TOD) clock is not working
- ***NONE***
  The local TP is not waiting for data or a confirmation.

In the variable text:

- **ttt** The number of milliseconds.
ATB103I

ssss or ss
    The number of seconds.

mm
    The number of minutes.

hh or hhhhh
    The number of hours.

LCID=lcid
    The local conversation identifier. It is an 8-digit hexadecimal value. For a Virtual Telecommunications Access Method (VTAM) conversation, *NONE* appears in this field.

MODE=modename
    The mode used by the conversation.

VTAMCID=clid
    The VTAM conversation identifier. For a VTAM conversation, this provides the link between APPC and VTAM. For a local conversation, *NONE* appears in this field. It is an 8-digit hexadecimal value.

System action: The system continues processing.

SERVERS=ssssss  KEEP TIME=tttt  TIME LEFT=tttt

[ ASNAME=asname
  ASID=asid  REGTIME=mm/dd/yy  hh:mm:ss  TOT RCVD=nnnnnnnn
  RCVA ISS=hh:mm:ss  RCVA RET=hh:mm:ss]]

The operator entered the DISPLAY APPC,SERVER command to display information about allocate queues and their servers.

The first three lines of the message always appear.

In the first three lines of the message text:

hh.mm.ss
    The hour, minute, and second at which the system processed the DISPLAY command.

id
    A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on printer consoles or displayed inline on a console. This identifier does not appear when the display appears in a display area on a console.

Under ALLOCATE QUEUES: ttttt
    The number of allocate queues. This number is equal to the total number of unique Register_for_Allocate calls that are currently in effect.

Under SERVERS: nnnnnn
    The total number of APPC/MVS servers. These servers are address spaces that are currently registered to serve inbound allocate requests.

Under QUEUED ALLOCATES: nnnnnn
    The total number of inbound allocates currently queued on allocate queues.
If the command includes the LIST parameter, lines 4 through 8 appear for each allocate queue that is currently active, or that is selected by optional keyword parameters.

In lines 4 through 8 of the message text:

**STPN=** *stpname* | ¬ *X’hh’ccc*

- The served TP name. It is 1 to 64 characters long.
  - *stpname* The served TP name. *stpname* is a string 1 to 64 characters long.
  - ¬ *X’hh’ccc*
    - The system network architecture (SNA) service TP name:
      - *hh* The first character of the SNA service TP name, in hexadecimal. This character is non-displayable in non-hexadecimal form.
      - *ccc* A character string, with a maximum length of 3.

**LLUN=** *luname*

- The name of the logical unit (LU) at which the APPC/MVS server resides.

**PLUN=** *pluname*

- The name of the LU from which the allocate request originated. A value of * indicates that allocate requests from any partner LU are accepted.

**USERID=** *userid*

- The userid that flowed in with the allocate request. A value of * indicates that allocate requests from any userid are accepted.

**PROFILE=** *profile*

- The name of the security profile from which inbound allocates are to be accepted. A value of * indicates that allocate requests with any profile are to be accepted.

**REGTIME=** *mm/dd/yy hh:mm:ss*

- The time at which the Register_for_Allocates call that created the allocate queue was processed. *mm/dd/yy* represents the month, day, and year. *hh:mm:ss* represents the hour, minute, and second, based on the time of day (TOD) clock.

**QUEUED=** *nnnnn*

- The number of inbound allocates currently residing on the queue.

**OLDEST=** *nnnnnnnn*

- The amount of time that the oldest inbound allocate has been on the allocate queue. Depending on the amount of time, *tttttttt* has one of the following formats:
  - *sss.ttt S* The time is less than 1000 seconds.
  - *hh:mm:ss* The time is at least 1000 seconds, but less than 100 hours.
  - *hhhh:mm* The time is at least 100 hours.
  - ******** The time is greater than 99999 hours.
  - *NONE* There are no allocate requests on the allocate queue.

In the variable text:

- *ttt* The number of milliseconds.
- *sss or ss* The number of seconds.
- *nn* The number of minutes.
- *hh or hhhhh* The number of hours.
LAST RCVD=tttttttt
The amount of time since an inbound allocate was last received (and thus removed from the allocate queue) through the Receive_Allocate service. Depending on the amount of time, ttttttttt has one of the following formats:

sss.ttt S  The time is less than 1000 seconds.

hh:mm:ss  The time is at least 1000 seconds, but less than 100 hours.

hhhh:mm  The time is at least 100 hours.

*******  The time is greater than 99999 hours.

*NONE*  No inbound allocates have been received from the queue.

In the variable text:

 ttt  The number of milliseconds.

 sss or ss  The number of seconds.

 mm  The number of minutes.

 hh or hhhhh  The number of hours.

TOT ALLOCS=nnnnnnnn
This is the number of allocate requests waiting to be received from the allocate queue, plus the number of allocate requests that have already been received.

SERVERS=nnnnn
The number of servers processing requests on the allocate queue.

KEEP TIME=nnnn.
The amount of time, in seconds, that the allocate queue is to remain active after all of its servers unregister (as specified through the Set_Allocate_Queue_Attributes service).

TIME LEFT=nnnn.
The amount of time, in seconds, remaining before the allocate queue will be purged. This field is only valid when there are no servers processing the served TP (that is, SERVERS=0). When SERVERS does not equal zero, TIME LEFT contains a value of *N/A*.

If the DISPLAY APPC,SERVER command includes the ALL parameter, the following lines appear in the message text:

• One occurrence of lines 4 through 8 for all active allocate queues, or a subset of active allocate queues that is selected by optional keyword parameters.

• For each queue:
  – One occurrence of lines 9 through 11 for each address space serving the queue.

In lines 9 through 11 of the message text:

ASNAME=asname
The address space name of the server. This field will contain *UNKNOWN* if the address space name cannot be determined.

ASID=asid
The address space identifier (ASID) of the server. This field is set to *UNKNOWN* if the ASID cannot be determined.

REGTIME=mm/dd/yy hh:mm:ss
The time at which the last Register_For_Allocates service was processed for this server. mm/dd/yy represents the month, day, and year. hh:mm:ss represents the hour, minute, and second, based on the time of day (TOD) clock.
**ATB104I**

**TOT RCVD=nnnnnnnn**
Total number of allocates that the server has received from the allocate queue during the current IPL.

**RCVA ISS=hh:mm:ss**
The time (hour, minute, and second) at which the server last issued the Receive_Allocate service. This time is based on the time of day (TOD) clock. A value of "NONE" indicates that the server has not yet issued the Receive_Allocate service.

**RCVA RET=hh:mm:ss**
The time (hour, minute, and second) at which the Receive_Allocate service last returned to the caller (after attempting to return an allocate request). This time is based on the time of day (TOD) clock.

The Receive_Allocate call might or might not have returned an allocate request to the caller. A value of "NONE" indicates that no allocate requests have yet been returned.

**System action:** The system continues processing.

**Source:** APPC/MVS

**Routing Code:** 2

**Descriptor Code:** 5

---

**ATB104I**  
*hh.mm.ss*  
APPC DISPLAY *[id]*

**Explanation:** In the message, the following appears:

- **APPC UR'S**  
  *ttttt*  
  The number of URs that have at least one expression of recoverable interest from APPC/MVS that meets all the specified optional selection parameters. *ttttt* is displayed as a decimal integer.

- **EXPRESSIONS OF INTEREST**  
  *eeeee*  
  The number of expressions of recoverable interest from APPC/MVS that meet all the specified optional selection parameters. *eeeee* is displayed as a decimal integer.

- **LOGSTREAM NAME**  
  *logstream_name*  
  The log stream name APPC uses to store information related to partner LUs that APPC has established sync-level syncpoint conversations with. If LOGGING=RRSGNAME was specified in the APPC started procedure, and if RRS is not active, then a value of "UNKNOWN" will be displayed. See [z/OS MVS Planning: APPC/MVS Management](link) for further information regarding the naming of APPC log streams.

When the operator enters the DISPLAY APPC,UR command, this message displays information that APPC/MVS has about local units of recovery (URs) and APPC/MVS expressions of interest in these URs. The information is displayed with conversation information, such as local and partner LU names, protected LUWIDs, conversation correlators, and local and remote TP names.

The first three lines of the message always appear.

In the first three lines of the message text:

- *hh.mm.ss*
  The hour, minute, and second at which the DISPLAY command was processed.

- *id*
  A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display appears in a display area on a display console.

- **APPC UR'S**  
  *ttttt*  
  The number of URs that have at least one expression of recoverable interest from APPC/MVS that meets all the specified optional selection parameters. *ttttt* is displayed as a decimal integer.

- **EXPRESSIONS OF INTEREST**  
  *eeeee*  
  The number of expressions of recoverable interest from APPC/MVS that meet all the specified optional selection parameters. *eeeee* is displayed as a decimal integer.

- **LOGSTREAM NAME**  
  *logstream_name*  
  The log stream name APPC uses to store information related to partner LUs that APPC has established sync-level syncpoint conversations with. If LOGGING=RRSGNAME was specified in the APPC started procedure, and if RRS is not active, then a value of "UNKNOWN" will be displayed. See [z/OS MVS Planning: APPC/MVS Management](link) for further information regarding the naming of APPC log streams.
If the command includes the LIST parameter, lines 4 through 6 appear for each UR included in the summary.

In lines 4 through 6 of the message text:

**URID=urid**

The URID is the RRS unit of recovery identifier (in hexadecimal)

You can use this URID with the LUWID also displayed by this message to correlate information when using the RRS ISPF panels. For more information on the RRS ISPF panel interface, see [z/OS MVS Programming](#). Resource Recovery

**EXPRESSION OF INTEREST COUNT=num**

The number of APPC/MVS expressions of recoverable interest in this unit of recovery that meet all the specified optional selection parameters. num is displayed as a decimal integer.

**SYNC POINT IN PROG=sss**

sss is one of the following:

- **YES** A syncpoint verb (Commit or Backout) is in progress for the unit of recovery.
- **NO** There is no syncpoint verb in progress for the unit of recovery.

**LUWID=luwid**

The protected logical unit of work ID (LUWID) for this unit of recovery. You can use this LUWID with the URID also displayed by this message to correlate information when using the RRS ISPF panels. For more information on the RRS ISPF panel interface, see [z/OS MVS Programming](#). Resource Recovery

If the DISPLAY APPC,UR command includes the ALL parameter, the following lines appear in the message text:

- One occurrence of lines 4 through 6, for each unit of recovery for which APPC/MVS has at least one expression of recoverable interest that meets all the specified optional selection parameters.
- One occurrence of lines 7 through 10, for each APPC/MVS expression of recoverable interest that meets all the specified optional selection parameters.

The expressions of interest are grouped together by unit of recovery.

In lines 7 through 11 of the message text:

**LTPN=tpname1X'hh'Mccc**

In the message text:

- **tpname** The local TP name. It is 1 to 64 characters long. If there is no inbound conversation or the TP name cannot be determined, *UNKNOWN* appears in this field.

- **X'hh'Mccc**

  The SNA service TP name. In the variable text:

  - **hh** The first character of the SNA service TP name, in hexadecimal. This character is non-displayable in non-hexadecimal form.

  - **ccc** A character string, with a maximum length of 3.

If there is no inbound conversation to the TP, *UNKNOWN* appears in this field.

**PTPN=tpname1X'hh'Mccc**

In the message text:

- **tpname** The partner TP name. It is 1 to 64 characters long. For inbound conversations, *UNKNOWN* appears in this field.

- **X'hh'Mccc**

  The SNA service TP name. In the variable text:

  - **hh** The first character of the SNA service TP name, in hexadecimal. This character is non-displayable in non-hexadecimal form.

  - **ccc** A character string, with a maximum length of 3.

*UNKNOWN* appears in this field when either:

- The conversation is inbound, or
**ATB105I**

- The TP name cannot be determined

**CONV CORRELATOR=ccid**

The conversation correlator of the conversation for which APPC expressed interest. ccid is displayed in character representation of hexadecimal digits.

**Note:** A conversation correlator is unique among all the conversation correlators created by a particular LU. All conversation correlators are created by the LU that initiates the conversation allocation.

**LLUN=luname**

The 8-byte network LU name of the local LU. luname is displayed as character data.

**PLUN=pluname**

The network-qualified name of the partner LU, if its network ID is known. pluname is displayed as character data.

**DIRECTION=dir**

The direction of the conversation, which is one of the following:

- **INBOUND**
  - The conversation is inbound. It was allocated by the partner TP.

- **OUTBOUND**
  - The conversation is outbound. It was allocated by the local TP.

- **UNKNOWN**
  - The conversation direction is either not applicable or not available.

**RESYNC REQUIRED=rrr**

rrr is one of the following:

- **YES**
  - Resynchronization is required for the unit of recovery because of a protected conversation failure. Resynchronization is required to achieve a state of consistency.

- **NO**
  - Resynchronization is not required for the unit of recovery.

**IMPLIED FORGET=fff**

fff is one of the following:

- **YES**
  - Indicates an implied-forget condition. Before it can complete, the unit of recovery requires the receipt of a network flow as notification that the syncpoint initiator has received the last message about the expression of interest.

- **NO**
  - Indicates there is no implied-forget condition.

**System action:** The system continues processing.

**ATB105I**  **DISPLAY APPC SYNTAX ERROR. UNEXPECTED END OF COMMAND:** error

**Explanation:** In the DISPLAY APPC command, the system found a blank space where operands were expected. In the message text:

- error  The 20-character string preceding the blank space.

**System action:** The system does not run the command.

**Operator response:** Remove any unnecessary blank spaces that are embedded in the text of the command. Enter the command again.

**Module:** ATBCODI

**Source:** APPC/MVS
ATB106I  DISPLAY APPC SYNTAX ERROR. INVALID PARAMETER: error

Explanation: In the DISPLAY APPC command, a parameter is not valid.

In the message text:
error A 20-character string starting with the parameter in error.

System action: The system rejects the command.

Operator response: Enter the command again, using a valid parameter. See z/OS MVS Programming: Writing Transaction Programs for APPC/MVS for a list of valid parameters.

Module: ATBCODI
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 5

ATB107I  DISPLAY APPC SYNTAX ERROR. INVALID DELIMITER AFTER PARAMETER: error

Explanation: In the DISPLAY APPC command, the system found an incorrect delimiter. For the DISPLAY ASCH command, delimiters are commas and equal signs.

In the message text:
error A 20-character string starting with the parameter preceding the incorrect delimiter.

System action: The system does not run the command.

Operator response: Remove or replace the incorrect delimiter. Enter the command again.

Module: ATBCODI
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 5

ATB108I  DISPLAY APPC SYNTAX ERROR. DUPLICATE KEYWORD PARAMETER: error

Explanation: In the DISPLAY APPC command, the system found a duplicate keyword.

In the message text:
error A 20-character string starting with the second occurrence of the duplicate keyword parameter.

System action: The system rejects the command.

Operator response: Remove the duplicate keyword. Enter the command again.

Module: ATBCODI

Source: APPC/MVS
Routing Code: 2
Descriptor Code: 5

ATB121I hh.mm.ss APPC DISPLAY [id]

Explanation: In the message, the following appears:

ACTIVE LU'S aaaa OUTBOUND LU'S ooooo PENDING LU'S ppppp TERMINATING LU'S ttttt
SIDEINFO=side_dsetname
[LLUN=lluname - SCHED=schedname BASE=xxx NQN=xxx
 STATUS=stat PARTNERS=nmmnn TLEVEL=tplvel SYCPT=sss
 GRNAME=grname RMNAME=rmname
 TPDATA=dsetname
 [ PLUN=pluname ]]}

When the operator enters a DISPLAY APPC,LU command, this message displays information about local and partner LUs.

The first four lines of the message always appear.

In the first four lines of the message text:

hh.mm.ss The hour, minute, and second at which the display command was processed.

id A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display is presented in a display area on a display console.

ACTIVE LU'S aaaa
The number of APPC/MVS logical units (LU) with ACTIVE status. An LU is active when it is fully initialized and capable of processing both inbound and outbound requests.

OUTBOUND LU'S ooooo
The number of APPC/MVS LUs with OUTBOUND status. An LU is OUTBOUND when the transaction scheduler that owns the LU halts all transaction requests to the LU.

PENDING LU'S ppppp
The number of APPC/MVS LUs with PENDING status. An LU is pending when the system is initializing the LU.

TERMINATING LU'S ttttt
The number of APPC/MVS LUs with TERMINATING status. A logical unit is ending when a SET command removes it from the system and the system allows active conversations on the LUs sessions to complete.

SIDEINFO=side_dsetname
The name of the currently active side information file. The side information file is a Virtual Storage Access
Method (VSAM) key sequenced data set containing the side information. If no side information file was specified in the APPCPMxx parmlib member this value will be "NONE".

Lines 5-8 of the message text:

Lines 5-8 appear in the message text if the DISPLAY APPC,LU command includes the LIST parameter. Lines 5-8 are repeated for each local LU that is defined to APPC/MVS or selected by optional keyword parameters.

LLUN=lluname
   The local logical unit name.

SCHED=schedname
   The name of the APPC/MVS transaction scheduler that schedules transactions for this LU. It is specified on the SCHED keyword in the current parmlib configuration. If there is no scheduler associated with the LU (that is, the NOSCHED option is specified in the parmlib configuration), this value will be "NONE".

BASE=xxx
   xxx is one of the following:
   YES    The logical unit is a base logical unit.
   NO     The logical unit is not the base logical unit.

NQN=xxx
   xxx is one of the following:
   YES    Any Allocate request originating from this LU may specify a network-qualified partner LU name where the LU name does not have to be unique across interconnected networks.
   NO     Any Allocate request originating from this LU must specify a partner LU name (network-qualified or not) where the LU name must be unique across interconnected networks.

STATUS=stat
   The status of the logical unit, which is one of the following:
   ACTIVE   The logical unit is active.
   OUTBOUND The logical unit is outbound.
   PENDING  The logical unit is pending.
   TERMINATING The logical unit is ending.

PARTNERS=nnnnn
   The number of LUs with at least one session bound to LU lluname. The maximum value is 99999.

TPLEVEL=tplvel
   The transaction program (TP) level specified in parmlib for this LU, which is one of the following:
   SYSTEM    The TP is available to all users defined to LU lluname. This is the default level.
   GROUP     The TP is available to a group defined to LU lluname.
   USER      The TP is available to an individual user defined to LU lluname.

SYNCPT=sss
   Specifies whether the local LU’s resource manager exits are set with RRS and the LU is capable of supporting protected conversations (that is, conversations with a synchronization level of Syncpt). sss is one of the following:
   YES    The local LU is registered with RRS and is capable of supporting protected conversations.
   NO     The local LU either is not registered with RRS at the current time, or is not capable of supporting protected conversations because of one of the following:
The VTAM APPL definition for the local LU does not specify SYNCLVL=SYNCPT and ATNLOSS=ALL.

The status of the local LU is pending.

RRS is not active.

An internal APPC/MVS error caused the local LU to become unregistered as a resource manager.

**GRNAME**=grname

grname is the generic resource name with which the LU will register or has registered. The generic resource name identifies a set of LUs that provide the same function. Sessions initiated using a generic resource name are established with one of the LUs mapped to the generic resource name. This name is specified on the GRNAME parameter of the LUADD statement in the APPCPMxx parmlib member. If the GRNAME parameter was not specified in APPCPMxx, this value will be *NONE*.

**RMNAME**=rmname

The APPC/MVS-generated resource manager name for the LU, if the LU is registered as a communications resource manager with RRS, and is capable of supporting protected conversations. If SYNCPT=NO appears in the display, this value will be *NONE*.

**TPDATA**=dsetname

A 1 to 44 character name for a data set that contains the TP profile for LU luname.

Line 9 of the message text:

Line 9 appears if the DISPLAY APPC,LU command includes the ALL parameter. Line 9 appears once for either:

- Each partner LU with at least one session bound to LU luname
- The partner LUs specified on the PLUN keyword.

**PLUN**=pluname

The partner LU name. This name is network-qualified if the network ID is known.

**System action:** The system continues processing.

**Module:** ATBCODP

**Source:** APPC/MVS

**Routing Code:** 2

**Descriptor Code:** 5

---

**ATB122I**

hh:mm:ss  APPC DISPLAY [id]

**Explanation:** In the message, the following appears:

LOCAL TP'S INBOUND CONVERSATIONS OUTBOUND CONVERSATIONS
ttttt  ccccc  ooooo

[LTPN=tpname |X'hh'ccc  | STPN=tpname |-X'hh'ccc
  LLUN=luname  WUID=workid  CONVERSATIONS=mm  ASID=asid
  SCHED=schednm  ASNAME=adspname  TPID=tp-id]

[PTPN=tpname |X'hh'ccc
  PLUN=luname
  PROTECTED=ppp  USERID=userid  DIRECTION=dir
  VERBS=verbs  IT=nmnmnmnm  LCID=lcid
  MODE=mode  VTAMCID=cid  SYNC POINT IN PROG=sss
  LUWID=luwid]

The operator entered the DISPLAY APPC,TP command to display information about local transaction programs (TPs) and their conversations.

The first three lines of the message always appear.

In the first three lines of the message text:
ATB122I

hh.mm.ss
The hour, minute, and second at which the system processed the DISPLAY command. 00.00.00 appears in this field if the time of day (TOD) clock is not working.

id
A decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. This identifier does not appear when the display appears in a display area on a display console.

LOCAL TPS nnnnn
The number of APPC/MVS TPs that the system is currently processing, or that were selected by optional keyword parameters. This value includes the number of TPs that are being processed by APPC/MVS servers (served TPs) and TPs that have been scheduled by APPC/MVS transaction schedulers. This later group of TPs is called scheduled TPs.

INBOUND CONVERSATIONS nnnnn
The number of inbound conversations that are currently allocated, or that were selected by optional keyword parameters.

OUTBOUND CONVERSATIONS nnnnn
The number of outbound conversations currently allocated, or that are selected by optional keyword parameters.

Note: If the partner TP is another local APPC/MVS TP, the conversation is considered local. Unless one or both ends of a local conversation are suppressed from the display by keyword filter parameters, the system displays all local conversations twice, as follows:

• The TP that did the allocate is shown as the local TP. The allocated TP is shown as the partner.
• The allocated TP is shown as the local TP. The TP that did the allocate is shown as the partner.

If the command includes the LIST parameter, lines 4 through 6 appear for each local TP that is currently active, or a subset of these TPs, depending on whether the operator specified one or more optional filter keyword parameters on the command.

The TPs are grouped by address space, with lines 4 through 6 repeated for each local TP running in an address space. Information about TPs processed by APPC/MVS servers (served TPs) is separate from information about TPs scheduled by an APPC/MVS transaction scheduler.

Lines 4-6 appear first for a local scheduled TP, if one is running in the address space. The LTPN= variable indicates local scheduled TPs. Lines 4 through 6 appear for each served TP running in an address space, if any. The STPN= variable indicates local served TPs.

An address space can contain, at most, one local inbound scheduled TP, together with TP. An address space can, however, contain any number of served local TPs.

In lines 4 through 6 of the message text:

LTPN=tpname | X'hhl'ccc or STPN=tpname | X'hhl'ccc
In the message text:

 tpname The local TP name. If the TP is scheduled by a transaction scheduler, LTPN= precedes the name. If the TP is served by an APPC/MVS server, STPN= precedes the name. The TP name is 1 to 64 characters long.
~X'hhl'ccc
The systems network architecture (SNA) service TP name. In the variable text:

 hh The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.
 ccc A character string, with a maximum length of 3.

For outbound conversations, *UNKNOWN* appears in this field.

LLUN=luname
The logical unit (LU) name.
WUID=workid
The work unit identifier, which the transaction scheduler assigns to a program instance using the Unit_of_Work_ID. The value in this field is *UNKNOWN* if:
- The transaction scheduler does not use the associate service
- The transaction scheduler does not use the Unit_of_Work_ID parameter on the associate service
- The TP is not scheduled by a transaction scheduler

CONVERSATIONS=nnnnn
The number of conversations in which the TP is involved. The maximum value is 99999.

ASID=asid
The address space identifier (ASID) to which the TP is associated.

SCHED=schedname
The name of the transaction scheduler that scheduled the TP. It is the value of a SCHED keyword in the APPCPMxx parmlib member. If the TP is a batch job, started task, or TSO/E user, or if the TP is running under an LU that is not associated with a transaction scheduler (NOSCHED LU), *NONE* appears in this field.

ASNAME=nadsname
The name of the address space with which the TP is currently associated. If the local TP is running as a batch job, the job name appears in this field. If the local TP is running under TSO/E, the TSO/E userid appears in this field. If the local TP is running in a transaction initiator, a value from the TP profile appears in this field.

TPID=tpid
The TP identifier. It is a 16-digit hexadecimal value. The field (including TPID=) does not appear for served TPs.

If the DISPLAY APPC,TP command includes the ALL parameter, the following lines appear in the message text:
- Lines 4 through 6
- One occurrence of lines 7 through 10 for each conversation in which the local transaction program is involved.

In lines 7 through 10 of the message text:

PTPN=tpname|X'hh'ccc
In the message text:

  tname    The partner TP name. It is 1 to 64 characters long. For inbound conversations, *UNKNOWN* appears in this field.

  -X'hh'ccc
  The systems network architecture (SNA) service TP name. In the variable text:

     hh     The first character of the SNA service TP name, in hexadecimal. This character is non-displayable.

     ccc    A character string, with a maximum length of 3.

  For inbound conversations, *UNKNOWN* appears in this field.

PLUN=unitname
The partner LU name. This name is network-qualified if the network ID is known.

PROTECTED=ppp
An indicator of the synchronization level of the conversation. ppp is one of the following:

  NO       The conversation was allocated with a synchronization level of either None or Confirm.

  YES      The conversation was allocated with a synchronization level of Syncpt; it is a protected conversation.

USERID=userid
The userid that flowed into or out of APPC/MVS on an Allocate request for this conversation. For an inbound conversation, it is the userid of the local system TP. For an outbound conversation, it is the userid of the partner TP. If a userid was not specified, *NONE* appears in this field.
DIRECTION=dir
The direction of the conversation, which is one of the following:

INBOUND
The conversation is inbound. It was allocated by the partner TP.

OUTBOUND
The conversation is outbound. It was allocated by the local TP.

VERBS=nnnnnnnn
The number of APPC callable services issued by the local TP on this conversation. The maximum value is 99999999.

IT=nnnnnnnn
The amount of time that the local TP has been waiting for data or a confirmation from the partner TP. Depending on the amount of time, nnnnnnnn has one of the following formats:

sss.ttt S The time is less than 1000 seconds.

hh:mm:ss The time is at least 1000 seconds, but less than 100 hours.

hhhh:mm The time is at least 100 hours.

****** The time is greater than 99999 hours.

NOTA VAIL
The time-of-day (TOD) clock is not working

*NONE*
The local TP is not waiting for data or a confirmation.

In the variable text:

ttt The number of milliseconds.

sss or ss The number of seconds.

mm The number of minutes.

hh or hhhhh The number of hours.

LCID=lcid
The local conversation identifier. It is an 8-digit hexadecimal value. For a Virtual Telecommunications Access Method (VTAM) conversation, *NONE* appears in this field.

MODE=modename
The mode used by the conversation.

VTAMCID=cid
The VTAM conversation identifier. For a VTAM conversation, this provides the link between APPC and VTAM. For a local conversation, *NONE* appears in this field. It is an 8-digit hexadecimal value.

SYNC POINT IN PROG=sss
An indication of whether a sync point operation is in progress for a protected conversation. sss is one of the following:

NO No Commit or Backout request is in progress.

YES A Commit or Backout request is in progress for a unit of recovery of a protected conversation.

LUWID=luwid
The logical unit of work identifier, which is one of the following depending on the type of conversation:

• For an unprotected conversation, the LUWID is a value supplied by the TP that allocated the conversation.
For a protected conversation, the LUWID represents the processing a program performs from one sync point to the next. This LUWID can be up to 33 bytes in length; the last 16 characters are the hexadecimal representation of the instance number and sequence number.

If the TP that allocated the conversation did not supply a LUWID, and the conversation is not a protected conversation, *NONE* appears in the display.

**System action:** The system continues processing.

**ATB178I**  
**THE DUMP FOR APPC COMPONENT TRACE FAILED. REASON= xxxxxxx. DATA= kkkkkkk.

**Explanation:** This message supplies further diagnostic information for message ATB078I, which is issued to the console.

In the message text:

```
xxxxxxx  
The reason code issued in message ATB078I. The reason code is one of the following:
```

**Reason Code**

**Explanation**

61000001

The SDUMPX macro returned a zero return code, but the asynchronous part of the dump failed. kkkkkkk is the contents of the event control block (ECB) posted by SDUMP after the dump completes. SDUMP puts the reason of failure into the ECB as the completion code.

61000002

The SDUMPX macro returned a nonzero return code. kkkkkkk is the return code from SDUMPX. Since SDUMPX is issued with TYPE=FAILRC, the reason code is inserted in the return code by SDUMP.

kkkkkk

The reason code from the SDUMP macro describing the reason why dump failed (in hexadecimal).
ATB179I  •  ATB200I

System action:  The system cannot issue the dump for APPC component trace.
Operator response:  Report this message to the system programmer.
System programmer response:  See the explanation for REASON and DATA above and correct the error indicated.

ATB200I  LOGICAL UNIT luname FOR TRANSACTION SCHEDULER schedname IS ACTIVE, BUT WILL REJECT ALL PROTECTED CONVERSATIONS UNTIL RRS/MVS IS ACTIVE.

Explanation:  The APPL statement for the logical unit specifies that it is capable of handling protected conversations, but it is waiting for the system syncpoint manager (RRS) to become active before allowing any protected conversations to be processed by the logical unit. Protected conversations are conversations with a synchronization level of syncpt.
In the message text:

luname  The name of the logical unit that is waiting for the activation of the system syncpoint manager.
schedname  The name of the scheduler that uses the specified logical unit.

System action:  The system continues processing. The logical unit is in active state, but rejects Allocate requests for protected conversations.
Operator response:  Notify the system programmer. At the request of the system programmer, activate RRS.
System programmer response:  Determine why RRS is not active. If RRS should be activated, notify the operator.
Module:  ATBLUPR
Source:  APPC/MVS
Routing Code:  2
Descriptor Code:  4
ATB201I LOGICAL UNIT luname FOR TRANSACTION SCHEDULER schedname NOW ACCEPTS PROTECTED CONVERSATIONS.

Explanation: The APPC/MVS LU can now process protected conversations.

In the message text:

luname The name of the logical unit that is now accepting protected conversations.

schedname The name of the scheduler that uses the specified logical unit.

System action: The system continues processing. The logical unit is in active state, and accepts conversations with a synchronization level of syncpt, as well as levels of none and confirm.

Module: ATBLUPR
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 4

ATB201I LOGICAL UNIT luname IS RESTARTING. BECAUSE HARDENED DATA WAS LOST, INCOMPLETE UNITS OF RECOVERY MIGHT NOT BE RESOLVED TO A CONSISTENT STATE.

Explanation: The system syncpoint manager (RRS) has lost hardened data and, therefore, might not be able to provide APPC/MVS with data for all incomplete units of recovery for the resource manager luname.

In the message text:

luname The name of the logical unit that is performing resource manager restart processing.

System action: The system continues processing. APPC/MVS processes units of recovery that RRS returns.

System programmer response: See message ATR212I.

Module: ATBPCRR
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 4
Automation: Display this message.

ATB203I LOGICAL UNIT luname ENCOUNTERED AN INSTALLATION ERROR FOR LOGSTREAM: logstream_name. SYSTEM LOGGER RETURN CODE: return-code, REASON CODE: rsncode FOR THE IXGCONN SERVICE.

Explanation: APPC/MVS is attempting to restart luname as a resource manager. APPC/MVS received an error from the system logger while attempting to access the APPC/MVS log stream. Action must be taken before APPC/MVS can successfully access the log stream.

In the message text:

luname The name of the logical unit that encountered the installation error.

logstream_name The name of the APPC/MVS log stream.

return-code The system logger return code from the IXGCONN service.
rsncode The system logger reason code from the IXGCONN service.

System action: APPC/MVS activates this LU, but does not allow it to process protected conversations (conversations with a synchronization level of syncpt).

Operator response: Notify the system programmer.
**System programmer response:** Take the action described for the IXGCONN return and reason codes in [z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG](http://www.ibm.com). Then reactivate the LU through either:

- Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for the LUs; or
- Entering a VTAM VARY INACT command, followed by a VARY ACT command for the LUs.

**Module:** ATBPCRR  
**Source:** APPC/MVS  
**Routing Code:** 2  
**Descriptor Code:** 4  
**Automation:** Trap the return and reason code from IXGCONN and translate it into text. Notify the system programmer.

**ATB204I**  
LOGICAL UNIT OF WORK `luwid` WITH CONVERSATION CORRELATOR `convcorr` IS outcome AT  
LU `partner_lu` BECAUSE OF RESYNCHRONIZATION BETWEEN LU `local_lu` AND LU `partner_lu`.

**Explanation:** This message indicates that during resynchronization processing, the logical unit of work (identified by logical unit of work ID `luwid` and conversation correlator `convcorr`) has been committed or backed out at the participating LUs.

In the message text:

- `luwid` A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.  
- `convcorr` A value that identifies the conversation that is being resynchronized.  
- `outcome` One of the following:
  - COMMITTED  
    The overall outcome for the distributed unit of recovery is committed.  
  - BACKED OUT  
    The overall outcome for the distributed unit of recovery is backed out.  
- `partner_lu` The name of the logical unit that is the target of the resynchronization exchange.  
- `local_lu` The name of the logical unit that initiated the resynchronization exchange.  

**System action:** Resynchronization processing completes by informing the system syncpoint manager (RRS) of the outcome of the expression of interest for the logical unit of work.

**Module:** ATBPCRS  
**Source:** APPC/MVS  
**Routing Code:** Hardcopy only  
**Descriptor Code:** 4

**ATB205I**  
RESYNCHRONIZATION FOR LOGICAL UNIT OF WORK `luwid` WITH CONVERSATION CORRELATOR `convcorr` HAS COMPLETED, BUT RESOURCES FOR LOCAL LU `local_lu` AND PARTNER LU `partner_lu` HAVE NOT BEEN BROUGHT TO A CONSISTENT STATE.

**Explanation:** APPC/MVS detected an out-of-synchronization condition that cannot be corrected by resynchronization. During resynchronization with a partner resource manager, APPC/MVS received an unexpected response that resulted from a heuristic decision made prior to or during resynchronization processing. Heuristic damage has been detected for the logical unit of work identified by `luwid` and conversation correlator `convcorr`.

More than one LU might be affected by the error reported in this message. If so, this message is displayed once for each affected LU.

In the message text:
ATB206E  LU luname1 DETECTED A PROTOCOL VIOLATION MADE BY LU luname2 DURING RESYNCHRONIZATION. THE RESYNCHRONIZATION HAS FAILED. SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL THE PROBLEM IS RESOLVED. REASON: description-of-protocol-violation

Explanation: This message is issued during APPC/MVS resynchronization processing or exchange log name processing when an error is detected by luname1 in the data sent by luname2 during the transaction exchange.

In the message text:

luname1
   The name of the logical unit that detected the protocol violation.

luname2
   The name of the logical unit that generated the protocol violation.

description-of-protocol-violation
   One of the following:

   COMPARStates GDS VARIABLE NOT RECEIVED
      During a resynchronization exchange, the partner did not send a Compare States GDS variable reply containing the state of the logical unit of work at the partner LU.

   UNEXPECTED DATA RECEIVED FROM INITIATOR
      Unexpected data was received from a partner who was initiating a cold-start exchange log name transaction.

   DEALLOCATE ABEND OF CONVERSATION NOT RECEIVED
      A deallocation of the exchange log name or resynchronization transaction conversation from the initiator was expected, but not received.

   UNEXPECTED STATUS DATA RECEIVED FROM PARTNER
      Unexpected status data was received from a partner who was replying to an exchange log name or resynchronization transaction initiated by the local LU.

   NO DATA RECEIVED FROM THE PARTNER
      During a resynchronization or exchange log name transaction exchange, the partner responded but failed to send GDS variable data containing the state of the partner LU.
ATB207I

UNEXPECTED DATA RECEIVED FROM PARTNER
Unexpected data was received from a partner who was replying to an exchange log name or
resynchronization transaction initiated by the local LU.

INVALID STATUS DATA RECEIVED FROM THE PARTNER
Status data that was invalid for the reply was received by the initiator of the exchange log name or
resynchronization transaction.

NO DATA RECEIVED FROM THE INITIATOR
The initiator of the SNA service TP request failed to send GDS variable data describing the request.

TOO MUCH DATA RECEIVED FROM THE INITIATOR
The initiator of the SNA service TP request sent more than the expected amount of GDS variable
data for the request.

INVALID STATUS DATA RECEIVED FROM THE INITIATOR
Status data that was invalid for the request was received by the partner of the exchange log name
or resynchronization transaction.

SYNCPT CAPABILITIES NEGOTIATION NOT ALLOWED
The partner attempted to negotiate syncpt capabilities while there was outstanding
resynchronization work to be performed between the local and partner LUs.

UNEXPECTED COLD START REQUEST RECEIVED
A cold-start exchange log name request was received from a partner LU while sessions were still
active between the local and partner LUs. The request was rejected.

SYNCPT CAPABILITIES DO NOT MATCH
The syncpt capabilities sent in an exchange log name GDS variable for a warm-start exchange do
not match the capabilities previously negotiated by the the local and partner LUs.

System action: If this message is issued during APPC/MVS resynchronization processing to resolve incomplete
units of recovery, resynchronization does not continue. Resynchronization will be attempted again automatically at a
later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or
inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected
conversations between the local and partner LU will be allocated until the warm/cold mismatch can be resolved.

Operator response: Contact the operator at LU luname to determine the cause of the error.

System programmer response: Examine the logrec data set of the local LU’s system. When a protocol violation is
detected during the transaction exchange of Exchange Log Names GDS variables or Compare States GDS variables,
APPC/MVS records diagnostic information pertaining to the protocol violation made by the partner LU system.
APPC/MVS sends message ATB70051I or ATB70056I to the partner system as log data when deallocating the
resynchronization conversation abnormally.

Module: ATBPCRS
Source: APPC/MVS
Routing Code: Hardcopy only
Descriptor Code: 4
Automation: Trap and suppress the first four occurrences of this message for the same luname. Notify the system
programmer of the fifth occurrence and display the message.

ATB207I EXCHANGE LOG NAME PROCESSING HAS COMPLETED SUCCESSFULLY BETWEEN LOCAL
LU luname AND PARTNER LU pluname LOCAL LOG: local-log PARTNER LOG: partner-log

Explanation: An APPC/MVS LU and its partner LU have successfully completed an exchange log name transaction,
which must precede the allocation of protected conversations (conversations with a synchronization level of syncpt).

In the message text:

luname The name of the local LU that initiated the exchange log name transaction.

pluname The name of the logical unit that is the target of the exchange log name transaction.
local-log  The name of the Local LU log.

partner-log  The name of the partner LU log.

**System action:**  The system continues processing. The local and partner LU pair can accept and process requests to allocate conversations with a synchronization level of syncpt between the LU pair.

**Operator response:**  None.

**System programmer response:**  None.

**Module:**  ATBPCRS

**Source:**  APPC/MVS

**Routing Code:**  Hardcopy only

**Descriptor Code:**  4

---

**ATB208I**  LOGICAL UNIT `lu_name` FOR TRANSACTION SCHEDULER `schedname` WILL REJECT ALL PROTECTED CONVERSATIONS. THE RESOURCE MANAGER EXITs HAVE BEEN UNSET.

**Explanation:**  Because of the reason indicated by `rsncode`, the resource manager notification exit for this logical unit has been unset. The LU can no longer accept protected conversations (conversations with a synchronization level of syncpt).

In the message text:

- `lu_name`  The name of the logical unit that can no longer accept protected conversations.
- `schedname`  The name of the scheduler that uses the specified logical unit.
- `rsncode`  The value passed to the resource manager notification exit for this LU. This value indicates why the resource manager exits have been unset. For an explanation of these values, see the description of field `value2` in the parameter list for the NOTIFICATION exit routine in [z/OS MVS Programming: Resource Recovery](https://www.ibm.com/support/docview.wss?rs=160&context=56562058&category=CS000000&articleNumber=gh210568).

**System action:**  The LU continues processing conversations with a synchronization level of none or confirm. Protected conversations (conversations with a synchronization level of syncpoint) are terminated at the time the exits are unset. APPC/MVS will attempt to reset this LU’s resource manager exits, so the LU can resume processing protected conversations.

**Module:**  ATBLUPR

**Source:**  APPC/MVS

**Routing Code:**  2

**Descriptor Code:**  4

**Automation:**  Trap and suppress the first three occurrences of this message for the same `lu_name` and `schedname`. Notify the system programmer of the fourth occurrence and display the message.

---

**ATB209I**  LOGICAL UNIT `lu_name` DETECTED A MAXBUFSIZE VALUE THAT IS TOO SMALL FOR THE APPC/MVS LOG STREAM `logstream_name`. APPC/MVS EXPECTS A BUFFER SIZE OF AT LEAST 65276 BYTES.

**Explanation:**  APPC/MVS is attempting to restart this LU as a resource manager. APPC/MVS expects a buffer size of at least 65,276 bytes. The MAXBUFSIZE value returned from the IXGCONN service is smaller than 65,276.

In the message text:

- `lu_name`  The name of the LU that APPC/MVS is attempting to restart.
- `logstream_name`  The name of the APPC/MVS log stream.
**ATB210E**

**System action:** APPC/MVS activates this LU, but does not allow it to process protected conversations (conversations with a synchronization level of synxpt).

**Operator response:** Notify the system programmer.

**System programmer response:** Do the following:
1. Redefine the structure for the APPC/MVS log stream to have a MAXBUFSIZE value of at least 65,276 bytes.
2. Redefine the APPC/MVS log stream using the utilities provided by the system logger, and restart the LUs.
3. Reactivate the LU through either:
   - Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for the LUs; or
   - Entering a VTAM VARY INACT command, followed by a VARY ACT command for the LUs.

**Module:** ATBPCRR

**Automation:** This message cannot be automated. System programmer action is required.

---

**ATB210E**
A LOG NAME EXCHANGE INITIATED BY LU `luname1` WITH LU `luname2` HAS FAILED. LU `luname3` DETECTED A WARM/COLD MISMATCH. AS A RESULT, SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL THE MISMATCH IS RESOLVED. REASON: `reason`

**Explanation:** This message is issued during an exchange log name transaction when the local LU or partner LU has detected a warm/cold log status mismatch. An exchange log name transaction is initiated following a session failure or at first session initiation after system restart.

In the message text:

- `luname1` The name of the logical unit that initiated the log name exchange
- `luname2` The name of the logical unit that is the target of the exchange log name
- `luname3` The name of the logical unit that detected the exchange log name error.
- `reason` One of the following:
  
  **COLD LOG STATUS REJECTED BY INITIATOR**
  The initiator of an exchange log name transaction rejected the local LU cold-log status because the initiating LU has incomplete units of work on its log that require resynchronization with the local LU.

  **RESYNC WORK EXISTS WITH THE PARTNER LU**
  The initiator of an exchange log name transaction detected that the partner LU has reported a cold-log status. The cold-log status is rejected because the initiating LU has incomplete units of work on its log that require resynchronization with the partner LU.

  **COLD LOG STATUS REJECTED BY PARTNER**
  The partner in an exchange log name transaction rejected the initiator LU cold-log status because the partner LU has incomplete units of work on its log that require resynchronization with the initiating LU.

  **RESYNC WORK EXISTS WITH THE INITIATOR LU**
  The partner in an exchange log name transaction detected that the initiating LU has reported a cold-log status. The cold-log status is rejected because the partner LU has incomplete units of work on its log that require resynchronization with the initiating LU.

**System action:** If this message is issued during APPC/MVS resynchronization processing to resolve incomplete
units of recovery, resynchronization does not continue. If APPC/MVS is the initiator of resynchronization processing, APPC/MVS will attempt resynchronization again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the warm/cold mismatch can be resolved.

Symptom records are written to the logrec data set to record the error condition and record diagnostic data.

Operator response: Notify the system programmer.

System programmer response: For complete information on resolving this problem, see the description of how to handle warm/cold mismatch in z/OS MVS Planning: APPC/MVS Management.

Module: ATBPCRS

Source: APPC/MVS

Routing Code: 2

Descriptor Code: 4

ATB211E A LOG NAME EXCHANGE INITIATED BY LU luname1 WITH LU luname2 HAS FAILED. LU luname3 DETECTED A LOG NAME MISMATCH. AS A RESULT, SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL THE MISMATCH IS RESOLVED. REASON: reason

Explanation: A log name mismatch was detected during an exchange log name request by luname3 during conversation allocation processing between luname1 and luname2 or during a resynchronization exchange between luname1 and luname2 to bring distributed units of recovery to a consistent state after a session or system failure. reason further describes the cause of the log name mismatch.

In the message text:

luname1

The name of the LU that initiated the log name exchange

luname2

The name of the LU that is the target of the exchange log name

luname3

The name of the LU that detected the mismatch

reason One of the following:

PARTNER XLN REPLY LOG NAME DOES NOT MATCH LOCAL LOG
The log name sent by the partner LU in reply to the exchange log name request does not match what is stored by the local LU in its log.

ABNORMAL REPLY RECEIVED FROM PARTNER LU
The initiator of an exchange log name transaction received an abnormal reply from the partner LU. The most likely cause of this abnormal reply is a mismatch between the log name sent by the local LU in the exchange log name GDS variable, and the log name for the initiator LU stored in the partner’s log.

PARTNER XLN REQUEST LOG NAME DOES NOT MATCH LOCAL LOG
The log name sent by the initiator LU in the exchange log name request does not match what is stored by the local LU in its log.

System action: If this message is issued during APPC/MVS resynchronization processing to resolve incomplete units of recovery, resynchronization does not continue. Resynchronization will be attempted again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the log name mismatch can be resolved.

Symptom records are written to the logrec data set to record the error condition and record diagnostic data.
**Operator response:** Ensure that the local system has restarted with the correct system logs, including the correct RRS log group name (GNAME parameter specified on the RRS cataloged procedure).

Contact the operator for the partner system to ensure that the partner system restarted with the correct system logs.

Make sure to provide the complete text of message ATB227I, if it is issued.

**System programmer response:** The cause of the log name mismatch may be due to:

- The incorrect system log being used on the local or partner system.
- An internal error in APPC/MVS logging or in the logging function of the partner system.

If an incorrect system log caused the problem, attempt to correct the log name mismatch problem on the partner system using the partner system's local log name mismatch recovery procedures. For complete information on resolving this problem, see the description of how to handle log name mismatch in z/OS MVS Planning: APPC/MVS Management.

**Module:** ATBPCRS  
**Source:** APPC/MVS  
**Routing Code:** 2  
**Descriptor Code:** 4

**Automation:** Ensure that the local system has restarted with the correct system logs, including the correct RRS log group name (GNAME in the cataloged procedure both on this and on the partner system. Also make sure to note message ATB227I, if it is issued.

---

**ATB212E**  
**Operator response:** LU *luname1* DETECTED A PROTOCOL VIOLATION IN THE EXCHANGE LOG NAME DATA SENT BY LU *luname2*. SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL THE PROBLEM IS RESOLVED.

**Explanation:** This message is issued during APPC/MVS resynchronization or exchange log name processing when an error is detected by *luname1* in the negotiated syncpoint capabilities sent by *luname2*. The partner responded with an indication that it supports a capability that APPC/MVS does not support.

In the message text:

- *luname1*  
The name of the LU that detected the protocol violation.

- *luname2*  
The name of the LU that generated the protocol violation.

**System action:** If this message is issued during APPC/MVS resynchronization processing to resolve incomplete units of recovery, resynchronization does not continue. Resynchronization will be attempted again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the protocol violation can be corrected.

**Operator response:** Contact the operator at LU *luname2* to determine the cause of the error.

**System programmer response:** Examine the logrec data set of the local LU’s system. When a protocol violation is detected during the transaction exchange of Exchange Log Names GDS variables or Compare States GDS variables, APPC/MVS records diagnostic information pertaining to the protocol violation made by the partner LU system. APPC/MVS sends message ATB70051I or ATB70056I to the partner system as log data when deallocating the resynchronization conversation abnormally.

**Module:** ATBPCRS  
**Source:** APPC/MVS  
**Routing Code:** 2  
**Descriptor Code:** 4
ATB213I • ATB214I

Automation: This message cannot be automated. System programmer action is required.

---

ATB213I  LOGICAL UNIT OF WORK luwid WITH CONVERSATION CORRELATOR convcorr REQUIRED RESYNCHRONIZATION ON mm/dd/yyyy AT resynctime. TO RESOLVE THE LOGICAL UNIT OF WORK, RESYNCHRONIZATION HAS STARTED BETWEEN LOCAL LU luname AND PARTNER LU pluname.

Explanation: This message notifies the operator that APPC/MVS detected a need for resynchronization of a logical unit of work involving APPC/MVS logical unit luname and logical unit pluname.

In the message text:

luwid  A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr  A value that identifies the conversation that is being resynchronized.

mm/dd/yyyy  The date on which resynchronization was initiated for the distributed unit of recovery identified by luwid and convcorr.

resynctime  The time at which resynchronization was initiated for the distributed unit of recovery identified by luwid and convcorr.

luname  The name of the LU that initiated the resynchronization exchange.

pluname  The name of the LU that is the target of the resynchronization exchange.

System action: Resynchronization has been scheduled for the specified logical unit of work.

Operator response: Note this message for future reference. It might be needed for problem determination.

Module: ATBPCRS
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 4

---

ATB214I  THE RESYNCHRONIZATION OF LOGICAL UNIT OF WORK luwid WITH CONVERSATION CORRELATOR convcorr IS BEING SUSPENDED ON mm/dd/yyyy AT resynctime. RESYNCHRONIZATION WAS STARTED BY LOCAL LU luname ON mm/dd/yyyy AT resynctime FOR THE LOGICAL UNIT OF WORK. THE LOCAL LU WILL TRY AGAIN TO RESYNCHRONIZE WITH LU pluname TO RESOLVE THE LOGICAL UNIT OF WORK.

Explanation: This message indicates an attempt to resynchronize logical unit of work represented by the ID luwid and conversation correlator convcorr. Resynchronization can be delayed by the inability to establish connections with the conversation partner, a log name mismatch or a protocol violation that requires operator intervention. APPC/MVS periodically retries resynchronization after encountering such recoverable errors.

In the message text:

luwid  A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr  A value that identifies the conversation that is being resynchronized.

mm/dd/yyyy  The date on which resynchronization is being suspended due to a failure to complete a resynchronization exchange for logical unit of work luwid and convcorr with LU pluname.

resynctime  The time at which:
**ATB215E**

- Resynchronization is suspended because of a failure to complete a resynchronization exchange for luwid and convcorr with pluname, or
- Resynchronization originally began for luwid and convcorr with pluname.

**luuname**  The name of the LU that initiated the resynchronization exchange.

**partner_lu**  The name of the LU that is the target of the resynchronization exchange.

**System action**:  Resynchronization has been scheduled for the specified logical unit of work; after the APPC/MVS-defined time-out period, APPC/MVS will begin resynchronization again.

**Operator response**:  If resynchronization continues to be delayed, you might need to communicate with other operators (if the resources are supported at different locations), or contact the system programmer.

**System programmer response**:  The error that caused resynchronization for the logical unit of work to fail has been recorded by a symptom record written to the logrec data set. Keep the symptom record for future reference; you might need it for problem determination.

**Module**:  ATBPCRS

**Source**:  APPC/MVS

**Routing Code**:  2

**Descriptor Code**:  4

**Automation**:  Trap and suppress the first three occurrences of this message. Notify the system programmer of the fourth occurrence and display the message.

**ATB215E**  LOGICAL UNIT pluname HAS ISSUED A DEALLOCATE OF TYPE DEALLOCATE_ABEND TO ABNORMALLY TERMINATE THE RESYNCHRONIZATION TRANSACTION EXCHANGE.

**Explanation**:  This message is issued during initialization processing of exchange log names or APPC/MVS resynchronization recovery processing if the partner in the resynchronization transaction issues a deallocate type of abend on the resynchronization conversation. The partner might do so because of a protocol violation in exchange log name data, or compare states data sent by the local system and detected by the partner.

An appropriate message indicating the cause of the error may be displayed on the partner LU system.

In the message text:

**pluname**  The name of the LU that deallocated the resynchronization conversation abnormally.

**System action**:  If this message is issued during exchange log name processing for an allocate request or an inbound attach request, the protected conversation allocate request or inbound attach request fails.

If this message is issued during resynchronization processing, initiated by APPC/MVS, the resynchronization attempt fails and APPC/MVS will attempt resynchronization for the logical unit of work at a later time.

**System programmer response**:  Examine the log of the partner LU's system. If a protocol violation was detected in the local system's Exchange log Names GDS variable or Compare States GDS variable, the remote system may have generated diagnostic information itself. This information may help to diagnose the cause of a protocol violation.

**Module**:  ATBPCRS

**Source**:  APPC/MVS

**Routing Code**:  2

**Descriptor Code**:  4

**Automation**:  Display this message.
ATB216E  PROTOCOL VIOLATION DETECTED IN THE RESYNCHRONIZATION OF LOGICAL UNIT OF WORK luwid WITH CONVERSATION CORRELATOR convcorr. LOGICAL UNIT OF WORK STATE SENT WAS state AND LOGICAL UNIT OF WORK STATE RECEIVED FROM LU luname WAS state.

Explanation: Resynchronization processing detected a response that violates the resynchronization protocol during resynchronization of logical unit of work luwid. Resynchronization support in the syncpoint manager at LU luname probably has a program error.

In the message text:

luwid A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

convcorr A value that identifies the conversation that is being resynchronized.

state One of the following:
- RESET
- IN DOUBT
- COMMITTED
- HEURISTIC RESET
- HEURISTIC COMMITTED
- HEURISTIC MIXED

luname The name of the partner LU that participated in the resynchronization transaction and the protocol violating state value was received from.

System action: APPC/MVS suspends the resynchronization for the logical unit of work with the specified LU, and issues message ATB214I. A resynchronization request for the logical unit of work will be attempted at a later time.

Operator response: Make inquiries to determine the state of the resources. Take installation-defined action to resynchronize the resources. Installation-defined action may include removing APPC/MVS’s interest for the logical unit of work. For information on removing interest in RRS units of recovery, see z/OS MVS Programming: Resource Recovery.

Module: ATBPCRS
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 4

Automation: Suppress this message until the operator message described in the automation action for ATB214I is issued. Then issue this message.

ATB217I  EXCHANGE LOG NAME PROCESSING INITIATED BY LU luname1 WITH LU luname2 HAS FAILED ON mm/dd/yyyy AT resynctime. THE LOCAL LU WILL TRY AGAIN TO COMPLETE A SUCCESSFUL EXCHANGE LOG NAME WITH LU pluname. SOME LOGICAL UNITS OF WORK MIGHT NOT BE AUTOMATICALLY RESOLVED BY RESYNCHRONIZATION AND NO NEW PROTECTED CONVERSATIONS MAY BE ALLOCATED BETWEEN THE TWO LOGICAL UNITS UNTIL AN EXCHANGE LOG NAME TRANSACTION COMPLETES.

Explanation: This message is issued during resource manager restart processing, prior to initiation of resynchronization recovery processing for incomplete units of recovery returned by the system syncpoint manager (RRS). During the exchange log name interchange, an error prevented the exchange log name transaction from completing successfully.

In the message text:

luname1 The name of the LU that initiated the log name exchange

luname2 The name of the LU that is the target of the exchange log name
**ATB218E**

*mm/dd/yyyy*

The date on which the exchange log name process is suspended.

*resynctime*

The time at which the exchange log name process is suspended.

*pluname*

The name of the LU that is the target of the resynchronization exchange.

**System action:** APPC/MVS suspends resynchronization recovery processing for incomplete units of recovery returned during resource manager restart processing, until an exchange log name transaction completes successfully between *luname1* and *luname2*. *luname1* will try again to complete an exchange log name transaction with *luname2*.

**Operator response:** Contact the operator at *luname2* to determine the status of *luname2*.

**Module:** ATBPCRS

**Source:** APPC/MVS

**Routing Code:** Hardcopy only

**Descriptor Code:** 4

**Automation:** APPC suspends resynchronization recovery processing until an exchange logname transaction completes successfully. Trap and suppress the first three occurrences. Notify the operator of the fourth occurrence to contact the operator at *luname2* to determine the status of *luname2*.

---

**ATB218E** PROTOCOL VIOLATION DETECTED IN THE *gds-variable-name* DATA SENT BY LU *luname*. THE RESYNCHRONIZATION HAS FAILED.

**Explanation:** This message is issued during APPC/MVS exchange log name processing or APPC/MVS resynchronization recovery processing. If this message is issued during exchange log processing, it indicates that a format error was detected in the exchange log name data sent by another communications resource manager.

If this message is issued during APPC/MVS resynchronization recovery, it indicates that a format error was detected in the exchange log name data or the compare states data that is sent by a communications resource manager as part of resynchronization recovery.

In the message text:

*gds-variable-name*

One of the following:

- EXCHANGE LOG NAMES GDS VARIABLE
- COMPARE STATES GDS VARIABLE

*luname* The name of the LU that sent a GDS variable containing a protocol violation in its format.

**System action:** If this message is issued during APPC/MVS resynchronization processing to resolve incomplete units of recovery, resynchronization does not continue. Resynchronization will be attempted again automatically at a later time.

If this message is issued during an exchange log name interchange preceding a protected conversation allocate or inbound attach request, the protected conversation between the local and partner LU is not allocated. No protected conversations between the local and partner LU will be allocated until the protocol violation can be corrected.

**Operator response:** Contact the operator at LU *luname* to determine the cause of the error.

**System programmer response:** Examine the logrec data set of the local LU's system. When a protocol violation is detected during the transaction exchange of Exchange Log Names GDS variables or Compare States GDS variables, APPC/MVS records diagnostic information pertaining to the protocol violation made by the partner LU system. APPC/MVS sends message ATB70051I or ATB70056I to the partner system as log data when deallocating the resynchronization conversation abnormally.

**Module:** ATBPCRS

**Source:** APPC/MVS

**Routing Code:** 2

**Descriptor Code:** 4
**ATB219E**  APPC/MVS, AS INITIATOR OF A RESYNCHRONIZATION, HAS RECEIVED AN ERROR REPLY IN THE COMPARE STATES DATA FROM LU luname. THE RESYNCHRONIZATION HAS FAILED.

**Explanation:** A resynchronization interchange originated by APPC/MVS has received an error reply in the compare states data from its partner.

The error reply resulted because the partner LU detected a violation in the compare states data that was sent by APPC/MVS.

In the message text:

*luname*  The name of the LU that sent a GDS variable that contains an abnormal reply indication.

**System action:** APPC/MVS suspends resynchronization with the partner LU and issues message ATB214I. After a system-specified time interval, APPC/MVS will initiate the resynchronization exchange again.

**Operator response:** Contact the operator at LU luname to determine the cause of the error. Manual intervention might be required to finish the resynchronization and allow the unit of recovery to complete.

**System programmer response:** Examine the log of the partner LU’s system. If a protocol violation was detected in the local system’s Exchange log Names GDS variable or Compare States GDS variable, the remote system may have generated diagnostic information itself. This information may help to diagnose the cause of a protocol violation.

**Module:** ATBPCRS

**Source:** APPC/MVS

**Routing Code:** 2

**Descriptor Code:** 4

**Automation:** Suppress this message until the operator message described in the automation action ATB214I is issued. Then issue this message. Contact operator at luname and see system programmers response. Check the error logs on the partner system.

**ATB220I**  PROTOCOL VIOLATION MADE BY LU luname1 WAS DETECTED BY LU luname2 IN THE SYNCPOINT PROCESSING OF LUWID lwid WITH CONVERSATION CORRELATOR convcorr. syncpoint-message-in-error. THE SYNCPOINT PROCESSING WAS TERMINATED.

**Explanation:** The local LU has detected a response sent by the partner LU that violates the syncpoint exchange protocol during the syncpoint processing of a logical unit of work.

In the message text:

*luname1*  The network-qualified name of the partner LU that violated the syncpoint exchange protocol

*luname2*  The network-qualified name of the LU that detected the protocol violation

 lwid  A unique identifier that distinguishes one logical unit of work from another for the purposes of accounting, network management, and resynchronization.

*convcorr*  A value that uniquely identifies the branch of the transaction tree for which the syncpoint exchange is being conducted.

*syncpoint-message-in-error*  One of the following:

- NO PS HEADER WAS RECEIVED
- EXPECTED PS HEADER WAS NOT RECEIVED
- EXPECTED STATUS WAS NOT RECEIVED
- UNEXPECTED RETURN CODE WAS RECEIVED
- UNEXPECTED DATA WAS RECEIVED
CONVERSATION STATE WAS INVALID

System action: Syncpoint processing continues, but APPC/MVS deallocates the protected conversation and the state of the distributed resources is unknown; a heuristic condition might exist. If the TPs involved in the deallocated conversation use the Error_Extract service, they will receive message ATB80134I, which indicates why the conversation was terminated during the syncpoint operation.

Operator response: Notify the system programmer or the operator at luname1 to determine the cause of the protocol violation.

Module: ATBPCBO, ATBPCCM, ATBPCDS, ATBPCEF, ATBPCEU ATBPCPR

Source: APPC/MVS

Descriptor Code: 4

Automation: This message cannot be automated. System programmer action is required.

ATB221I AN ATRSUSI CALL ISSUED TO SET side_information HAS FAILED. INTERNAL REASON CODE = rsncode.

Explanation: APPC/MVS issued a call to the ATRSUSI service, which is a service of the system syncpoint manager (RRS). The call failed. When such a failure is detected during a syncpoint exchange, the system cannot perform logical unit of work management (that is, back out the next LUWID, or dismantle the syncpoint tree), as specified by the LU 6.2 syncpoint architecture.

In the message text:

side_information
One of the following:
DRIVE BACKOUT
BREAK TREE

rsncode The code returned by the ATRSUSI service. Codes from this service are documented in z/OS MVS Programming: Resource Recovery.

System action: APPC/MVS terminates the syncpoint processing for the logical unit of work luwid with the conversation correlator convcorr.

Operator response: Notify the system programmer.

System programmer response: Search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center, and provide the dump that was taken when the error occurred.

Programmer response: The application program should backout all local resources associated with the next unit of recovery and abnormally deallocate all APPC/MVS protected conversations associated with the next unit of recovery to cause all remote resources associated with the local application to backout also.

Module: ATBPCBO, ATBPCCM, ATBPCDS, ATBPCEF, ATBPCEU, ATBPCPR

Automation: Trap the reason code from ATRSUSI and translate it into text. Notify the system programmer.

ATB222I LOGICAL UNIT luname ATTEMPTED A SYSTEM LOGGER SERVICE FOR A LOGSTREAM THAT HAS NOT BEEN DEFINED. THE LOGSTREAM NAME IS: logstream_name.

Explanation: APPC/MVS received an error from system logger while attempting to access the APPC/MVS log stream. The system logger return and reason codes indicate that the APPC/MVS log stream has not been defined to the system. Without a log stream, APPC/MVS cannot process protected conversations (conversations with a synchronization level of syncpt).

In the message text:
**ATB223I • ATB224I**

*luname*  The APPC/MVS LU that attempted to access the log stream.

*logstream_name*  The name of the APPC/MVS log stream.

**System action:**  APPC/MVS logical units continue processing conversations with a synchronization level of none or confirm, but cannot process any protected conversations.

**Operator response:**  Notify the system programmer.

**System programmer response:**  To correct the problem, define the APPC/MVS log stream as documented in z/OS MVS Planning: APPC/MVS Management. Then, reactivate the LU through either:

- Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for this LU; or
- Entering a VTAM VARY INACT command, followed by a VARY ACT command for this LU.

**Module:**  ATBPCRR

**Source:**  APPC/MVS

**Routing Code:**  2

**Descriptor Code:**  4

**Automation:**  This message cannot be automated. System programmer action is required.

---

**ATB223I**  APPC/MVS ENCOUNTERED INTERNAL ERRORS WHILE ISSUING A LOGGING SERVICE. LOGGING SERVICES ARE NOT AVAILABLE.

**Explanation:**  This message is issued when an APPC/MVS internal error occurs while initializing the logging service or performing logging of protected conversation information. Because the logging service is not available, APPC/MVS cannot process any protected conversations (conversations with a synchronization level of syncpt).

**System action:**  APPC/MVS issues an SVC dump. APPC/MVS logical units continue processing conversations with a synchronization level of none or confirm, but cannot process any protected conversations.

**Operator response:**  Notify the system programmer.

**System programmer response:**  Search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center, and provide the dump that was taken when the error occurred.

**Module:**  ATBPCLT

**Source:**  APPC/MVS

**Routing Code:**  2

**Descriptor Code:**  4

**Automation:**  This message cannot be automated. System programmer action is required.

---

**ATB224I**  BECAUSE OF AN INTERNAL ERROR, LOGICAL UNIT *luname* IS ACTIVE, BUT WILL REJECT ALL PROTECTED CONVERSATIONS.

**Explanation:**  An internal error occurred while APPC/MVS was initializing the logical unit *luname*. A system dump might accompany this message.

The LU can process only conversations with a synchronization level of none or confirm.

In the message text:

*luname*  The name of the logical unit that APPC/MVS was initializing.

**System action:**  APPC/MVS activates the LU, which is capable of processing only conversations with a synchronization level of none or confirm.

**Operator response:**  Notify the system programmer.

**System programmer response:**  To correct the problem, follow the responses for the ATB message or EC7 abend reason code that accompanies ATB224I. Then, reactivate the LU through either:
ATB225I • ATB226I

• Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for this LU; or
• Entering a VTAM VARY INACT command, followed by a VARY ACT command for this LU.

If the error persists, search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center with the dump that was taken when the error occurred.

Module: ATBLUPR
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 4
Automation: Follow the directions given for the accompanying ATB message or the abend EC7 reason code. Collect the dump. Reactivate the LU.

---

ATB225I

LOGICAL UNIT luname IS ACTIVE, BUT WILL REJECT ALL PROTECTED CONVERSATIONS BECAUSE OF A FAILURE RETURN CODE FROM THE service SERVICE. RETURN CODE IS retcode.

Explanation: While trying to initialize a logical unit, APPC/MVS received an error return code from registration services or from an RRS service.

In the message text:

luname  The name of the logical unit that APPC/MVS was initializing
service  The name of the registration service or RRS service that returned the non-zero return code
retcode  The return code from the registration service

System action: APPC/MVS activates the LU, but it can process only conversations with a synchronization level of none or confirm.

Operator response: Notify the system programmer.

System programmer response: To correct the problem, follow the response for the registration service reason code, which is described in [z/OS MVS Programming: Resource Recovery]. Then, reactivate the LU through either:

• Issuing a SET command for a parmlib member with an LUDEL statement, followed by a SET command for a parmlib member with an LUADD for this LU; or
• Entering a VTAM VARY INACT command, followed by a VARY ACT command for this LU.

If the error persists, search the problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: ATBLUPR
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 4
Automation: This message cannot be automated. System programmer action is required.

---

ATB226I

LOGICAL UNIT luname IS ACTIVE, BUT WILL REJECT ALL PROTECTED CONVERSATIONS UNTIL RRS/MVS NOTIFIES APPC/MVS ABOUT THE STATUS OF RESOURCE MANAGER EXITS.

Explanation: APPC/MVS has activated an LU, but cannot allow it to process protected conversations until the system syncpoint manager (RRS) communicates the status of resource manager exits. This is a temporary condition that APPC/MVS will correct, once it receives notification from RRS.

In the message text:
luname  The name of the logical unit that APPC/MVS activated
ATB227I • ATB229E

System action:  APPC/MVS activated the LU, but it can process only conversations with a synchronization level of none or confirm.

Operator response:  If the system does not issue an ATB201I message for this LU, notify the system programmer.

System programmer response:  If the LU does not become capable of processing protected conversations, search the problem reporting data bases for a fix to the problem. If no fix exists, contact the IBM Support Center.

Module:  ATBLUPR
Source:  APPC/MVS
Routing Code:  Hardcopy only
Descriptor Code:  4

Automation:  Suppress this message. Wait for message ATB201I to be issued within 5 minutes. If it is not issued, notify the system programmer.

ATB227I  LOCAL LU luname IS log-status AS A RESOURCE MANAGER WITH RRS/MVS. LOCAL LOG: locales

Explanation:  Local LU luname has begun resource manager restart processing with the system syncpoint manager (RRS).

In the message text:

luname  The name of the logical unit that is beginning resource manager restart processing with the system syncpoint manager (RRS).

log-status

COLD STARTING
The local LU is cold starting because RRS is cold starting.

WARM STARTING
The local LU is warm starting because RRS is warm starting.

locales  The name of the local LU log.

System action:  The system continues processing. Upon completion of resource manager restart processing, the local LU will initiate resynchronization for incomplete units of recovery if any are returned by the syncpoint manager and will process conversations with a synchronization level of syncpt.

Operator response:  None.

System programmer response:  None.

Module:  ATBPCRS
Source:  APPC/MVS
Routing Code:  2
Descriptor Code:  4

ATB229E  APPC/MVS WAS NOT ABLE TO RESYNCHRONIZE THE INCOMPLETE UNIT OF RECOVERY urid IN IN-DOUBT STATE. MANUAL INTERVENTION IS REQUIRED TO RESOLVE THIS UR.

Explanation:  The contents of the APPC/MVS logstream cannot be used to resolve incomplete units of recovery in in-doubt state. The logstream may have been deleted and redefined or an internal APPC/MVS error has occurred. As a result, APPC/MVS is unable to automatically resynchronize these URs when the LU is reinitialized.

In the message text:

luname  The name of the logical unit that is beginning resource manager restart processing with the system syncpoint manager (RRS).

urid  The unit of recovery that is in in-doubt state.

System action:  The unit of recovery remains in in-doubt state until manual intervention resolves it. APPC/MVS will not perform resynchronization for this UR.

Operator response:  None.
ATB275I • ATB277E

System programmer response:  Go to the RRS administration panels and resolve the in-doubt UR identified by urid. For more information on how to use these panels, see z/OS MVS Programming: Resource Recovery.

Module:   ATBPCRR
Source:   APPC/MVS
Routing Code:   2
Descriptor Code:   7,11
Automation:  Use the RRS administration panels to resolve the in-doubt UR. Check the logrec data set for additional information.

ATB275I  SIDEINFO KEYWORD WAS NOT PROCESSED DUE TO SYSTEM ERROR. REASON
CODE=reason-code

Explanation:  The Advanced Program-to-Program Communication (APPC) side information file could not be used because of a system error.

In the message text:

reason-code
The hexadecimal reason code from dynamic allocation.

System action:  If the error occurs while the system is processing a START command, the system does not process allocate requests that require side information. If the error occurs while the system is processing a SET command, the system continues processing with the side information file it was using before the operator entered the SET command.

Operator response:  Enter the START or SET command again. If the error occurs again, notify the system programmer.

System programmer response:  If the problem persists, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:   ATBSD93
Source:   APPC/MVS
Routing Code:   2
Descriptor Code:   3

ATB277E  SIDEINFO KEYWORD IGNORED. DATA SET WAS NOT OPENED SUCCESSFULLY.

Explanation:  To process a SET or START command, the system tried to process an OPEN macro. While the system was processing the OPEN macro, an error occurred.

System action:  If the error occurs while the system is processing a START command, the system does not process requests that require side information. If the error occurs while the system is processing a SET command, the system continues processing with the side information file it was using before the operator entered the SET command.

Operator response:  Enter the START or SET command again.

System programmer response:  Ensure that the Systems Application Architecture® (SAA) common programming interface (CPI) communications side information data set specified in parmlib is correct.

Module:   ATBDF30
Source:   APPC/MVS
Routing Code:   2
Descriptor Code:   3
ATB278E  LOGICAL UNIT unitname NOT ADDED. TP PROFILE DATA SET WAS NOT OPENED SUCCESSFULLY.

Explanation: To process a SET or START command, the system tried to process an OPEN macro. While the system was processing the OPEN macro, an error occurred.

System action: The system does not add or modify the LU in the system configuration.

Operator response: After the system programmer corrects the problem, enter the SET command again.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: ATBDF30
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 3

ATB279I SIDEINFO KEYWORD IGNORED. DATA SET SPECIFIED IS ALREADY THE ACTIVE SIDEINFO DATA SET.

Explanation: An Advanced Program-to-Program Communication (APPC) side information file is already active on the system. The file was processed by a previous SET command.

System action: The system continues processing.

Module: ATBSD93
Source: APPC/MVS
Routing Code: 2
Descriptor Code: 3

ATB280E SIDEINFO KEYWORD IGNORED. SIDEINFO DATA SET WAS NOT ALLOCATED. REASON CODE=reason-code

Explanation: The system could not allocate the side information file.

In the message text:

reason-code
The hexadecimal reason code from dynamic allocation.

System action: The system continues processing.

Source: APPC/MVS
Routing Code: 2
Descriptor Code: 3

ATB281E LOGICAL UNIT unitname NOT ADDED. TP PROFILE DATA SET WAS NOT ALLOCATED. REASON CODE=reason-code

Explanation: To process a SET or START command, the system tried to open the transaction program (TP) data set. The TP data set was not allocated.

In the message text:

unitname
The logical unit (LU) name.

reason-code
The hexadecimal reason code from dynamic allocation.

System action: The system does not add or modify the LU in the system configuration.
ATB300E  ATB302I

Operator response: After the system programmer corrects the problem, enter the SET command again.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: ATBDF30
Source: APPC/MVS
Routing Code: 2

ATB342I  Start of JCL messages.
Explanation: This message marks the start of the JCL messages for the APPC/MVS administration utility.
System action: The system continues processing.
Module: ATBSDFMR
Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB343I  End of JCL messages.
Explanation: This message marks the end of the JCL messages for the APPC/MVS administration utility.
System action: The system continues processing.
User response: If all preceding JCL messages for the APPC/MVS administration utility are informational, no action is necessary. Otherwise, correct any errors in the JCL and resubmit the request.
Module: ATBSDFMR
Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -
ATB345I  *keyword* *keyword must not be entered as part of Scheduler Data.*

**Explanation:** The APPC/MVS administration utility encountered a keyword in the wrong place in the transaction program (TP) scheduler section of the request. See [z/OS MVS Planning: APPC/MVS Management](https://www.ibm.com) for more information on the placement of keywords.

In the message text:

*keyword* The APPC/MVS administration utility found the ACTIVE keyword in the wrong place.

**System action:** The APPC/MVS administration utility does not process the request containing the out of place keyword. Processing continues with the next request.

**User response:** Correct the placement of the ACTIVE request and resubmit it.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

ATB346I  Error - GENERIC_ID required when TPSCHED_TYPE is MULTI-TRANS.

**Explanation:** An attempt was made to add a MULTI_TRANS transaction program (TP) Profile without giving a GENERIC_ID.

**System action:** The request fails.

**User response:** Resubmit the request with a GENERIC_ID.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

ATB347I  Error - SYSTEM, USERID and GROUPID keywords are mutually exclusive.

**Explanation:** Two or more of the following mutually exclusive keywords have been entered:

- GROUPID
- SYSTEM
- USERID

**System action:** The request fails but the job continues processing.

**User response:** Change the job to contain only one of the keywords.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

ATB348I  Required keyword(s) missing from *request* request.

**Explanation:** The APPC/MVS administration utility cannot process a request because one or more required keywords are missing.

In the message text:

*request* The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
For example, SIADD requires the DESTNAME, MODENAME, PARTNER_LU, and TPNAME keywords. If any of these keywords is missing, message ATB348I is issued. For information on required keywords, see [z/OS MVS Planning: APPC/MVS Management].

**System action:** The APPC/MVS administration utility does not process the request but continues processing with the next request.

**User response:** Include the required keywords in the request and resubmit the job.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

**ATB349I**  
**Unrecognized line encountered:**

**Explanation:** The APPC/MVS administration utility encountered unexpected input.

**System action:** The request fails but the job continues processing.

**User response:** This message is followed by message ATB301I indicating the line in error. Correct the line and resubmit the request.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

**ATB350I**  
**Unrecognized keyword on request line:**

**Explanation:** The APPC/MVS administration utility encountered an incorrect keyword while processing a request.

In the message text:

**request** The APPC/MVS administration utility request was one of the following:

- TPADD
- TPALIAS
- TPDELETE
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

**System action:** The APPC/MVS administration utility does not process this request but continues processing with the next request. Message ATB301I follows this message showing the line containing the incorrect keyword.

**User response:** If necessary, correct the request containing the incorrect keyword and resubmit it.

**Source:** APPC/MVS
ATB351I • ATB353I

Routing Code:  Note 11
Descriptor Code:  -

ATB351I  Operation expected - unrecognized line encountered:

Explanation:  The APPC/MVS administration utility encountered unrecognized data on the first line of an APPC/MVS administration utility job. The first line of an APPC/MVS administration utility job has to be a request.

System action:  The request fails, but processing continues with the next request. The APPC/MVS administration utility issues message ATB301I to display the unrecognized data.

User response:  Ensure that the first line in the APPC/MVS administration utility job is a request. Resubmit the job.

Source:  APPC/MVS
Routing Code:  Note 11
Descriptor Code:  -

ATB352I  keyword keyword must be entered as part of Scheduler Data.

Explanation:  A keyword was entered outside of the Scheduler Data section of the transaction program (TP) Profile.

In the message text:

keyword  The keyword that must be entered as part of Scheduler Data is one of the following:
  • CLASS
  • DATA_CLASS
  • DATASET_STATUS
  • GENERIC_ID
  • JCL_DELIMITER
  • KEEP_MESSAGE_LOG
  • MANAGEMENT_CLASS
  • MESSAGE_DATA_SET
  • STORAGE_CLASS
  • TAILOR_SYSOUT
  • TAILOR_ACCOUNT

System action:  The request fails but the job continues processing.

User response:  Move the specified keyword to the Scheduler Data section by placing it between the TPSCHED_DELIMITER(xxxx) and the delimiter end.

Source:  APPC/MVS
Routing Code:  Note 11
Descriptor Code:  -

ATB353I  Maximum length allowed for keyword is length.

Explanation:  Data given for the specified keyword exceeds the maximum allowable length.

In the message text:

keyword  The keyword that was specified incorrectly is one of the following:
  • ACTIVE
  • CLASS
  • DATA_CLASS
  • DATASET_STATUS
  • DBTOKEN
  • DESTNAME
ATB354I

- GENERIC_ID
- GROUPID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNNAME
- TPSCHED_EXIT
- TPSCHED_DELIMITER
- USERID

**length**  The maximum allowable length for the keyword.

**System action:** The request fails but the job continues processing.

**User response:** See [z/OS MVS Planning: APPC/MVS Management](https://www.ibm.com/support/knowledgecenter/ST41U_2.2.0/com.ibm.zos.v2r2.iseries.doc.mvs/aoc9i/8406.html) for information on the keyword. Correct the keyword and resubmit the request.

**Source:** APPC/MVS

**Routing Code:**  Note 11

**Descriptor Code:** -

---

ATB354I  **Minimum length allowed for** keyword **is** length.

**Explanation:** Data given for the specified keyword is shorter than the minimum allowable length.

In the message text:

**keyword**  The keyword that was specified incorrectly is one of the following:

- ACTIVE
- CLASS
- DATA_CLASS
- DATASET_STATUS
- DBTOKEN
- DESTNAME
- GENERIC_ID
- GROUPID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNNAME
- TPSCHED_EXIT
Keyword value is not valid for keyword keyword:

Explanation: The data given for the specified keyword is not valid.

In the message text:

keyword The keyword that was specified incorrectly is one of the following:

- ACTIVE
- CLASS
- DATA_CLASS
- DATASET_STATUS
- DBTOKEN
- DESTNAME
- GENERIC_ID
- GROUPID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- SYSTEM
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNAME
- TPSCHED_EXIT
- TPSCHED_DELIMITER
- TPSCHED_TYPE
- USERID

System action: The request fails but the job continues processing.

User response: Correct the keyword and resubmit the request. Refer to z/OS MVS Planning: APPC/MVS Management for a description of the allowable data for the specified keyword.

Source: APPC/MVS

Routing Code: Note 11

Descriptor Code: -
ATB356I • ATB357I

ATB356I  Duplicate entry found for *keyword* keyword.

Explanation:  The APPC/MVS administration utility encountered the specified keyword twice.  

In the message text:

*keyword*  The keyword that was encountered twice is one of the following:
- ACTIVE
- CLASS
- DATA_CLASS
- DATASET_STATUS
- DBTOKEN
- DESTNAME
- GENERIC_ID
- GROUPID
- JCL_DELIMITER
- KEEP_MESSAGE_LOG
- MANAGEMENT_CLASS
- MESSAGE_DATA_SET
- MODENAME
- PARTNER_LU
- STORAGE_CLASS
- SYSTEM
- TAILOR_SYSOUT
- TAILOR_ACCOUNT
- TPNNAME
- TPSCHED_EXIT
- TPSCHED_DELIMITER
- USERID

System action:  The request fails.  The APPC/MVS administration utility continues processing the job.

User response:  Remove one of the duplicate keywords.  Resubmit the request.

Source:  APPC/MVS

Routing Code:  Note 11

Descriptor Code:  -

ATB357I  Keyword not recognized for *request* request:

Explanation:  The APPC/MVS administration utility encountered a keyword that is incorrect for the given request.  

In the message text:

*request*  The APPC/MVS administration utility request was one of the following:
- TPADD
- TPALIAS
- TPDELETE
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIMODIFY
- SIRETRIEVE
ATB358I • ATB361I

- DBRETRIEVE
- DBMODIFY

**System action:** The request fails. The APPC/MVS administration utility continues processing the job. The system issues message ATB301I showing the keyword that is incorrect.

**User response:** Refer to [z/OS MVS Planning: APPC/MVS Management](#) for the expected keywords for requests. Correct the syntax of the request and resubmit it.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

**ATB358I**  
**keyword** keyword may not have an associated parameter:

**Explanation:** The APPC/MVS administration utility encountered a keyword with an associated parameter. The keyword may not have an associated parameter.

In the message text:

`keyword` The keyword in error is the SYSTEM keyword.

**System action:** The request fails. The APPC/MVS administration utility continues processing the job. The system issues message ATB301I showing the keyword that is incorrect.

**User response:** Refer to [z/OS MVS Planning: APPC/MVS Management](#) for the correct syntax for the SYSTEM keyword. Correct the syntax of the request and resubmit it.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

**ATB360I**  
Failed to locate Alternate Transaction Scheduler Exit: `module`

**Explanation:** While processing a TPADD or TPMODIFY request of a non-ASCH transaction program (TP) Profile, the system could not locate the alternate transaction scheduler exit specified with the TPSCHED_EXIT keyword.

In the message text:

`module` The name of the alternate transaction scheduler exit that could not be found.

**System action:** The request fails. The APPC/MVS administration utility continues processing the job.

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**User response:** Ensure that the alternate transaction scheduler exit is not misspelled. Contact the system programmer for further help.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

**ATB361I**  
Alternate Transaction Scheduler Exit is not authorized: `module`.

**Explanation:** The alternate transaction scheduler exit specified with the TPSCHED_EXIT keyword is not authorized.

The transaction scheduler exit must meet all the following conditions:

- Reside in LPA or in the LINKLIST concatenation (for example, SYS1.LINKLIB)
- Be in an APF-authorized STEPLIB
- Be linkededit with attributes reusable and reentrant.

In the message text:
**module**  The name of the alternate transaction scheduler exit

**System action:**  The request fails but the job continues processing.

**User response:**  Contact the system programmer for assistance.

**Source:**  APPC/MVS

**Routing Code:**  Note 11

**Descriptor Code:**  -

---

**ATB362I**  TP ALIAS already exists.

**Explanation:**  The APPC/MVS administration utility encountered a transaction program (TP) alias that was already in use for this TP NAME.

**System action:**  The APPC/MVS administration utility does not add the requested alias for this TP name but continues processing the rest of the job.

**User response:**  If necessary, choose another alias for this TP name.

**Source:**  APPC/MVS

**Routing Code:**  Note 11

**Descriptor Code:**  -

---

**ATB363I**  Severe error returned from APPC administration utility.

**Explanation:**  The APPC/MVS administration utility encountered an internal error.

**System action:**  The job fails, but the APPC administration tries processing the next job. The system issues an SVC dump.

**System programmer response:**  Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

**Source:**  APPC/MVS

**Routing Code:**  Note 11

**Descriptor Code:**  -

---

**ATB364I**  TP profile already exists.

**Explanation:**  The APPC/MVS administration utility encountered a request to add a transaction program (TP) profile for a TP name and level that already exists.

**System action:**  The APPC/MVS administration utility does not add the requested TP profile. Processing continues with the next request.

**User response:**  Determine why there are two TP profiles with the same name and level. If necessary, choose a different name for the TP profile you are trying to add and resubmit the request.

**Source:**  APPC/MVS

**Routing Code:**  Note 11

**Descriptor Code:**  -

---

**ATB365I**  Side information already exists.

**Explanation:**  The APPC/MVS administration utility encountered a request to add a side information entry that already exists to a side information file.

**System action:**  The APPC/MVS administration utility does not add the requested side information destination name. Processing continues with the next request.

**User response:**  Determine why there are two identical side information entries for this side information data set. If necessary, choose a different side information destination name and resubmit the request.
ATB366I  Syntax error in TP profile JCL.

Explanation: The APPC/MVS administration utility found an error in the JCL for the transaction program (TP) profile.

System action: The APPC/MVS administration utility issues messages ATB320I and ATB321I to show the start and end of the statement image records containing the JCL error. The APPC/MVS administration utility does not process this request but continues processing with the next request.

User response: Look in the statement image records for the JCL error. Correct the error and resubmit the job.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB367I  TP profile not added, dataset full.

Explanation: The APPC/MVS administration utility cannot add a requested transaction program (TP) profile to the TP profile data set. This problem is caused by one of the following:

• The TP profile data set is already full.
• The TP profile data set will be too full if the APPC/MVS administration utility adds this TP profile to the data set.
• The number of records for this TP profile exceeds the maximum limit defined for this TP profile data set.

System action: The APPC/MVS administration utility does not add the requested TP profile to the data set. Processing continues with the next request.

User response: Do the following:
1. Look at the data set definition for the TP profile data set. Check to see whether the number of records for the requested TP profile exceeds the maximum. See z/OS MVS Planning: APPC/MVS Management for more information.
2. If the record length of the requested TP profile fits the data set definition, use the REPRO command to copy the VSAM KSDS containing the TP profile data set into a larger object. For more information on the REPRO command, see z/OS DFSMS Access Method Services Commands. Then resubmit the job using the larger VSAM KSDS.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB368I  Side information not added, dataset full.

Explanation: The APPC/MVS administration utility cannot add the requested side information. Either the side information file is already full or would be full if the APPC/MVS administration utility adds this entry.

System action: The APPC/MVS administration utility does not add the requested side information to the data set. Processing continues with the next request.

User response: Use the REPRO command to copy the VSAM KSDS containing the side information file into a larger object. For more information on the REPRO command, see z/OS DFSMS Access Method Services Commands. Then resubmit the request using the larger VSAM KSDS.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -
ATB369I  Insufficient authority to perform request.

Explanation: The APPC/MVS administration utility found that the user had no Resource Access Control Facility (RACF) authority to perform the request on this transaction program (TP) profile or side information.

In the message text:

request  The APPC/MVS administration utility request was one of the following:
- TPADD
- TPALIAS
- TPDELETE
- TPKEYS
- TPMODIFY
- TPRETRIEVE
- SIADD
- SIDELETE
- SIKEYS
- SIMODIFY
- SIRETRIEVE
- DBRETRIEVE
- DBMODIFY

System action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User response: If it is necessary to perform the request on this TP profile or side information, see your RACF administrator.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB370I  Second TP profile name specified is an alias.

Explanation: The APPC/MVS administration utility encountered a request to add an alias for a transaction program (TP) name that is already an alias. You cannot have an alias for an alias.

System action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User response: Find out what the second TP profile name is an alias for using the TPRETRIEVE request.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB371I  Specified TP profile not found.

Explanation: The APPC/MVS administration utility could not find the transaction program (TP) name specified in a request. This can be due to one of the following errors:
- The TP name is misspelled in the TP profile
- The APPC/MVS administration utility job specified the wrong TP profile data set
- This TP name does not exist

System action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User response: Submit a TPKEYS request to retrieve all the TP names defined in this data set. If necessary, resubmit the request using a correct TP name.
ATB372I  Specified side information not found.

Explanation: The APPC/MVS administration utility could not find the side information destination name specified in a request. This can be due to one of the following errors:

- The side information destination name was misspelled
- The APPC/MVS administration utility job specified the wrong side information file
- This side information destination name does not exist

System action: The APPC/MVS administration utility does not process this request but continues processing with the next request.

User response: Submit a SIKEYS request to find the entries defined in this data set. If necessary, correct the error and resubmit the request.

Routing Code: Note 11
Descriptor Code: -

ATB374I  The TP profile is registered for test.

Explanation: During processing of a TPDELETE request, the APPC/MVS administration utility found that the transaction program (TP) profile is registered for the Time Sharing Option Extensions (TSO/E) TEST command. The APPC/MVS administration utility cannot delete the TP profile until it is unregistered.

System action: The APPC/MVS administration utility does not process this request, but continues processing with the next request.

User response: Ensure that the TP profile is unregistered and then resubmit the request to delete it.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB375I  TPMODIFY of an alias TP profile is not allowed.

Explanation: The APPC/MVS administration utility could not process a TPMODIFY request to modify an alias transaction program (TP) profile. You cannot modify an alias TP profile name. A TPMODIFY is only valid for the TP profile itself.

System action: The APPC/MVS administration utility does not process this request, but continues processing with the next request.

User response: Change the TPMODIFY request to modify the TP profile rather than the alias and resubmit the request.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB376I  SCHED_EXIT may not be changed from non-ASCH to ASCH.

Explanation: The APPC/MVS administration utility encountered a TPMODIFY request that is not valid. You cannot use a TPMODIFY request to change the scheduler for a TP profile.

System action: The APPC/MVS administration utility does not process this request but continues processing with the next request.
**User response:** Delete the TP profile and then submit a TPADD request with the new scheduler name for this TP profile.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:**

**ATB378E**  
Error getting APPC administration utility storage - Getmain RC: *return-code*.

**Explanation:** The APPC/MVS administration utility encountered an error while attempting to obtain storage.

In the message text:

*return-code*

The return code from the GETMAIN macro (in decimal).

**System action:** The APPC/MVS administration utility job ends.

**Operator response:** Notify the system programmer. Obtain an ABEND dump.

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the ABEND dump and the GETMAIN macro return code.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:**

---

**ATB380E**  
APPC admin. utility error - Keyword table contains unknown type for *keyword*.

**Explanation:** An internal error has occurred in the APPC administration utility.

**System action:** The request fails. The APPC/MVS administration utility continues processing the job.

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the ABEND dump, if available.

**User response:** Obtain an ABEND dump if possible. Notify the system programmer.

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:**

---

**ATB381E**  
No match found for the following *delimiter_type* value:

**Explanation:** The APPC/MVS administration utility found a delimiter missing in the input while processing a request. The APPC/MVS administration utility cannot process the request without the missing delimiter.

In the message text:

*delimiter_type*

The delimiter missing from the input can be one of the following types:

**TPSCHED_DELIMITER**

Marks the start and end of scheduler statements in the input.

**JCL_DELIMITER**

Marks the start and end of the JCL in the input.

**System action:** The APPC/MVS administration utility does not process the request containing the error, but does process the next request, if one exists. The APPC/MVS administration utility issues message ATB301I after this message showing the JCL delimiter that is missing its matching delimiter.

**User response:** Add the missing JCL delimiter to the TP profile JCL and resubmit the request.

**Source:** APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB383E  Unknown error from APPC administration utility for request: RC = return-code.

Explanation: The APPC/MVS administration utility encountered an internal error.
In the message text:

request  The APPC/MVS administration utility request was one of the following:
  - TPADD
  - TPALIAS
  - TPDELETE
  - TPKEYS
  - TPMODIFY
  - TPRETRIEVE
  - SIADD
  - SIDELETE
  - SIKEYS
  - SIMODIFY
  - SIRETRIEVE
  - DBRETRIEVE
  - DBMODIFY

return-code  The reason code for the error.

System action: The job fails, but processing continues with the next job. The system issues an SVC dump.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the text of this message.

Routing Code: Note 11
Descriptor Code: -

ATB386E  APPC administration utility error - keyword not recognized:

Explanation: The APPC/MVS administration utility encountered an internal error.

System action: The job fails, but processing continues with the next job. The APPC/MVS administration utility issues message ATB301I after this message to display the unrecognized data where a keyword was expected. The system issues an SVC dump.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the text of message ATB301I.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB389E  Error opening ddname file.

Explanation: The APPC/MVS administration utility encountered an error while trying to open a data set.

In the message text:

ddname  The name of the data set that the APPC/MVS administration utility could not open is one of the following:
- SYSSDLIB
- SYSSDOUT
- SYSPRINT

System action: The job fails.

User response: If the data set is SYSSDLIB, it is the Virtual Storage Access Method (VSAM) key sequenced data set (KSDS) that contains the transaction program (TP) profile or side information entries. For information about opening a VSAM KSDS, see z/OS DFSMS Access Method Services Commands.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -
ATB390E  Required *ddname* file is not allocated.

Explanation: The APPC/MVS administration utility could not allocate a data set.

In the message text:

*ddname* The name of the data set that the APPC/MVS administration utility could not allocate is one of the following:

- SYSSDLIB
- SYSSDOUT
- SYSPRINT

System action: The job fails.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

User response: This problem may be due to a typographical error. Check the data set names in the job stream. Otherwise, notify the system programmer.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

Explanation: The APPC/MVS administration utility encountered an internal error.

In the message text:

*return-code* The return code from SVC 99 (in decimal).

System action: The job fails.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -

ATB392E  Error reading record from dataset: *ddname*.

Explanation: The APPC/MVS administration utility encountered an error while trying to read from a data set.

In the message text:

*ddname* The name of the data set from which the APPC/MVS administration utility could not read is one of the following:

- SYSSDLIB
- SYSSDOUT
- SYSPRINT

System action: The job fails.

User response: If the name of the data set is SYSSDLIB, ensure that the keyed sequential data set (KSDS), to which SYSSDLIB is pointing, is not corrupted.

Issue the DIAGNOSE command to determine the error. For more information, see z/OS DFSMS Managing Catalogs.

Source: APPC/MVS
Routing Code: Note 11
Descriptor Code: -
Error writing to dataset: *ddname*.

**Explanation:** The APPC/MVS administration utility encountered an error while trying to write to a data set.

In the message text:

*ddname* The name of the data set to which the APPC/MVS administration utility could not write is one of the following:

- SYSSDLIB
- SYSSDOUT
- SYSPRINT

**System action:** The job fails.

**User response:** If the name of the data set is SYSSDLIB, make sure that the keyed sequential data set (KSDS), to which SYSSDLIB is pointing, is not corrupted.

Issue the DIAGNOSE command to determine the error. For more information, see [z/OS DFSMS Managing Catalogs](https://www.ibm.com/support/knowledgecenter/SG2478_2.4.0/com.ibm.zos.var1.r2.4/clr_dfsms_mct_anw.html).

**Descriptor Code:** -

---

APPC administration utility error - I/O action requested is not valid: *action*.

**Explanation:** The APPC/MVS administration utility encountered an I/O error.

In the message text:

*action* The requested I/O action that failed, one of the following:

- I Read-type operation
- O Write-type operation

**System action:** The job fails. The system issues other messages further describing the error.

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**User response:** Follow the user response(s) in the accompanying message(s).

**Source:** APPC/MVS

**Routing Code:** Note 11

**Descriptor Code:** -

---

Error loading *module* - Module Load RC: *return-code*.

**Explanation:** An error occurred while trying to load the alternate transaction scheduler exit.

In the message text:

*module* The module that could not be loaded.

*return-code* The return code from the LOAD macro (in decimal).

**System action:** The request fails. The APPC/MVS administration utility continues processing the job.

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**User response:** Contact the system programmer for assistance.

**Source:** APPC/MVS

**Routing Code:** Note 11
ATB397E  ATBSDFMU input PARM not recognized: TYPRUN.

Explanation: An input parameter on the TYPRUN statement was not recognized. The parameter must be one of the following:

- APPC
- RUN
- SCAN

RUN is the default if no parameter is specified.

System action: The system continues processing.

User response: Put a valid parameter on the TYPRUN statement. Resubmit the job.

Source: APPC/MVS

Routing Code: Note 11

Descriptor Code: -

ATB400I  APPC/MVS TEST SERVICES UNAVAILABLE. REASON= xxxxxxxx.

Explanation: Because errors occurred in the test services initialization process, test services will not be available until the next time Advanced Program-to-Program Communication (APPC) is started.

In the message text:

xxxxxxx

The reason code.

System action: The system continues processing without test services.

Operator response: Notify the system programmer.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: ATBTEIT

Source: APPC/MVS

Routing Code: 2

Descriptor Code: 4

ATB498I  API TRACES STARTED WITH THE DATA SET dsnname IN USE BY user WERE STOPPED BECAUSE OF A SEVERE INTERNAL ERROR

Explanation: The system encountered a severe error while processing an application program interface (API) trace record, and stopped the trace. Any API trace entries that were collected but not written to the data set might be lost. The error might be an I/O error, or an error in APPC/MVS.

In the message text:

dsnname     The data set for which all the API traces were stopped.

user         The user ID under which the ATBTRACE START request was issued for this data set.

System action: The system stops all active API traces associated with the data set. For an I/O error, the system issues messages with the prefix AHL, IEC, or IOS, along with this message. If no AHL, IEC, or IOS messages accompany ATB498I, the error is in APPC/MVS, and the system issues a dump of the APPC address space.

Operator response: Provide the system programmer with the dump or the I/O-related error messages. If possible, notify the user of the data set that API tracing activity has stopped.

System programmer response: If an I/O error was encountered, follow the instructions for the accompanying AHL, IEC, or IOS messages to correct the problem. Otherwise, search problem reporting databases for a fix for the problem.
**ATB499I • ATB500E**

If no fix exists, contact the IBM Support Center, and provide the dump.

**Programmer response:** If API tracing is still required, submit the ATBTRACE START request again. If an I/O error was encountered for the data set, allocate another data set on a different device and resubmit the ATBTRACE START request, specifying the name of the new data set.

**Module:** ATBVSTW  
**Source:** APPC/MVS  
**Routing Code:** 2  
**Descriptor Code:** 4

---

**ATB499I**  
**Explanation:** The system encountered a severe error while processing an ATBTRACE START or STOP request. APPC/MVS is not able to continue processing application program interface (API) trace requests because it has brought down the trace routine.

**System action:** The system stops all active API traces for all data sets, and requests a dump of the APPC address space.

**Operator response:** Provide the system programmer with the dump. If requested by the system programmer, bring down the APPC address space and restart APPC.

**System programmer response:** Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center, and provide the dump. If API tracing is still required, ask the operator to bring down the APPC address space and restart APPC.

**Module:** ATBVSTT  
**Source:** APPC/MVS  
**Routing Code:** 2  
**Descriptor Code:** 4

---

**ATB500E**  
**Explanation:** An internal error occurred.

In the message text:

```
return-code
```

A reason code associated with the error.

**System action:** The system issues an SVC dump. The system continues processing.

**Operator response:** Delete the current logical units. This action will prevent any new transaction programs (TPs) from entering the system while the TPs in progress quiesce. Once all the TPs have quiesced, restart APPC.

**System programmer response:** Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump and the reason code issued in this message.

**Source:** APPC/MVS  
**Routing Code:** 2

Chapter 3. ATR messages

ATR001I   SYSRRS COMPONENT TRACE OPTIONS ERROR. EXPECTED expected BEFORE seen

Explanation: The OPTIONS keyword provided on the TRACE command contained syntax errors.

In the message text:

expected
  is text that should have been specified.

seen
  is the last recognized text.

System action: RRS continues processing, but the SYSRRS component trace is not started.

Operator response: Correct any syntax errors in the OPTIONS keyword and issue the TRACE command again.

System programmer response: If component trace messages (prefix ITT) accompany this message, see the system programmer response for the ITT messages.

Module: ATRVMLEX
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR002I   SYSRRS COMPONENT TRACE OPTIONS ERROR. FOUND keyword INSTEAD OF ONE OF THESE EXPECTED KEYWORDS: keyword1 keyword2 keyword3 keyword4 keyword5 keyword6 keyword7 keyword8 keyword9 keyword10

Explanation: The operator issued the TRACE command to request RRS component tracing, but none of the expected keywords were found. The following list identifies keywords that might appear in the message and the kind of data expected:

NAME   Resource manager name was expected
LUWID   Logical unit of work identifier was expected
USER    User identifier was expected
END_OF_FILE   Indicates that text was found beyond the expected end of the input string.

In the message text:

keyword
  is the text that was found.

keyword1...keyword10
  is an expected keyword.

System action: RRS processing continues, but the SYSRRS component trace is not started.

Operator response: Correct any syntax errors in the OPTIONS keyword and issue the TRACE command again.

System programmer response: If component trace messages (prefix ITT) accompany this message, see the system programmer response for the ITT messages.

Module: ATRVMLEX

Descriptor Code: 12

ATR004I  SYSRRS COMPONENT TRACE FAILED USING PARMLIB MEMBER member, RC=ctracerc RSN=ctracersn. USING DEFAULT OPTIONS.

Explanation: RRS was unable to activate its component trace using the parmlib member named in the message.

In the message text:

member
is the name of the CTnRRSxx parmlib member name that contains SYSRRS component trace options.

ctracerc
is the return code from the CTRACE DEFINE macro.

ctracersn
is the reason code from the CTRACE DEFINE macro.

System action: RRS tries to activate its component trace using default component options.

Operator response: None

System programmer response: Verify that the specified parmlib member exists and contains no syntax errors. For explanation of the return and reason codes, see the description of the CTRACE macro in z/OS MVS Programming. If the parmlib member is correct, provide this message text to the IBM Support Center.

Module: ATRVMINT

**ATR051I**  
UNABLE TO CONNECT TO logstreamname, RC=retcode RSN=rsncode Diag1–4=diag1area diag2area diag3area diag4area

**Explanation:** In response to a request from a panel or ATRQSRV user, RRS tried to connect to the named log stream but was unable to do so. This message displays some System Logger diagnostic information regarding the previously issued RRS message.

In the message text:

- **logstreamname** is the name of an RRS log stream
- **retcode** is the return code from the IXGCONN macro.
- **rsncode** is the reason code from the IXGCONN macro.

**System action:** The report is ended.

**Operator response:** None

**System programmer response:** None

**User response:** Review the return code and reason code from the system logger service and fix the error. You can
find an explanation of the codes under IXGCONN in [IBM z/OS MVS Programming: Assembler Services Reference ABE-HSP].

**Module:** ATRFMLBC, ATRQMSRX  
**Source:** Resource recovery services (RRS)

---

**ATR052I**  
**Explanation:** In response to a request from a panel or ATRQSRV user, RRS tried to browse the named log stream but was unable to do so. This message displays some System Logger diagnostic information regarding the previously issued RRS message.

In the message text:
- `loggstreamname` is the name of an RRS log stream.
- `retcode` is the return code from the IXGBRWSE macro.
- `rsncode` is the reason code from the IXGBRWSE macro.

**System action:** The report is ended.  
**Operator response:** None  
**System programmer response:** None  
**User response:** Review the return code and reason code from the system logger service and fix the error. You can find an explanation of the codes under IXGBRWSE in [IBM z/OS MVS Programming: Assembler Services Reference ABE-HSP].

---

**ATR053I**  
**Explanation:** In response to a request from a panel or ATRQSRV user, RRS tried to browse the named log stream but was unable to do so. The named log stream is empty.

In the message text:
- `loggstreamname` is the name of an RRS log stream.
- `retcode` is the return code from the IXGBRWSE macro.
- `rsncode` is the reason code from the IXGBRWSE macro.

**System action:** The report is ended.  
**Operator response:** None  
**System programmer response:** None  
**User response:** If the log stream should have contained data, review the return code and reason code from the system logger service and fix the error. You can find an explanation of the codes under IXGBRWSE in [IBM z/OS MVS Programming: Assembler Services Reference ABE-HSP].

---

Chapter 3. ATR messages 135
ATR054I • ATR056I

ATR054I  BROWSE OF logstreamname FAILED, RC=retcode RSN=rsncode Diag1–4=diag1area diag2area diag3area diag4area

Explanation: When an RRS panel or ATRQSRV user was browsing the named RRS log stream, a system logger error occurred. This message displays some System Logger diagnostic information regarding the previously issued RRS message.

In the message text:

logstreamname
  is the name of an RRS log stream.

retcode
  is the return code from the IXGBRWSE macro.

rsncode
  is the reason code from the IXGBRWSE macro.

System action: The system continues generating the report, if possible.
Operator response: None
System programmer response: None
User response: Review the return code and reason code from the system logger service and fix the error. You can find an explanation of the codes under IXGBRWSE in z/OS MVS Programming: Assembler Services Reference ABE-HSP.
Module: ATRFMLBC, ATRQMSRX
Source: Resource recovery services (RRS)

ATR055I  NO ENTRIES MATCHED THE PROVIDED FILTERS

Explanation: An RRS panel or ATRQSRV user defined filters for a search, but none of the entries in the log stream matched the filters the user provided.
System action: The report is ended.
Operator response: None
System programmer response: None
User response: None
Module: ATRFMLBC, ATRQMSRX
Source: Resource recovery services (RRS)

ATR056I  numbytes BYTES OF THIS ENTRY WERE TRUNCATED WHEN LOGGED

Explanation: The size of the log entry exceeded the maximum buffer size defined for this log stream.

In the message text:

numbytes
  is the number of bytes, in hexadecimal, that were not logged

System action: The system continues to generate the report.
Operator response: None
System programmer response: Decide whether or not to increase the maximum buffer size of the log stream.
User response: None
Module: ATRFMLBC, ATRQMSRX
Source: Resource recovery services (RRS)
**ATR060I**  No information matches the selection criteria

**Explanation:**  An RRS panel or ATRQSRV user defined filters to search for one or more units of recovery (URs), but there were no URs that matched the filters the user provided.

**System action:**  The command is ended.

**Operator response:**  None

**System programmer response:**  None

**User response:**  None

**Module:**  ATRFMQRY

**Source:**  Resource recovery services (RRS)

---

**ATR061I**  ATRQUERY failed, rc=retcode rsn=rsncode

**Explanation:**  While processing a command from a panel or ATRQSRV user, RRS issued the ATRQUERY macro to obtain information on behalf of the user, but the ATRQUERY macro encountered an error.

In the message text:

*retcode* is the return code from the ATRQUERY macro.

*rsncode* is the reason code from the ATRQUERY macro.

**System action:**  The command is ended.

**Operator response:**  None

**System programmer response:**  None

**User response:**  Review the return code and reason code from the ATRQUERY macro and fix the error, then issue the command again. You can find an explanation of the codes in [ATRQUERY – Obtain RRS Information](https://www.ibm.com) in the [z/OS MVS Programming: Resource Recovery]

**Module:**  ATRFMQRY

**Source:**  Resource recovery services (RRS)

---

**ATR062I**  Command command is unknown.

**Explanation:**  An RRS panel user entered a character in the command selection field, but RRS does not recognize the character as a valid command.

In the message text:

*command* is the unrecognized character

**System action:**  The command is rejected.

**Operator response:**  None

**System programmer response:**  None

**User response:**  Enter the character for a valid command.

**Module:**  ATRFMURC

**Source:**  Resource recovery services (RRS)
ATR063I  Address space asid does not exist.

Explanation:  An RRS panel user supplied an address space identifier (ASID), but the specified address space does not exist.

In the message text:

asid

is the address space identifier (ASID).

System action:  The command is rejected.

Operator response:  None

System programmer response:  None

User response:  Enter a valid ASID.

Module:  ATRFMURC

Source:  Resource recovery services (RRS)

ATR064I  RRS is not active on this system.

Explanation:  An RRS panel or ATRQSRV user attempted to obtain information from RRS. RRS, however, is not active, so no information can be returned.

System action:  The command is rejected.

Operator response:  None

System programmer response:  None

User response:  When RRS is active, try the request again.

Module:  ATRFMURC, ATRFMRC

Source:  Resource recovery services (RRS)

ATR065I  A date is required if a time is given.

Explanation:  On the Log Stream Browse Selection panel, the user specified a before or after time but did not supply an associated date.

System action:  The request is rejected.

Operator response:  None

System programmer response:  None

User response:  Either specify the data required with the time or omit the time specification.

Module:  ATRFMLBC

Source:  Resource recovery services (RRS)

ATR066I  The luname has an invalid length.

Explanation:  On the Unit of Recovery Selection panel, the user specified a logical unit of work identifier (LUWID), but the length of the luname is not valid.

System action:  The request is rejected.

Operator response:  None

System programmer response:  None

User response:  Specify the luname correctly and issue the request again. The correct format of the input LUWID is:

netid.luname,instnum,seqnum

and the length of netid.luname must be from 1-17 bytes.
Module: ATRFMURC
Source: Resource recovery services (RRS)

ATR067I  A instance number was not found in the LUWID.
Explanation: On the Unit of Recovery Selection panel, the user specified a logical unit of work identifier (LUWID), but the LUWID did not specify an instance number, which is required.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Include the instance number in the LUWID and issue the request again. The correct format of the input LUWID is:
netid.luname,instnum,seqnum

Module: ATRFMURC
Source: Resource recovery services (RRS)

ATR068I  A sequence number was not found in the LUWID.
Explanation: On the Unit of Recovery Selection panel, the user specified a logical unit of work identifier (LUWID), but the LUWID did not specify a sequence number, which is required.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Include the sequence number in the LUWID and issue the request again. The correct format of the input LUWID is:
netid.luname,instnum,seqnum

Module: ATRFMURC
Source: Resource recovery services (RRS)

ATR069I  This UR is not in the In-Doubt state.
Explanation: An RRS panel or ATRQSRV user requested commit or backout for a unit of recovery (UR). The state of the specified UR, however, is not in-doubt. A UR that a panel or ATRQSRV user resolves to commit or backout must be in-doubt.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Wait for the UR state to reach in-doubt. It might also be possible to resolve the problem by removing a resource manager's interest in the UR.

Module: ATRFMRID
Source: Resource recovery services (RRS)

ATR070I  One of the RMs is still active.
Explanation: The RRS panel or ATRQSRV user issued a Remove Interest request, but at least one of the resource managers involved is still active with RRS.
System action: The request is rejected.
Operator response: None
ATR071I - ATR074I

System programmer response: None
User response: Issue the request again after all involved resource managers have become inactive with RRS.
Module: ATRFRIN
Source: Resource recovery services (RRS)

ATR071I  Can not request REMOVEINT for the DSRM of an In-Doubt UR.
Explanation: An RRS panel or ATRQSRV user issued a remove interest request for the interest of a distributed syncpoint resource manager while the state of the specified UR was in_doubt.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Either issue the request again after the DSRM resolves the in_doubt UR or issue a remove interest request for all the resource managers involved with the UR.
Module: ATRFRIN
Source: Resource recovery services (RRS)

ATR073I  ATRSRV failed, rc=rcode rsn=rsncode
Explanation: While processing a command from a panel or ATRQSRV user, RRS issued the ATRSRV macro to process a user request, but the ATRSRV macro encountered an error.
In the message text:
rcode
    is the return code from ATRSRV.
rsncode
    is the reason code from ATRSRV.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Review the return code and reason code from the ATRSRV macro and fix the error, then issue the command again. You can find an explanation of the codes in ATRSRV – Resolve Units of Recovery in z/OS MVS Programming: Resource Recovery.
Module: ATRFMRSV
Source: Resource recovery services (RRS)

ATR074I  Remove Interest processed successfully.
Explanation: The remove interest request completed successfully.
System action: The request is processed.
Operator response: None
System programmer response: None
User response: None
Module: ATRFMURC, ATRFMRMC
Source: Resource recovery services (RRS)
ATR075I  Commit request was scheduled successfully.
Explanation:  RRS schedules the commit request for processing.
System action:  RRS schedules the commit request.
Operator response:  None
System programmer response:  None
User response:  None
Module:  ATRFMURC
Source:  Resource recovery services (RRS)

ATR076I  Backout request was scheduled successfully.
Explanation:  RRS schedules the backout request for processing.
System action:  RRS schedules the backout request.
Operator response:  None
System programmer response:  None
User response:  None
Module:  ATRFMURC
Source:  Resource recovery services (RRS)

ATR077I  Member name required for an output partitioned data set
Explanation:  For the output data set, you specified the name of a partitioned data set but did not specify a member name. When you specify a partitioned data set name, a member name is required.
System action:  The request is rejected.
Operator response:  None
System programmer response:  None
User response:  Provide a member name or provide the name of a sequential data set.
Module:  ATRFMLBC
Source:  Resource recovery services (ATR)

ATR078I  A member name is not allowed for a SEQ listing data set
Explanation:  For the listing data set, you specified the name of a sequential data set but also specified a member name. A member name is not valid with a sequential data set.
System action:  The request is rejected.
Operator response:  None
System programmer response:  None
User response:  Either remove the member name or provide a partitioned data set name with the member name.
Module:  ATRFMLBC
Source:  Resource recovery services (ATR)

ATR079I  No UR interests were found for this RM.
Explanation:  The system could not find any URs associated with the resource manager (RM) you selected. The resource manager might have interests in URs, but these interests are no longer directly associated with the resource manager.
ATR080I - ATR083I

System action: The request is rejected.
Operator response: None
System programmer response: None
User response: If you are looking for particular URs, use the UR panel or ATRQSRV.
Module: ATRFMQRY
Source: Resource recovery services (ATR)

ATR080I No UR can be found for the input URID.
Explanation: You specified a UR identifier that the system is unable to find. The UR may still exist but RRS is unable to find the UR.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Verify that you specified the correct UR identifier. If you did not specify the correct UR identifier, do so and retry the request. If you did specify the correct UR identifier, retry the request later.
Module: ATRFMURC
Source: Resource Recovery Services (RRS)

ATR081I The output dataset name, including the prefix, must be 44 characters or less
Explanation: The RRS panel user supplied an output data set name that is greater than 44 characters when the system adds the TSO prefix or TSO userid as the first qualifier.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Provide a data set name that will be 44 characters or less.
Module: ATRFMLBC
Source: Resource recovery services (RRS)

ATR082I Not all information was returned, too many URs/RMs were found.
Explanation: RRS found too many resource manager (RM) entries or unit of recovery (UR) entries that matched the selection criteria for the panels or ATRQSRV to handle.
System action: The system returns as many complete UR entries or RM entries as possible.
Operator response: None
System programmer response: None
User response: Change the selection criteria to reduce the number of entries returned.
Module: ATRFMQRM, ATRFMQSI, ATRFMQUR, ATRFMQWM, ATRFMQRY
Source: Resource recovery services (RRS)

ATR083I READ access to the MVSADMIN.RRS.COMMANDS resource is required to request the RRS query functions.
Explanation: To use the RRS query functions to view RRS information, the user needs READ access to the MVSADMIN.RRS.COMMANDS resource in the RACF FACILITY class.
System action: The request is rejected.
ATR084I  ALTER access to the MVSADMIN.RRS.COMMANDS resource is required to request the function function.

Explanation: To resolve an in-doubt UR or to remove resource manager interests, the user needs ALTER access to the MVSADMIN.RRS.COMMANDS resource in the RACF FACILITY class.

In the message text:

function
  One of the following:
    Remove Interest
      Remove a resource manager's interest in all URs or remove all resource managers' interests in a specific UR.
    Commit
      Resolve an in-doubt UR to in-commit.
    Backout
      Resolve an in-doubt UR to in-backout.

System action: The request is rejected.

Operator response: None

System programmer response: None

User response: Obtain ALTER access to the MVSADMIN.RRS.COMMANDS resource.

Module: ATRFMRC, ATRFMURC

Source: Resource Recovery Services (RRS)

ATR085I  Supervisor state, system key is required to request the function function.

Explanation: To resolve an in-doubt UR or to remove resource manager interests, the user needs ALTER access to the MVSADMIN.RRS.COMMANDS resource in the FACILITY class, but RACF is not active or the MVSADMIN.RRS.COMMANDS resource is not defined or the FACILITY class is not activated. The panels do not run in supervisor state or with system key.

In the message text:

function
  One of the following:
    Remove Interest
      Remove a resource manager's interest in all URs or remove all resource managers' interests in a specific UR.
    Commit
      Resolve an in-doubt UR to in-commit.
    Backout
      Resolve an in-doubt UR to in-backout.

System action: The request is rejected.

Operator response: None

System programmer response: None

User response: Ensure that RACF is active, that the MVSADMIN.RRS.COMMANDS resource is defined, and that the FACILITY class is activated. Retry the request.
ATR086I  Request failed - RRS internal error.

Explanation: An internal RRS error has occurred; RRS cannot return the requested information.

System action: The request is rejected.

Operator response: None

System programmer response: None

User response: After the RRS problem has been resolved, retry the request.

Module: ATRFMURC
Source: Resource Recovery Services (RRS)

ATR087I  RRS is not at the correct level to process this UR, the function request is rejected.

Explanation: An RRS panel user attempted to process the displayed unit of recovery, however this level of RRS cannot honor the function requested. The unit of recovery contains information unknown to this level of RRS.

In the message text:

function
  One of the following:
    Remove Interest
      Remove a resource manager's interest in all URs or remove all resource managers' interests in a specific UR.
    Commit
      Resolve an in-doubt UR to in-commit.
    Backout
      Resolve an in-doubt UR to in-backout.

System action: The request is rejected.

Operator response: None

System programmer response: None

User response: Enter the command from a system that is running a level of RRS that is capable of performing the request.

Module: ATRFMLBC
Source: Resource recovery services (RRS)

ATR088I  No work identifiers are present. Display request ignored.

Explanation: An RRS panel user attempted to display the work identifiers for the displayed unit of recovery, but none were set.

System action: The display attempt is ignored.

Operator response: None

System programmer response: None

User response: None.

Module: ATRFMLBC
Source: Resource recovery services (RRS)
ATR089I  Sort order is not contiguous starting at 1.

Explanation: An RRS panel user has attempted to specify a sort order that is not contiguous starting from the number one (1). RRS expects that the primary sort key will be specified as sort order 1, the secondary sort key specified as sort order 2, the tertiary sort order specified as sort order 3, and so on. If a secondary sort key is specified, a primary key must be specified. If a tertiary key is specified, then a secondary key must be specified, and so on.

System action: The input is rejected.
Operator response: None
System programmer response: None
User response: Reenter the sort key orders so that the primary sort key is specified as sort order 1, the secondary sort key is specified as sort order 2, and so on.
Module: ATRFMLBC
Source: Resource recovery services (RRS)

ATR090I  Sort option specified is not valid.

Explanation: An RRS panel user has attempted to specify a sort option that is not valid. The only sort options available are a (ascending) and d (descending).

System action: The input is rejected.
Operator response: None
System programmer response: None
User response: Correct the input and retry the command.
Module: ATRFMLBC
Source: Resource recovery services (RRS)

ATR091I  Low TID is greater than High TID.

Explanation: An RRS panel user has attempted to specify a Low TID number that is greater than the High TID number specified.

System action: The input is rejected.
Operator response: None
System programmer response: None
User response: Correct the input and retry the command.
Module: ATRFMLBC
Source: Resource recovery services (RRS)

ATR092I  Begin Time Range is after End Time Range.

Explanation: An RRS panel user has attempted to specify a beginning time range that is chronologically after the ending time range. This would result in no URs ever returning from the query.

System action: The input is rejected.
Operator response: None
System programmer response: None
User response: Correct the input and retry the command.
Module: ATRFMLBC
Source: Resource recovery services (RRS)
ATR093I  Profile name required for command.

Explanation: The command specified required that a profile name be specified.

System action: The request is rejected.

Operator response: None

System programmer response: None

User response: Specify the name of the profile you would like to save or retrieve.

Module: ATRFMURC

Source: Resource recovery services (RRS)

ATR094I  Profile dataset allocation error.

Explanation: An attempt was made to allocate the profile dataset, but it failed for some unspecified reason.

System action: The request is rejected.

Operator response: None

System programmer response: None

User response: Check the operator console or log for messages. If there are no messages, ensure that any exiting userid.ATR.PROFILE dataset is deleted and retry the request. If that does not correct the problem, ensure that there is enough storage on an accessible storage device for the allocation of the profile dataset.

Module: ATRFMURC

Source: Resource recovery services (RRS)

ATR095I  Command not valid.

Explanation: The command specified is not recognized by this panel.

System action: The request is rejected.

Operator response: None

System programmer response: None

User response: Correct the command and retry the request.

Module: ATRFMURC, ATRFMRC, ATRFMWMC, ATRFMLBC

Source: Resource recovery services (RRS)

ATR096I  ATR.PROFILE must be a partitioned data set.

Explanation: The userid.ATR.PROFILE dataset with the high-level qualifier matching this TSOUSER's prefix was allocated; however, it was not a partitioned dataset.

System action: The request is rejected.

Operator response: None

System programmer response: None

User response: Either

- Change the TSOUSER's prefix so the non-partitioned data set userid.ATR.PROFILE will not be allocated by the dialog; or,
- Rename or delete the non-partitioned data set userid.ATR.PROFILE,

and retry the request.

Module: ATRFMURC

Source: Resource recovery services (RRS)
The profile member was not found in the userid.ATR.PROFILE dataset, where mprof is the name of the profile.

The request is rejected.

None

None

In certain circumstances, this message is purely informational. When issued from an attempt to perform the GET command, it indicates that the profile name specified does not exist. The user may have incorrectly typed the profile name.

ATRFMURC

Resource recovery services (RRS)

The profile member was successfully saved in the userid.ATR.PROFILE dataset.

The request was successful.

None

None

None

None

This message is purely informational.

ATRFMURC

Resource recovery services (RRS)

The user has overtyped information into the prompt field, but no option was selected to operate on the prompt field.

The request is rejected.

None

None

Either

Blank out the overtyped prompt field; or,

Specify a correct option to be performed,

and retry the request.

Resource recovery services (RRS)

ATRFMURC

The user has specified a profile member in the prompt field that already exists in the userid.ATR.PROFILE dataset where mprof is the name of the profile.

The request is rejected.

None

None

Change the prompt field specification so the resulting profile name will not conflict with an existing profile in userid.ATR.PROFILE, and retry the request.

ATR101I  CANCEL REQUEST WAS RECEIVED FOR RRS.
Explanation: The system has received the SETRRS CANCEL command the operator issued and is now processing the request.
System action: SETRRS CANCEL processing continues with syntax verification.
Operator response: None.
System programmer response: None.
Module: ATRAMSFR
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR102I  SETRRS OPTIONS SYNTAX ERROR. EXPECTED expected BEFORE known
Explanation: The SETRRS command contains text that RRS does not recognize as valid input.
In the message text:
expected
is the expected input.
known
is the last known text.
System action: The SETRRS command is not processed.
Operator response: Correct the syntax and issue the SETRRS command again.
System programmer response: None
Module: ATRAMSLA
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR103I  SETRRS OPTIONS SYNTAX ERROR. FOUND keyword INSTEAD OF ONE OF THESE EXPECTED KEYWORDS: keyword1 keyword2 keyword3
Explanation: The operator issued the SETRRS CANCEL command, but the command did not contain an expected keyword.
In the message text:
keyword
is the text that was found.
keyword1...keyword3
is an expected keyword.
System action: The system rejects the SETRRS command. RRS remains active.
Operator response: Correct the syntax and issue the SETRRS command again.
System programmer response: None
Module: ATRAMSLA
Source: Resource recovery services (RRS)
Routing Code: 1,2
ATR104I  SHUTDOWN REQUEST WAS RECEIVED FOR RRS.

Explanation: The system has received the SETRRS SHUTDOWN command that the operator issued and is now processing the request.

System action: Shutdown processing continues.

Operator response: None.

System programmer response: None.

User response: None.

Module: ATRAMSFR

Source: Resource recovery services (RRS)

ATR105I  RRS requested_cmd REJECTED, RRS inprogress_cmd IS ALREADY IN PROGRESS.

Explanation: The requested command is rejected because RRS address space is already in the progress of terminating.

In the message text:

requested_cmd
   The name of the requested command.

inprogress_cmd
   The name of the command in progress.

System action: The SHUTDOWN command is rejected.

Operator response: None.

System programmer response: None.

User response: None.

Module: ATRAMSFR

Source: Resource recovery services (RRS)

ATR106I  AN UNEXPECTED ERROR OCCURRED DURING RRS SHUTDOWN PROCESSING. RRS CANCEL COMMAND IS ISSUED.

Explanation: The RRS SHUTDOWN command was not processed due to an unexpected error. An RRS CANCEL command is issued to bring RRS down.

System action: The SHUTDOWN command is rejected. The RRS CANCEL command is issued.

Operator response: None.

System programmer response: None.

User response: None.

Module: ATRAMSFR

Source: Resource recovery services (RRS)

ATR120I  RRS LOGSTREAM DISCONNECT HAS FAILED FOR LOGSTREAM: logstreamname. RC=return-code, RSN=reason-code

Explanation: When trying to disconnect from the specified log stream, RRS encountered an error.

In the message text:

logstreamname
   is the name of the log stream in error.
**return-code**

is the return code from the IXGCONN macro.

**reason-code**

is the last encountered reason code from the IXGCONN macro.

**System action:** RRS processing continues; it remains connected to the specified log stream.

**Operator response:** Inform the system programmer.

**System programmer response:** Verify that the specified log stream has been correctly defined. If the error disconnecting from it is expected based upon other related system events that indicate similar errors encountered with this log stream, no action might be needed. Otherwise, provide this information to your IBM Support Center.

**Module:** ATRAMSFR

**Source:** Resource recovery services (RRS)

**Routing Code:** 1,2

**Descriptor Code:** 12

---

**ATR121I SETRRS CANCEL HAS FAILED. CALLRTM RC=return-code**

**Explanation:** When trying to stop the RRS address space, SETRRS CANCEL processing has encountered an error.

In the message text:

**return-code**

is the return code value from the CALLRTM macro.

**System action:** SETRRS CANCEL processing is ended. RRS remains active.

**Operator response:** Inform the system programmer.

**System programmer response:** For an explanation of the return code, see the description of CALLRTM in [z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN](#). Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:** ATRAMSFR

**Source:** Resource recovery services (RRS)

**Routing Code:** 1,2

**Descriptor Code:** 12

---

**ATR122E WRITES TO LOGSTREAM logstreamname DELAYED DUE TO OFFLOAD FAILURE**

**Explanation:** While attempting to write data to the specified logstream, system logger rejected the request, because the coupling facility is full and offload has failed.

In the message text:

**logstreamname**

The name of the logstream in error.

**System action:** The system retries the write periodically until the write is successful. Once the write is successful, this message is deleted by the system.

**Operator response:** Notify the system programmer.

**System programmer response:** Determine why offload cannot occur for the specified logstream and fix the error.

**Module:** ATRBMTME

**Source:** Resource recovery services (RRS)

**Routing Code:** 1,2

**Descriptor Code:** 12
**ATR123I**   *SETRRS cmdname COMMAND ERROR -- NOT AUTHORIZED TO ISSUE COMMAND*

**Explanation:** The operator or console is not authorized to enter the specified command.

In the message text:

*cmdname*

The SETRRS command specified.

**System action:** SETRRS command processing is ended.

**Operator response:** Contact your installation’s security administrator to ensure both you and the console are properly authorized to enter the command that you were attempting.

**System programmer response:** None.

**Module:** ATRAMSFR  
**Source:** Resource recovery services (RRS)  
**Routing Code:** 1,2  
**Descriptor Code:** 12

---

**ATR130I**   *RRS LOGSTREAM CONNECT HAS FAILED FOR MANDATORY LOGSTREAM logstreamname.  \[RC=return-code, RSN=reason-code\]*

**Explanation:** RRS initialization has encountered an error connecting to the named log stream, which is required for normal RRS processing.

In the message text:

*logstreamname*

is the log stream in error.

*return-code*

is the return code from the IXGCONN macro.

*reason-code*

is the most recent reason code from the IXGCONN macro.

**System action:** RRS, which cannot function without this log stream, stops its initialization process. The RRS address space is therefore not available for use.

**Operator response:** Contact the system programmer for help with solving the problem.

**System programmer response:** For an explanation of the return and reason codes, see the description of IXGCONN in [z/OS MVS Programming: Assembler Services Reference IAR-XCT](https://www.ibm.com/support/docview/IT104627). Verify that all RRS log streams are defined correctly. If necessary, redefine the log streams correctly and reissue the START command for RRS.

**Module:** ATRAMINI  
**Source:** Resource recovery services (RRS)  
**Routing Code:** 1,2  
**Descriptor Code:** 12

---

**ATR131I**   *RRS RESTART DENIED - RRS IS ALREADY ACTIVE*

**Explanation:** RRS initialization has determined that an RRS subsystem is already active on this MVS image. This message appears only when the name of the newly started RRS subsystem does not match that of the currently active RRS subsystem.

**System action:** Initialization of the new RRS subsystem is ended. The current RRS subsystem continues processing.

**Operator response:** If possible, use the currently active RRS subsystem. If you do need to stop the current subsystem, issue the SETRRS CANCEL command. If the RRS subsystem was already canceled using the SETRRS CANCEL command, RRS termination may be delayed. Check SYSLOG for an ATR167I message that is issued when RRS termination completes. If this message is not found, check SYSLOG for messages ATR165I and ATR166I. If you find an ATR165I without an ATR166 that has the same ASID and JOBNAME, RRS is waiting for SRB exits in that
space to be purged. You can CANCEL/FORCE that space to allow RRS termination to continue. Contact the system programmer for help with solving the problem.

**System programmer response:** Verify any required operator actions.

**Module:** ATRAMINI

**Source:** Resource recovery services (RRS)

**Routing Code:** 1,2

**Descriptor Code:** 12

---

**ATR132I**

**Message:** RRS LOGSTREAM CONNECT HAS FAILED FOR OPTIONAL LOGSTREAM logstreamname.

**RC=** return-code, **RSN=** reason-code

**Explanation:** RRS initialization cannot connect to the specified optional log stream.

In the message text:

- `logstreamname` is the name of the log stream that RRS tried to connect to.
- `return-code` is the most recent return code from the IXGCONN macro.
- `reason-code` is the most recent reason code from the IXGCONN macro.

**System action:** RRS initialization continues without the optional log stream.

**Operator response:** None.

**System programmer response:** For an explanation of the return and reason codes, see the description of IXGCONN in [z/OS MVS Programming: Assembler Services Reference ABE-HSP](https://www.ibm.com). Verify that all RRS log streams are defined correctly. Take any steps required to ensure that the problem does not recur.

**ATR133I**

**Message:** RRS COULD NOT REGISTER AS A RESOURCE MANAGER. RC= return-code

**Explanation:** RRS initialization cannot register itself as a resource manager.

In the message text:

- `return-code` is the most recent return code for the Register_Resource_Manager callable service.

**System action:** RRS initialization stops. The RRS address space is not available for use.

**Operator response:** Inform your system programmer.

**System programmer response:** For an explanation of the return code from the service, see the description of Register_Resource_Manager in [z/OS MVS Programming: Resource Recovery](https://www.ibm.com). Provide the information to your IBM Support Center.

**Module:** ATRAMINI

**Source:** Resource recovery services (RRS)

**Routing Code:** 1,2

**Descriptor Code:** 12
ATR134I  RRS COULD NOT REGISTER AS AN EXIT MANAGER. RC = return-code

Explanation: RRS initialization cannot register itself as an exit manager.

In the message text:

return-code

is the return code from the Set_Exit_Information service.

System action: RRS initialization is stopped. The RRS address space is not available for use.

Operator response: Inform your system programmer.

System programmer response: For an explanation of the return code from the service, see the description of Set_Exit_Information in [z/OS MVS Programming: Resource Recovery]. Provide this information to your IBM Support Center.

Module: ATRAMINI

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 12

ATR135I  RRS RESMGR COULD NOT BE ESTABLISHED, RESMGR RC = return-code

Explanation: RRS initialization cannot establish the RTM resource manager routine it needs to monitor the RRS address space.

In the message text:

return-code

is the return code from the RESMGR macro.

System action: RRS initialization backs out all processing and brings down the RRS address space. RRS is not available.

Operator response: Contact your system programmer.

System programmer response: For an explanation of the return code, see the description of the RESMGR macro in [z/OS MVS Programming: Authorized Assembler Services Reference LLA-SDU]. Provide the information to your IBM Support Center.

Module: ATRAMINI

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 12

ATR137I  RRS ATTEMPT TO SET EXITS WITH CONTEXT SERVICES HAS FAILED, RC = return-code

Explanation: RRS initialization, having registered RRS as both a resource manager and an exit manager, cannot set exits for RRS.

In the message text:

return-code

is the return code from the Set_Exit_Information service.

System action: RRS initialization backs out all processing and brings itself down.

Operator response: Notify the system programmer. Examine the return code to determine the error. If it is correctable, correct it and restart RRS. If it is not correctable, inform the system programmer.

System programmer response: For an explanation of the return code, see the description of Set_Exit_Information in [z/OS MVS Programming: Resource Recovery]. Determine if the error is correctable and, if so, correct it and restart RRS. Otherwise, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR138I ATTEMPT TO BRING UP RRS FAILED, DIAG = return-code
Explanation: RRS initialization cannot activate RRS because of an internal system error.
In the message text:
return-code
  is IBM internal diagnostic information
System action: RRS initialization backs out all processing and brings RRS down.
Operator response: Contact your system programmer.
System programmer response: Provide this information to your IBM Support Center.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR139I RRS WAS UNABLE TO REGISTER FOR AUTOMATIC RESTART. RC = return-code, RSN = reason-code
Explanation: RRS initialization was unable to register with the automatic restart manager.
In the message text:
return-code
  is the return code from the IXCARM macro.
reason-code
  is the reason code from the IXCARM macro.
System action: RRS initialization continues, but the automatic restart manager will not restart RRS if RRS fails.
Operator response: Notify the system programmer.
System programmer response: For an explanation of the return and reason codes, see the description of IXCARM in z/OS MVS Programming: Sysplex Services Reference. Examine the return and reason codes to determine the problem. If you need automatic restart and you can fix the problem, use the SETRRS CANCEL command to stop RRS, fix the problem, and then restart RRS. If you cannot fix the problem, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR140I RRS READY ATTEMPT FOR ARM HAS FAILED, RC = return-code, RSN = reason-code
Explanation: RRS was unable to mark itself with the automatic restart manager as ready to receive work.
In the message text:
return-code
  is the return code from the IXCARM macro.
reason-code

is the reason code from the IXCARM macro.

System action: RRS initialization continues, but the automatic restart manager will not restart RRS if RRS fails.

Operator response: Notify the system programmer.

System programmer response: For an explanation of the return and reason codes, see the description of IXCARM in z/OS MVS Programming: Sysplex Services Reference. Examine the return and reason codes to determine the problem. If you need automatic restart and you can fix the problem, use the SETRRS CANCEL command to stop RRS, fix the problem, and then restart RRS. If you cannot fix the problem, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: ATRAMINI
Source: Resource recovery services (RRS)

Descriptor Code: 12

ATR141I RRS WILL NOT AUTOMATICALLY RESTART.

Explanation: The automatic restart manager will not restart RRS if RRS fails.

System action: Message ATR139I or ATR140I accompanies this message. RRS initialization continues, but the automatic restart manager will not restart RRS if it fails.

Operator response: Notify the system programmer.

System programmer response: Respond as described for the message that accompanies this message.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR142I RRS WAS UNABLE TO Deregister FROM ARM, RC = return-code, RSN = reason-code

Explanation: SETRRS CANCEL processing tried to deregister itself from the automatic restart manager but was unable to do so.

In the message text:

return-code

is the return code from the IXCARM macro.

reason-code

is the reason code from the IXCARM macro.

System action: RRS cancel processing continues.

Operator response: None.

System programmer response: Provide this information to your IBM Support Center.

Module: ATRAMSFR
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12
ATR143I • ATR145I

ATR143I  RRS HAS BEEN DEREGISTERED FROM ARM.
Explanation:  RRS has been deregistered from the automatic restart manager.
System action:  RRS continues processing; if the RRS address space comes down, it will not be automatically restarted.
Operator response:  None.
System programmer response:  Examine any accompanying messages. If these messages indicate that the automatic restart manager is not available and that RRS is still available, determine if you need automatic restart. If so, either wait for automatic restart manager to become available, or take action to make it available, as determined by the response to other accompanying messages related to the automatic restart manager. Once the automatic restart manager is available, issue the SETRRS CANCEL command to stop RRS, followed by the START command to restart RRS.
Module:  ATRAMINI
Source:  Resource recovery services (RRS)
Routing Code:  1,2
Descriptor Code:  12

ATR144I  RRS ENF TYPE 48 LISTENER EXIT COULD NOT BE ESTABLISHED, RC = return-code
Explanation:  RRS could not establish a type 48 listener exit to monitor system logger events.
In the message text:
return-code
  is the return code from the ENFREQ macro.
System action:  RRS stops the RRS address space because the ENF type 48 listener exit is essential to the use of all RRS log streams.
Operator response:  Notify your system programmer.
System programmer response:  Provide this information to the IBM Support Center. For an explanation of the code, see the description of ENFREQ in z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG.
Module:  ATRAMINI
Source:  Resource recovery services (RRS)
Routing Code:  1,2
Descriptor Code:  12

ATR145I  RRS ENF TYPE 38 LISTENER EXIT COULD NOT BE ESTABLISHED, RC = return-code
Explanation:  RRS could not establish a type 38 listener exit to monitor automatic restart manager events.
In the message text:
return-code
  is the return code from the ENFREQ macro.
System action:  RRS continues processing without the listener exit. If, however, the automatic restart manager fails, RRS will be implicitly deregistered from the automatic restart manager. If the RRS address space ends unexpectedly, it will not be automatically restarted.
Operator response:  None.
System programmer response:  Provide this information to your IBM Support Center. For an explanation of the code, see the description of ENFREQ in z/OS MVS Programming: Authorized Assembler Services Reference EDT-IXG.
Module:  ATRAMINI
Source:  Resource recovery services (RRS)
Routing Code:  1,2
ATR149I - RRS initialization has failed. System logger is unavailable for this IPL.

Explanation: In its attempt to connect to log streams, RRS has determined that system logger services will not be available for the duration of this IPL.

System action: RRS initialization backs out all processing and brings down the RRS address space.

Operator response: Inform your system programmer.

System programmer response: If RRS processing is required, system logger must be available. Investigate and resolve the logger problem, then re-IPL the systems and restart RRS.

Module: ATRAMINI

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 12

ATR150E - RRS processing is delayed pending system logger signal. RC=return-code, RSN=reason-code

Explanation: Through its attempt to connect to a log stream, RRS has determined that the system logger is temporarily unable to process the request.

In the message text:

return-code
is the most recent return code from the IXGCONN macro.

reason-code
is the most recent reason code from the IXGCONN macro.

System action: RRS issues message ATR151A to request input and waits for the reply.

Operator response: Inform your system programmer.

System programmer response: Use the explanation of the return and reason codes, which you can find in the description of IXGCONN in z/OS MVS Programming: Assembler Services Reference ABE-HSF, to resolve the error.

Module: ATRAMINI

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 12

ATR151A - System logger delay was not resolved. Resolve the delay or reply TERMINATE to terminate RRS.

Explanation: RRS tried to connect to a log stream but could not. After waiting for system logger to process its request, RRS issued the request again and again received a response indicating that system logger is temporarily unable to process this connect request. Message ATR150E accompanies this message.

System action: RRS waits for system logger to resume handling requests, at which time RRS will retry the connect request, or a reply of TERMINATE, at which time RRS initialization will back out all processing and bring down the RRS address space.

Operator response: Inform your system programmer.

System programmer response: To make RRS services available, you need to resolve the error condition. See message ATR150E, which accompanies this message, to obtain more information about the error. Once the error is resolved, RRS can begin to process requests.

If you decide you do not need RRS services at this time, or if you cannot resolve the error condition, reply TERMINATE to end RRS initialization and bring down the RRS address space.
If the reply is incorrect, the system issues message ATR152I to notify the operator, then reissues message ATR151A.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

**ATR152I**  THE RESPONSE TO MESSAGE *message* IS INCORRECT: *reply*

**Explanation:** The operator entered an incorrect response to the specified message.

In the message text:

*message*  The message identifier.

*reply*  The incorrect response.

**System action:** The system reissues the message that received an incorrect reply.

**Operator response:** See the operator response for the indicated message and respond accordingly, if applicable.

**System programmer response:** None.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

**ATR153I**  OPERATOR REQUEST TO BACKOUT RRS INITIALIZATION WAS RECEIVED.

**Explanation:** The operator responded TERMINATE to message ATR152A.

**System action:** RRS initialization backs out all processing and brings down the RRS address space.

**Operator response:** None.

**System programmer response:** None.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

**ATR154I**  RRS RECONNECTION TO MANDATORY LOGSTREAM: *logstreamname* HAS FAILED. IXGCONN

**Explanation:** Following the restored availability of the system logger address space, RRS cannot successfully reconnect to the specified log stream.

In the message text:

*logstreamname*  is the name of the log stream in error.

$return-code$  is the most recent return code from the IXGCONN macro.

$reason-code$  is the most recent reason code from the IXGCONN macro.

**System action:** If the return and reason code combination from logger indicates that the connect attempt failed so that RRS cannot wait for system logger to notify RRS when the log stream is available, RRS will take a dump and
bring itself down. In this event, message ATR156I will accompany this one.

If, however, the failure to reconnect was due to a logger problem that might be temporary, RRS will again try to reconnect to the log stream.

**Operator response:** If RRS comes down, inform your system programmer, otherwise, no action is required.

**System programmer response:** If possible, use the logger return and reason code combination to diagnose and solve the problem that caused the failure. In the system log, see message IXG231I for the named log stream. Message IXG231I provides more detailed information about the reason for the failure. Once the problem has been resolved, use the START command to restart RRS. If you cannot resolve the problem, search problem reporting databases for a fix for the problem. If no fix exists, supply the accompanying dump and system log to your IBM Support Center.

**Module:** ATRBMTME

**Source:** Resource Recovery Services (RRS)

**Routing Code:** 1,2

**Descriptor Code:** 12

---

### ATR155I

**Explanation:** In an attempt to reconnect to the RRS log streams, from which RRS has been disconnected by either system logger or hardware action, RRS has received a response from system logger indicating that the reconnection was not successful. Message IXG231I, issued to the system log, provides more detailed information about the reason for this failure.

In the message text:

- `logstreamname` is the name of the log stream in error.
- `return-code` is the most recent return code from the IXGCONN service.
- `reason-code` is the most recent reason code from the IXGCONN service.

**System action:** RRS remains completely operational but does not use the named log stream.

**Operator response:** Inform your system programmer.

**System programmer response:** If you want RRS to use this log stream, you need the logger return and reason codes to diagnose the problem that caused the failure. In the system log, locate message IXG231I for the named log stream; the message contains more detailed information about the reason for the failure. Resolving the problem might require clearing and/or redefining the log stream in question, which, in turn, means you will first need to bring down RRS. After you fix the log stream problem, you can use the START RRS command to make RRS active again.

**Module:** ATRBMTME

**Source:** Resource Recovery Services (RRS)

**Routing Code:** 1,2

**Descriptor Code:** 12

---

### ATR156I

**Explanation:** RRS could not reinstate its connection to the named log stream.

In the message text:

- `logstreamname` is the name of the log stream in error.

**System action:** RRS ends its processing and requests a dump. Message ATR154I accompanies this message.

**Operator response:** Inform your system programmer.
System programmer response: See the response for message ATR154I. If you cannot solve the problem, provide this information and the associated dump to your IBM Support Center.

Module: ATRBMTME
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR157E  RRS INITIALIZATION IS UNABLE TO PROCEED. SYSTEM LOGGER IS UNAVAILABLE.

Explanation: In its attempt to connect to its log streams, RRS has determined that the system logger address space is not active.

System action: RRS is suspended until system logger becomes available. Message ATR162A accompanies this message.

Operator response: Examine the hardcopy log to determine why system logger is not active. If the problem is simply that system logger has not been started, issue the START IXGLOGR command to activate system logger. If there is another reason why system logger is not available, inform your system programmer.

System programmer response: Determine why system logger has not started. If it is not possible to bring up system logger, respond TERMINATE to message ATR162A to halt RRS initialization, then provide this information to your IBM Support Center.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR158I  RRS INITIALIZATION IS UNABLE TO PROCEED. THE Istype LOGSTREAM Isname HAS A MAXIMUM BUFFER SIZE OF actualmaxbufsize WHICH IS NOT EQUAL TO THE MAXIMUM BUFFER SIZE OF requiredmaxbufsize FOR THE MAIN UR LOGSTREAM mainlsname.

Explanation: When connecting to log stream Isname, RRS detected that the actual maximum buffer size, actualmaxbufsize, for the log stream was not equal to the maximum buffer size, requiredmaxbufsize, for the MAIN UR log stream, mainlsname. To support the log block size that could be written into the log stream, the actual maximum buffer size must be at least as large as the required maximum buffer size for the MAIN UR log stream.

In the message text:

Istype
One of the following:

DELAYED UR
DELAYED UR log stream.

RESTART
RESTART log stream.

Isname
name of the log stream in error.

actualmaxbufsize
maximum buffer size of the log stream in error

requiredmaxbufsize
maximum buffer size of the RRS MAIN UR log stream.

mainlsname
name of the RRS MAIN UR log stream.

System action: RRS backs out of initialization.

Operator response: Inform your system programmer.
System programmer response:
1. Examine the rules for defining the logging structure for the RRS log stream logstreamname. See z/OS MVS Programming: Resource Recovery.
2. Change the LOGR policy to ensure that the logging structure for log stream logstreamname meets the requirement. See z/OS MVS Setting Up a Sysplex.
3. Restart RRS.

Module: ATRAMINI
Source: Resource Recovery Services (RRS)
Routing Code: 1,2
Descriptor Code: 12

---

**ATR159I**  RRS INITIALIZATION IS UNABLE TO PROCEED. LOGSTREAM logstreamname HAS A MAXIMUM BUFFER SIZE OF actualmaxbufsize WHICH IS LESS THAN THE MINIMUM SIZE OF minimummaxbufsize.

**Explanation:** When connecting to the named log stream, RRS detected that the actual maximum buffer size for the log stream was less than the minimum allowable maximum buffer size.

In the message text:

- **logstreamname**
  - is the name of the log stream.
- **actualmaxbufsize**
  - is the actual maximum buffer size.
- **minimummaxbufsize**
  - is the minimum allowable maximum buffer size required to support the minimum log block size that could be written into the log stream.

**System action:** RRS backs out of initialization.

**Operator response:** Inform your system programmer.

**System programmer response:**
1. Verify the requirement for defining the log structure for the RRS log stream logstreamname. See z/OS MVS Programming: Resource Recovery.
2. Change the LOGR policy to ensure that the logging structure for log stream logstreamname meets the requirement. See z/OS MVS Setting Up a Sysplex.
3. Restart RRS.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

---

**ATR160I**  LOGSTREAM logstreamname HAS A MAXIMUM BUFFER SIZE OF actualmaxbufsize WHICH IS LESS THAN THE MINIMUM SIZE OF minimummaxbufsize. LOG RECORDS MAY BE TRUNCATED.

**Explanation:** After connecting to the named log stream, RRS determined that the actual maximum buffer size for the log stream was less than the minimum required maximum buffer size. Log records that exceed the actual maximum buffer size will be truncated when written to the log.

In the message text:

- **logstreamname**
  - is the name of the log stream.
- **actualmaxbufsize**
  - is the actual maximum buffer size.
minimummaxbufsize is the minimum allowable buffer size required to support the maximum log block size that could be written into the log stream.

**System action:** RRS initialization continues.

**Operator response:** Inform your system programmer.

**System programmer response:** Determine whether the potential truncation of log records is acceptable.

If it is not acceptable,
1. Verify the requirements for defining the log structure for log stream logstreamname. See Resource Recovery.
2. Across the sysplex, stop each RRS group member that is using the log stream.
3. Change the LOGR policy to ensure that the log structure for logstreamname meets the requirement. See Setting Up a Sysplex.
4. Across the sysplex, restart each RRS group member that was stopped to change the LOGR policy.

### ATR161I  RRS TERMINATING DUE TO FAILURE OF task

**Explanation:** A task critical to RRS operation has failed and cannot be reinstated.

In the message text:

**task**

One of the following:

- RRS SERIALIZATION SERVER
- RRS MASTER SERVER
- NON-RRS MASTER SERVER
- RRS TERMINATION SERVER
- RRS SERVER ETXR

**System action:** RRS terminates. An ABEND and dump can accompany this message. The automatic restart manager (ARM) will, if possible, restart RRS.

**Operator response:** Capture the dump, if one is issued. Notify your system programmer. If RRS does not restart automatically, use the START command to restart RRS.

**System programmer response:** Review the dump and logrec to identify the original error. Supply this information to the IBM Support Center.

**Module:** ATRBMETX
**Source:** Resource Recovery Services (RRS)
**Routing Code:** 2,10
**Descriptor Code:** 4

---

### ATR162A  START THE SYSTEM LOGGER ADDRESS SPACE OR REPLY TERMINATE TO TERMINATE RRS.

**Explanation:** RRS initialization cannot proceed because the system logger address space is not available.

**System action:** RRS initialization is suspended, waiting for the system logger address space to start.

Once the system logger address space starts, this message is deleted.

**Operator response:** Inform your system programmer.

**System programmer response:** To make RRS services available, you need to resolve the error condition. See
message ATR157E, which accompanies this message, to obtain more information about the error. Once the error is resolved, RRS can begin to process requests.

If you decide you do not need RRS services at this time, or if you cannot resolve the error condition, reply TERMINATE to end RRS initialization and bring down the RRS address space.

If the reply is incorrect, the system issues message ATR152I to notify the operator, then reissues message ATR162A.

**Module:** ATRAMINI  
**Source:** Resource Recovery Services (RRS)  
**Routing Code:** 1,2  
**Descriptor Code:** 12

---

**ATR163E**  
**Explanation:** In an attempt to reconnect to the RRS log streams, from which RRS has been disconnected by either system logger or hardware action, RRS has received a response from system logger indicating a structure problem on the couple data set. Message ATR154I will accompany this message.

In the message text:

- **structurename**  
  is the name of the couple data set structure.

- **logstreamname**  
  is the name of the log stream.

**System action:** RRS continues to try to reconnect to the log streams, but any outstanding RRS requests are suspended until RRS can reconnect.

**Operator response:** Notify your system programmer if this message remains outstanding for a significant amount of time (more than 10-15 minutes, for example).

**System programmer response:** If this message has remained outstanding for a significant amount of time, you might need to define the RRS log stream(s) to another structure. Once the structure problem has been resolved, RRS will reconnect to the desired log streams without any further intervention.

If you want to stop the suspension of RRS requests, issue the SETRRS CANCEL command, which will stop RRS and not allow automatic restart. When you have resolved the structure problem, issue the START RRS command to restart RRS.

**Module:** ATRBMTME  
**Source:** Resource Recovery Services (RRS)  
**Routing Code:** 1,2  
**Descriptor Code:** 3

---

**ATR164I**  
**Explanation:** RRS connected to its log streams and found at least one was a DASD-only log stream. RRS does not support DASD-only log streams.

**System action:** The RRS address space terminates.

**Operator response:** Start RRS with coupling facility log streams or notify your system programmer.

**System programmer response:** Define coupling facility log streams for RRS.

**Module:** ATRAMINI  
**Source:** Resource Recovery Services (RRS)  
**Routing Code:** 1,2  
**Descriptor Code:** 12
ATR165I  RRS EXITS FOR jobname IN ASID asid ARE BEING PURGED.

Explanation: The RRS address space has terminated. RRS RESMGR processing is attempting to purge the outstanding SRB exits that RRS scheduled to the named jobname/ASID.

In the message text:

jobname
  is the jobname.

asid
  is the ASID.

System action: The RRS RESMAG waits for the purge to complete.

Operator response: None.
System programmer response: None.
Module:  ATRAMRM
Source:  Resource Recovery Services (RRS)
Routing Code:  1,2
Descriptor Code:  12

ATR166I  RRS EXITS FOR jobname IN ASID asid ARE BEING PURGED. DIAG=diag

Explanation: RRS RESMGR processing has completed purging the outstanding SRB exits that RRS scheduled to the named jobname/ASID. A zero DIAG value indicates a successful purge. A non-zero DIAG value indicates that the target space is terminating or has terminated and only SRBs that have been scheduled, but not dispatched, have been purged.

In the message text:

jobname
  is the jobname.

asid
  is the ASID.

diag
  is an internal diagnostic code.

System action: RRS RESMAG processing continues.

Operator response: None.
System programmer response: None.
Module:  ATRAMRM
Source:  Resource Recovery Services (RRS)
Routing Code:  1,2
Descriptor Code:  12

ATR167I  RRS RESMGR PROCESSING COMPLETED.

Explanation: RRS RESMGR processing is complete.

System action: RRS address space termination is complete and RRS is no longer active.

Operator response: None.
System programmer response: None.
Module:  ATRAMRM
Source:  Resource Recovery Services (RRS)
Routing Code: 1,2  
Descriptor Code: 12

**ATR168I** JOB *jobname* DOES NOT HAVE THE PROPER ACCESS FOR THE REQUEST.

**Explanation:** The job does not have the proper access to the RRS resource named in the ICH408I message, where *jobname* is the jobname.

**System action:** The request is rejected.

**System programmer response:** Obtain the proper authorization to the RRS resource named in the ICH408I message.

**Module:** ATRFMSRV, ATRFMSRV, ATRAMMSG

**Source:** Resource recovery services (RRS)

Routing Code: 1, 2  
Descriptor Code: 12

**ATR169I** RRS HAS UNSET EXITS FOR RESOURCE MANAGER *rmname* REASON *reason*

**Explanation:** RRS has unset the named resource manager’s RRS exits for the reason noted in this message.

In the message text:

*rmname*  
is the name of the resource manager whose exits were unset.

*reason*  
One of the following:

**REQUESTED**  
The resource manager’s exit failed exit requested RRS to unset the resource manager’s exits.

**FAILED**  
The resource manager’s exit failed exit failed.

**BAD RETCODE**  
The resource manager’s exit failed exit returned an invalid return code to RRS.

**EXIT MANAGER UNAVAILABLE**  
The resource manager is unset from the SHUTDOWN command.

**UNREGISTERED**  
The resource manager unregistered as a resource manager.

**System action:** The system continues, but the named resource manager cannot participate in syncpoint operations managed by RRS until it sets exits with RRS again.

**Operator response:** Notify your system programmer.

**System programmer response:** Use the RRS panels to determine if the resource manager automatically detected the error and set exits with RRS again. If not, restarting the resource manager will usually cause the resource manager to set exits with RRS. If restarting the resource manager is not acceptable or does not resolve the problem, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:** ATRBMSER

**Source:** Resource Recovery Services (RRS)

Routing Code: 1,2  
Descriptor Code: 12
ATR170I  RM rmname WAS DELETED.

Explanation: The resource manager was deleted from the RRS resource manager logs and from all RRS systems in the logging group.

Note: This message is written to the system where the RM was last active. If the last active system for the RM was not determined, the message is written to the system that originated the delete RM request.

In the message text:

rmname
   The name of the deleted resource manager.

System action: The system continues, but the named resource manager cannot participate in syncpoint operations managed by RRS until it sets exits with RRS again.

Operator response: None.
System programmer response: None.
User response: None.
Module: ATRFMDRM
Source: Resource Recovery Services (RRS)

ATR171I  RM rmname WAS DELETED FROM THE RRS LOGS. THE RM MAY REMAIN ON SOME SYSTEMS.

Explanation: An error occurred while processing the RemovRM request. The resource manager was deleted from the RRS resource manager logs and from some of the RRS systems in the logging group. However, it may remain on some RRS systems in the logging group.

Note: This message is written to the system where the RM was last active. If the last active system for the RM was not determined, then the message is written to the system that originated the Delete RM request.

In the message text:

rmname
   The name of the deleted resource manager.

System action: The system continues, but the named resource manager cannot participate in syncpoint operations managed by RRS until it sets exits with RRS again.

Operator response: None.
System programmer response: None.
User response: None.
Module: ATRFMDRM
Source: Resource Recovery Services (RRS)

ATR172E  LOGSTREAM logstreamname HAS A MAXIMUM BUFFER SIZE OF actualmaxbufsize WHICH IS LESS THAN THE MINIMUM SIZE OF minmaxbufsize. REDEFINE THE LOG STREAM TO THE MINIMUM BUFFER SIZE.

Explanation: After connecting to the named log stream, RRS determined that the actual maximum buffer size for the log stream was less than the minimum required maximum buffer size.

In the message text:

logstreamname
   The name of the log stream.

actualmaxbufsize
   The actual maximum buffer size.

minmaxbufsize
   The minimum maximum buffer size.
minmaxbufsize
The minimum allowable buffer size required to support the maximum log block size that could be written into
the log stream.

System action: RRS continues to run without the log stream. Once the log stream is defined, this message is
DOMed.

Operator response: Notify your system programmer.

System programmer response: Change the LOGR policy to ensure that the log structure for log stream
logstreamname meets the requirement. For more information about defining log streams, see Resource Recovery.

Module: ATRBMSEI ATRBMTME
Source: Resource Recovery Services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR173E  OPTIONAL LOGSTREAM logstreamname IS NOW REQUIRED. AN RM HAS REQUESTED THE USE OF THE LOGSTREAM.

Explanation: The named log stream is optional during RRS startup. During the setting of exits an RM has indicated
that it wants to be able to set and retrieve RM metadata. However, the log stream is not defined so RRS cannot
connect to it.

In the message text:
logstreamname
The name of the log stream.

System action: RRS prevents the RM from setting any exits. Once the log stream is defined, this message is DOMed.

Operator response: Notify your system programmer.

System programmer response: Define the log stream and update the LOGR policy to ensure that the log structure
for log stream logstreamname is present and meets the requirement. For more information about defining log streams,
see Resource Recovery.

Module: ATRBMSEI ATRBMTME
Source: Resource Recovery Services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR174I  RRS ARCHIVE LOGGING HAS BEEN DISABLED.

Explanation: The operator or console has disabled archive logging on this system. RRS will stop writing new
completion records to the archive log and has disconnected from the archive log stream on this system.

System action: RRS will stop writing new completion records to the archive log and has disconnected from the
archive log stream on this system.

Operator response: None

System programmer response: None

Module: ATRAMSFR
Source: Resource Recovery Services (RRS)
ATR175I  RRS ARCHIVE LOGGING HAS BEEN ENABLED.

Explanation: The operator or console has enabled archive logging on this system. RRS will start writing new completion records to the archive log stream.

System action: RRS will start writing new completion records to the archive log stream.

Operator response: None

System programmer response: None

User response: None

Module: ATRAMSFR

Source: Resource Recovery Rervices (RRS)

ATR176I  ARCHIVE LOGGING enabledisable FAILED SAVING THE STATUS FLAGS IN THE COUPLE DATA SET. RC=returncode, RSN=reasoncode

Explanation: During the processing of the SetRRS ArchiveLogging command, RRS encountered an error with the IXCSETUS macro. Its return and reason codes are listed in the message. The flags indicating the Archive Logging state were not saved in the couple data set. When RRS restarts again, Archive Logging might not be what the user just set. After the RRS restart, the SetRRS ArchiveLogging command should be issued again to establish the required usage of the Archive log stream.

In the message text:

enabledisable  Archive Logging command being processed, either Enable or Disable.

returncode  is the return code from the IXCSETUS macro.

reasoncode  is the reason code from the IXCSETUS macro.

System action: RRS processing continues. However, when RRS restarts, Archive Logging might not be what the user just set.

Operator response: Notify the system programmer.

System programmer response: Based on the IXCSETUS return and reason codes determine if the situation can be resolved. If the situation cannot be resolved, provide this information to your IBM Support Center.

User response: None

Module: ATRAMSFR

Source: Resource Recovery Services (RRS)

ATR201I  RRS COLD START IS IN PROGRESS.

Explanation: RRS is cold starting.

System action: RRS clears out its logs to eliminate any work that might have been active.

Operator response: None.

System programmer response: None.

Module: ATRTMRRS

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 12
Explanation: RRS has encountered a gap in the named log stream. Possible reasons for the gap are:

- At least one of the DASD volumes that back up the named log stream is offline.
- Incorrect SHAREOPTIONS were specified when the log stream data sets or staging data sets were defined. If you have multiple systems in the sysplex and you use SMS to manage DASD data sets, you must specify VSAM SHAREOPTIONS(3,3) for log stream data sets and staging area data sets.

In the message text:

$logstreamname$

is the name of the affected log stream.

System action: RRS waits for your reply. If you reply RETRY, RRS assumes the log stream gap has been repaired; it will retry the function. If you reply ACCEPT, RRS will treat the gap as a loss of data, which might cause mixed outcome transactions, or if the gap is in the RM.DATA log stream, RRS will terminate.

Operator response: Reply RETRY if the log stream gap has been fixed, reply ACCEPT if the gap cannot be fixed, or contact the system programmer.

If the gap is in the RM.DATA log stream, replying ACCEPT will cause RRS to terminate, as RRS cannot tolerate a data loss in the RM.DATA log stream.

System programmer response: Try to fix the gap in the named log stream. For example, verify that all the required backup DASD volumes are online, then reply RETRY. If you cannot fix the gap, reply ACCEPT.

If the gap is in the RM.DATA log stream and you cannot fix the gap, remember that replying ACCEPT will cause RRS to terminate. You must cold start each member of the RRS group. The RRS group name is the second qualifier of the log stream name. See [z/OS MVS Programming: Resource Recovery] for a description of how to cold start RRS, and for a description of some actions to avoid because they can cause problems that require a cold start.

ATR207I RRS COULD NOT CREATE NAME TOKEN PAIR. RC = return-code
Explanation: RRS initialization has been unable to create a name/token pair to hold the RRS STOKEN.

In the message text:
return-code is the return code from the IEANTCR service

System action: RRS initialization ends. The RRS address space is not available.

Operator response: Inform your system programmer.
System programmer response: Report the problem and the diagnostic information in the message to your IBM Support Center.

Module: ATRAMINI

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 12

**ATR208I**

**Explanation:** RRS has detected a log data loss as the result of connecting to a new version of the named log stream. The log stream version changed because the log stream definition in the LOGR policy for the named log stream was deleted and then redefined.

In the message text:

**lstype**
One of the following log streams:

- **MAIN UR**
  The RRS MAIN.UR log stream.

- **DELAYED UR**
  The RRS DELAYED.UR log stream.

- **RESTART**
  The RRS RESTART log stream.

- **RM META DATA**
  The RRS RM Meta Data log stream.

**lsname**
The name of the log stream.

**oldlsversion**
The version of the log stream that RRS expected to connect to. The identifier is the GMT timestamp created when the log stream was defined.

**newlsversion**
The version of the log stream that RRS connected to. The identifier is the GMT timestamp created when the log stream was defined.

**System action:** The system action depends on which log stream encountered the version mismatch.

**MAIN UR**
Each resource manager that might have had data in the MAIN.UR log stream is marked as having potentially lost log data. During resource manager restart, RRS issues a unique return code to inform the resource manager of the possible data loss.

RRS initialization continues.

**DELAYED UR**
Each resource manager that might have had data in the DELAYED.UR log stream is marked as having potentially lost log data. During resource manager restart, RRS issues a unique return code to inform the resource manager of the possible data loss.

Additionally, RRS marks all UR state log entries in the MAIN.UR log as heuristic mixed, and it issues message ATR219I whenever it marks URs as heuristic mixed during log takeover processing.

RRS initialization continues.

**RESTART**
Each resource manager that might have had data in the RESTART log stream is marked as having potentially lost log data. During resource manager restart, RRS issues a unique return code to inform the resource manager of the possible data loss.
RRS initialization continues.

RM META DATA

No action is taken against the RM Meta Data log and RRS initialization continues.

RRS issues message ATR209I whenever it marks a resource manager as having lost log data.

Operator response: Inform your system programmer.

System programmer response: Check the hardcopy log to see if messages ATR209I and ATR219I were issued as a result of this error. Follow the system programmer response for whichever additional message that was issued.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 4

ATR209I RESOURCE MANAGER rmname MAY HAVE LOST LOG DATA.

Explanation: RRS has detected inaccessible data in its logs, and the lost data potentially affects the named resource manager.

Message ATR208I or ATR212I provides more information about why the RRS log data was inaccessible.

In the message text:

rmname is the resource manager name.

System action: Whenever the named resource manager restarts with RRS, it will be notified that RRS has lost log data in which the resource manager had interest.

Operator response: Inform your system programmer.

System programmer response: Use any accompanying message to determine what caused RRS to lose log data for this resource manager.

Module: ATRMTMLE
Source: Resource recovery services (RRS)
Routing Code: 11
Descriptor Code: 6

ATR210E INACCESSIBLE LOG DATA DETECTED ON THE RRS RM DATA LOGSTREAM logstreamname

Explanation: RRS has encountered inaccessible log data in the named RM DATA log stream. RRS cannot access the log data either because data has been lost or there is an uncorrectable gap in the log data.

In the message text:

logstreamname is the name of the log stream.

System action: The system issues message ATR218I, which will explain the effects on the system.

Operator response: Notify your system programmer.

System programmer response: To clear the problem with the named RM DATA log, you must cold start each member of the RRS group. The RRS group name is the second qualifier of the log stream name. See z/OS MVS Programming: Resource Recovery for a description of how to cold start RRS, and for a description of some actions to avoid because they can cause problems that require a cold start.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
### ATR211I

**RRS DETECTED AN ATTEMPT TO COLD START WHILE RRS WAS ACTIVE.**

**REASON:** `reason`  

**Explanation:** RRS detected an attempt to cold start RRS while RRS was active. The condition that caused RRS to detect the cold start request is indicated by `reason`.  

In the message text:

- `reason` is one of the following:
  - **LOGSTREAM VERSION MISMATCH.**
    - RRS detected a different version of the RM.DATA log stream from the one to which RRS was previously connected.  
  - **LOGSTREAM EMPTY.**
    - RRS detected an empty RM.DATA log stream after a cold start.  

**System action:** The RRS address space ends.  

**Operator response:** Inform your system programmer.  

**System programmer response:** Depending on the `reason`, determine why the problem occurred:  

- **LOGSTREAM VERSION MISMATCH**  
  - Determine whether deleting and redefining the RM.DATA log stream definition in the LOGR policy was intentional. If so, to avoid this message in the future, cancel all active RRS members in the RRS group before redefining the RM data log stream.  
  - If it was not intentional, rework your procedures for redefining the RRS RM.DATA log stream to avoid the problem in the future.  

- **LOGSTREAM EMPTY**  
  - Determine if an application other than RRS could have deleted log data from the RM.DATA log stream. If so, either change the application or remove its authorization to update the log stream. Only RRS should have update authority to the RM.DATA log stream.  
  - If there were no applications in the installation that could have deleted log data from the RM.DATA log stream, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.  

**Module:** ATRAMINI  

**Source:** Resource recovery services (RRS)  

**Routing Code:** 1,2  

**Descriptor Code:** 4  

### ATR212I

**RRS DETECTED LOG DATA LOSS ON LOGSTREAM** `logstreamname` DUE TO INACCESSIBLE LOG DATA. LOG DATA FROM `lowgmt` TO `highgmt` ARE AFFECTED.  

**Explanation:** RRS detected inaccessible log data on the named log stream. RRS cannot access the log data either because data has been lost or there is an uncorrectable gap in the log data.  

In the message text:

- `logstreamname` is the name of the log stream.  
- `lowgmt` is either the GMT timestamp of the last valid log data before the inaccessible range of log data or `**************` if there was no valid log data before the inaccessible range.  
- `highgmt` is the GMT timestamp of the first accessible log data after the inaccessible range of log data or the GMT time when the message was issued if there is no valid log data after the inaccessible range.  

**System action:** The message reports the fact that RRS detected inaccessible log data. Subsequent messages provide more specific information about how the error affect processing.

---

Chapter 3. ATR messages 173
The subsequent messages that RRS might issue are: ATR209I, ATR210E, ATR238E, ATR218I, ATR219I or ATR250E.

Operator response: Notify your system programmer.

System programmer response: Determine if message ATR209I, ATR210E, ATR238E, ATR218I, ATR219I or ATR250E were issued in addition to this message. Follow the system programmer response provided for the additional message.

Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 4

---

**ATR213I**  
ARCHIVE FAILED FOR LOGSTREAM *lsname* DUE TO THE LACK OF A CONNECTED ARCHIVE LOG.

Explanation: RRS did not move the log entries from log stream *lsname* to the ARCHIVE log during an RRS cold start because RRS was not connected to the ARCHIVE log stream.

In the message text:

*lsname* is the name of the log stream.

System action: RRS continues cold start processing, but all entries in the named log stream are deleted.

Operator response: Inform your system programmer.

System programmer response: This message records the fact that RRS was unable to move existing UR state log entries from log stream *lsname* to the ARCHIVE log stream when RRS cold started.

Module: ATRTMFLG
Source: Resource recovery services (RRS)
Routing Code: 11
Descriptor Code: 6

---

**ATR214I**  
RRS FAILED TO FLUSH ALL LOG DATA FOR LOGSTREAM *lsname* DUE TO INACCESSIBLE LOG DATA. LOG DATA FROM *lowgmt* TO *highgmt* ARE AFFECTED.

Explanation: While moving entries to the archive log during an RRS cold start, RRS encountered inaccessible log data in the named log stream. RRS cannot access the log data either because data has been lost or there is an uncorrectable gap in the log data.

In the message text:

*lsname* is the name of the log stream.

*lowgmt* is either the GMT timestamp of the last valid log data before the inaccessible range of log data or *************** if there was no valid log data before the inaccessible range.

*highgmt* is the GMT timestamp of the first accessible log data after the inaccessible range of log data or the current GMT time when the message was issued if there is no valid log data after the inaccessible range.

System action: RRS moves the accessible entries in log stream *lsname* to the archive log and writes an entry to the archive log that describes the time range of the log data that might be missing. This information is displayed to a user of the RRS ISPF panels when browsing the archive log stream.

The RRS address space continues cold start processing.

Operator response: Inform your system programmer.

System programmer response: This message records the fact that, during a cold start, RRS was unable to move
existing UR state log entries from log stream lsname to the archive log.

**Module:** ATRTMFLG

**Source:** Resource recovery services (RRS)

**Routing Code:** 11

**Descriptor Code:** 6

---

### ATR215I

**Explanation:** While reading log stream lsname, RRS encountered the error this message reports. Additional messages will describe how the error affects processing.

This message includes the return code and reason code from the system logger browse service, IXGBRWSE, as well as additional diagnostic information that system logger returns.

In the message text:

- **lsname** is the name of the log stream.
- **return-code** is the return code from IXGBRWSE.
- **reason-code** is the reason code from IXGBRWSE.
- **diag1** is the diagnostic field, ANSAA_DIAG1, from the IXGBRWSE answer area. For the meaning of this field, see the description of the return code and reason code from IXGBRWSE in z/OS MVS Programming: Assembler Services Reference ABE-HSP.
- **diag2** is the diagnostic field, ANSAA_DIAG2, from the IXGBRWSE answer area. For the meaning of this field, see the description of the return code and reason code from IXGBRWSE in z/OS MVS Programming: Assembler Services Reference ABE-HSP.
- **diag3** is additional diagnostic information for the use of the IBM Support Center.
- **diag4** is additional diagnostic information for the use of the IBM Support Center.

**System action:** RRS returns the error to the function that requested the log read.

**Operator response:** Inform your system programmer.

**System programmer response:** Use the description of IXGBRWSE in z/OS MVS Programming: Assembler Services Reference ABE-HSP to determine the reason for the error and the action required for the specific error.

---

### ATR216I

**Explanation:** While trying to write to log stream lsname, RRS encountered the error this message reports. Additional messages will describe how the error affects processing.

This message includes the return code and reason code from the system logger write service, IXGWRITE, as well as additional diagnostic information that system logger returns.

In the message text:
ATR217I

lsname
    is the name of the log stream.

return-code
    is the return code from IXGWRITE.

reason-code
    is the reason code from IXGWRITE.

diag1
    is the diagnostic field, ANSAA_DIAG1, from the IXGWRITE answer area. For the meaning of this field, see the description of the return code and reason code from IXGWRITE in [z/OS MVS Programming: Assembler Services Reference ABE-HSP].

diag2
    is the diagnostic field, ANSAA_DIAG2, from the IXGWRITE answer area. For the meaning of this field, see the description of the return code and reason code from IXGWRITE in [z/OS MVS Programming: Assembler Services Reference ABE-HSP].

diag3
    is additional diagnostic information for the use of the IBM Support Center.

diag4
    is additional diagnostic information for the use of the IBM Support Center.

System action:  RRS returns the error to the function that requested the log write.

Operator response:  Inform your system programmer.

System programmer response:  Use the description of IXGWRITE in [z/OS MVS Programming: Assembler Services Reference ABE-HSP] to determine the reason for the error and the action required for the specific error. If you cannot resolve the problem, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module:  ATRAMINI

Source:  Resource recovery services (RRS)

Routing Code:  1,2

Descriptor Code:  4

Explanation:  RRS reconnected to a new version of the log stream identified in this message. The log stream version changed because the log stream definition in the LOGR policy for the named log stream was being deleted and then redefined.

In the message text:

lstype
    One of the following log streams:

    RM DATA
        The RRS RMDATA log stream.

    MAIN UR
        The RRS MAIN.UR log stream.

    DELAYED UR
        The RRS DELAYED.UR log stream.

    RESTART
        The RRS RESTART log stream.

    RM META DATA
        The RRS RM Meta Data log stream.
logstreamname
   The name of the log stream.

oldlsversion
   The version of the log stream RRS expected to connect to. The identifier is the GMT timestamp created when the log stream was defined.

newlsversion
   The version of the log stream RRS connected to. The identifier is the GMT timestamp created when the log stream was defined.

System action: The RRS address space ends so that a restart of RRS can resolve the log stream version change and the resulting log data loss.

Operator response: Restart RRS.

System programmer response: None.

Module: ATRAMINI

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 3

ATR218I processname PROCESS HAS FAILED DUE TO INACCESSIBLE LOG DATA IN LOGSTREAM logstreamname.

Explanation: The named RRS process has failed because inaccessible log data was detected in the named log stream. Message ATR210E or ATR238E accompanies this message.

In the message text:

processname
   One of the following:

   INITIALIZE
      RRS address space initialization.

   TAKEOVER
      RRS log takeover for a failed peer instance of RRS.

   RM RESTART
      Resource manager begin restart.

   RETRIEVE LOGNAME
      Resource manager retrieve logname.

   SET LOGNAME
      Resource manager set logname.

   RM DATA LOG COMPRESSION
      R.M.DA.TA log compression.

   MAIN UR LOG COMPRESSION
      MAIN.UR log compression.

   DELAYED UR LOG COMPRESSION
      DELAYED.UR log compression.

   RECONNECT
      Log stream reconnection.

   SET META DATA
      Resource manager set Meta Data.

   RETRIEVE META DATA
      Resource manager RETRIEVE Meta Data.
**ATR218I**

**RM META DATA LOG COMPRESSION**
RM Meta Data log compression.

**INTERNAL COLD START**
Internal Cold Start.

*logstreamname*
The name of the log stream.

**System action:** The system action depends on the process that failed, as follows:

**INITIALIZATION**
RRS initialization has failed. All subsequent attempts to restart RRS will fail.

**TAKEOVER**
Log takeover processing has failed. Takeover processing has been disabled on this system.

**RM RESTART**
Resource manager restart processing has failed. Resource manager restart processing has been disabled on this system.

**RETRIEVE LOGNAME**
An attempt by a resource manager to retrieve a logname has failed. All subsequent logname retrieval attempts will fail.

**SET LOGNAME**
An attempt by a resource manager to set its logname has failed. All subsequent attempts to set a resource manager logname will fail.

**RM DATA LOG COMPRESSION**
Log stream compression for the RM.DATA log stream has failed. Compression processing for the RM.DATA log stream has been disabled.

**MAIN UR LOG COMPRESSION**
Log stream compression for the MAIN.UR log stream has failed. Compression processing for the MAIN.UR log stream has been disabled.

**DELAYED UR LOG COMPRESSION**
Log stream compression for the DELAYED.UR log stream has failed. Compression processing for the DELAYED.UR log stream has been disabled.

**RECONNECT**
The RRS address space failed because there is inaccessible log data in the RM.DATA log named *lsname*.

**SET META DATA**
An attempt by a resource manager to set Meta Data has failed. All subsequent attempts to set Meta Data for a resource manager may fail.

**RETRIEVE META DATA**
An attempt by a resource manager to retrieve Meta Data has failed. All subsequent attempts to retrieve Meta Data for a resource manager may fail.

**RM DELETE ENTRY**
An attempt to delete a resource manager from the named log stream has failed. Subsequent attempts to delete the resource manager from the log stream may fail.

**RM META DATA DELETE ENTRY**
An attempt by a resource manager to delete its Meta Data entry via the Set RM Metadata service has failed. Subsequent attempts to set Meta Data for a resource manager may fail.

**RM META DATA LOG COMPRESSION**
Log stream compression for the named RM Meta Data log stream has failed. Compression processing for the RM Meta Data log stream has been disabled.

**INTERNAL COLD START**
An attempt to search for a resource manager in the named log stream has failed. The RRS address space terminates.

**Operator response:** Notify your system programmer.
System programmer response: To clear the error in the RM data log stream, you must cold start all the RRS members in the RRS group. The RRS group name is the second qualifier of the log stream name. See [z/OS MVS Programming: Resource Recovery](https://www.ibm.com) for a description of how to cold start RRS, and for a description of some actions to avoid because they can cause problems that require a cold start.

ATR219I  RRS HAS MARKED SOME UR STATE LOG ENTRIES AS HEURISTIC MIX WHILE PERFORMING LOG TAKEOVER FOR `sysname`

Explanation: RRS has marked one or more URs as heuristic mixed because it detected inaccessible log data while performing log takeover for system `sysname`.

The state of the resources associated with the UR might be questionable.

In the message text:

`sysname`

is the system name of the system for which RRS is performing takeover.

System action: RRS has marked as heuristic mixed any URs that were in-prepare or in-doubt that might be missing more recent log entries.

Log takeover processing continues.

Operator response: Inform your system programmer.

System programmer response: Ensure that the resources are returned to a consistent state.

Module: ATRTMRL

Source: Resource recovery services (RRS)

Routing Code: 11

Descriptor Code: 6

---

ATR220A  GAP FOUND IN `logstreamname`. REPAIR THE GAP AND REPLY TO ATR202D

Explanation: RRS has encountered a gap in the named log stream.

In the message text:

`logstreamname`

is the name of the affected log stream.

System action: RRS waits for the reply to message ATR202D. If the reply is RETRY, RRS assumes the gap has been repaired and will retry the function. If the reply is ACCEPT, RRS will proceed with processing the loss of data.

Operator response: In response to message ATR202D, reply RETRY if the gap condition has been fixed or reply ACCEPT if the gap condition can not be fixed, or notify the system programmer.

System programmer response: Try to fix the gap in the named log stream, then reply RETRY. Otherwise, reply ACCEPT.

Module: ATRMRRS

Source: Resource Recovery Services (RRS)

Routing Code: 1,2

Descriptor Code: 12
ATR221I • ATR223I

ATR221I  RRS IS JOINING RRS GROUP groupname ON SYSTEM sysname

Explanation:  RRS is starting on the named system and joining the RRS log group identified by groupname.

In the message text:

groupname
  is the RRS log group name.

sysname
  is the name of system on which this instance of RRS is running.

System action:  RRS initialization continues.

Operator response:  If the log group name is correct, none. Otherwise, notify the system programmer.

System programmer response:  If the log group name is not correct, you might need to stop RRS and restart it with the correct log group name.

Module:  ATRAMINI

Source:  Resource recovery services (RRS)

Routing Code:  1,2

Descriptor Code:  12

ATR222I  LOG TAKEOVER FOR SYSTEM sysname HAS COMPLETED SUCCESSFULLY.

Explanation:  The system issuing this message has detected that RRS on the named system is not active and moved the RRS UR State log entries for the named system into the RRS Restart logstream. This allows the resource managers that were active on the named system to restart with RRS on some other system.

In the message text:

sysname
  is the system name of the system whose log entries are being taken over.

System action:  Processing continues.

Operator response:  None.

System programmer response:  None.

Module:  ATRTMLTK

Source:  Resource Recovery Services (RRS)

Routing Code:  1,2

Descriptor Code:  12

ATR223I  LOG TAKEOVER FOR SYSTEM sysname HAS FAILED.

Explanation:  RRS failed to complete log takeover for system sysname.

In the message text:

sysname
  is the system name of the system whose log entries are being taken over.

System action:  Processing continues. RRS will continue to attempt log takeover for sysname until it is successful, at which point message ATR222I is issued.

Operator response:  None.

System programmer response:  Check the hardcopy log to determine if a subsequent attempt to take over the log entries for system sysname was successful. RRS issues message ATR222I whenever log takeover completes successfully.

If log takeover continues to fail, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center and provide the diagnostic data from the message.
ATR224I • ATR225D

ATR225D  CANCEL DELAYED. REPLY WAIT, BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR.

URID=uridentifier

Explanation: An operator issued the CANCEL command for an application, but there is a sync-point operation in progress for an in-doubt UR (unit of recovery). Before CANCEL command processing can continue, the in-doubt UR must be resolved.

In the message text:

uridentifier

is the identifier of the in-doubt UR.

System action: The system delays CANCEL command processing until the UR is resolved. When the UR is resolved, the system processes the CANCEL command.

Operator response: Notify the system programmer.

System programmer response: Reply WAIT to cause RRS to wait for the distributed sync-point manager (DSRM) to resolve the in-doubt UR. If replying WAIT does not work, you can use the RRS panels to resolve the in-doubt UR. IBM recommends that you do not use the FORCE command after you have replied WAIT.

If you do not want RRS to wait for the DSRM, reply either:
• BACKOUT to cause RRS to complete the sync-point operation and back out the changes
• COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

User response: None.

- BACKOUT to cause RRS to complete the sync-point operation and back out the changes
- COMMIT to complete the sync-point operation and commit the changes.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

Module: ATRBMECY
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR233D CANCEL DELAYED. REPLY BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR.
URID=uridentifier

Explanation: An operator issued the CANCEL command to cancel the server distributed sync-point resource manager (SDSRM), but there is a sync-point operation in progress for an in-doubt UR (unit of recovery), and the SDSRM being canceled is the program needed to resolve the in-doubt UR. Before CANCEL command processing can continue, the in-doubt UR must be resolved.

In the message text:
ATR234D

uridentifier

UR identifier for the in-doubt UR

System action: The system delays CANCEL command processing until the UR is resolved. When the UR is resolved, the system processes the CANCEL command.

Operator response: Notify the system programmer.

System programmer response: Reply either:
    • BACKOUT to cause RRS to complete the sync-point operation and back out the changes
    • COMMIT to complete the sync-point operation and commit the changes.

IBM recommends that you do not use the FORCE command when this message is outstanding.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

User response: None.

Module: ATRBMECY

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 12

ATR234D MEMTERM DELAYED. REPLY BACKOUT, OR COMMIT TO RESOLVE INDOUBT UR.

uridentifier

UR identifier for the in-doubt UR

Explanation: The system tried to end an address space where the server distributed sync-point resource manager (SDSRM) program was running, but there is a sync-point operation in progress for an in-doubt UR (unit of recovery), and the SDSRM being ended is the program needed to resolve the in-doubt UR. Before the address space can end, the in-doubt UR must be resolved.

In the message text:

uridentifier

UR identifier for the in-doubt UR

System action: The system does not end the address space; it delays ending the address space until the UR is resolved. When the UR is resolved, the system ends the address space.

Operator response: Notify the system programmer.

System programmer response: Reply either:
    • BACKOUT to cause RRS to complete the sync-point operation and back out the changes
    • COMMIT to complete the sync-point operation and commit the changes.

IBM recommends that you do not use the FORCE command when this message is outstanding.

If you need more information about the UR identified in the message, you can use the RRS panels, both to find out more about the UR and to resolve the UR.

User response: None.

Module: ATRBMECY

Source: Resource recovery services (RRS)

Routing Code: 1,2

Descriptor Code: 12
ATR235I  RRS FAILED TO JOIN THE RRS XCF GROUP. RC=returncode, RSN=reasoncode

Explanation:  RRS initialization was unable to join the RRS XCF group.

In the message text:

returncode  
is the return code received from the IXCJOIN macro

reasoncode  
is the reason code received from the IXCJOIN macro

System action:  RRS initialization is terminated.

Operator response:  Notify the system programmer.

System programmer response:  Investigate IXCJOIN's return and reason codes in the [z/OS MVS Programming: Sysplex Services Reference](#). With the introduction of z/OS V1R10, IXCJOIN error IXCJoinRsnIsFailed, return code 8 and reason code 10x, could become more prevalent when a V1R10 or higher system is backed off to a lower level z/OS system. APAR number OA23153 has been created to prevent this situation from happening and should be installed to allow RRS to start on the lower level system. If the APAR is not available or installed, RRS must be removed from XCF before RRS can be started. For more details, see the 'RRS use of XCF' section in [z/OS MVS Programming: Resource Recovery](#) at the V1R10 level or higher.

Module:  ATRAMINI

Source:  Resource Recovery Services (RRS)

ATR236I  RRS WAS UNABLE TO OBTAIN MEMBER INFORMATION ABOUT RRS XCF GROUP. RC=returncode, RSN=reasoncode

Explanation:  RRS initialization was unable to obtain member information about the RRS XCF group.

In the message text:

returncode  
is the return code received from the IXCQUERY macro

reasoncode  
is the reason code received from the IXCQUERY macro

System action:  RRS initialization is terminated.

Operator response:  Notify the system programmer.

System programmer response:  For an explanation of the return and reason codes, see the description of IXCQUERY in [z/OS MVS Programming: Sysplex Services Reference](#). Examine the return and reason codes to determine the problem. If you cannot fix the problem, contact your IBM Support Center.

Module:  ATRAMINI, ATRAMMSG

Source:  Resource Recovery Services (RRS)

Routing Code:  1,2

Descriptor Code:  4

ATR237I  RRS HAS DETECTED A LOG DATA LOSS ON RM META DATA LOGSTREAM lsnname. RRS COULD NOT CONNECT TO THE LOG STREAM BUT AN OLDER VERSION WAS USED LAST. OLD VERSION: oldversion

Explanation:  RRS has detected a log data loss as a result of not connecting to a previous version of the named log stream. The log stream version changed because the log stream definition in the LOGR policy for the named log stream was deleted.

In the message text:
ATR238E • ATR246I

lsname
The name of the log stream.

oldlsversion
Identifies the version of the log stream RRS expected to connect to. The identifier is the GMT timestamp created when the log stream was defined.

System action: RRS initialization continues without the optional log stream.
Operator response: Notify your system programmer.
System programmer response: Determine what caused the log stream to be deleted or why RRS cannot connect to it.
User response: None.
Module: ATRRMRRS
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR238E INACCESSIBLE LOG DATA DETECTED ON THE RRS RM META DATA LOGSTREAM

logstreamname

Explanation: RRS has encountered inaccessible log data in the named RM META DATA log stream. RRS cannot access the log data either because data has been lost or there is an uncorrectable gap in the log data.

In the message text:

logstreamname
The name of the log stream.

System action: The system issues message ATR218I, which will explain the effects on the system.
Operator response: Notify your system programmer.
System programmer response: To clear the problem with the named RM META DATA log, consider either deleting and redefining the RM META DATA log stream or restarting RRS with a different RRS log group name. In either case, you will need to bring down all members of the RRS group, redefine (define) the log streams and then restart the members of the RRS log group.
User response: None.
Module: ATRAMINI
Source: Resource recovery services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR246I RRS HAS DETECTED A controlblock CONTROL BLOCK ERROR - UNEXPECTED ERROR DUMP REQUESTED

controlblock

Explanation: RRS processing has detected a problem with the identified control block that could potentially need to be investigated. In the message text:

controlblock
control block name

System action: RRS processing continues but individual transaction results may be impacted and should be monitored. If the processing has determined that the error is severe, then message ATR247E will be issued to signal that action needs to be taken.
Operator response: Notify your system programmer.
System programmer response: You can collect the available diagnostic information, including the unexpected error dump and the associated symptom records and contact IBM Service. The dump for this message may have been
suppressed by DAE if there was a prior occurrence of the error for the same control block in the same module. In
addition, there can be multiple messages reporting errors for the same control block depending on what the problem
is.

User response: None.

Descriptor Code: 4

ATR247E

RRS HAS DETECTED A SEVERE ERROR - TERMINATE RMS AND Optionally REPLY
SHUTDOWN TO SHUTDOWN RRS

Explanation: RRS processing has detected a severe problem with the control block identified in message ATR246I
and has determined that RRS processing should be terminated.

System action: RRS will first issue message ATR246I and generate an error dump. Normal transaction processing
will continue but the individual transaction represented by the affected control block will be suspended.

Operator response: Notify your system programmer.

System programmer response: RRS will need to be terminated properly in order to cleanup the suspended
transaction that is affected by the control block. You can collect the available diagnostic information, including the
unexpected error dump and the associated symptom records and contact IBM Service. Once the diagnostic
information has been collected you can manually clean up and terminate RMs. RRS may be terminated by using
normal shutdown procedures or a reply of SHUTDOWN may be given to instruct RRS to attempt a clean shutdown
if possible and perform a forced shutdown otherwise.

User response: None.

ATR248E

RRS IS WAITING FOR SIGNAL FROM LOGGER TO RESUME PROCESSING RETURN CODE:
returncode REASON CODE: reasoncode DIAGNOSTIC INFORMATION: diag1 diag2 diag3 diag4

Explanation: RRS has received an error from logger indicating that a global logger failure has occurred and no
future calls to logger services will be allowed until logger signals the failure has been corrected which then allows for
requests to be resumed.

In the message text:

returncode

returncode is the return code from the logger service.

reasoncode

reasoncode is the reason code from the logger service.

diag1

diag1 is the diagnostic field, ANSAA_DIAG1, from the logger request answer area.

diag2

diag2 is the diagnostic field, ANSAA_DIAG2, from the logger request answer area.
ATR249E  •  ATR250E

diag3  
diag3 is additional diagnostic information for the use of the IBM Support Center.

diag4  
diag4 is additional diagnostic information for the use of the IBM Support Center.

**System action:** RRS processing waits for the signal from logger to resume logger activity.

**Operator response:** Notify your system programmer.

**System programmer response:** Check for and correct problems with the logger subsystem using the reported diagnostic information.

**Module:** ATRBMTME

**Source:** Resource Recovery Services (RRS)

---

**ATR249E**  
**RRS IS WAITING FOR SIGNAL FROM LOGGER TO RESUME PROCESSING LOGSTREAM**

**NAME:** logstreamname  
**RETURN:** returncode  
**REASON:** reasoncode  
**DIAGNOSTIC INFORMATION:** diag1 diag2 diag3 diag4

**Explanation:** RRS has received an error from logger indicating that a failure with the specified logstream has occurred and no future calls to logger services for that logstream will be allowed until logger signals the failure has been corrected which then allows for requests to be resumed.

In the message text:

logstreamname  
logstreamname is the name of the log stream.

returncode  
returncode is the return code from the logger service.

reasoncode  
reasoncode is the reason code from the logger service.

diag1  
diag1 is the diagnostic field, ANSAA_DIAG1, from the logger request answer area.

diag2  
diag2 is the diagnostic field, ANSAA_DIAG2, from the logger request answer area.

diag3  
diag3 is additional diagnostic information for the use of the IBM Support Center.

diag4  
diag4 is additional diagnostic information for the use of the IBM Support Center.

**System action:** RRS processing waits for the signal from logger to resume logger activity on this logstream.

**Operator response:** Notify your system programmer.

**System programmer response:** Check for and correct problems with the logger subsystem or specific logstream using the reported diagnostic information.

**Module:** ATRBMTME

**Source:** Resource Recovery Services (RRS)

---

**ATR250E**  
**RRS LOGSTREAM ERROR FOUND. CORRECT THE ERROR OR OPTIONALLY REPLY COLDSTART TO BEGIN A RRS INTERNAL COLD START.**

**Explanation:** RRS processing has detected a severe log stream error as identified in the previously issued messages ATR210E, ATR212I, or ATR218I.

**System action:** RRS waits for a reply of COLDSTART to the message or termination of RRS.

**Operator response:** Notify your system programmer.

**System programmer response:** For RRS to continue processing, the log stream error needs to be corrected. A reply of COLDSTART can be given to instruct RRS to attempt an Internal Cold Start. RRS will remain active, but new work
will not be accepted till the cold start is complete. An attempt will be made to save in storage transactions which will be relogged as part of the Internal Cold Start procedure. This prevents a system wide outage of RRS. Without the COLDSTART reply, a cold start of RRS using the ATRCOLD procedure, requiring RRS to be terminated properly on all systems in the RRS group is needed. Once terminated, request a cold start of RRS using the ATRCOLD procedure and then restart RRS on each system in the RRS group. This can be done manually resulting in all outstanding transactions being lost and not recoverable.

Module: ATRLMCLD
Source: Resource Recovery Services (RRS)
Routing Code: 1, 2, 10
Descriptor Code: 4

ATR251I  RRS INTERNAL COLD START IS IN PROGRESS.

Explanation: RRS processing has detected a severe log stream error and the operator has responded COLDSTART to message ATR250E to request RRS to attempt to correct the problem internally. RRS internal processing has started to correct the problem. Message ATR253I will be issued when the processing is complete and RRS will resume normal processing. Should RRS fail to correct the problem, message ATR255E will be issued and RRS will be terminated. Messages ATR251I and ATR252I are the same. However ATR251I is issued to the operator console and ATR252I is written to the hardcopy log.

System action: RRS internal processing is trying to correct the problem.
Operator response: None.
System programmer response: None.

Module: ATRLMCLD
Source: Resource Recovery Services (RRS)
Routing Code: 1, 2, 10
Descriptor Code: 4

ATR252I  RRS INTERNAL COLD START IS IN PROGRESS.

Explanation: RRS processing has detected a severe log stream error and the operator has responded COLDSTART to message ATR250E to request RRS to attempt to correct the problem internally. RRS internal processing has started to correct the problem. Message ATR253I will be issued when the processing is complete and RRS will resume normal processing. Should RRS fail to correct the problem, message ATR255E will be issued and RRS will be terminated. Messages ATR251I and ATR252I are the same. However ATR251I is issued to the operator console and ATR252I is written to the hardcopy log.

System action: RRS internal processing is trying to correct the problem.
Operator response: None.
System programmer response: None.

Module: ATRLMCLD
Source: Resource Recovery Services (RRS)

ATR253I  RRS INTERNAL COLD START HAS COMPLETED SUCCESSFULLY.

Explanation: RRS Internal Cold Start processing has completed successfully. The severe log stream error that prompted the cold start has been corrected. There was no loss of data or resource manager(s). Messages ATR253I and ATR254I are the same. However ATR253I is issued to the operator console and ATR254I is written to the hardcopy log.

System action: RRS transaction processing resumes and new work is accepted.
Operator response: None.
System programmer response: None.
ATR254I • ATR256E

Module:  ATRLMCLD
Source:  Resource Recovery Services (RRS)

ATR254I  RRS INTERNAL COLD START HAS COMPLETED SUCCESSFULLY.

Explanation:  RRS Internal Cold Start processing has completed successfully. The severe log stream error that prompted the cold start has been corrected. There was no loss of data or resource manager(s). Messages ATR253I and ATR254I are the same. However, ATR253I is issued to the operator console and ATR254I is written to the hardcopy log.

System action:  RRS transaction processing resumes and new work is accepted.
Operator response:  None.
System programmer response:  None.

Module:  ATRLMCLD
Source:  Resource Recovery Services (RRS)

ATR255E  RRS INTERNAL COLD START FAILED.

Explanation:  RRS Internal Cold Start processing has failed due to some error resulting in the termination of the RRS address space.

System action:  The RRS address space terminates with completion code of 5C4, reason code xxxx0029, and a dump.
Operator response:  Notify your system programmer.
System programmer response:  Request a cold start of RRS using the ATRCOLD procedure and then restart RRS on each system in the RRS group. Also provide this information to your IBM Support Center to correct the Internal Cold Start processing error for future uses.

Module:  ATRLMCLD
Source:  Resource Recovery Services (RRS)
Routing Code:  1, 2, 10
Descriptor Code:  4

ATR256E  RRS PROCESSING FAILED SAVING THE process FLAG IN THE COUPLE DATA SET.

RC=returncode, RSN=reasoncode

Explanation:  RRS encountered an error with the IXCSETUS macro. The return and reason codes are listed in the message. The flag indicating the process, was not saved in the Couple Data Set.

In the message text:

process
 cr Process flag, either In_Process or NotIn_Process.

returncode
 cr is the return code from the IXCSETUS macro.

reasoncode
 cr is the reason code from the IXCSETUS macro.

System action:  RRS continues processing. In the event RRS was doing an Internal Cold Start, this has resulted in the failure of RRS processing and the termination of the RRS address space.
Operator response:  Notify your system programmer.
System programmer response:  Provide this information to your IBM Support Center to correct the macro error for future uses. In the event RRS was doing an Internal Cold Start, request a cold start of RRS using the ATRCOLD procedure and then restart RRS on each system in the RRS group.

192  z/OS V2R2 MVS System Messages, Vol 3 (ASB-BPX)
ATR257E • ATR301E

Module: ATRLMCLD
Source: Resource Recovery Services (RRS)
Routing Code: 1, 2, 10
Descriptor Code: 4

ATR257E  INTERNAL COLD START PROCESSING FAILED TO START.
Explanation: RRS processing has detected a severe log stream error as identified in the previously issued messages ATR210E, ATR212I, or ATR218I. The Internal Cold Start cannot be done due to the internal error.
System action: RRS continues in a degraded state.
Operator response: Notify your system programmer.
System programmer response: Refer to message ATR210E, ATR212I, or ATR218I that were issued prior to message ATR257E as they will explain the original error and how it should be corrected. In all cases, you must request a cold start of RRS using the ATRCOLD procedure and then restart RRS on each system in the RRS group. Also provide this information to your IBM Support Center.

Module: ATRLMCLD
Source: Resource Recovery Services (RRS)
Routing Code: 1, 2, 10
Descriptor Code: 4

ATR301E  RRS IS UNABLE TO COMPRESS lstype LOGSTREAM logstreamname
Explanation: RRS cannot compress the log stream identified in this message because of unexpected errors from system logger.
Message ATR216I, ATR302I or ATR303I, issued to the system log, provides additional information about the error.
In the message text:
lstype
One of the following log streams:

MAIN UR
The RRS MAIN.UR log stream.

DELAYED UR
The RRS DELAYED.UR log stream.

RM DATA
The RRS RM DATA log stream.

RESTART
The RRS RESTART log stream.

RM META DATA
The RRS RM Meta Data log stream.

logstreamname
The name of the log stream.
System action: RRS is unable to delete log data from the identified log stream. The log stream will continue to increase in size until the error condition is corrected.
Once RRS is again able to compress the log stream, or if the RRS address space terminates, this message is deleted.
Operator response: Locate message ATR216I, ATR302I or ATR303I in the system log and notify the system programmer.
System programmer response: To determine the error and take appropriate action, locate message ATR216I, ATR302I or ATR303I in the system log. Use the system programmer response to correct the error condition, if possible.
 Otherwise, monitor the size of the log stream by using the system logger policy utility to list the number of data sets in the log stream. To prevent the named log stream from encountering a log stream full condition, you might need to provide data set directory extent records in the system logger couple data set.

**Module:** ATRAMINI  
**Source:** Resource recovery services (RRS)  
**Routing Code:** 1,2  
**Descriptor Code:** 3

### ATR302I  
**Explanation:** While compressing the log stream named in the message, RRS encountered an error. No log data is deleted from this log stream until the error is corrected. Message ATR301E accompanies this message.

In the message text:

- `lsname` is the name of the log stream.
- `return-code` is the return code from the system logger delete service, IXGDELET.
- `reason-code` is the reason code from the system logger delete service, IXGDELET.
- `diag1` is the diagnostic field, ANSAA_DIAG1, from the IXGDELET answer area. For the meaning of this field, see the description of the return code and reason code from IXGDELET in [z/OS MVS Programming: Assembler Services Reference ABE-HSP](#).
- `diag2` is the diagnostic field, ANSAA_DIAG2, from the IXGDELET answer area. For the meaning of this field, see the description of the return code and reason code from IXGDELET in [z/OS MVS Programming: Assembler Services Reference ABE-HSP](#).
- `diag3` is additional diagnostic information for the use of the IBM Support Center.
- `diag4` is additional diagnostic information for the use of the IBM Support Center.

**System action:** RRS cannot delete log data from the log stream until the error is corrected. The log stream will continue to increase in size until the error condition is corrected.

**Operator response:** Inform your system programmer.

**System programmer response:** Use the description of IXGDELET in [z/OS MVS Programming: Assembler Services Reference ABE-HSP](#) to determine the reason for the error and the action required for the specific error.

### ATR303I  
**Explanation:** RRS encountered an error while either reading or updating the delete point for a system in log stream `logstreamname`. No log data is deleted from this log stream until the error is corrected. Message ATR301E is also issued for this condition.
In the message text:

- `logstreamname` is the name of the log stream.
- `return-code` is the return code from the system logger service.
- `reason-code` is the reason code from the system logger service.
- `diag1` is the diagnostic field, ANSAA_DIAG1, from the IXGWRITE answer area. For the meaning of this field, see the description of the return code and reason code from IXGWRITE in [z/OS MVS Programming: Assembler Services Reference ABE-HSP](z/OS MVS Programming: Assembler Services Reference ABE-HSP).
- `diag2` is the diagnostic field, ANSAA_DIAG2, from the IXGWRITE answer area. For the meaning of this field, see the description of the return code and reason code from IXGWRITE in [z/OS MVS Programming: Assembler Services Reference ABE-HSP](z/OS MVS Programming: Assembler Services Reference ABE-HSP).
- `diag3` is diagnostic information for IBM use only.
- `diag4` is diagnostic information for IBM use only.
- `diag5` is diagnostic information for IBM use only.

**System action:** RRS is unable to delete log data from the log stream until the condition is resolved. The log stream will continue to grow in size until the error condition that is preventing RRS from deleting log data is corrected.

**Operator response:** None.

**System programmer response:** Use the description of IXGWRITE in [z/OS MVS Programming: Assembler Services Reference ABE-HSP](z/OS MVS Programming: Assembler Services Reference ABE-HSP) to determine the reason for the error and the action required for the specific error.

If you are unable to determine the cause of the error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center and provide this message.

**Module:** ATRAMINI

**Source:** Resource Recovery Services (RRS)

**Routing Code:** 1,2

**Descriptor Code:** 12

---

**ATR304E**

**Explanation:** RRS on `systemname` is unable to join RRS group `groupname` because of an error from the system logger.

- `systemname` is the name of the system from which RRS attempted to join the RRS group.
- `groupname` is the name of the RRS group that the `system` attempted to join.

**System action:** RRS does not allow any resource manager to restart until the error is fixed, at which point RRS deletes the message.

RRS issues message ATR303I to the hardcopy log. The message provides specific diagnostic information.

**Operator response:** Find message ATR303I in the hardcopy log and inform the system programmer.

**System programmer response:** Use the contents of message ATR303I to identify the error condition the system
logger returned. Follow the system programmer response for that message to correct the error condition, if possible, then restart the resource managers.

Otherwise, consider having this RRS join a different RRS group by changing the procedure used to start RRS. Make this decision carefully because there might be resource managers running on systemname. You can use the RRS ISPF Log Browse panel to determine whether resource managers that will restart on systemname have interests in the RESTART log of the RRS group identified in groupname.

Module: ATRAMINI
Source: Resource Recovery Services (RRS)
Routing Code: 1,2
Descriptor Code: 12

ATR305E RRS IS UNABLE TO WRITE TO lstype LOGSTREAM logstreamname ON SYSTEM sysname

Explanation: RRS cannot write to the log stream identified in this message because RRS encountered an error when using the system logger IXGWRITE macro.

Message ATR216I accompanies this message, which provides the specific diagnostic information.

In the message text:

lstype
Identifies the log stream type as one of the following:
   RM DATA
   MAIN UR
   DELAYED UR
   RESTART
   ARCHIVE
   RM META DATA

logstreamname
The name of the log stream.

sysname
The system name on which the error was encountered

System action: The action varies with the type of log stream that encountered the write error. The actions based upon the lstype are:

RM DATA
   If RRS was initializing when the error occurred and RRS needed to update the log to complete initialization, then RRS initialization fails.
   Otherwise, any RRS function that must update the RM DATA log stream will fail. These functions include log takeover processing for another system and RM restarts. RRS will continue to attempt to write to the RM DATA log stream on subsequent requests that require updates to the log. If a write succeeds, RRS will delete this message.

MAIN UR
   RRS stops logging to the MAIN UR log stream on system sysname. All UR state log records for sysname are logged to the DELAYED UR log stream for the remainder of the life of the RRS address space on sysname.

DELAYED UR
   RRS address space on system sysname terminates.

RESTART
   RRS functions that must update the RESTART log fail. These functions include log takeover, remove interest, and resolve an in-doubt condition.

ARCHIVE
   RRS stops logging to the ARCHIVE log stream on system sysname for the remainder of the life of the RRS address space on sysname.
RM META DATA

RRS functions that update the RM Meta Data log stream may fail. These functions include set meta data, remove/delete RM, and Meta Data log compression. RRS will continue to attempt to write to the RM Meta Data log stream on subsequent requests that require updates to the log stream. If a write succeeds, RRS will delete this message.

This message will be deleted when the RRS address space terminates.

Operator response: Locate message ATR216I and notify the system programmer.

System programmer response: The response varies with the type of log stream, as follows:

RM DATA

You need to correct the error or cold start.

To correct the error, find message ATR216I and follow the system programmer response for that message. Once RRS can write to the RM data log stream, it will delete this message.

If you cannot correct the error, you must cold start all the RRS members in the RRS group. The RRS group name is the second qualifier in the log stream name. See z/OS MVS Programming: Resource Recovery for a description of how to cold start RRS, and for a description of some actions to avoid because they can cause problems that require a cold start.

MAIN UR

You can either try to fix the problem or have RRS run without logging to the MAIN UR log stream.

Fixing the problem: If you try to fix the problem, you will need to determine the error condition returned by the system logger. Locate message ATR216I and follow the system programmer response for that message. Then, cancel RRS on system sysname and restart it to have it begin using the log stream again.

If you cannot correct the problem and you want to have RRS use the MAIN UR log stream, you will need to cancel RRS and start RRS with a different log group name.

Running without a MAIN UR log stream: If you choose to run RRS without logging to the MAIN UR log stream, you need to consider the impact on RRS performance.

Because system sysname is now logging all its UR state log entries to the DELAYED UR log stream, as opposed to both the MAIN UR and DELAYED UR log streams, the amount of data in the DELAYED UR log stream will increase. Consider monitoring the DELAYED UR log stream to ensure the log stream does not run out of log data set directory space. You can use the LOGR policy utility LIST function to monitor the log data set usage. You might also consider formatting DSEXTENT records in your LOGR couple data set if you have not already done so. This action will allow the log stream to extend its log data set directory, if necessary.

DELAYED UR

Determine the error condition returned by the system logger. Locate message ATR216I and follow the system programmer response for that message to correct the problem, then restart the RRS address space on sysname.

If you cannot correct the problem, consider starting RRS with a different log group name.

RESTART

Determine the error condition returned by the system logger. Locate message ATR216I and follow the system programmer response for that message to correct the problem. Once RRS can successfully write to the RESTART log stream on sysname, it deletes this message.

If you cannot correct the problem, consider either deleting and redefining the RESTART log stream or starting RRS with a different log group name. In either case, you will need to bring down all members of the RRS group, redefine (define) the log stream(s), and then restart the members of the RRS group.

ARCHIVE

You can either try to fix the problem or have RRS run without logging to the ARCHIVE log stream.

Fixing the problem: If you try to fix the problem, locate message ATR216I to determine the error condition the system logger returned and follow the system programmer response for that message. Then, cancel RRS on system sysname and restart it to have it begin using the log stream again.

If you cannot correct the problem and you want to have RRS use the ARCHIVE log stream, you will need to cancel RRS and start RRS with a different group name.
Running without an ARCHIVE log stream: If you choose to run without an ARCHIVE log stream, RRS will not log completed units of recovery (URs) to the ARCHIVE log stream.

RM META DATA
Determine the error condition returned by the system logger. Locate message ATR216I and follow the system programmer response for that message to correct the problem. Once RRS can successfully write to the RM META DATA log stream on sysname, RRS deletes this message.

If you cannot correct the problem, consider either deleting and redefining the RM META DATA log stream or restarting RRS with a different RRS log group name. In either case, you will need to bring down all members of the RRS group, redefine (define) the log stream(s) and then restart the members of the RRS log group.

ATR306I RESOURCE MANAGER rmname CAUSED A hmcond CONDITION FOR URID = uridentifier

Explanation: RRS has detected a heuristic condition while processing the unit of recovery (UR) identified in the message; RRS records this exceptional condition in LOGREC.

In the message text:

rmname
is the resource manager name.

hmcond
One of the following:

HEURISTIC-MIXED
A heuristic-mixed condition.

HEURISTIC COMMIT
A heuristic commit condition.

HEURISTIC RESET
A heuristic reset condition.

HEURISTIC-MIXED BACKOUT
A heuristic-mixed backout condition.

HEURISTIC-MIXED COMMIT
A heuristic-mixed commit condition.

OK-OUTCOME-PENDING
An OK outcome pending condition.

BACKOUT-OUTCOME-PENDING
A BACKOUT outcome pending condition.

uridentifier
is URID for the specified UR

System action: The system action depends on which heuristic condition was detected.

HEURISTIC-MIXED
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

HEURISTIC COMMIT
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

HEURISTIC RESET
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

HEURISTIC-MIXED BACKOUT
RRS records this exceptional condition in LOGREC and backs out the UR.
HEURISTIC-MIXED COMMIT
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

OK-OUTCOME-PENDING
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

BACKOUT-OUTCOME-PENDING
RRS records this exceptional condition in LOGREC and continues with the syncpoint processing for the UR.

Operator response:  None.

System programmer response:  Provide the symptom record to your IBM Support Center.

ATR528I  RM *rmname* cannot be deleted since it still has outstanding interests in one or more URs.

Explanation: The requested Resource Manager cannot be deleted since it has outstanding interest in one or more URs.

In the message text:

*rmname* is the name of a Resource Manager.

System action: The request is rejected.

User response: The interests in all URs must be removed prior to deleting the resource manager.

Module: ATRFMQRY

Source: Resource Recovery Services (RRS)

ATR529I  RM *rmname* was deleted successfully.

Explanation: The specified Resource Manager has been deleted from all systems in the RRS logging group and the Resource Manager logs.

In the message text:

*rmname* is the name of a Resource Manager.

System action: None

User response: None

Module: ATRFMQRY

Source: Resource Recovery Services (RRS)
ATR530I • ATR532I

ATR530I   RM rmname cannot be deleted since it is still active.
Explanation: The requested Resource Manager cannot be deleted since it is still active with RRS.
In the message text:

rmname
   is the name of a Resource Manager.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Issue the request again after the resource manager has become inactive with RRS.
Module: ATRFMDRM
Source: Resource Recovery Services (RRS)

ATR531I   RM rmname could not be found on a system in the RRS logging group or in the RM Data log.
Explanation: The requested Resource Manager cannot be deleted since it could not be found on a system in the RRS logging group or in the Resource Manager Data log. Either the Resource Manager has already been deleted or it was entered incorrectly.
In the message text:

rmname
   is the name of a Resource Manager.
System action: The request is rejected.
Operator response: None
System programmer response: None
User response: Make sure the Resource Manager's name is spelled correctly. Otherwise, the Resource Manager is deleted.
Module: ATRFMDRM
Source: Resource Recovery Services (RRS)

ATR532I   RM rmname was not deleted due to errors deleting the RM from the RRS RM logs. Try the request again.
Explanation: A delete request was issued for the specified Resource Manager and it was determined that the RM can be deleted. However, an error was detected trying to remove the RM from the Resource Manager logs. The Delete RM processing was terminated.
In the message text:

rmname
   is the name of a Resource Manager.
System action: Further processing of the request is terminated.
Operator response: None
System programmer response: Provide debugging information to the IBM Support Center.
User response: Retry your request. If this warning persists, contact your system programmer.
Module: ATRFMDRM
Source: Resource Recovery Services (RRS)
**ATR533I**  RM *rmname* cannot be deleted since it is on a system that does not support the Delete RM function.

**Explanation:** A delete request was issued for the specified Resource Manager. However, the RM is on a system that does not support the Delete RM function.

In the message text:

*rmname*  
is the name of a Resource Manager.

**System action:** The request is rejected.

**Operator response:** None

**System programmer response:** None

**User response:** None

**Module:** ATRFMDRM

**Source:** Resource Recovery Services (RRS)

**ATR534I**  RM *rmname* was unregistered successfully.

**Explanation:** The specified Resource Manager has been unregistered with RRS.

In the message text:

*rmname*  
is the name of a Resource Manager.

**System action:** None

**Operator response:** None

**System programmer response:** None

**User response:** None

**Module:** ATRFMRMC

**Source:** Resource Recovery Services (RRS)

**ATR535I**  RM *rmname* cannot be found on the specified RRS system.

**Explanation:** The requested Resource Manager could not be found on the specified system in the RRS logging group. Either the Resource Manager is not currently defined on the specified system or it was entered incorrectly.

In the message text:

*rmname*  
is the name of a Resource Manager.

**System action:** The request is rejected.

**Operator response:** None

**System programmer response:** None

**User response:** Make sure the Resource Manager's name is spelled correctly. Otherwise, determine where the Resource Manager is currently defined and perform the RM Unregister request on that system.

**Module:** ATRFMRMC

**Source:** Resource Recovery Services (RRS)

**ATR536I**  RM *rmname* is still registered with Registration Services and cannot be unregistered with RRS.

**Explanation:** The requested Resource Manager is still registered with Registration Services. To unregister a Resource Manager with RRS, it must be unregistered with Registration Services.

In the message text:

**ATR537I** • **ATR601I**

*rmname* is the name of a Resource Manager.

**System action**: The request is rejected.

**Operator response**: None

**System programmer response**: None

**User response**: Issue the request again after the resource manager has become unregistered with Registration Services.

**Module**: ATRFMRC

**Source**: Resource Recovery Services (RRS)

---

**ATR537I** Unregister processing for RM *rmname* is not allowed when the RM state is either Reset or Unset.

**Explanation**: A Resource Manager in the Reset or Unset state is already considered unregistered with RRS so it cannot be unregistered again.

In the message text:

*rmname* is the name of a Resource Manager.

**System action**: The request is rejected.

**Operator response**: None

**System programmer response**: None

**User response**: None, the Resource Manager is already considered unregistered.

**Module**: ATRFMRC

**Source**: Resource Recovery Services (RRS)

---

**ATR538I** The ATRSRV request was processed on a downlevel RRS system that could not honor the request.

**Explanation**: An ATRSRV request was processed on a downlevel version of RRS that does not understand the request.

**System action**: The request is rejected.

**Operator response**: None

**System programmer response**: None

**User response**: None

**Module**: ATRFMRC

**ATR601I** *hh.mm.ss* RRS UR SUMMARY [*id*]

**Explanation**: When the operator enters the DISPLAY RRS,UR command, using the summary form, this message displays information about RRS coordinated transactions.

In the message text:

*hh.mm.ss* name

The hour, minute and second at which the system processed the display command. 00.00.00 appears in this field if the time-of-day (TOD) clock is not working.

*id* The decimal identifier used with the CONTROL C,J command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. The identifier does not appear when the display appears in a display area on a display console.

**System action**: The system continues processing.
Operator response: None.
System programmer response: None.
User response: None.
Module: ATRDMRRS
Source: Resource Recovery Services (RRS)

ATR602I  hh.mm.ss  RRS RM SUMMARY [id]

Explanation: When the operator enters the DISPLAY RRS, RM command, using the summary form, this message displays information about resource managers which are currently active or were previously active with RRS.

In the message text:

 hh.mm.ss  name
 The hour, minute and second at which the system processed the display command. 00.00.00 appears in this field if the time-of-day (TOD) clock is not working.

 id  The decimal identifier used with the CONTROL C,0 command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. The identifier does not appear when the display appears in a display area on a display console.

System action: The system continues processing.
Operator response: None.
System programmer response: None.
User response: None.
Module: ATRDMRRS
Source: Resource Recovery Services (RRS)

ATR603I  hh.mm.ss  RRS UR DETAIL [id]

Explanation: When the operator enters the DISPLAY RRS, UR command, using the detailed form, this message displays information about a particular transaction as indicated by the URID= parameter.

In the message text:

 hh.mm.ss  name
 The hour, minute and second at which the system processed the display command. 00.00.00 appears in this field if the time-of-day (TOD) clock is not working.

 id  The decimal identifier used with the CONTROL C,0 command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. The identifier does not appear when the display appears in a display area on a display console.

System action: The system continues processing.
Operator response: None.
System programmer response: None.
User response: None.
Module: ATRDMRRS
Source: Resource Recovery Services (RRS)

ATR604I  hh.mm.ss  RRS RM DETAIL [id]

Explanation: When the operator enters the DISPLAY RRS, RM command, using the detailed form, this message displays information about a specific resource manager as indicated by the RMNAME= parameter.

In the message text:
**ATR605I • ATR607I**

*hh.mm.ss name*

The hour, minute and second at which the system processed the display command. 00.00.00 appears in this field if the time-of-day (TOD) clock is not working.

*id*
The decimal identifier used with the CONTROL C,D command to cancel status displays that are written on typewriter or printer consoles or displayed inline on a display console. The identifier does not appear when the display appears in a display area on a display console.

**System action:** The system continues processing.

**Operator response:** None.

**System programmer response:** None.

**User response:** None.

ATR621I  DISPLAY RRS COMMAND NOT PROCESSED, FAMILY OPTION IS ONLY VALID FOR CASCADED URID.

Explanation: The specified URID is not part of a cascaded family, so the FAMILY option is not valid.
System action: The request is ignored.
Operator response: None.
System programmer response: None.
User response: Specify a cascaded URID and retry your display request.
Module: ATRDMRRS
Source: Resource Recovery Services (RRS)

ATR622I  hh.mm.ss  RRS UR FAMILY id  URID SYSTEM GNAME ST COMMENTS urid sysname gname state comments

Explanation: Presented when the DISPLAY RRS,UR,FAMILY console command is issued specifying a cascaded URID as input.
The resulting display shows the TOP level UR on the first line and any other local or Sysplex URs for the transaction.
Sysplex Cascaded Transaction output is sorted by SYSNAME by default.
In the message text:

- hh:mm:ss The hour, minute and second at which the system processed the display command. 00:00:00 appears in this field if
  the time-of-day (TOD) clock is not working.
- id A decimal identifier used to control C,D command to cancel status displays that are written on typewriter or
  printer console or displayed inline on a display console. The identifier does not appear when the display appears
  in a display area on a display console.
- urid Unit of Recovery Identifier.
**sysname**
The name of a system.

**gname**
The name of an RRS logging group.

**state**
UR (Unit of Recovery) state.

**comments**
UR (Unit of Recovery) comments. The values can be:

- **D** The UR is damaged.
- **M** The UR is in a heuristic mixed condition.
- **R** The UR information came from the RRS Restart log.

**Note:** The system name and logging group name do not apply to these URs, because URs in the restart log are not owned by any system but are shared by all systems in the RRS logging group.

- **U** The UR information came from the RRS Main or Delayed log stream.

**Note:** This entry usually represents an incomplete Sysplex Cascaded Subordinate UR on a system where either RRS or the system itself has failed and the Coordinator UR is still active on another system.

- ***** A portion of the syncpoint represented by this UR has been marked deferred.
- **?** The UR contains information that this release of RRS does not understand.
- **X** The UR and its interests are not all in the same state.
- **T** The UR is a top-level UR in a cascaded UR family.
- **C** The UR is a child UR in a cascaded UR family.
- **S** The UR is part of a sysplex cascaded UR family.
- **A** The UR is waiting for the child or subordinate application to signal that it is complete (ready for the syncpoint to be driven).
- **E** The UR is waiting for a Resource Manager to reply to a syncpoint exit.
- **P** The coordinator UR is waiting for a response from RRS on one or more remote systems in the SysPlex.

**System action:** The system continues processing.

**Operator response:** None.

**System programmer response:** None.

**User response:** None.

**Module:** ATRDMRRS

**Source:** Resource Recovery Services (RRS)

<table>
<thead>
<tr>
<th>sysname</th>
<th>gname</th>
<th>state</th>
<th>comments</th>
<th>num of URS</th>
<th>min time</th>
<th>max time</th>
</tr>
</thead>
</table>

**Explanation:** When the operator enters the DISPLAY RRS,URSTATUS command, this message reports on global RRS statistics on the system specified. This information can be used for RRS behavior modeling.

RRS currently only reports on transaction state statistics of in storage URs and does not process any URs found in the log streams.

For a given state, RRS invokes exits for that state. RRS keeps track of the elapsed time, in a TOD format, that was used for the exit to do its processing. When an exit has not yet returned to RRS, its elapsed time will continue to increase until the exit returns.

For a given UR, Unit of Recovery, in a given state, any number of exits can be driven based on the number of Resource Managers that have expressed interest in the UR. The duration for that UR is the largest elapsed time for all
the Resource Managers associated with that UR. The largest duration displayed is 999:59:59 which equates to 41
days, 15 hours, 59 minutes, and 59 seconds. When this value is displayed, the actual duration is most likely more
than that value.

For all the URs on a given system, Logging Group (Gname) and System Name (SysName), in a given state, the Max
Time is the largest UR duration. Conversely the Min Time is the smallest UR duration. For example:

<table>
<thead>
<tr>
<th>SYSTEM</th>
<th>GNAME</th>
<th>STATE</th>
<th>NUM OF URS</th>
<th>MIN TIME</th>
<th>MAX TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>SY1</td>
<td>PLEX1</td>
<td>COMMIT...</td>
<td>15</td>
<td>000:00:24</td>
<td>000:23:35</td>
</tr>
</tbody>
</table>

At this point, on system SY1 and group name PLEX1, there are 15 URs in commit. Of all the URs, one has been in
commit for 23 minutes and 35 seconds although another has been there just 24 seconds. The other URs in commit
have a duration in between those two times. Issuing the D RRS,URSTATUS command again will probably have
different results as transactions proceed to completion. If subsequent D RRS,URSTATUS commands indicate an
increasing Max Time for a particular state, steps should be taken to identify the transaction that is not progressing. A
suggestion would be D RRS,UREXCEPTION.

In the message text:

```
hh.mm.ss
```

- The hour, minute and second at which the system processed the display command. 00.00.00 appears in this field
  if the time-of-day (TOD) clock is not working.

```
id
```

- A decimal identifier used to control C,D command to cancel status displays that are written on typewriter or
  printer console or displayed inline on a display console. The identifier does not appear when the display appears
  in a display area on a display console.

```
sysname
```

- The name of a system.

```
gname
```

- The name of an RRS logging group.

```
state
```

- UR (Unit of Recovery) state or text. The text could also:

  **TOTAL URS**
  Indicates the total number URs for all states on the specified sysname and gname.

  **NO UR STATUS**
  * SYSTEM DOES NOT SUPPORT DISPLAY RRS,URSTATUS Indicates a sysname and gname that doesn’t
  support the DISPLAY RRS,URSTATUS command because of a downlevel version of RRS on that system.
  Data from that system cannot be retrieved for this report.

```
um of urs
```

- Number of URs in that state.

```
min time
```

- Minimum UR duration time, in the format HHH:MM:SS. See note above for further explanation.

```
max time
```

- Maximum UR duration time, in the format HHH:MM:SS. See note above for further explanation.

**System action:** The system continues processing.

**Operator response:** None.

**System programmer response:** None.

**User response:** None.

**Module:** ATRDMRRS

**Source:** Resource Recovery Services (RRS)
**Explanation:** When the operator enters the DISPLAY RRS,UREXCEPTION command, this message reports on units of recovery (UR) on the system specified that are waiting for completion of other tasks. The Wait For text has the following forms:

**JOBNAME APPL COMP**
Waiting for application complete from a work manager running on a specific system. It is the responsibility of the work manager (jobname) that created the cascaded UR to tell RRS when it is application-complete by using the ATRSUSI (Set Side Information) service. In this case, the ATRSUSI from the work manager has not been issued. In some instances, the jobname could be "UnKnown", indicating that the work manager cannot be determined. In most cases, this is a result of other failures identified in message ATR624I.

**JOBNAME STATE EXIT**
Waiting for the work manager (jobname) exit to complete. In the text, the "state" indicates the state exit that is still not complete. Either the work manager has not yet responded to the call from RRS or the responded ATRX_Later and the ATRPDUE (Post Deferred UR Exit) from the work manager have not been issued. In some instances, the jobname can be "UnKnown" indicating the work manager cannot be determined. In most cases, this is a result of other failures identified in message ATR624I.

**RRS**
For a cascaded transaction, a coordinator, on system name, is waiting for a subordinate to respond. From the Wait For text, subordinates can be found on systems identified by sysname. If this Wait For text, persists after repeatedly issuing the DISPLAY RRS,UREXCEPTION command, there is a possibility that RRS is hung on one of those systems. In this case, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

* NO UR EXCEPTION DATA* SYSTEM DOES NOT SUPPORT DISPLAY RRS,UREXCEPTION
Indicates that a sysname that doesn’t support the DISPLAY RRS,UREXCEPTION command because of a downlevel version of RRS on that system. Data from that system cannot be retrieved for this report.

* DATA TRUNCATED. DISPLAY RRS WORK AREA EXCEEDED* DATA TRUNCATED. DISPLAY RRS SECONDARY WORK AREA EXCEEDED
Indicates that the DISPLAY RRS,UREXCEPTION command processing, running on sysname, has exceeded an internal work area because of the number of URs (Units of Recovery) on the system. The command will process all the data in the work area but because of the truncation, all exceptions cannot be identified. If the large number URs are normal for the system, search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

* ATRQUERY FAILURE. SEE OTHER ATR6__I MESSAGES FOR DETAILS*
Indicates that the DISPLAY RRS,UREXCEPTION command processing, has encountered an error while calling ATRQUERY. Message ATR6__I has been issued to indicate the failure and usually appears before message ATR624I. The command will continue to process the data but because of the failure, all exceptions cannot be identified. Resolve the failure based on the description for message ATR6__I.

Issuing the D RRS,UREXCEPTION command again will probably have different results as transactions proceed to completion. However, for transactions where the same Wait For text appears, investigate the Wait For text as mentioned above.

In the message text:

- **hh.mm.ss** The hour, minute and second at which the system processed the display command. 00.00.00 appears in this field if the time-of-day (TOD) clock is not working.

- **id** A decimal identifier used to control C,D command to cancel status displays that are written on typewriter or printer console or displayed inline on a display console. The identifier does not appear when the display appears in a display area on a display console.

- **sysname** The name of a system.

- **urid** Unit of Recovery Identifier.
waitfortext

What the UR (Unit of Recovery) is waiting for. See Explanation for details.

System action: The system continues processing.

Operator response: None.

System programmer response: Respond as described for the Wait For text that accompanies this message.

User response: None.

Module: ATRDMRRS

Source: Resource Recovery Services (RRS)

ATR650I ATRQSRV encountered an error: error_text.

Explanation: The RRS ATRQSRV utility program ended because of errors.

In the message text:

error_text

is a description of the error which occurred. An error-text is one of the following:

Unable to open SYSIN.

An error occurred when the system tried to open the SYSIN file. The SYSIN DD control statement may be missing.

I/O error on SYSIN

An I/O error occurred when the system attempted to read the SYSIN data set.

No SYSIN control statements.

No control statements were provided in the SYSIN data set. Either the SYSIN data set is empty or no valid RRS ATRQSRV statements were found.

No ATRQUERY storage.

RRS was unable to obtain enough storage to hold the ATRQUERY results. Rerun the job when more system storage is available.

SYSIN control statements too long.

The control statement is longer than the buffer allocated to hold the SYSIN statement. Rewrite the control statement to use fewer lines.

SYSIN control statement invalid.

The control statement is not a valid RRS ATRQSRV statement. The next line of text identifies the incorrect statement. Correct the control statement.

Keyword missing.

The RRS ATRQSRV statement requires certain keywords. The next line of text identifies the keyword that must be specified. Specify the keyword on the statement.

URID keyword is only valid with:

The URID keyword was specified with a log that does not support the URID keyword. The next line of text identifies the logs where the URID can be specified.

SURID keyword is only valid with:

The SURID keyword was specified with a log that does not support the SURID keyword. The next line of text identifies the logs where the SURID can be specified.

RMNAME keyword is only valid with:

The RMNAME keyword was specified with a log that does not support the RMNAME keyword. The next line of text identifies the logs where the RMNAME can be specified.

System action: The RRS ATRQSRV utility program terminates.

Operator response: None

System programmer response: None

User response: Correct the JCL or the RRS ATRQSRV statements and rerun the program.
Module: ATRQMSRV
Source: Resource Recovery Services (RRS)

ATR651I ATRQSRV Syntax Error: *seen* was seen, where one of *(expected)* would be correct.

**Explanation:** The keyword provided on the RRS ATRQSRV statement contained a syntax error.

In the message text:

*seen*  
is the last recognized text.

*expected*  
is text that should have been specified.

**System action:** The RRS ATRQSRV utility program terminates.

**Operator response:** None

**System programmer response:** None

**User response:** Correct the RRS ATRQSRV statement keyword and rerun the program.

Module: ATRQMSLX
Source: Resource Recovery Services (RRS)

ATR652I ATRQSrv Syntax Error in value for *keyword* - *error*.

**Explanation:** The system found an incorrect value for a keyword.

In the message text:

*keyword*  
is the name of the keyword that has the syntax error.

*error*  
is one of the following:

- **Contains unacceptable character(s).**  
The value contains characters that are not valid. For example, the value might have been required to be a decimal number but contained a character outside of the range 0-9.

- **First character is not valid.**  
The first character specified for the value is not valid.

- **It is too long.**  
The specified value contains too many characters.

- **Out of range.**  
The specified value does not fit within the required range.

- **Missing operand.**  
The required operand is not specified.

- **It is too short.**  
The specified value contains too few characters.

- **String is not valid.**  
The value contains characters that are not valid or the value is not in the correct form. For example, the value might have been required to be a decimal number but contained a character outside of the range 0-9. Another example, the value might require a special format such as 8 characters followed by a comma, and then 4 numbers.

- **EIDTID cannot be specified with low and/or high TID.**  
The TID was specified with a Low TID and/or High TID. TID can not be specified with these fields. Specify just TID or remove TID and specify Low TID and/or High TID.
Low TID is greater than high TID.
The Low TID specified has a value that is greater than the High TID. Correct the TID range specification and retry the request.

Invalid date range.
The AFTER date/time parameter is higher than the BEFORE date/time parameter. This will cause no information to be returned. Correct the date range specification and retry the request.

ALL cannot be specified in the list.
The keyword allows for one or more values. Since a list of values was specified, the ALL value may not be part of the list. Either remove the ALL value from the list or just specify ALL.

NONE cannot be specified in the list.
The keyword allows for one or more values. Since a list of values was specified, the NONE value may not be part of the list. Either remove the NONE value from the list or just specify NONE.

Duplicate SORT values not allowed.
The SORT keyword allows for one or more values. However, a value can only be specified once. Remove the duplicate value.

System action: The RRS ATRQSRV utility program terminates.
Operator response: None
System programmer response: None
User response: Correct the RRS ATRQSRV statement keyword and rerun the program.
Module: ATRQMSLX
Source: Resource Recovery Services (RRS)

ATR653I ATRQSRV Syntax Error: symbol1 expected before symbol2.
Explanation: The system found a syntax error while processing a command. The command is:
• Missing a necessary character or symbol, or
• Contains a character or symbol in error.

In the message text:
symbol1 is the missing character or symbol that the system expects.
symbol2 is the character or symbol after the missing symbol, symbol1. Either symbol1 is missing, or symbol2 is not correct.

System action: The RRS ATRQSRV utility program terminates.
Operator response: None
System programmer response: None
User response: Correct the RRS ATRQSRV statement keyword and rerun the program.
Module: ATRQMSLX
Source: Resource Recovery Services (RRS)

ATR655I ATRQSRV Syntax Error in value for keyword. It has a value of (errortxt) where one or more of the following (expected) would be correct.
Explanation: The keyword provided on the RRS ATRQSRV statement contained an invalid value. The value must be one or more of the correct values.

In the message text:
keyword is the name of the keyword that has the syntax error.
ATR656I  

**Keyword:** ATR656I  
**Message:** ATRQSRV Syntax Error in value for *keyword*. It has a value of *(errortxt)* where *(expected)* or one or more of the following *(expected)* would be correct.  
**Explanation:** The keyword provided on the RRS ATRQSRV statement contained an invalid value. The value must be one or more of the correct values.  
In the message text:

- **keyword** is the name of the keyword that has the syntax error.
- **errortxt** is the text that is in error.
- **expected** is the text that should have been specified.

**System action:** The RRS ATRQSRV utility program terminates.  
**Operator response:** None  
**System programmer response:** None  
**User response:** Correct the RRS ATRQSRV statement keyword value and rerun the program.  
**Module:** ATRQMSLX

Chapter 4. ATRH messages

ATRH001E  RRS stream log stream is not using the recommended duplexing method.

Explanation: Using local buffer duplexing can result in a loss of data in the named log stream if both the coupling facility and the local buffers are on the same machine. For example, a loss of data in the RRS RM Data log stream will eventually require an RRS cold start to repair the log stream and may also require a cold start of any resource manager using RRS at the time of the RRS cold start.

System action: RRS continues processing.

Operator response: Contact the system programmer.

System programmer response: Update the RRS RM Data log stream definition to use a better duplexing scheme, such as defining staging data sets and requesting DUPLEXMODE(UNCOND) STG_DUPLEX(YES).

Problem determination: N/A

ATRH005I  System logger on system system_name can find no offload data set for logstream stream, so the size of
the offload data set cannot be checked. System logger will be able to find an offload data set as
soon as RRS on system system_name writes some data to an offload data set.
Explanation:   Sometimes system logger is unable to find offload data sets even though they exist. In particular, IBM
cannot find an offload data set if the system has not written anything to an offload data set since the last time RRS
connected to the logstream. For example, if RRS on system SY1 writes to offload data set DS1, but RRS on SY2 has
not written to offload data set DS1, then system logger on system SY1 will be able to report on offload data set
DS1, but system logger on system SY2 will not be able to report on offload data set DS1.
System action:  RRS continues processing.

Module: ATTRHMCHK

Source: Resource Recovery Services (RRS)

Reference Documentation: z/OS MVS Programming: Resource Recovery
ATRH009I  RRS health checker's last attempt to gather information about the log stream named stream failed.
Ixgquery return code is ReturnCd. Ixgquery reason code is ReasonCd. The information health checker
presents for the named log stream was constructed using obsolete data.

Explanation:  RRS called Ixgquery to gather information about the named log stream. The Ixgquery failed. The
return code and reason code from Ixgquery appear in the message. If the Ixgquery return code is 8, and the reason
code is 806, and the log stream is optional, then RRS is not using the named optional log stream because it does not
exist. This is the expected result when you have decided that RRS should not use the named log stream.

System action:  RRS continues processing. RRS continues to call Ixgquery at regular intervals. If a future Ixgquery
succeeds, health checker will present information about the named log stream using up-to-date data.

Operator response:  If the Ixgquery return code is 8, and the reason code is 806, and you know that your installation
does not want RRS to use the named log stream, then no action is needed. Otherwise, contact the system
programmer.

System programmer response:  If the Ixgquery return code is 8, and the reason code is 806, and the log stream is
optional, then RRS is not using the named optional log stream because it does not exist. If you
want RRS to use the named log stream, define it and restart RRS. See the z/OS MVS Programming: Resource Recovery
for more information on defining the named log stream. For other Ixgquery return and reason codes, consult the z/OS MVS Programming:
Assembler Services Reference IAR-XCT to find the meaning of the Ixgquery return and reason code, and take
appropriate action.

Problem determination:  N/A

Module:  ATRHMCHK

Source:  Resource Recovery Services (RRS)

ATRH010E  RRS stream log stream is allowed to share its coupling facility structure with another log stream.
This is not recommended.

Explanation:  IBM recommends that each RRS log stream reside in its own coupling facility structure. This is
particularly important for the archive log. Allowing the RRS archive log stream to share its coupling facility structure
with another log stream is likely to result in sub-optimal use of the storage in the coupling facility structure. The
system performance might be affected.

You can prevent this check from running. For more details, see the IBM Health Checker for z/OS User’s Guide

System action:  RRS continues processing.

Operator response:  N/A

System programmer response:  Consider putting the RRS archive log in its own coupling facility structure. Use the
IXCMIAPU utility to accomplish this. For example, to give the archive log its own structure named ABC, run the
IXCMIAPU program with the this input:

DATA TYPE(LOGR)
DEFINE STRUCTURE NAME(ABC) LOGSNUM(1)

The LOGSNUM(1) means that only one log stream can use structure ABC. See the z/OS MVS Setting Up a Sysplex
for more information about IXCMIAPU.

Problem determination:  N/A

Module:  ATRHMCHK
**ATRH011I** The RRS stream log stream is in its own coupling facility structure. This is the best practice.

**Explanation:** The named log stream's configuration complies with IBM recommendations. IBM recommends that each RRS log stream reside in its own coupling facility structure. This is particularly important for the archive log. Placing the RRS archive log stream in its own coupling facility structure makes it possible to efficiently use storage in the coupling facility structure.

**System action:** RRS continues processing.

**Operator response:** N/A

**System programmer response:** N/A

**Problem determination:** N/A

**Module:** ATRHMCHK

---

**ATRH012I** All attempts to gather information about the log stream named stream have failed. The most recent Ixgquery return code is ReturnCd. The most recent Ixgquery reason code is ReasonCd. RRS Health Checker can present no information about this log stream.

**Explanation:** RRS calls Ixgquery at regular intervals to gather information about the named log stream. All calls to Ixgquery failed. The return code and reason code from the most recent Ixgquery appear in the message. If the Ixgquery return code is 8, and the reason code is 806, and the log stream is optional, then RRS is not using the named optional log stream because it does not exist. This is the expected result when you have decided that RRS should not use the named log stream.

**System action:** RRS continues processing. RRS continues to call Ixgquery at regular intervals. If a future Ixgquery succeeds, health checker will present information about the named log stream using up-to-date data.

**Operator response:** If the Ixgquery return code is 8, and the reason code is 806, and you know that your installation does not want RRS to use the named log stream, then no action is needed. Otherwise, contact the system programmer.

**System programmer response:** If the Ixgquery return code is 8, and the reason code is 806, and the log stream is optional, then RRS is not using the named optional log stream because it does not exist. If you want RRS to use the named log stream, define it and restart RRS. See the [z/OS MVS Programming: Resource Recovery](https://www.ibm.com) for more information on defining the named log stream. For other Ixgquery return and reason codes, consult the [z/OS MVS Programming: Assembler Services Reference IAR-XCT](https://www.ibm.com) to find the meaning of the Ixgquery return and reason code, and take appropriate action.

Descriptor Code: N/A

ATRH014E  The current number of active RRS transactions is curtrans which exceeds the current threshold of maxtrans.

Explanation: The number of transactions being managed by RRS at the current time has exceeded the threshold specified in the health check. This can be an indication of a potential storage usage failure in RRS.

System action: RRS continues processing.

Operator response: Contact the system programmer.

System programmer response: Use the available RRS data collection techniques (panels, console display command, or batch program) to assess the level of transaction activity in RRS and determine if it is unusual or unexpected.

If the level of activity is determined to be a problem then use the data collection methods to determine if it is a problem with a specific work manager then check with that work manager function for problems.

If not a work manager problem then use the data collection methods to determine if it is a problem with a specific resource manager.

If it appears to be neither a specific work manager nor a specific resource manager problem then monitor RRS using this health check until either the exception is resolved or the count continues to grow. You can use the following command to change the timing of the check F HZSPROC,UPDATE,CHECK=(IBMRRS,RRS_STORAGE_NUMTRANS),INTERVAL=hh:mm
where 'hh' is the number of hours and 'mm' the number of minutes that should be used at the timing interval for the check.

If it is an RRS problem then take a dump of the RRS address space and report the situation to IBM service.

The other possibility is that this level of activity is not unusual for the workload on this system in which case you can use the following command to change the threshold level for this check.
F HZSPROC,UPDATE,CHECK=(IBMRRS,RRS_STORAGE_NUMTRANS),parm=xxxx
where 'xxxx' is the number to be used as the threshold for the check.

In this case the HZSPRMMxx parmlib for the RRS checks should be updated similarly (the RRS default checks are in ATRHZS00 in SAMPLIB).

Problem determination: N/A
ATRH015I  The current number of active RRS transactions is curtrans which is below the current threshold of maxtrans

Explanation: The current level of transaction activity in RRS is within the threshold that has been specified.

System action: RRS continues processing.

Operator response: N/A

System programmer response: N/A

Problem determination: N/A

ATRH016E  The current number of server task requests in RRS is curreqs which exceeds the threshold

Explanation: The number of server task requests in RRS has exceeded the manageable threshold and could be an indication of a potential problem in RRS. Please monitor the level of activity in RRS and the associated resource managers and see if anything indicates a slow down or complete halt to transaction processing.

System action: RRS continues processing.

Operator response: Contact the system programmer.

System programmer response: Use the available RRS data collection techniques (panels, console display command, or batch program) to assess the level of activity in RRS and determine if it is unusual or unexpected.

You can use the following command to change the timing of the check F HZSPROC,UPDATE,CHECK=(IBMRRS,RRS_STORAGE_NUMSERVERREQS),INTERVAL=hh:mm

where 'hh' is the number of hours and 'mm' the number of minutes that should be used at the timing interval for the check.

Problem determination: N/A

Chapter 5. AVM messages

**AVM001I** AVM IS INITIALIZED

**Explanation:** The system successfully initialized the availability manager.

**System action:** The system continues processing.

**Module:** AVFSR

**Source:** Availability manager

**Routing Code:** 2,10

**Descriptor Code:** 4

**AVM002I** AVM START REJECTED, AVM IS ALREADY ACTIVE WITH ASID=asid

**Explanation:** When initializing the availability manager, the system found that another availability manager address space is active. One of the following may have caused this problem:

- A subsystem requested availability manager services.
- The system issued an internal START command in response to a request by the information management system (IMS™).
- The system is ending the availability manager.
- The system ended the availability manager previously without releasing all of its resources.
- Storage containing availability manager control blocks was overlaid.

In the message text:

*asid* The address space identifier (ASID) of the address space where the availability manager is already active.

**System action:** The system rejects the second START command.

**Operator response:** Wait until message AVM010E appears. Then enter the START command again. If the error persists, notify the system programmer.

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:** AVFMB

**Source:** Availability manager

**Routing Code:** *

**Descriptor Code:** 5

**AVM004I** TAKEOVER IN PROGRESS FOR SUBSYSTEM ssid, [ACTIVE|BACKUP] ELEMENT OF RSE rsename

**Explanation:** The availability manager began a takeover for a subsystem.

In the message text:

*ssid* The subsystem identifier.

*rsename* The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.

**System action:** The system does one of the following:

- When **ACTIVE** appears in the message, the failing active subsystem does not perform any I/O operations to the subsystem's data bases. The system displays message AVM004I on the system containing the failing active subsystem. When I/O prevention is complete, the system issues message AVM006E.
When BACKUP appears in the message, the availability manager and the alternate subsystem begin takeover processing for the failing active subsystem. Message AVM004I is displayed on the system containing the alternate subsystem.

**Module:** AVFKP  
**Source:** Availability manager  
**Routing Code:** 2,10  
**Descriptor Code:** 4

AVM005A **REPLY UNLOCK WHEN I/O PREVENTION COMPLETES FOR RSE** rsename  
**Explanation:** An alternate subsystem is taking over for a failing active subsystem.  
In the message text:  
rsename The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.  
**System action:** The system issues this message on the system where the alternate subsystem is running.  
**Operator response:** Check if the active subsystem completed I/O prevention by looking for an occurrence of message AVM006E that contains the same RSE name specified in message AVM005A. Do one of the following:  
• If you find a match, reply UNLOCK to message AVM005A.  
• If you do not find a match, do one of the following to stop I/O for the failing active subsystem:  
  – Switch the direct access storage device (DASD).  
  – Perform a system reset.  

Then reply UNLOCK to message AVM005A.

**Module:** AVFWA  
**Source:** Availability manager  
**Routing Code:** 1,10  
**Descriptor Code:** 2

AVM006E **TELL OPERATOR AT BACKUP TO REPLY “UNLOCK” TO MESSAGE AVM005A. I/O PREVENTION IS COMPLETE FOR SUBSYSTEM** ssid, **FAILING ACTIVE ELEMENT OF RSE** rsename.  
**Explanation:** The availability manager completed I/O prevention for a failing active subsystem. The alternate subsystem can now provide full data access.  
In the message text:  
ssid The subsystem identifier.  
rsename The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.  
**System action:** The availability manager completes takeover processing for the failing active subsystem.  
The system does not issue message AVM005A, or deletes message AVM005A before the operator can reply, when:  
• No alternate subsystem for the RSE connected to the availability manager.  
• A connected alternate subsystem does not have to be notified of I/O prevention completion.  
**Operator response:** Delete message AVM006E from the console. If the system issues message AVM005A, reply UNLOCK on the system where the alternate subsystem is running.

**Module:** AVFIW  
**Source:** Availability manager  
**Routing Code:** 1,10  
**Descriptor Code:** 11
AVM007I  SUBSYSTEM ssid ASID asid IS NOW THE [ACTIVE | BACKUP] ELEMENT OF RSE rsename

Explanation: A subsystem is the either the active or the backup element of a recoverable service element (RSE).

In the message text:
ssid  The subsystem identifier.
asid  The address space identifier.
rsename  The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.

ACTIVE
One of the following occurred:
• The subsystem completed initialization and is active.
• An alternate subsystem completed takeover of a failing active subsystem.

BACKUP
The alternate subsystem is ready to take over for the active subsystem, if necessary.

System action: Depending on the message text, the system establishes the subsystem as the active or alternate element of the RSE.

Module: AVFNS
Source: Availability manager
Routing Code: 2,10
Descriptor Code: 4

AVM008I  INVALID REPLY TO MESSAGE “AVMnnn”

Explanation: The operator entered an incorrect reply to message AVMnnn.

System action: The system issues message AVMnnn again.

Operator response: Enter a correct reply to message AVMnnn.

Module: AVFMS
Source: Availability manager
Routing Code: *
Descriptor Code: 5

AVM010E  AVM ENDED ABNORMALLY (ABEND=Scde REASON=reason-code)

Explanation: The availability manager address space ended abnormally.

In the message text:
Scde  The system completion code.
reason-code  The reason code. If no reason code exists, NONE appears in this field.

System action: The availability manager releases its resources and ends. Data about subsystems previously defined to the availability manager may be lost. If availability manager is restarted, the subsystems must redefine themselves to the availability manager.

Operator response: Notify the system programmer.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: AVFMH
Source: Availability manager
Routing Code: 1,10
AVM011E • AVM012E

Descriptor Code: 11

AVM011E  ENSURE A TAKEOVER IS IN PROGRESS FOR THE [ACTIVE|BACKUP] ELEMENT OF RSE rsename

Explanation: The system issues this message twice after issuing message AVM004I.
In the message text:

rsename  The recoverable service element (RSE) formed by the failing subsystem and the alternate subsystem.

ACTIVE  The message appears on the system console for the specified BACKUP element.

BACKUP  The message appears on the system console for the failing ACTIVE element.

System action: If BACKUP appears in the message text, the system deletes the message when I/O prevention is complete.
If ACTIVE appears in the message text, the system deletes the message when the backup subsystem takes over.

Operator response: Do the following:
• When BACKUP appears in the message, ensure that a takeover is in progress for the RSE on the alternate subsystem. If a takeover is not in progress, enter the IMS SWITCH command to initiate takeover.
• When ACTIVE appears in the message, ensure that a takeover is in progress for the RSE on the active subsystem. If a takeover is not in progress, enter the IMS SWITCH command to start a takeover.
  If you cannot start a takeover, do one of the following to disable the system:
  – Switch the direct access storage device (DASD).
  – Perform a system reset.
• If you disabled the system, reply UNLOCK to message AVM005A.

Module: AVFKP
Source: Availability manager
Routing Code: 1,10
Descriptor Code: 11

AVM012E  INITIATE MANUAL I/O PREVENTION FOR SUBSYSTEM ssid, FAILING ACTIVE ELEMENT OF RSE rsename. I/O PREVENTION COULD NOT BE INITIATED BY AVM.

Explanation: The availability manager could not prevent a failing active subsystem from performing I/O to external data base(s) shared with the backup subsystem.
In the message text:

ssid  The subsystem identifier.
rsename  The recoverable service element (RSE) that contains the failing subsystem.

System action: The availability manager removes the failing active subsystem from the RSE. The system takes an SVC dump. The system may write a logrec data set error record.

Operator response: Do the following:
• Disable the system on which message AVM012E appears by doing one of the following:
  – Switch the direct access storage device (DASD).
  – Perform a system reset.
• Reply UNLOCK to message AVM005A if message AVM005A was issued on the system where the alternate subsystem is running.
• Notify the system programmer.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.
AVM022I - AVM START FAILED (ABEND=Scode,REASON=reason-code)
Explanation: The system could not build a new address space for the availability manager.
In the message text:
Scode The abend code.
reason-code The reason code. If no reason code exists, NONE appears in this field.
System action: The system does not initialize a new availability manager. The system writes an SVC dump. The system may write a logrec data set error record.
Operator response: Notify the system programmer.

AVM031I - SUBSYSTEM ssid ASID asid CONNECTION TO AVM COMPLETED
Explanation: A subsystem in the specified address space successfully connected to the availability manager.
In the message text:
ssid The subsystem identifier.
asid The address space identifier (ASID) of the address space where the subsystem is running.
System action: The system connects the availability manager and the subsystem. The system routes this message to the system log.

AVM032I - SUBSYSTEM ssid ASID asid CONNECTION TO AVM FAILED (REASON CODE=reason-code)
Explanation: A subsystem failed to connect to the availability manager. When requesting the connection, the subsystem issued the CALLAVM macro with the TYPE=JOINAVM parameter.
In the message text:
ssid The subsystem identifier.
asid The identifier for the address space where the subsystem is running.
reason-code The reason code. If no reason code exists, NONE appears in this field.
System action: The system routes this message to the system log. The system continues processing.
Operator response: Notify the system programmer.
System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: AVFJA
Source: Availability manager
Routing Code: 10
Descriptor Code: 4

Explanation: A subsystem became a member of the specified recoverable service element (RSE).

In the message text:
ssid The subsystem identifier.
asid The address space identifier (ASID) of the address space where the subsystem is running.
sname The recoverable service element (RSE) for which the subsystem is a member.

System action: The system routes this message to the system log. The system continues processing.

Operator response: Notify the system programmer.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: AVFJB
Source: Availability manager
Routing Code: 10
Descriptor Code: 4

Explanation: The availability manager could not make a subsystem a member of a recoverable service element (RSE). The subsystem requested to become a member of the RSE by issuing the CALLVM macro with the TYPE=JOINRSE parameter.

In the message text:
ssid The subsystem identifier.
asid The address space identifier (ASID) of the address space where the subsystem is running.
sname The RSE for which the subsystem requested membership.
reason-code The reason code. If no reason code exists, NONE appears in this field.

System action: The system routes this message to the system log. The system continues processing.

Operator response: Notify the system programmer.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: AVFJB
Source: Availability manager
Routing Code: 10
Descriptor Code: 4

Explanation: The availability manager has disconnected, or is disconnecting, a subsystem.

One of the following occurred:

AVM033I SUBSYSTEM ssid ASID asid CONNECTION TO RSE sname COMPLETED
AVM034I SUBSYSTEM ssid ASID asid CONNECTION TO RSE sname FAILED (REASON CODE = reason-code)
AVM035I SUBSYSTEM ssid ASID asid TERMINATION FROM AVM [COMPLETED | IN PROGRESS] OPTION = [NORMAL | ABEND]
The subsystem asked to disconnect from the availability manager. The availability manager found that the address space containing the subsystem ended.

In the message text:

ssid  The subsystem identifier.
asid  The address space identifier (ASID) of the address space where the subsystem is running.

**IN PROGRESS**
AVM is disconnecting the specified subsystem.

**COMPLETED**
AVM successfully disconnected the specified subsystem.

**NORMAL**
The subsystem ended normally.

**ABEND**
The subsystem ended abnormally.

**System action:** The system routes this message to the system log.

If **COMPLETED** appears in the message, the availability manager disconnected the subsystem. The system continues processing.

If **IN PROGRESS** appears in the message, the system removes the subsystem from a recoverable service element (RSE) if it was part of an RSE. Then the availability manager disconnects the subsystem. The system issues message AVM035I again with **COMPLETED** in the text.

**Module:** AVFLA
**Source:** Availability manager
**Routing Code:** 10
**Descriptor Code:** 4

---

**AVM036I**  **SUBSYSTEM ssid ASID asid TERMINATION FROM AVM FAILED OPTION (NORMAL|ABEND) (REASON CODE = reason-code)**

**Explanation:** A subsystem asked to be disconnected from the availability manager. The subsystem issued the CALLAVM macro with the TYPE=LEAVEAVM parameter.

In the message text:

ssid  The subsystem identifier.
asid  The address space identifier (ASID) of the address space where the subsystem is running.

**NORMAL**
The subsystem ended normally.

**ABEND**
The subsystem ended abnormally.

**System action:** The availability manager stops processing the request. The system routes this message to the system log.

**Operator response:** Notify the system programmer.

**System programmer response:** Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:** AVFLA
**Source:** Availability manager

**AVM037I • AVM038I**

**AVM037I**  
SUBSYSTEM ssid ASID asid TERMINATION FROM RSE rsename COMPLETED, OPTION = [IOP | TAKEOVER | NORMAL]

Explanation: To remove a subsystem from a recoverable service element (RSE), the availability manager issued the CALLAVM macro with the TYPE=LEAVERSE parameter. In the message text:

ssid  The subsystem identifier.

asid  The address space identifier (ASID) of the address space where the subsystem is running.

rsename  The RSE from which the availability manager removed the subsystem.

NORMAL  The subsystem requested a LEAVERSE with OPTION=NORMAL.

TAKEOVER  The subsystem requested a LEAVERSE with OPTION=TAKEOVER.

IOP  The subsystem requested a LEAVERSE with OPTION=IOP (I/O prevention).

System action: The system issues message AVM037I. The system issues message AVM039I. The availability manager removes the subsystem from the RSE.

Module: AVFLR

Source: Availability manager

Routing Code: 10

Descriptor Code: 4

**AVM038I**  
SUBSYSTEM ssid ASID asid TERMINATION FROM RSE rsename FAILED, OPTION = [NORMAL | TAKEOVER | IOP] (REASON CODE = reason-code)

Explanation: The availability manager failed to remove a subsystem from a recoverable service element (RSE). The subsystem issued a CALLAVM macro with the TYPE=LEAVERSE parameter.

In the message text:

ssid  The subsystem identifier.

asid  The address space identifier (ASID) of the address space where the subsystem is running.

rsename  The RSE from which the availability manager removed the subsystem.

NORMAL  The subsystem requested a LEAVERSE with OPTION=NORMAL.

TAKEOVER  The subsystem requested a LEAVERSE with OPTION=TAKEOVER.

IOP  The subsystem requested a LEAVERSE with OPTION=IOP (I/O prevention).

reason-code  The reason code. If no reason code exists, NONE appears in this field.

System action: The availability manager stops processing the request. The system routes this message to the system log.

Operator response: Notify the system programmer.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: AVFLR

Source: Availability manager

Routing Code: 10

Descriptor Code: 4
Explanation: The availability manager removed a subsystem from a recoverable service element (RSE). The request to remove the subsystem came from one of the following:

- The subsystem itself
- The availability manager

In the message text:

- ssid: The subsystem identifier.
- asid: The address space identifier (ASID) of the address space where the subsystem is running.
- rsename: The RSE from which the availability manager removed the subsystem.

System action: The system issues message AVM039I. The system issues message AVM037I. The system continues processing.

Chapter 6. AXR messages

AXR0101I  SYSTEM REXX (AXR) IS ALREADY ACTIVE
Explanation:  A request to start System REXX was received, however it is already active.
System action:  The system ignores the start request.
Module:  AXRINIT
Source:  System REXX (SCAXR)
Routing Code:  2
Descriptor Code:  4

AXR0102I  SYSTEM REXX INITIALIZATION COMPLETE
Explanation:  System REXX initialization is now complete.
System action:  System REXX is ready for work.
Module:  AXRINIT
Source:  System REXX (SCAXR)
Routing Code:  2
Descriptor Code:  4

AXR0103I  SYSTEM REXX HAS ENDED
Explanation:  System REXX processing ended either in response to a system command or unexpectedly as a result of a serious system problem.
System action:  System REXX ends.
Operator response:  Contact your system programmer if there are error messages accompanying this message.
System programmer response:  No action is required if this is a normal termination of System REXX processing. If this is an error situation, see the message associated with the error.
Module:  AXRINMTR
Source:  System REXX (SCAXR)
Routing Code:  2
Descriptor Code:  4

AXR0104I  ASCRE FOR SYSTEM REXX FAILED. RC=r, RSN=r
Explanation:  System REXX was unable to start because the ASCRE macro request failed.
In the message text:
r  The return code provided by the ASCRE macro.
rsn  The reason code provided by the ASCRE macro.
System action:  System REXX does not initialize.
Operator response:  Contact your system programmer.
System programmer response:  Lookup the return/reason codes from ASCRE in z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN to determine the root cause of the problem.
Module:  AXRINSTR
AXR0105I • AXR0107I

Source: System REXX (SCAXR)
Routing Code: 2,10
Descriptor Code: 4

AXR0105I  SYSTEM REXX MUST BE STARTED AS A STARTED TASK. JOB jobname IS IGNORED

Explanation: The named batch job tried to start System REXX. System REXX cannot be a batch job, it must be a started task.

In the message text:
jobname  The name of the batch job.

System action: The system ignored the request to start System REXX.
Operator response: To start AXR, issue START AXRPSTRT.
Module: AXRINIT
Source: System REXX (SCAXR)
Routing Code: 1,2,10
Descriptor Code: 4

AXR0106I  THE JOBNAME FOR SYSTEM REXX IS NOT CORRECT. JOB jobname IS IGNORED

Explanation: The jobname for the System REXX address space is AXR. The address space is not started.

In the message text:
jobname  The name of the batch job.

System action: The system ignored the request to start System REXX.
Operator response: Issue START AXRPSTRT to start System REXX.
Module: AXRINIT
Source: System REXX (SCAXR)
Routing Code: 1,2,10
Descriptor Code: 4

AXR0107I  SYSTEM REXX SUBSYSTEM INITIALIZATION FAILED. servicename RETURN CODE=returncode
          REASON CODE=reasoncode

Explanation: One of the services used to set up the subsystem interface connection for System REXX failed.

In the message text:
servicename  The name of the system service that failed.
returncode  The return code from the failing service.
reasoncode  The reason code from the failing service.

System action: The system continues processing.
Operator response: Provide the message text to the System Programmer.
System programmer response: Look up the failing service and return code in z/OS MVS Programming: Authorized
Assembler Services Reference ALE-DYN to determine the cause of the problem.
Module: AXRINSSI
Source: System REXX (SCAXR)
AXR0108I • AXR0109I

Routing Code: 1,2,10
Descriptor Code: 4

AXR0108I SYSTEM REXX WAS NOT STARTED UNDER THE MASTER SUBSYSTEM.

Explanation: The operator attempted to start the System REXX address space under a subsystem other than MASTER.

System action: System REXX fails to initialize.

Operator response: Issue START AXRPSTRT to start System REXX.

Module: AXRINIT
Source: System REXX (SCAXR)
Routing Code: 1,2,10
Descriptor Code: 4

AXR0109I THE STARTED TASK ID FOR SYSTEM REXX IS NOT CORRECT. STID=std IS IGNORED

Explanation: The started task ID for the System REXX address space must be AXR.

In the message text:

std The name of the started task ID.

System action: The system ignored the request to start System REXX.

Operator response: Enter START AXRPSTRT to restart System REXX.

Module: AXRINIT
Source: System REXX (SCAXR)

AXR0110I SYSTEM REXX SUBSYSTEM DEACTIVATION FAILED. servicename RETURN CODE=returncode REASON CODE=reasoncode

Explanation: One of the services used to deactivate the subsystem interface connection for System REXX failed.

In the message text:

servicename The name of the system service that failed.

returncode The return code from the failing service.

reasoncode The reason code from the failing service.

System action: The system continues processing.

Operator response: Provide the message text to the System Programmer.

System programmer response: Look up the failing service and return code in z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN and determine the cause of the problem.

Module: AXRINMTR
Source: System REXX (SCAXR)
Routing Code: 1,2,10
Descriptor Code: 4

Chapter 6. AXR messages 245
AXR0111I  AXRUSER VALUE OF axruservalue IS REJECTED BY RACROUTE REQUEST=racrouteservice.
RACROUTE (SAF) RETCODE=returncode, RACF RETCODE=racfreturncode, RACF RSN=racfreasoncode. ANY SUBSEQUENT USE OF AXRUSER WILL BE REJECTED.

Explanation: The value specified for AXRUSER in AXRxx did not pass the authorization check. Any subsequent use of AXRUSER in AXREXX invocations will be rejected.

In the message text:

axruservalue
  The value of AXRUSER specified in AXRxx.

racrouteservice
  The name of the RACROUTE service that failed.

returncode
  The SAF return code.

racfreturncode
  The RACF return code.

racfreasoncode
  The RACF reason code.

System action: System REXX rejects AXREXX invocations with SECURITY=BYAXRUSER.

Operator response: Inform the system programmer.

System programmer response: See z/OS MVS Programming: Authorized Assembler Services Guide for guidance on how to set up AXRUSER.

Module: AXRINCRE
Source: System REXX (SCAXR)
Routing Code: 2,9,10
Descriptor Code: 4

AXR0112I  DYNALLOC FOR datasetname ACCESSED THROUGH howaccessed FAILED. RC=rc, RSN=rsn

Explanation: A data set specified in the REXXLIB concatenation failed in allocation.

In the message text:

datasetname
  The name of the data set.

howaccessed
  The specified volume or catalog if no volume was specified.

c
  The return code provided by the DYNALLOC macro.

rsn
  The reason code provided by the DYNALLOC macro.

System action: If this message is issued during AXR initialization and the data set is SYS1.SAXREXEC, the AXR address space stops; otherwise, the data set is removed from the concatenation.

Operator response: Contact your system programmer.

System programmer response: See the return and reason codes from DYNALLOC in z/OS MVS Programming Authorized Assembler Services Guide to determine the cause of the problem. Also look for any message that DYNALLOC might have issued.

Module: AXRINALC
Source: System REXX (SCAXR)
Routing Code: 2,10
Descriptor Code: 12
AXR0113I  DATA SET datasetname ACCESSED THROUGH howaccessed text

Explanation: A data set specified in the REXXLIB concatenation is not the correct type. The data set must be a PDS or PDSE.

In the message text:

datasetname
   The name of the data set.

howaccessed
   The specified volume or catalog if no volume was specified.

text

HAS INCORRECT DSORG
   The DSORG of the specified data set is incorrect. The data set must be a PDS or PDSE.

HAS INCORRECT RECORD LENGTH
   The record length of the specified data set does not match that of SYS1.SAXREXEC.

HAS INCORRECT RECORD FORMAT
   The record format of the specified data set does not match that of SYS1.SAXREXEC.

DOES NOT RESIDE ON THE SPECIFIED VOLUME
   The data set does not reside on the specified volume.

REMOVED FROM CONCATENATION TO MAKE ROOM FOR SYS1.SAXREXEC
   The data set was removed from the REXXLIB concatenation in order to append sys1.saxrexxec to the end of the concatenation (otherwise the 255 data set limit would be exceeded when SYS1.SAXREXEC is appended).

DOES NOT EXIST
   The data set does not exist, although a catalog entry for it may.

System action: If this message is issued during AXR initialization and the data set is SYS1.SAXREXEC, the AXR address space stops; otherwise the data set is removed from the concatenation. In the case where this is issued after AXR has initialized, the AXREXX request will fail and the started address space that would have run the exec will terminate.

Operator response: Contact your system programmer.

System programmer response: Correct the problem with the specified data set.

Module: AXRINALC
Source: System REXX (SCAXR)
Routing Code: 2,10
Descriptor Code: 12

AXR0114I  DYNALLOC REXXLIB CONCATENATION FAILED. RC=rc, RSN=rsn

Explanation: The attempt to concatenate the data sets specified by the REXXLIB AXRnn parameter failed.

In the message text:

rc
   The return code provided by the DYNALLOC macro.

rsn
   The reason code provided by the DYNALLOC macro.

System action: If this message is issued during AXR initialization, AXR will terminate. In the case where this is issued after AXR has initialized, the AXREXX request will fail and the started address space that would have run the exec will terminate.

Operator response: Contact your system programmer.

System programmer response: See the return and reason codes from DYNALLOC in "zos MVS Programming Authorized Assembler Services Guide" to determine the cause of the problem. Also look for any message that DYNALLOC might have issued.
AXR0115E • AXR0200I

Module: AXRINALC

AXR0115E TOTAL NUMBER OF EXTENTS IN REXXLIB CONCATENATION EXCEEDS SYSTEM LIMIT.
ALTER CONCATENATION AND RESTART SYSTEM REXX.

Explanation: The total number of extents in data sets used in the System REXX Rexxlib concatenation exceeds the system limit. See z/OS DFSMS Using Data Sets for more details.

System action: The system REXX address space (AXR) terminates if this is detected during initialization. If detected after System REXX initializes, no new work can start.

Operator response: Contact your system programmer.

System programmer response: If this problem occurred after System REXX initialized, terminate System REXX by issuing FORCE AXR,ARM at the operator console.
Determine which data sets should be removed from the concatenation and modify AXRnn parmlib members accordingly to reduce the total number of extents to an acceptable value.
Restart System REXX.

Module: AXRINALC, AXRENEXE
Source: System REXX (SCAXR)
Routing Code: 2,10
Descriptor Code: 3,12

AXR0116I SYSTEM REXX IS TERMINATING.

Explanation: Some system event or environmental condition has caused System REXX to terminate.

System action: System REXX will wait for a period of time for active requests to complete. Once active requests have completed or the time period has expired System REXX ends.

Operator response: If the termination of System REXX is unexpected, contact your system programmer.

System programmer response: Check the System Log for additional messages which may indicate why System REXX terminated.

Routing Code: 2,10

UNTIMED numbertsonuntimed
TSO SERVER SPACES:
ACTIVE: ActiveTsoServers
TOTAL: TotalTsoServers
Explanation: The response to the SYSREXX STATUS command.

In the message text:

hh.mm.ss
The time in hours (00-23), minutes (00-59), and seconds (00-59) when the AXR address space was started.

mm/dd/yyyy
The date when the AXR was started.

memname
The name of the parmlib members that were used.

cpf
The command prefix for System REXX.

(systemorsysplex)
Whether the CPF is defined just for the system or for the entire Sysplex.

axruser
The value of AXRUSER.

timeint
The default timeout interval.

**TMP:ENABLED**
TSO=YES requests will use the TMP (terminal monitor program).

**TMP:NOT ENABLED**
TSO=YES requests will use the TSO Environment Service.

subsystem
Subsystem name.

| TSO:YES <ENABLED> |
| Indicates that TSO=YES processing is enabled. |

| TSO:YES <DISABLED> |
| Indicates that TSO=YES processing was disabled by the MODIFY AXR,SYSREXX STOPTSO command. |

| TSO:YES <PENDING> |
| Indicates that the MODIFY AXR,SYSREXX STOPTSO command has not yet completed. |

| SYSREXX STOP <PENDING> |
| Indicates that STOP AXR was issued and is still in progress. |

numberqueued
The number of AXREXX EXECUTE requests waiting for service.

newworkstatus
Indicates whether new work is being accepted or rejected because there are too many waiting requests.

activeworkertasks
The number of tasks executing TSO=NO execs.

totalworkertasks
The sum of idle and active worker tasks.

numberidletasks
The number of worker tasks waiting to execute TSO=NO requests.

maxworkertasks
The maximum number of worker tasks.

numbertsnoasync
The number of asynchronous TSO=NO requests currently being executed.

numbertsonosync
The number of synchronous TSO=NO requests currently being executed.
numbertsonountimed
The number of untimed TSO=NO requests currently being executed.

ActiveTsoServers
The number of active TSO Server address spaces.

TotalTsoServers
The total number of TSO Server address spaces.

numberidleservers
The number of TSO server address spaces waiting to execute REXX execs.

maxtsoservers
The maximum number of TSO Server address spaces.

numbertsoyesasync
The number of asynchronous TSO=YES requests currently being executed.

numbertsoyessync
The number of synchronous TSO=YES requests currently being executed.

numbertsoyesuntimed
The number of untimed TSO=YES requests currently being executed.

System action: System REXX processing continues.

Explanation: SYSREXX STATUS,DETAIL command response.

In the message text:

execname
The name of the REXX exec being executed.

jobname
The name of the job that invoked AXREXX.

asid
The Primary ASID of the Task that invoked AXREXX.

y/n
Indicates whether the Exec runs in the TSO environment.

timelimit
The time limit associated with the request.

reqtoken1
The first half of the request token of the request.

reqtoken2
The second half of the request token of the request.

ejobname
The name of the job that is running the REXX exec.

easid
The ASID of the task running the REXX exec.

etcb
The TCB address of the task running the exec.

cputime
The total cpu time used by the exec. This has the following format:
  • sss.tttS when the time is less than 1000 seconds
• hh.mm.ss when the time is at least 1000 but less than 100 hours
• hhmm.mm when the time is at least 100 hours
• ******** when the time exceeds 100000 hours.

realtime The elapsed (wall clock) time used by the exec. Uses the same format as CPU.

AXR0502I  REXX envtype ENVIRONMENT FAILED INITIALIZATION. IRXINIT RETCODE=retcode. IRXINIT RSNCODE=rsncode. IRXINIT RETURNED THE FOLLOWING MESSAGES: irxinit msgs

Explanation: When attempting to start a REXX environment, the REXX IRXINIT service returned a return code indicating some type of environmental error.
In the message text:
  envtype  Type of environment, either TSO=YES or TSO=NO
  retcode  Return code from IRXINIT
  rsncode  Return code from IRXINIT

System action: System REXX terminates.
Operator response: Contact System Programmer.
System programmer response: Refer to the REXX messages that are associated with the failure that are contained in this message.
Routing Code: 2, 10
Descriptor Code: 12

AXR0503I  AXRRXWKD IS NO LONGER LISTED AS AUTHORIZED IN IKJTSOXX. TMP IS NO LONGER ENABLED.

Explanation: For SYSREXX to use the TMP (terminal monitor program), AXRRXWKD must be listed as an authorized command in IKJTSOxx, however, it no longer is.

System action: System REXX will no longer process TSO=YES requests using the TMP. The current request will be retried under the TSO Environment Service.
Operator response: Contact your System Programmer.
System programmer response: The TSO Authorized Commands table must have changed to exclude AXRRXWKD after System REXX started. Add AXRRXWKD back into the table, using SET IKJTSO and restart System REXX.
Routing Code: 2, 10
Descriptor Code: 12
AXR0700I  ERROR(S) FOUND PROCESSING PARMLIB MEMBER=memname: text

Explanation: The system could not obtain the needed information from a parmlib member.

In the message text:

memname

The name of the parmlib member in which the error was found.

INSUFFICIENT STORAGE FOR PARMLIB BUFFER
The system did not have enough storage to process the parmlib member.

DYNAMIC ALLOCATION OF PARMLIB FAILED
The system could not allocate the parmlib member.

SYNTAX ERROR FOUND IN PARMLIB MEMBER
One or more syntax errors were found in the member.

PARSER FAILURE
The parser encountered an internal error.

OTHER PARMLIB ERROR
Accompanying messages explained the error.

System action: The system might ignore the parmlib member except for the case of syntax error.

Operator response: Notify the system programmer.

System programmer response: If syntax errors are found, correct the errors. Retry the request. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

AXR0800I  traceoptn IS NOT A VALID SYSTEM REXX TRACE OPTION FOR SYSAXR. ALLOWABLE OPTIONS ARE ALL, RXCLIENT, ERROR, COMMAND, RXSERVER, AXRINFO, AXRCMD, AXRWT0, AXRMLWTO, AXRWAIT, EXEC=, CANCEL, GETRXLIB, REXXARGS AND REXXVARS.

Explanation: The string traceoptn was received as part of the trace options. This string does not represent a valid SYSAXR trace option.

In the message text:

traceoptn

The value of the invalid trace option specified.

System action: The system rejects the TRACE CT command.
AXR0801I • AXR0802I

Operator response: Notify the system programmer.

System programmer response: Issue the TRACE CT command again and supply valid SYSAXR trace options.

Module: AXRCTST
Source: System REXX (SCAXR)
Routing Code: 2, 10
Descriptor Code: 5

AXR0801I execname IS NOT A VALID NAME FOR AN EXEC.

Explanation: The operand of the EXEC= keyword is not a valid EXEC name.

In the message text:

execname

Is the value of the invalid exec name that was specified.

System action: The system rejects the TRACE CT command.

Operator response: Notify the system programmer.

System programmer response: Issue the TRACE CT command again and supply a valid EXEC name.

Module: AXRCTST
Source: System REXX (SCAXR)
Routing Code: 2, 10
Descriptor Code: 5

AXR0802I CTRACE DEFINE FOR SYSAXR FAILED. RETCODE=rc, RSNCODE=rsn

Explanation: CTRACE DEFINE for the System REXX component trace failed.

In the message text:

rc The return code provided by the CTRACE macro.
rsn The reason code provided by the CTRACE macro.

System action: The System REXX address space (AXR) terminates.

Operator response: Notify the system programmer.

System programmer response: See the return code and reason code for CTRACE in the [z/OS MVS Programming](http://www.ibm.com/servers/zseries/manuals/). Ensure that parmlib member CTIAXR00 exists in SYS1.PARMLIB and has no syntax errors.

Module: AXRCTDEF

Chapter 7. BCD messages

z/OS Batch Runtime messages, with the message prefix BCD, writes messages to the file specified on the JCL //BCDOUT statement.

BCD0101E Internal error occurred in class-name:method-name, reason=reason-text.
Explanation: An internal error occurred in z/OS Batch Runtime and was detected by the indicated class and method. In the message text:

    method-name
    Name of the method detecting the error.

    reason-text
    The internal reason code.

System action: z/OS Batch Runtime continues if possible.
User response: If you cannot correct the problem, contact IBM Support.

BCD0102E Exception occurred: exception-text.
Explanation: An exception occurred in the batch runtime. In the message text:

    exception-text
    Describes the exception-text and trace back.

System action: z/OS Batch Runtime continues if possible.
User response: Use the exception text to diagnose the error. Follow your local procedures to contact IBM for support.

BCD0103E Unexpected condition: reason-text.
Explanation: An unexpected condition has occurred in the batch runtime. In the message text:

    reason-text
    Describes the condition.

System action: z/OS Batch Runtime continues if possible.
User response: Use the reason text to diagnose the error. Follow your local procedures to contact IBM for support.

BCD0104E Batch Runtime terminating abnormally.
Explanation: An unrecoverable error has occurred that causes the Batch Runtime to terminate. Messages will have been previously issued which describe the error.

System action: The Batch Runtime terminates.
User response: Correct the error and retry.

BCD0110I Installation verification processing started.
Explanation: The installation verification procedure (IVP) started.
System action: None
User response: None

<td>The program arguments are ignored.</td>
<td>Remove any program arguments and retry.</td>
</tr>
<tr>
<td>BCD0115E</td>
<td>Unrecognized option option.</td>
<td>The installation verification program was invoked with an unrecognized option. In the message text:</td>
<td>The installation verification program terminates.</td>
<td>Correct the installation verification option and retry.</td>
</tr>
<tr>
<td>BCD0116E</td>
<td>Value not allowed for option option.</td>
<td>The installation verification program was invoked with an incorrect value for an option. In the message text:</td>
<td>The installation verification program terminates.</td>
<td>Correct the installation verification option and retry.</td>
</tr>
</tbody>
</table>
BCD0117E  Value required for option "option".
Explanation: The installation verification program was invoked but a required value is missing for the indicated option. In the message text:

option  Name of the option

System action: The installation verification program terminates.
User response: Correct the installation verification option and retry.

BCD0118I  Report completed, number lines written.
Explanation: The installation verification program (IVP) has created a summary report containing a number of lines. In the message text:

number  The number of lines written by the IVP.

System action: None.
User response: None.

BCD0201E  Unrecognized Batch Runtime option option.
Explanation: z/OS Batch Runtime configuration option is not recognized. In the message text:

option  Name of the option

System action: z/OS Batch Runtime ends.
User response: Correct the option, and restart. For information about z/OS Batch Runtime options, see the topic about Configuration options for z/OS Batch Runtime in z/OS Batch Runtime Planning and User’s Guide.

BCD0202E  Batch Runtime option option value required.
Explanation: z/OS Batch Runtime configuration option requires a value. In the message text:

option  Name of the option

System action: z/OS Batch Runtime ends.
User response: Provide a z/OS Batch Runtime option, and restart. For information about z/OS Batch Runtime options, see the topic about Configuration options for z/OS Batch Runtime in z/OS Batch Runtime Planning and User’s Guide.

BCD0203E  Batch Runtime option option has value option-value that is not valid.
Explanation: z/OS Batch Runtime configuration option has an incorrect value. In the message text:

option  Name of the option

option-value  Value of the option

System action: z/OS Batch Runtime ends.
User response: Correct the value for the option, and restart. For information about z/OS Batch Runtime options, see the topic about Configuration options for z/OS Batch Runtime in z/OS Batch Runtime Planning and User’s Guide.

BCD0204E  Batch Runtime option option has a suffix that is not valid.
Explanation: z/OS Batch Runtime configuration option has a suffix that is not valid. In the message text:

option  Name of the option

You cannot specify a suffix of zero.
System action: z/OS Batch Runtime ends.
BCD0205E • BCD0208I

User response: Correct the suffix for the option, and restart. For information about z/OS Batch Runtime options, see the topic about Configuration options for z/OS Batch Runtime in z/OS Batch Runtime Planning and User’s Guide.

BCD0205E  z/OS Batch Runtime option option is required.

Explanation: z/OS Batch Runtime configuration option is required but was not specified. In the message text:

option     Name of the option

System action: z/OS Batch Runtime ends

User response: Add the option to z/OS Batch Runtime configuration, and restart. For information about z/OS Batch Runtime options, see the topic about Configuration options for z/OS Batch Runtime in z/OS Batch Runtime Planning and User’s Guide.

BCD0206I  z/OS Batch Runtime started at local-specific-time-and-date (build build-name framework framework-id).

Explanation: z/OS Batch Runtime has started processing. In the message text:

build-name     The build-name identifies the build level of the Batch Runtime.

framework-id    The framework-id identifies the framework level of the Batch Runtime.

The time and date are locale specific. The format is:

• Locale specific short day of week, for example Sun
• Locale specific short abbreviated month, for example Jan
• Day of month
• Time in 24 hour clock at HH:MM:SS
• Time zone abbreviation, for example EDT
• Year

For example:
Sun Jul 24 16:17:00 EDT 2011

System action: None.

User response: None.

BCD0207I  Correct the errors and restart.

Explanation: z/OS Batch Runtime has detected configuration errors and is ending.

System action: z/OS Batch Runtime ends

User response: See any messages that the system issued earlier in the log data set to correct the errors, then restart.

BCD0208I  Initialization started for z/OS Batch Runtime support class class-name.

Explanation: z/OS Batch Runtime has invoked the specified support class for initialization. In the message text:

class-name     Name of the support class

System action: None.

User response: None.
BCD0209I  Initialization complete for Batch Runtime support class class-name.

Explanation:  The support class has completed initialization and is ready to process requests. In the message text:

  class-name
  Name of the support class

System action:  None.

User response:  None.

BCD0210E  Unable to load z/OS Batch Runtime support class class-name: reason=reason-text.

Explanation:  z/OS Batch Runtime was unable to load the support class. In the message text:

  class-name
  Name of the support class

  reason-text
  Description of the error

System action:  z/OS Batch Runtime ends.

User response:  Use the reason text that the Java™ application provides to diagnose the error. Check that the class name is spelled correctly and is accessible on the z/OS Batch Runtime CLASSPATH. Correct the errors, and restart.

BCD0211E  Unable to invoke support class class-name method method-name: reason=reason-text.

Explanation:  z/OS Batch Runtime cannot invoke the Java method in the supported class. In the message text:

  class-name
  Name of the support class

  method-name
  Name of the Java method

  reason-text
  Description of the error

System action:  z/OS Batch Runtime ends.

User response:  The support class is required to implement the named method for use by z/OS Batch Runtime. Verify that the support class name is correct and is accessible on the z/OS Batch Runtime CLASSPATH. Use the reason text that the Java application provides to diagnose the error. If the error persists, contact your support class provider for assistance.

BCD0212E  Java SDK bit mode unacceptable; current mode current-mode but required-mode is required.

Explanation:  z/OS Batch Runtime was not invoked using the 31-bit Java SDK. In the message text:

  current-mode
  Current mode

  required-mode
  Correct mode required for the environment

System action:  z/OS Batch Runtime ends.

User response:  Verify that z/OS Batch Runtime is running the 31-bit version of the JZOS launcher and that the CLASSPATH and LIBPATH environment variables have been configured correctly.

BCD0213E  Option option-name value option-value exceeds the maximum length of maximum-length.

Explanation:  z/OS Batch Runtime configuration option has a value that exceeds the maximum length allowed. In the message text:

  option-name
  Name of the option
option-value
  Value of the option
maximum-length
  Maximum length allowed by z/OS Batch Runtime

System action: z/OS Batch Runtime ends.
User response: Correct the option, and restart.

BCD0214I Termination started for z/OS Batch Runtime support class class-name.
Explanation: z/OS Batch Runtime support class is being invoked to end the specified support class. In the message text:

class-name
  Name of the support class
System action: None.
User response: None.

BCD0215I Termination complete for z/OS Batch Runtime support class class-name.
Explanation: z/OS Batch Runtime support class has ended. In the message text:

class-name
  Name of the support class
System action: None.
User response: None.

BCD0216E Initialization failed for z/OS Batch Runtime support class class-name, reason=reason-text.
Explanation: z/OS Batch Runtime support class has failed to initialize. In the message text:

class-name
  Name of the support class
reason-text
  Description of the error
System action: z/OS Batch Runtime ends.
User response: Use the reason text that the Java application provides to diagnose the error. The support class also might have issued additional messages describing the error.

BCD0217I Termination failed for z/OS Batch Runtime support class class-name.
Explanation: z/OS Batch Runtime support class has failed during end processing. In the message text:

class-name
  Name of the support class
System action: z/OS Batch Runtime continues to end.
User response: Use the reason-text that the Java program has returned to diagnose the error. The support class might have issued additional messages describing the error.

BCD0218I z/OS Batch Runtime options in effect:
Explanation: The message provides the header for z/OS Batch Runtime options that are currently in effect. The options are listed in message BCD0219I.
System action: None.
User response: None.
BCD0219I  option-name=option-value

Explanation:  z/OS Batch Runtime configuration option is currently being processed with the specified value. In the message text:

option-name
  Name of the option

option-value
  Value that z/OS Batch Runtime uses for the option.

System action:  None.

User response:  None.

BCD0220I Unrecognized trace option option-name=option-value ignored; trace level set to OFF.

Explanation:  The indicated trace option has an unrecognized value. In the message text:

option-name
  Name of the option

option-value
  Value that z/OS Batch Runtime uses for the option.

System action:  z/OS Batch Runtime trace level is set to OFF, and trace records are not created.

User response:  Correct the trace option, and restart. For a description of valid trace options and other troubleshooting information, see the topic about Troubleshooting for z/OS Batch Runtime in z/OS Batch Runtime Planning and User’s Guide.

BCD0221E Argument count of count exceeds the maximum of maximum-count for language-name language.

Explanation:  z/OS Batch Runtime was configured to supply arguments to the application; however, the number of arguments exceeds the maximum allowed for an application. In the message text:

count
  Number of arguments that is not correct.

maximum-count
  Maximum number of the arguments allowed by the application

language-name
  Application language

System action:  z/OS Batch Runtime ends.

User response:  Provide a correct number of arguments for the application language, and restart.

BCD0223E Application argument length of argument-length exceeds the maximum length of maximum-length for language-name language.

Explanation:  An application argument exceeds the maximum length allowed for an application language. In the message text:

argument-length
  Length of the argument that is not correct.

maximum-count
  Maximum length of the argument allowed by the application. For COBOL programs, you cannot specify more than 100.

language-name
  Name of the application language.

System action:  z/OS Batch Runtime ends.

User response:  Correct the length of the argument for the application, and restart.
**BCD0224E**  Error occurred processing *option-name*:*reason*.

**Explanation:** An error has occurred processing the option. In the message text:

- **option-name**
  Name of the option

- **reason**
  Description of the error

**System action:** z/OS Batch Runtime ends.

**User response:** Use the reason text that the Java application provides to diagnose the error, and restart.

---

**BCD0225I**  z/OS Batch Runtime ended at *locale specific time and date*.

**Explanation:** z/OS Batch Runtime has ended. The time and date format is:

- Locale specific short day of week, for example Sun
- Locale specific short abbreviated month, for example Jan
- Day of month
- Time in 24 hour clock at HH:MM:SS
- Time zone abbreviation, for example EDT
- Year

For example:
Sun Jul 24 16:17:00 EDT 2011

**System action:** z/OS Batch Runtime ends.

**User response:** None.

---

**BCD0226I**  Unrecognized property *property*:*value*; *value* ignored.

**Explanation:** z/OS Batch Runtime does not recognize the property value. In the message text:

- **property**
  Name of the property

- **value**
  Property value

**System action:** None.

**User response:** Correct the error and rerun. For a description of valid trace options and other troubleshooting information, see the topic about Troubleshooting for z/OS Batch Runtime in [z/OS Batch Runtime Planning and User's Guide](#).

---

**BCD0227I**  z/OS Batch Runtime support class *class-name*:*version* information:*version-information*.

**Explanation:** z/OS Batch Runtime provides the version information for the support class. In the message text:

- **class-name**
  Name of the class

- **version**
  Version information

**System action:** None.

**User response:** None.
### BCD0228E  Java SDK version unacceptable, version is incorrect-version but correct-version is required.

**Explanation:** The specified version of the Java SDK is not accepted by z/OS Batch Runtime. In the message text:

- `incorrect-version`  
  Specified version  
- `correct-version`  
  Correct version  

**System action:** None.  

**User response:** Use the correct version of the Java SDK. For information about software requirements, see the topic about Configuring Java in [z/OS Batch Runtime Planning and User’s Guide](#).

### BCD0229E  Error occurred reading Batch Runtime options: reason=reason-text.

**Explanation:** An unrecoverable error occurred reading the Batch Runtime initialization options as indicated by the `reason-text`.  

**System action:** z/OS Batch Runtime is terminated.  

**User response:** Use the reason-text to diagnose the error and retry.

### BCD0230I  Class class-name was loaded from path-name.

**Explanation:** z/OS Batch Runtime has loaded `class-name` from the indicated path. This message is only issued in verbose mode. In the message text:

- `class-name`  
  Name of the support class  
- `path-name`  
  Name of the path name.  

**System action:** None.  

**User response:** None.

### BCD0231E  Unable to invoke Batch Runtime support class “class-name” method method-name: reason reason-text, causer=causer-text.

**Explanation:** The Batch Runtime was unable to invoke the indicated support class and method. In the message text:

- `reason-text`  
  The reason for the error.  
- `causer-text`  
  The initial condition causing the error.  

**System action:** The Batch Runtime ends.  

**User response:** Use the reason-text and causer-text to diagnose the error and retry.

### BCD0232I  JVM startup option “option” was not specified.

**Explanation:** The Batch Runtime found than an expected JVM startup option `option` was not specified.  

**System action:** The Batch Runtime continues processing but unexpected results may occur.  

**User response:** Determine the reason why the option was not specified.

### BCD0233E  Error occurred reading DD name ddname: reason(reason-text.

**Explanation:** An error occurred reading the named DD statement as described by the `reason-text`.  

**System action:** The Batch Runtime terminates.  

**User response:** Correct the error and retry.

</table>
BCD0242I  JVM file encoding in effect: encoding-name.
Explanation: The JVM is using encoding-name as the file encoding.
System action: None.
User response: None.

BCD0243E  Encoding encoding-name is not supported.
Explanation: The Batch Runtime was directed to use encoding-name as a file encoding, but encoding-name is not defined.
System action: The Batch Runtime is terminated.
User response: Correct the error and retry.

BCD0244I  Properties being read from DD name ddname for class class-name.
Explanation: Initialization properties for class class-name are being read using DD name ddname.
System action: None.
User response: None.

BCD0245E  Required DD name ddname does not exist.
Explanation: The Batch Runtime attempted to read the file referenced by ddname, but it does not exist. The file cannot be read.
System action: The Batch Runtime is terminated.
User response: Correct the error and retry.

BCD0246E  Batch Runtime option "option-name" value "value" is too small, minimum value allowed is minimum-value.
Explanation: The named Batch Runtime option has a value that is too small. Use a value of at least minimum-value.
System action: The Batch Runtime is terminated.
User response: Correct the error and retry.

BCD0247E  Batch Runtime option "option-name" value "value" is too large, maximum value allowed is maximum-value.
Explanation: The named Batch Runtime option has a value that is too large. Use a value no larger than maximum-value.
System action: The Batch Runtime is terminated.
User response: Correct the error and retry.

BCD0301E  Application application-name not launched: reason=reason-text.
Explanation: z/OS Batch Runtime cannot launch the application. In the message text:
application-name
    Name of the application
reason-text
    Description of the error
System action: z/OS Batch Runtime ends.
User response: Use the reason text that the Batch Runtime provides to diagnose the error. Verify that the application name is spelled correctly in the configuration options. For Java applications, the application must be accessible on the
CLASSPATH. For COBOL applications, the application must be in the JOBLIB, STEPLIB, or accessible through z/OS
LNKLST or LPALST.

**BCD0303I** Launching application *application-name*.

**Explanation:** z/OS Batch Runtime is launching the application. In the message text:

*application-name*

Name of the application

**System action:** None.

**User response:** None.

**BCD0304I** Application *application-name* completed.

**Explanation:** The launched application has completed. In the message text:

*application-name*

Name of the application

**System action:** None.

**User response:** None.

**BCD0305I** Application *application-name* completed: return code=*return-code*.

**Explanation:** The launched application has completed. In the message text:

*application-name*

Name of the application

*return-code*

Return code that the application issues.

**System action:** None.

**User response:** None unless the return code indicates an error. Then, use the error description to diagnose the problem.

**BCD0306E** Error occurred processing application “*application-name*”: reason=*reason-text*.

**Explanation:** An unhandled exception has occurred while z/OS Batch Runtime was processing the application. In the message text:

*application-name*

Name of the application

*reason-text*

Description of the error

**System action:** None.

**User response:** Use the reason text that the application provides to diagnose the error, and follow your installation diagnostic procedures. If the error persists, contact the IBM Support Center.

**BCD0307E** Unable to invoke application *application-names* method *method-name* is not static.

**Explanation:** z/OS Batch Runtime has attempted to launch method-name in the named application. However, the method is not declared as being static.

*application-name*

Name of the application

*method-name*

Name of the method

**System action:** z/OS Batch Runtime ends.
User response:   For Java applications, the class must contain a static main method that z/OS Batch Runtime calls. Use the reason text that the Java application provides to diagnose the error, and restart.

**BCD0308E**  Application application-name not launched; class not found.

**Explanation:** z/OS Batch Runtime could not find the class to launch the application.

*application-name*

  Name of the application

**System action:** z/OS Batch Runtime ends.

**User response:** Ensure the class has been configured on the CLASSPATH and retry

**BCD0309E**  Error occurred processing application “application-name”: reason reason-text, causer=causer-text.

**Explanation:** An error occurred while application-name was running. In the message text:

*application-name*

  Name of the application

*reason-text*

  Indicate the error.

*causer-text*

  Indicates the initial condition causing the error.

**System action:** z/OS Batch Runtime ends.

**User response:** Use the reason-text and causer-text to diagnose the error.

**BCD0310I**  Job ID jobid being processed.

**Explanation:** xJCL has been submitted to the scheduler and job ID jobid has been assigned.

**System action:** None

**User response:** None

**BCD0311I**  Property “property-name” has the value “property-value”.

**Explanation:** The named property property-name has been assigned a value of property-value.

**System action:** None

**User response:** None

**BCD0312E**  Processing of job jobid has ended abnormally.

**Explanation:** Job jobid has ended abnormally.

**System action:** Additional messages describing the error may have been issued.

**User response:** Correct the errors described by the messages and retry.

**BCD0313I**  Application issued message: message-text.

**Explanation:** The Batch Runtime is running an xJCL defined job and the job has issued a message, usually as a result of an exception.

**System action:** The message is written to the Batch Runtime log.

**User response:** None.
BCD0401E • BCD0404E

BCD0401E Unable to begin new transaction, ATRBEG return code 0xreturn-code, diagnostic area="diagnostic-area".

Explanation: z/OS Batch Runtime is unable to begin a new transaction. The Resource Recovery Services ATRBEG service issues a hexadecimal return code and ends. In the message text:

0xreturncode
Hexadecimal return code from ATRBEG
diagnostic-area
The diagnostic area for the function returned by RRS.

System action: z/OS Batch Runtime ends.

User response: Use the return code to diagnose the error. For information about functions and return codes that Resource Recovery Services provides, see z/OS MVS Programming: Resource Recovery.

BCD0402E Unable to commit transaction, ATREND return code 0xreturn-code, diagnostic area="diagnostic-area".

Explanation: z/OS Batch Runtime is unable to commit the current transaction. The Resource Recovery Services ATREND service issues a hexadecimal return code and ends. In the message text:

0xreturncode
Hexadecimal return code from ATREND
diagnostic-area
The diagnostic area for the function returned by RRS.

System action: z/OS Batch Runtime ends.

User response: Use the return code to diagnose the error. For information about functions and return codes that Resource Recovery Services provides, see z/OS MVS Programming: Resource Recovery.

BCD0403E Unable to rollback transaction, ATREND return code 0xreturn-code, diagnostic area="diagnostic-area".

Explanation: z/OS Batch Runtime is unable to rollback the current transaction. The Resource Recovery Services ATREND service issues a hexadecimal return code and ends. In the message text:

0xreturncode
Hexadecimal return code from ATREND
diagnostic-area
The diagnostic area for the function returned by RRS.

System action: z/OS Batch Runtime ends.

User response: Use the return code to diagnose the error.

BCD0404E Unable to set transaction environment, ATRSENV return code 0xreturncode, diagnostic area="diagnostic-area".

Explanation: z/OS Batch Runtime is unable to set the transaction mode to global mode. The Resource Recovery Services ATRSENV service issues a hexadecimal return code and ends. In the message text:

0xreturncode
Hexadecimal return code from ATRSENV
diagnostic-area
The diagnostic area for the function returned by RRS.

System action: z/OS Batch Runtime ends.

User response: Use the return code to diagnose the error. For information about functions and return codes that Resource Recovery Services provides, see z/OS MVS Programming: Resource Recovery.
Support class *support-class* unable to begin new transaction: *reason*: *reason-text*.

**Explanation:** 
*z/OS Batch Runtime* cannot continue because the support class is unable to start the transaction. In the message text:

- *support-class*
  - Name of the support class
- *reason-text*
  - Description of the error

**System action:** None.

**User response:** Use the reason text that the Java application provides to diagnose the error.

---

**Begin new transaction processing started at** locale specific time and date.

**Explanation:** *z/OS Batch Runtime* has started processing the transaction. This message is only issued when the Batch Runtime is running in verbose mode. The time and date are locale specific. The format is:

- Locale specific short day of week, for example *Sun*
- Locale specific short abbreviated month, for example *Jan*
- Day of month
- Time in 24 hour clock at *HH:MM:SS*
- Time zone abbreviation, for example *EDT*
- Year

For example:
Sun Jul 24 16:17:00 EDT 2011

**System action:** None.

**User response:** None.

---

**Begin new transaction processing completed at** locale specific date and time.

**Explanation:** *z/OS Batch Runtime* has completed processing the transaction. This message is only issued when the Batch Runtime is running in verbose mode. The time and date are locale specific. The format is:

- Locale specific short day of week, for example *Sun*
- Locale specific short abbreviated month, for example *Jan*
- Day of month
- Time in 24 hour clock at *HH:MM:SS*
- Time zone abbreviation, for example *EDT*
- Year

For example:
Sun Jul 24 16:17:00 EDT 2011

**System action:** None.

**User response:** None.

---

**Commit transaction processing started at** locale specific date and time.

**Explanation:** *z/OS Batch Runtime* has started commit processing for the transaction. This message is only issued when the Batch Runtime is running in verbose mode. The time and date are locale specific. The format is:

- Locale specific short day of week, for example *Sun*
- Locale specific short abbreviated month, for example *Jan*
- Day of month
- Time in 24 hour clock at *HH:MM:SS*
• Time zone abbreviation, for example EDT
• Year

For example:
Sun Jul 24 16:17:00 EDT 2011

System action: None.
User response: None.

BCD0409I  Commit transaction processing completed at locale specific date and time.

Explanation: z/OS Batch Runtime has completed commit processing for the transaction. This message is only issued when the Batch Runtime is running in verbose mode. The time and date are locale specific. The format is:
• Locale specific short day of week, for example Sun
• Locale specific short abbreviated month, for example Jan
• Day of month
• Time in 24 hour clock at HH:MM:SS
• Time zone abbreviation, for example EDT
• Year

For example:
Sun Jul 24 16:17:00 EDT 2011

System action: None.
User response: None.

BCD0410I  Rollback transaction processing started at locale specific date and time.

Explanation: z/OS Batch Runtime has started rollback processing for the transaction. This message is only issued when the Batch Runtime is running in verbose mode. The time and date are locale specific. The format is:
• Locale specific short day of week, for example Sun
• Locale specific short abbreviated month, for example Jan
• Day of month
• Time in 24 hour clock at HH:MM:SS
• Time zone abbreviation, for example EDT
• Year

For example:
Sun Jul 24 16:17:00 EDT 2011

System action: None.
User response: None.

BCD0411I  Rollback transaction processing completed at locale specific date and time.

Explanation: z/OS Batch Runtime has completed rollback processing for the transaction. This message is only issued when the Batch Runtime is running in verbose mode. The time and date are locale specific. The format is:
• Locale specific short day of week, for example Sun
• Locale specific short abbreviated month, for example Jan
• Day of month
• Time in 24 hour clock at HH:MM:SS
• Time zone abbreviation, for example EDT
• Year
For example:
Sun Jul 24 16:17:00 EDT 2011
System action: None.
User response: None.

**BCD0412I** Transaction counts: Begin=begin-count Commit=commit-count Rollback=rollback-count.

**Explanation:** The display of the begin, commit, and rollback transaction counts for this invocation of the z/OS Batch Runtime. In the message text:

- **begin-count**
  The beginning transaction count.

- **commit-count**
  The commit transaction count.

- **rollback-count**
  The rollback transaction count.

System action: None.
User response: None.

**BCD0413I** Transaction processing failed: reason=reason-text.

**Explanation:** An error has occurred during transaction processing as described by the reason-text. In the message text:

- **reason-text**
  The reason-text showing why the transaction failed.

System action: z/OS Batch Runtime terminates.
User response: Use the reason-text to diagnose the error and retry.

**BCD0414E** Support class termination failures: failure-count.

**Explanation:** At least one support class has failed during termination processing.

System action: Additional messages describing the error may have been issued. The Batch Runtime is terminated.
User response: Correct the errors described by the messages error and retry.

**BCD0415E** Error occurred processing restart table, reason: reason-text.

**Explanation:** An application is restart enabled, but the Batch Runtime encountered an error updating a restart table as described by reason-text.

System action: The Batch Runtime is terminated.
User response: Correct the error and retry.
Chapter 8. BHI messages

z/OS Basic HyperSwap® messages with the message prefix BHI.

BHI0001I  name-of-function: Service name-of-service failed with RC: retcode  RSN:rsncode

Explanation:  A service was invoked which could not process the request. This message records this error.
In the message text:

name-of-function  The name of the function that invoked the service.
name-of-service  The name of the service that failed.
retcode  The return code from the service that failed.
rsncode  The reason code from the service that failed.

System action:  This failing service, along with the function that invoked that service, govern the action that will be taken. In some cases, an ABEND may be issued because the function can not continue without the service.

Operator response:  Notify the system programmer.

System programmer response:  Search problem reporting data bases for a fix for this problem. If no fix exists, contact the IBM Support Center.

User response:  None.

Module:  Various. Refer to name-of-function as the detecting module.

Routing code:  10

Descriptor code:  4

BHI0002I  HyperSwap socket received incorrect data. Error code: errcode. Socket will be closed.

Explanation:  Basic HyperSwap received, over its socket interface, data that was incorrect.
In the message text:

errcode  Possible error codes:

1. Acronym was incorrect.
2. Version level was incorrect.
3. The size of the data was too large.
4. The size of the initialization data is too small or too large.
5. The offset of where the initialization data starts is incorrect.
6. The size of the output buffer is too small or too large.
7. The size of the output buffer is too small. It must be at least the size of the initialization data.
8. The size of the data specified in the header does not match the size of the header plus the size of the initialization data.
9. Reserved fields are not zero.
10. The buffer size for Start PCI requests is incorrect.

System action:  The socket connection to Basic HyperSwap is closed.

Operator response:  Notify the system programmer.

System programmer response:  Determine the program that was connected to Basic HyperSwap via sockets and notify the owner. Provide them with the error code which may help them is diagnosing the problem.

User response:  None.
BHI0003I  BHI0005I

Module:  BHIS1RST
Routing code:  10
Descriptor code:  4

BHI0003I  BHIHSRV task taskname ABENDed and was reattached.
Explanation:  The task name taskname abended and was reattached.
In the message text:
  taskname
    The name of the task that abended.
System action:  Processing continues.
Operator response:  None.
System programmer response:  None.
User response:  None.

Module:  BHIS1TST
Routing code:  10
Descriptor code:  4

BHI0004I  Component trace parmlib option xxxxxxxx is not valid or was previously specified
Explanation:  The system encountered an incorrect option in the CTIBHI00 parmlib member that had been specified
on a prior TRACE CT command.
In the message text:
  xxxxxxxx
    The specified option that is incorrect.
System action:  The system does not start the requested component trace. Processing continues with the next option
specified.
Operator response:  Contact the system programmer.
System programmer response:  Examine the options near the indicated character string for a misspelling or other
error. Correct the error in the parmlib member before reissuing the TRACE CT command.
User response:  None.

Module:  BHIS1SSM
Routing code:  -
Descriptor code:  5

BHI0005I  name-of-function: Service name-of-service failed with RetValue: retvalue RC: retcode RSN: rsncode
Explanation:  A service was invoked which could not process the request. This message records this error.
In the message text:
  name-of-function
    The name of the function that invoked the service.
  name-of-service
    The name of the service that failed.
  retvalue
    The return value from the service that failed.
  retcode
    The return value from the service that failed.
rncode
  The reason code from the service that failed.

System action:  This failing service, along with the function that invoked that service, govern the action that will be
taken. In some cases, an ABEND may be issued because the function can not continue without the service.

Operator response:  Notify the system programmer.

System programmer response:  Search problem reporting data bases for a fix for this problem. If no fix exists,
contact the IBM Support Center.

User response:  None.

Module:  Various. Refer to name-of-function as the detecting module.

Routing code:  10

Descriptor code:  4

BHI0006E  HyperSwap has failed. reason

Explanation:  HyperSwap has failed because there is no OMVS segment defined for BHIHSRV.

In the message text:

reason
  No OMVS segment defined for BHIHSRV.
  BHIHSRV requires an OMVS segment.

System action:  The BHIHSRV address space can not be started until an OMVS segment is defined.

Operator response:  Notify the system programmer.

System programmer response:  Define an OMVS segment for the BHIHSRV address space.

User response:  None.

Module:  BHII1TPC

Routing code:  2, 10

Descriptor code:  11
Chapter 9. BLS messages

BLS001E  UNABLE TO PROCESS SYS1.PARMLIB(BLSCECT) FOR SNAP

Explanation: The system detected an error while processing the BLSCECT parmlib member or any imbedded members.

System action: SYS1.PROCLIB procedure BLSJPRMI ends. Formatting for ABEND and SNAP dumps will be unable to use the installation exit routines or IBM-supplied support identified by the BLSCECT parmlib member or any imbedded members. For this IPL, SNAP will not be usable. IPL continues.

Operator response: Notify the system programmer.

System programmer response: Add a temporary SYSTSPRT file to SYS1.PROCLIB(BLSJPRMI). The system might send messages that describe the error in more detail. Then ask the operator to restart BLSJPRMI.

Source: Interactive problem control system (IPCS)

Routing Code: 1,10,11

Descriptor Code: 11

BLS002E  BLSQPRMI CAN ONLY BE INVOKED FROM A JOB INITIATED BY THE OPERATOR START COMMAND

Explanation: The system program BLSQPRMI was invoked in an environment other than from a job which was initiated by an operator START command. BLSQPRMI can only be invoked from a job initiated by a START command.

Note: The IEACMD00 parmlib member uses the START command to initiate the procedure SYS1.PROCLIB(BLSJPRMI). That procedure runs BLSQPRMI to initialize IPCS formatting tables for ABEND and SNAP dump processing.

System action: The system ends BLSQPRMI before it updates the IPCS formatting tables for ABEND and SNAP dump processing.

Operator response: Notify the system programmer.

System programmer response: Use the START command to initiate procedure SYS1.PROCLIB(BLSJPRMI).

Source: Interactive problem control system (IPCS)

Routing Code: 1,10,11

Descriptor Code: 11

Additional BLS Messages

See z/OS MVS Dump Output Messages for additional messages.
Chapter 10. BLW messages

BLW001I  THE FOLLOWING CPUS MAY NOT HAVE BEEN RESTARTED AFTER RESTARTABLE WAIT STATE 'www' [REASON 'reason-code'] [cpuid1, cpuid2, ....]

Explanation: The system could not restart at least one processor after the system entered a restartable wait state and the operator initiated a restart. In the message text:

www  The restartable wait state code.

reason-code  The accompanying reason code. If no reason code was specified, this field contains X'0'.

cpuid1, cpuid2  The central processor(s) that the system could not restart.

System action: The system continues processing.

Operator response: Restart the stopped central processor(s). If you cannot restart the stopped processor(s), reconfigure the processor(s) offline and configure them back online, using the CONFIG CPU(x), ONLINE/OFFLINE command.

Source: Loadwait/Restart
Routing Code: 1,10
Descriptor Code: 2,4

BLW002I  SYSTEM WAIT STATE X'CCC' QUIESCE FUNCTION PERFORMED

Explanation: The operator entered a QUIESCE command. The system performed the quiesce function.

System action: The system enters restartable wait state X'CCC'.

Operator response: See the operator response for wait state X'CCC'.

Module: BLWQUIES
Source: Loadwait/Restart
Routing Code: 1,Note 12
Descriptor Code: 11

BLW003I  SYSTEM ERROR ENCOUNTERED DURING QUIESCE

Explanation: The operator entered a QUIESCE command, but the system encountered an error while processing the command.

System action: The system does not process the command. The system writes an SVC dump. The system continues processing.

Operator response: Enter the command again. If the command fails again, notify the system programmer.

System programmer response: Search problem reporting data bases for a fix for the problem. If no fix exists, contact the IBM Support Center. Provide the SVC dump.

Source: Loadwait/Restart
Routing Code: -
Descriptor Code: 5
When the operator caused a restart interruption, the specified job was in progress. The message asks the operator to indicate which of the following the system should do:

- Resume or end the job that was in progress
- Perform repair actions.

In the message text:

**jobname**  The name of the job that the system was currently processing.

**stepname**  The name of the step that the system was currently processing or blanks.

**UNKNOWN JOBNAME**  The system could not identify the current job.

**ASID=asid**  The address space identifier (ASID)

**MODE=mode**  The system was processing one of the following units of work:

- **TASK**  A task
- **SRB**  A service request
- **WAIT**  The system wait task
- *  A unit of work other than those listed above

**PSW=psw**  The 16-byte program status word (PSW) at the time of the restart interruption.

**SYSTEM NON-DISPATCHABILITY INDICATOR IS {ON|OFF} [text]**  ON if the address spaces are not dispatchable. OFF if the address spaces are dispatchable.

[**PREVIOUS REPLY WAS INVALID, ENTER A VALID REPLY**]

The operator did not enter a valid reply to a previous instance of this message. The only valid replies to this message are:

- **ABEND**
- **RESUME**
- **REPAIR**

**[text]**  text can be one or both of the following:

**WRITE-TO-OPERATOR BUFFER LIMIT EXCEEDED ISSUE K M,MLIM COMMAND TO RAISE LIMIT.**  The write to operator (WTO) message buffer is full.

**NO BATCH JOBS OR TIME SHARING USERS FOUND. RECOMMEND YOU DISPLAY ACTIVE AND DISPLAY QUEUES.**

The system found no batch jobs or time sharing users. However, there may be started tasks in the system.
System action: The system prompts the operator for a reply. If the operator replies REPAIR when the non-dispatchability indicator is on, the system sets it off and marks all address spaces as dispatchable.

Operator response: Do the following:
1. Enter one of the following replies:
   - **RESUME**
     The job that was in progress continues at the next sequential instruction.
   - **ABEND**
     The system ends the job with abend X'071'.
   - **REPAIR**
     The system checks and repairs critical data areas.
2. If you receive one of the texts below, you may do one of the following only after replying to message BLW004A:
   - **WRITE-TO-OPERATOR BUFFER LIMIT EXCEEDED. ISSUE K M,MLIM COMMAND TO RAISE LIMIT**
     Enter the CONTROL M,REF command to display the limit. Enter the CONTROL M,MLIM=nnnn command to raise the limit.
   - **NO BATCH JOBS OR TIME SHARING USERS FOUND RECOMMEND YOU DISPLAY ACTIVE AND DISPLAY QUEUES**
     Enter the DISPLAY ACTIVE and/or the DISPLAY QUEUE command to determine if the system is holding a job queue.

**BLW007W**  MULTIPLE ACR ATTEMPTS BY CPU id

Explanation: A hardware error occurred on a processor. The system could not invoke alternate CPU recovery (ACR) because ACR was already in progress on another processor. In the message text:

    id The processor identifier.

System action: The system enters disabled wait state X'050'.
Operator response: See the operator response for wait state X'050'.
Source: Loadwait/Rotate
Routing Code: Note 12
Descriptor Code: -
Chapter 11. BLWH messages

BLWH0001E  AutoIPL policy is not active.

Explanation:  CHECK(check_owner,check_name) found no active AutoIPL policy. IBM suggests activating an AutoIPL policy using a DIAGxx parmlib member. Installations can activate the AutoIPL function so that the system will take predefined actions automatically when it is about to enter certain disabled wait states. Actions can be to re-IPL z/OS, take a stand-alone dump (SADMP), or take a SADMP and have SADMP re-IPL z/OS when it has finished.

System action:  The system continues processing.

Operator response:  Report this problem to the system programmer.

System programmer response:  Specify an AutoIPL policy using a DIAGxx parmlib member and activate it by issuing a SET DIAG=xx operator command.

Problem determination:  N/A

Module:  BLWHCCHK

Source:  Loadwait/Restart

Reference Documentation:  See DIAGxx in z/OS MVS Initialization and Tuning Guide for more information on how to set an AutoIPL policy. See z/OS MVS Planning: Operations for more information on how to exploit the Automatic IPL function.

Automation:  N/A

Routing Code:  See note 35.

Descriptor Code:  See note 1.

BLWH0002E  A problem was found for a device specified in the AutoIPL policy.

Explanation:  CHECK(check_owner,check_name) found a problem during device validation for a device specified in the AutoIPL policy. This message is followed by message BLWH901I, which lists information about invalid devices specified in the AutoIPL policy. The device must meet the following conditions to pass device validation:

• Must be DASD
• Must not be specified as a secondary device in a Metro Mirror pair
• Must be accessible
• Must exist

System action:  The system continues processing.

Operator response:  Report this to your system programmer.

System programmer response:  Examine logs to determine which AutoIPL policy devices do not pass the device validation. Resolve the problem either by specifying a new device in the DIAGxx parmlib member or by updating the existing device characteristics.

Cause MVS to read the DIAGxx parmlib member by issuing a SET DIAG =xx operator command.

Problem determination:  N/A

Module:  BLWHCCHK

Source:  Loadwait/Restart

Reference Documentation:

Automation:  N/A

Routing Code:  See note 35.

Descriptor Code:  See note 1.
List-Directed IPL or Program-Directed IPL is not supported.

Explanation: CHECK(check_owner,check_name) found that some or all of the hardware support that AutoIPL requires is not installed. The support is provided by hardware driver 67 (or later) and no-charge feature code 9904. Both are required. IBM suggests that you install the support, re-IPL, and define an AutoIPL policy using the DIAGxx parmlib member.

System action: The system continues processing normally.

Operator response: N/A

System programmer response: Obtain the required support and install it. After re-IPLing MVS, specify an AutoIPL policy using DIAGxx parmlib member and activate it by issuing a SET DIAG=xx operator command. DISPLAY DIAG command can be used to display information about the current AutoIPL settings.

Problem determination: N/A

Module: BLWHCCHK

Source: Loadwait/Rstart

Reference Documentation: See DIAGxx in z/OS MVS Initialization and Tuning Guide for more information on how to set an AutoIPL policy. See z/OS MVS Planning: Operations for more information on how to exploit the Automatic IPL function.

Automation: N/A

Routing Code: N/A

Descriptor Code: N/A

AUTOIPL policy is active.

Explanation: CHECK(check_owner,check_name) found an active AutoIPL policy.

System action: The system continues processing normally.

Operator response: N/A

System programmer response: N/A

Problem determination: N/A

Module: BLWHCCHK

BPXB001E  GROUP ID FOR group_name CANNOT BE OBTAINED. SAF RETURN CODE = saf_return_code, RACF RETURN CODE = racf_rc, RACF REASON CODE = racf_rsn. TERMINAL GROUP OWNERSHIP WILL NOT BE UPDATED.

Explanation: An error was reported by SAF, RACF or other security product during initialization of z/OS UNIX pseudoterminal support. The following return and reason codes may be returned:

<table>
<thead>
<tr>
<th>SAF return code</th>
<th>RACF return code</th>
<th>RACF reason code</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>0</td>
<td>0</td>
<td>RACF not installed</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>4</td>
<td>No OMVS segment found in group's profile</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>8</td>
<td>Group name not defined</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>12</td>
<td>Internal error during RACF processing</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>16</td>
<td>Unable to establish recovery</td>
</tr>
<tr>
<td>8</td>
<td>8</td>
<td>20</td>
<td>No GID in group's OMVS segment</td>
</tr>
</tbody>
</table>

In the message text:

- **group_name**: The RACF group name associated with opened terminals.
- **saf_return_code**: The error return code from the system authorization facility (SAF).
- **racf_return_code**: The error return code from the resource access control facility (RACF) or other security product.
- **racf_rsn**: The error reason code from the resource access control facility (RACF) or other security product.

System action: Initialization continues, but the group ownership of terminals will not be updated during open. This will prevent programs such as talk from accessing the terminal.

Operator response: Notify the system programmer or security administrator.

System programmer response: If the return and reason codes indicate that the group is not defined, use the RACF ADDGROUP command to add the group. Be sure to include the OMVS operand and to specify a unique GID.

If the group is defined, but does not have an OMVS segment or a GID, use the RACF ALTGROUP command to add this information.

The name used is specified in the TTYGROUP initialization parameter, which defaults to TTY. This group name is used for certain programs, such as talk, which run as setgid programs. The name specified should match the group owner of such programs.

For other reason codes, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: BPXBDCI

Routing Code: 1,10
Descriptor Code: 3
BPXB002E  OCS REQUIRES TCP/IP TO BE ACTIVE. START TCP/IP OR HAVE THE SYSTEM ADMINISTRATOR UNCONFIGURE THE OCS NODES.

Explanation: Outboard Communication Server (OCS) received an indication that TCP/IP is not active. TCP/IP is required for OCS to operate.

System action: OCS waits for TCP/IP to become active. There may be up to a two-minute delay between TCP/IP activation and OCS node connection.

Operator response: Either start TCP/IP or have the system administrator shut down OCS by issuing the ocsconfig command to unconfigure all OCS nodes. If TCP/IP is active, notify the system programmer.

System programmer response: Verify that the TSO/E command OBEYFILE was issued to cause TCP/IP to read the TCP/IP profile dataset. Verify that the IP address is correct for the OCS node. Issue the TSO/E command PING using the IP address or OCS node name to verify the connection. If the cause of the failure cannot be determined, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

BPXB003I  OCS text

Explanation: Outboard Communication Server (OCS) encountered a kernel service failure.

In the message text:

In the message text:

- One of the following:

  SOCKET KERNEL SERVICE FAILED. RETURN CODE = return_code, REASON CODE = reason_code.
  Indicates that a kernel SOCKET service failed.

  BIND KERNEL SERVICE FAILED. RETURN CODE = return_code, REASON CODE = reason_code.
  Indicates that a kernel BIND service failed.

  LISTEN KERNEL SERVICE FAILED. RETURN CODE = return_code, REASON CODE = reason_code.
  Indicates that a kernel LISTEN service failed.

  ACCEPT KERNEL SERVICE FAILED. RETURN CODE = return_code, REASON CODE = reason_code.
  Indicates that a kernel ACCEPT service failed.

  READV KERNEL SERVICE FAILED. RETURN CODE = return_code, REASON CODE = reason_code.
  Indicates that a kernel READV service failed.

  WRITEV KERNEL SERVICE FAILED. RETURN CODE = return_code, REASON CODE = reason_code.
  Indicates that a kernel WRITEV service failed.

  SOCKOPT KERNEL SERVICE FAILED. RETURN CODE = return_code, REASON CODE = reason_code.
  Indicates that a kernel SOCKOPT service failed.

return_code
The return code from the kernel service.

reason_code
The reason code from the kernel service. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: OCS stops running.

Operator response: Notify the system programmer.

System programmer response: Correct the problem indicated by the return code and then have the system administrator reissue the ocsconfig command to start OCS. If the cause of the failure cannot be determined, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

BPXC006I  THE COMBINATION OF THE OFFSET AND LENGTH EXCEEDS THE LENGTH OF THE CONTROL BLOCK trace_option

Explanation: The system encountered values for the offset and length specified with the SYSOMVS component trace option CBTR that would exceed the length of the specified control block.

In the message text:
trace_option
   The incorrect trace option specified.

System action: The system does not process the CBTR option of the SYSOMVS component trace.

Operator response: Contact the system programmer.

System programmer response: Enter an offset and length that do not exceed the length of the specified control block.

Module: BPXCTSSM
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

BPXF001I  A FILE SYSTEM WITH FILESYSTYPE type FAILED TO INITIALIZE. THE SOFTWARE LEVEL IS INCORRECT.

Explanation: During z/OS UNIX initialization, one of the physical file systems could not be initialized.

In the message text:

type
   The value specified with the TYPE parameter of the FILESYSTYPE statement in the BPXPRMxx parmlib member.

System action: How the file system type is handled depends on the restart option chosen by the file system.
   If the option is to be prompted for restart (which is the default option), the error that caused the problem can be corrected, and then the prompt responded to.
   If the option is to not start this file system type, the system will continue to run without that file system type.

Operator response: Contact the system programmer.

System programmer response: If any of the following are displayed as the FILESYSTYPE, report this to your IBM Support Center: BPXFCSIN, BPXFINT, BPXFTCLN, BPXFTSYN.

Try to determine the cause of the failure. Check the level of the software and verify that it is compatible with the level of z/OS UNIX.

Module: BPXFSLM
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4
BPXF002I • BPXF003I

BPXF002I  FILE SYSTEM name WAS NOT MOUNTED. RETURN CODE = return_code, REASON CODE = reason_code

Explanation: The system could not mount the specified file system. Note that for a shared file system configuration, the system might retry the parmlib MOUNTs after initialization completes.

In the message text:

name
The file system name specified on a MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

return_code
The return code from the mount request.

reason_code
The reason code from the mount request. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The file system is not mounted. The system continues to process other MOUNT statements. For a shared file system configuration, the system might attempt the MOUNT again.

Operator response: Contact the system programmer.

System programmer response: Use the D OMVS,FILE,NAME= command to verify that the file system is not mounted. If it is not mounted, do one of the following:

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start z/OS UNIX with the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command. If the statement in error was the ROOT statement, specify '/' as the mountpoint.

Consult the documentation for the file system type specified with the TYPE parameter on the MOUNT statement in the BPXPRMxx member specified to z/OS UNIX. Make changes as appropriate.

**BPXF008I**  
**FILE SYSTEM** name WAS NOT MOUNTED. THE MOUNT POINT SPECIFIED IN member-name DOES NOT EXIST.

**Explanation:** During z/OS UNIX initialization or in response to the SET OMVS=(xx) command, the system could not mount the specified file system. The mount point specified for the file system on the MOUNT statement is not defined. Note that for a shared file system configuration, the system might retry the parmlib MOUNTs after initialization completes.

In the message text:

- **name**
  The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

- **member-name**
  The member name processed as a result of the START request.
BPXF009I • BPXF010I

**System action:** The file system is not mounted. The system continues to process other MOUNT statements. For a shared file system configuration, the system might attempt the MOUNT again.

**Operator response:** Contact the system programmer.

**System programmer response:** Verify the existence of the mount point specified with the MOUNTPOINT parameter on the MOUNT statement.

Do one of the following:
- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start z/OS UNIX the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

**Module:** BPXFSLIT

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2,10

**Descriptor Code:** 4

---

**BPXF009I** FILE SYSTEM *name* WAS NOT MOUNTED. THE MOUNT POINT SPECIFIED IN *member-name* IS NOT A DIRECTORY.

**Explanation:** During z/OS UNIX initialization or in response to the SET OMVS=(xx) command, the system could not mount the specified file system because the mount point specified for the file system on the MOUNT statement is not a directory. A file system can be mounted only on a directory.

In the message text:

*name*

The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

*member-name*

The member name processed as a result of the START request.

**System action:** The file system is not mounted. The system continues to process other MOUNT statements.

**Operator response:** Contact the system programmer.

**System programmer response:** Verify that the mount point specified with the MOUNTPOINT parameter on the MOUNT statement in the specified member of SYS1.PARMLIB is a directory.

Do one of the following:
- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start z/OS UNIX with the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

**Module:** BPXFSLIT

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2,10

**Descriptor Code:** 4

---

**BPXF010I** FILE SYSTEM *name* WAS NOT MOUNTED. THE MOUNT POINT SPECIFIED IN *member-name* ALREADY HAS A FILE SYSTEM MOUNTED ON IT.

**Explanation:** During z/OS UNIX initialization, the system could not mount the specified file system.

The mount point specified for the file system on the MOUNT statement in SYS1.PARMLIB is the root for another mounted file system. A file system cannot be mounted on a root.

In the message text:
The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

The member name processed as a result of the START request.

System action: The file system is not mounted. The system continues to process other MOUNT statements.

Operator response: Contact the system programmer.

System programmer response: Verify that two mount statements don't specify the same MOUNTPOINT.

Do one of the following:

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start z/OS UNIX with the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

Module: BPXFSLIT

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2,10

Descriptor Code: 4

A FILE SYSTEM WITH FILESYSTYPE OR SUBFILESYSTEMTYPE type FAILED TO INITIALIZE. A DUPLICATE FILESYSTYPE/SUBFILESYSTEMTYPE STATEMENT WAS FOUND IN PARMLIB MEMBER member-name.

Explanation: During z/OS UNIX initialization or in response to the SET OMVS=(xx) command, a duplicate physical file system could not be initialized.

In the message text:

type

The value specified with the TYPE parameter of the FILESYSTYPE statement, or the NAME parameter of the SUBFILESYSTEMTYPE statement in the BPXPRMxx parmlib member named.

The member name processed as a result of the START request.

System action: The duplicate file system type was not started. The system will continue to run without that file system.

Operator response: Contact the system programmer.

System programmer response: Edit the specified member of SYS1.PARMLIB and rename or delete the duplicate FILESYSTYPE/SUBFILESYSTEMTYPE statement. Be sure to change all mounts for the renamed file system to specify the new type. In order to start that file system, IPL the system to start z/OS UNIX with the revised member.

Module: BPXFSLIT, BPXTCPINT

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2,10

Descriptor Code: 4

NEITHER FILESYSTEM NOR DDNAME WAS SPECIFIED ON EITHER A MOUNT OR A ROOT STATEMENT IN PARMLIB MEMBER member-name.

Explanation: During z/OS UNIX initialization or in response to the SET OMVS=(xx) command, an error was detected while processing the file system statements in the BPXPRMxx parmlib member named.

In the message text:
**BPXF013I**  
FILE SYSTEM *name* WAS SUCCESSFULLY MOUNTED.

**Explanation:** During z/OS UNIX initialization or in response to the SET OMVS=(xx) command, a file system was successfully mounted. Note that for a shared file system configuration, the system might retry the parmlib MOUNTs after initialization completes.

In the message text:

*name*  
The file system name specified on either the ROOT statement or a MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

**System action:** The file system was mounted. The system continues to process other SYS1.PARMLIB statements. For a shared file system configuration, the system might attempt the MOUNT again.

**Operator response:** None.

**System programmer response:** None.

**BPXF014D**  
FILESYSTEM *type* TERMINATED. REPLY 'R' WHEN READY TO RESTART.

**Explanation:** The named file system type has ended processing.

In the message text:

*type*  
The file system type from the FILESYSTYPE statement in the BPXPRMxx parmlib member.

**System action:** The system continues processing without the named file system type. Processing for other file systems continues, but the system does not try to restart the named file system type until the operator responds to this message.

**Operator response:** Gather any error indications, such as diagnostic messages or dump messages, that precede this message. If possible, correct the problem and reply R to restart the file system type. If you cannot resolve the problem, notify the system programmer.

**System programmer response:** If the operator action did not restart the file system type, use the error indication information to diagnose the problem; then, reply R to restart the file system type. If you cannot, search the problem reporting data base for a fix. If no fix exists, contact IBM Support for the product that failed.
BPXF015I  THE REPLY IS NOT VALID

Explanation: The operator replied incorrectly to a prompt.
System action: The prompt is repeated.
Operator response: Reply correctly to allow the restart to continue.
System programmer response: None.
Module: BPXFSLM

Descriptor Code: 5

BPXF017I  procname TERMINATING. FILE SYSTEM, FILESYSTYPE type, TERMINATED.

Explanation: The physical file system identified by the FILESYSTYPE specified failed. Because this is a required physical file system, z/OS UNIX is also terminated.

In the message text:

procname
The name of the z/OS UNIX cataloged procedure.

type
The value specified with the TYPE parameter of the FILESYSTYPE statement in the BPXPRMxx parmlib member.

System action: z/OS UNIX will terminate abnormally.
Operator response: Contact the system programmer.
System programmer response: Check for error indications that may have been issued by the file system to explain the error.
BPXF018I  DEVICE DRIVER INITIALIZATION ROUTINE modname FAILED. RETURN CODE = return_code

Explanation:  During character special file system initialization, a device driver could not be initialized.

In the message text:

modname  
The name of the module invoked during device driver initialization.

return_code  
The return code returned in register 15.

System action:  The character special file system bypasses the failing device driver and continues to initialize any remaining device drivers.

Operator response:  Contact the system programmer.

System programmer response:  Check for error indications that may have been issued by the character special file system to explain the error.

Module:  BPXFCSIN

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  2

Descriptor Code:  4

BPXF019I  AN ABEND OCCURRED WHILE PROCESSING DEVICE DRIVER INITIALIZATION ROUTINE modname.

Explanation:  During character special file system initialization, an abend occurred during processing of a device driver initialization routine.

In the message text:

modname  
The name of the module invoked during device driver initialization.

System action:  The character special file system bypasses the failing device driver and continues to initialize any remaining device drivers.

Operator response:  Contact the system programmer.

System programmer response:  Check for error indications that may have been issued by the character special file system to explain the error.

Module:  BPXFCSIN

Source:  z/OS UNIX System Services kernel (BPX)

Descriptor Code:  4

BPXF020I  FILE SYSTEM name MAY BE DAMAGED. RETURN CODE = return_code, REASON CODE = raison_code

Explanation:  A severe error occurred while the named file system was processing a request. It may have damaged the file system. Unless it was suppressed, there should also be an SDUMP created by the file system. In this case, service should be contacted to handle the problem.

In the message text:
name
The file system name specified either on a MOUNT statement in the BPXPRMxx parmlib member or on a MOUNT command.

return_code
The return code from the file system request.

reason_code
The reason code from the file system request. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: None. Processing continues, possibly causing further damage to the file system. However, if you can access the same files that you were accessing when this occurred without further problems, there is probably not any damage to the file system.

Operator response: Contact the system programmer.

System programmer response: Determine the cause of the error. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center for the physical file system that owns the damaged file system.

Problem determination: Determine the cause of the error. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM support center for the physical file system that owns the damaged file system.

Descriptor Code: 11

BPXF022I  A FILE SYSTEM WITH FILESYSTYPE type FAILED TO INITIALIZE. THE FILE SYSTEM MUST RUN IN THE OMVS ADDRESS SPACE.

Explanation: During file system initialization, a FILESYSTYPE statement was encountered with the ASNAME parameter specified. This file system can run only in the Kernel address space.

In the message text:

 type
The value specified with the TYPE parameter of the FILESYSTYPE statement in the BPXPRMxx parmlib member.

System action: z/OS UNIX initialization continues without this file system.

Operator response: Contact the system programmer.

System programmer response: Verify that the ASNAME parameter on the FILESYSTYPE statement in the BPXPRMxx parmlib member is not specified for this physical file system.

Module: BPXTUINT, BPXTINT, BPXTAMD, BPXTCINT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

BPXF023I  FILE SYSTEM name SPECIFIED ON EITHER A MOUNT OR A ROOT STATEMENT IN PARMLIB MEMBER member-name MAY NOT BE MOUNTED ASYNCHRONOUSLY.

Explanation: During z/OS UNIX initialization, the specified file system could not be mounted because the physical file system indicated that the mount would complete asynchronously.

In the message text:

 name
The file system name specified on either the ROOT statement or a MOUNT statement in the BPXPRMxx parmlib
member-name

The member name processed as a result of the START request.

System action: If the file system was specified on a ROOT statement, z/OS UNIX will instead mount an empty root file system, causing all subsequent mounts to fail. If the file system was specified on a MOUNT statement, the file system is not mounted, and the system continues to process other MOUNT statements.

Operator response: Contact the system programmer.

System programmer response: Direct the mount to a file system which completes mounts synchronously, mount the file system later using the TSO/E MOUNT command or mount callable service, or direct the file system to complete the mount synchronously at initialization.

Module: BPXFSLIT

BPXF026I • BPXF027I

BPXF026I FILE SYSTEM name WAS ALREADY MOUNTED.

Explanation: During z/OS UNIX initialization, a file system was found to be already mounted.

In the message text:

name The file system name specified on either the ROOT statement or a MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

System action: The system continues to process other SYS1.PARMLIB statements.

Operator response: None.

System programmer response: None.

Module: BPXFSLIT

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 4

BPXF027I FILE SYSTEM name MOUNT DELAYED BECAUSE MOUNT POINT mpname CANNOT BE RESOLVED. RETURN CODE = retcode, REASON CODE = reason

Explanation: OMVS was unable to resolve the mount point path name while attempting to mount a file system that was mounted by another system in the sysplex.

The file system that contains the mount point may have become inaccessible because the system that was serving the file system failed and sysplex partition recovery processing could not establish a new file system server. No mounts that have mount points in the inaccessible file system will succeed until the inaccessible file system is recovered.

For example, if the file system is mounted with the Automove=NO option then no attempt is made to recover the file system. Another example is that mount point directory may have been removed if the mount point file system was owned by another system that had not yet processed the mount. In this case, the file system should be unmounted from the owning system, since it will not be accessible.

In the message text:

name The file system name specified either on a MOUNT statement in the BPXPRMxx parmlib member or on a MOUNT command.

mpname The mount point path name specified either on a MOUNT statement in the BPXPRMxx parmlib member or on a MOUNT command, or the last 64 characters of it.

retcode The return code from the file system request.

reason The reason code from the file system request. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The mount will be reattempted the next time a mount is processed in the sysplex. At that time, another attempt will be made to resolve the mount point path name and complete the mount. However, if the mount point directory has been removed, the mount will never be successful.

Operator response: Contact the system programmer.

System programmer response: If a file system containing one of the directories in the mount point path name is not mounted, then mount it. If one of those directories has been renamed, then restore the original name, either by again renaming the directory or by creating a symbolic link with the old name. If the mount point directory has been removed, then unmout the file system from the owning system and mount it again on a valid mount point.

Module: BPXTXRMT
BPXF028I  •  BPXF029E

**BPXF028I**  FILE SYSTEM name WAS NOT MOUNTED. RETURN CODE = return_code, REASON CODE = reason_code

**Explanation:** The system could not complete mounting the specified file system.

In the message text:

- **name**: The file system name specified on a MOUNT request. For the HFS file system, it refers to the name of the HFS data set containing the file system.

- **return_code**: The return code from the mount request.

- **reason_code**: The reason code from the mount request. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

**System action:** The partially mounted file system is unmounted.

**Operator response:** Contact the system programmer.

**System programmer response:** Consult the documentation for the file system type specified with the TYPE parameter on the MOUNT request. Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

**Module:** BPXFTCLN

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 4

---

**BPXF029E**  ROOT FILE SYSTEM name WAS NOT MOUNTED. RETURN CODE = return_code, REASON CODE = reason_code

**Explanation:** During z/OS UNIX initialization or in response to the SET OMVS=(xx) command, the system could not mount the specified file system.

In the message text:

- **name**: The file system name specified on a ROOT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

- **return_code**: The return code from the mount request.

- **reason_code**: The reason code from the mount request. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

**System action:** The file system is not mounted. The system is activated without a ROOT.

For a shared file system configuration, if the root file system was already mounted and owned by another system, OMVS will fail to initialize and will shutdown.

**Operator response:** Contact the system programmer.

**System programmer response:** Do one of the following:
Ask the operator to correct the problem in BPXPRMxx. IPL the system to start z/OS UNIX with the revised member.

Ask a superuser to enter the corrected information using the TSO/E MOUNT command. In this case specify `/` as the mountpoint.

Consult the documentation for the file system type specified with the TYPE parameter on the ROOT statement in the BPXPRMxx member specified to z/OS UNIX. Make changes as appropriate.

If this is a shared file system configuration and the ROOT file system is already mounted, this mount failure may be a temporary condition. If the reported RETURN CODE is EMVSERR (x'9D') and the REASON CODE is JRTgtMemberInactive (X'xxxx03CC') then the server for the ROOT file system has failed and a new server is being established. Issue the F OMVS,RESTART system command to restart OMVS.

**Module:** BPXFSLIT  
**Source:** z/OS UNIX System Services kernel (BPX)  
**Routing Code:** 2  
**Descriptor Code:** 11

---

**BPXF030I • BPXF031I**

**BPXF030I** MAXSOCKETS HAS BEEN REACHED FOR DOMAIN domain-name. REQUESTS FOR SOCKETS MAY BE DENIED.

**Explanation:** While processing either a socket() or an accept() request the value specified for MAXSOCKETS was reached. Any requests for new sockets will be denied until some of the currently allocated sockets are closed.

In the message text:

`domain-name`

The domain name specified on the NETWORK statement in the BPXPRMxx parmlib member.

**System action:** This is just an informational message so that the operator will be aware that users may be being rejected. This message will only be issued once per IPL when the condition is first detected.

**Operator response:** Contact the system programmer.

**System programmer response:** Consider raising the MAXSOCKETS value specified in the BPXPRMxx parmlib member that was used to start z/OS UNIX. This new value will take effect with the next system IPL.

**Module:** BPXTSSMI, BPXTSSMU

**BPXF031I** A FILE SYSTEM WITH SUBFILESYSTYPE type WAS INCORRECTLY SPECIFIED AS THE DEFAULT TRANSPORT DRIVER IN PARMLIB MEMBER member-name

**Explanation:** During z/OS UNIX initialization, the DEFAULT parameter was found on a file system that cannot be specified as the default transport driver.

In the message text:

`type`

The value specified with the NAME parameter of the SUBFILESYSTYPE statement in the BPXPRMxx parmlib member named.

`member-name`

The member name processed as a result of the START request.

**System action:** The DEFAULT specification is ignored. Initialization continues as if no default was specified.

**Operator response:** Contact the system programmer.

**System programmer response:** If a default other than the generic default is desired, edit the member in SYS1.PARMLIB and move the DEFAULT parameter to the SUBFILESYSTYPE statement that is intended to be the
default. In order to have the changes take effect, a re-IPL of the system is needed.

**Module:** BPXTCINT  
**Source:** z/OS UNIX System Services kernel (BPX)

**Descriptor Code:** 4

---

**BPXF032D**  
**FILESYSTYPE** *type* TERMINATED. REPLY 'R' WHEN READY TO RESTART. REPLY 'I' TO IGNORE.

**Explanation:** The named file system type has ended processing.

In the message text:

*type*

The file system type from the FILESYSTYPE statement in the BPXPRMxx parmlib member.

**System action:** The system continues processing without the named file system type. Processing for other file systems continues, but the system does not try to restart the named file system type until the operator responds to this message.

**Operator response:** Gather any error indications, such as diagnostic messages or dump messages, that precede this message. If possible, correct the problem and reply R to restart the file system type. If you cannot resolve the problem, contact the system programmer. If processing can continue without this file system type, reply I to remove the prompt and leave this file system terminated.

In a shared file system environment, replying I results in moving ownership of all file systems of the terminating file system type and moving ownership of all subtrees mounted on those file systems. Then all such file systems and their subtrees are unmounted. The subtree unmount is local, except when the ownership of a subtree cannot be moved to another system and then the local subtree unmount is changed to a global subtree unmount across the sysplex.

**System programmer response:** If operator action did not restart the file system type, use the error indication information to diagnose the problem, then reply R to restart the file system type. If you cannot, search the problem reporting data base for a fix. If no fix exists, contact IBM support for the product that failed. If the reply to this message was I, and you later want to restart that file system type, use SETOMVS RESET=xx.

---

**BPXF033I**  
A FILESYSTEM WITH THE FILESYSTYPE OR SUBFILESYSTYPE NAME *type* FAILED TO INITIALIZE. THE MAXIMUM FILESYSTYPE OR SUBFILESYSTYPE STATEMENTS HAVE ALREADY BEEN PROCESSED. THE PARMLIB MEMBER PROCESSED AT THE TIME WAS *member-name*.

**Explanation:** During z/OS UNIX initialization or reset, a physical file system could not be initialized. The maximum number of sub-file systems have already been specified. The maximum number is 32.

In the message text:

*type*

The value specified with the TYPE parameter of the FILESYSTYPE statement, or the NAME parameter of the SUBFILESYSTYPE statement in the BPXPRMxx parmlib member named.

*member-name*

The member name being processed when the limit was reached.

**System action:** The sub-file system type was not started. The system will continue to run without that sub-file system.

**Operator response:** Contact the system programmer.
BPXF034I

**System programmer response:** Edit the specified member of SYS1.PARMLIB and delete unnecessary SUBFILESYSSTYPE statements.

**Module:** BPXTCINT

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2,10

**Descriptor Code:** 4

---

**BPXF034I** THE FOLLOWING FILE SYSTEM HAS BEEN QUIESCED FOR MORE THAN 10 MINUTES: name

**Explanation:** The file system is quiesced and will not be usable until it is unquiesced.

In the message text:

name

The file system name.

**System action:** The file system can't be used.

**Operator response:** If the condition persists, contact the system programmer.

**System programmer response:** The file system can only be unquiesced by an authorized user. To unquiesce the file system, use the ISPF Shell (ISHELL) to Reset unmount or quiesce from the Work with Mounted File Systems panel (BPXWP20).

Note that for a shared file system configuration, the attempt to unquiesce a quiesced sysplex root file system will fail if the authorized user ID you use was defined with an OMVS HOME directory, and the user ID is not already active (logged in and dubbed).

Use the D OMVS,U=userid system command to determine if the authorized user is dubbed. In a RACF environment, issue the following RACF command from the TSO command line to alter a userid to have no HOME directory.

alu userid omvs(home(''))

Additionally, the ISPF Shell (ISHELL) cannot be used to unquiesce the sysplex root because it attempts to access the root file system resources during its initialization processing. The following REXX exec can be executed from the TSO command line to unquiesce the sysplex root HFS file system with name 'ZOS17.SYSPLEX.ROOT.HFS'. Note that the user ID you use must be a superuser ID (UID=0) with NO HOME directory specified:

```rexx
/* REXX */
address syscall
call syscalls('ON')
unquiesce ZOS17.SYSPLEX.ROOT.HFS 1
```

Alternatively, you can use a non-UID 0 user (with NO HOME directory specified) to unquiesce the file system if the user is permitted to the BPX.SUPERUSER facility class. In this case, the REXX exec must also include a seteuid 0 call, as follows:

```rexx
/* REXX */
address syscall
call syscalls('ON')
seteuid 0
unquiesce ZOS17.SYSPLEX.ROOT.HFS 1
```

Another possible reason that this message is issued is because a backup is currently in progress. If the reason for the quiesce is unknown, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Routing Code:** 2

**Descriptor Code:** 11
In response to a MODIFY BPXOINIT,FILESYS=DISPLAY command, this message displays information about the global z/OS UNIX System Services file system representation in the sysplex.

In the message text:

**timestamp**
The date and local time for the MODIFY command output. The date is represented as year/month/day, and the time is represented as hours (00–23), minutes (00–59), and seconds (00–59).

**filesysname**
The name of the file system.

**device**
The device number to uniquely identify the file system.

**filemode**
One of the following:

- **RDWR**
The file system is mounted for read/write access.

- **READ**
The file system is mounted for read only access.

**pathname**
The name of the directory where the file system is mounted, truncated to 64 characters.

**usermntUID**
Nonprivileged user UID.

**parmname**
The parameters specified on the file system MOUNT, truncated to 63 characters.

**filestatus**
One of the following:

- **ACTIVE**
The file system is active.

- **MOUNT IN PROGRESS**
The file system is being mounted.

- **UNMOUNT IN PROGRESS**
The file system is being unmounted.
QUIESCE IN PROGRESS
   The file system is being quiesced.

QUIESCED
   The file system is quiesced.

IN RECOVERY
   The file system is in recovery.

UNOWNED
   The file system has no server or owner.

UNUSABLE
   The file system is unusable and must be unmounted.

NOT ACTIVE
   The file system is not active.

RE_MOUNT IN PROGRESS
   The file system is being remounted.

RECYCLING
   The file system is recycling.

RECYCLING, ASYNCH MOUNT
   The physical file system is recycling, and this file system is in an asynchronous mount waiting for mount completion.

RECYCLING, NOT ACTIVE
   The physical file system is recycling, and this file system failed to mount successfully.

fsowner
   The system that owns (serves) this file system.

recfsowner
   The system that must recover this file system if AUTOMOVE=N or PFSMOVE=N is indicated.

automove
   One of the following:

   AUTOMOVE=Y
      The file system will be automatically moved during recovery operations.

   AUTOMOVE=N
      The file system will NOT be automatically moved during recovery operations.

   AUTOMOVE=U
      The file system will be automatically unmounted during recovery operations.

   AUTOMOVE=I
      The file system will be automatically moved during recovery operations using the INCLUDE system list specified on the MOUNT command.

   AUTOMOVE=E
      The file system will be automatically moved during recovery operations using the EXCLUDE system list specified on the MOUNT command.

pfsmove
   One of the following:

   PFSMOVE=Y
      The PFS allows the file system to be moved in the event of a server system failure.

   PFSMOVE=N
      The PFS does not allow the file system to be moved in the event of a server system failure.

fsqsystem
   The system that quiesced this file system.

fsgowner
   The jobname that quiesced the file system.
*pid*
   The pid that quiesced the file system.

*type*
   The file system type as defined by the FILESYSTYPE statement.

*mptdevice*
   The device number of the file system owning the mount point directory.

*mountfsname*
   The name of the file system owning the mount point directory.

*mptflags*
   Flags field in the file system entry. This field is for use by the IBM support center.

*vfsflags*
   VfsFlags field in the global representation of the file system. This field is for use by the IBM support center.

*vfsflsflags*
   VfsLfsFlags field in the global representation of the file system. This field is for use by the IBM support center.

*lvfsflags*
   VfsFlags field in the local representation of the file system. This field is for use by the IBM support center.

*lvfsflsflags*
   VfsLfsFlags field in the local representation of the file system. This field is for use by the IBM support center.

*sysliststs*
   Syslist status array. This field is for use by the IBM Support Center.

*syslistv*
   Syslist valid entry array. This field is for use by the IBM Support Center.

*syslisttype*
   One of the following:
   
   **INCLUDE**
   The system list is an INCLUDE system list.

   **EXCLUDE**
   The system list is an EXCLUDE system list.

*syslistnum*
   The number of systems in the system list.

*syslistname*
   The name of the system in the system list.

*analysis*
   One of the following:
   
   * **STATUS AND LOCAL STATUS ARE INCONSISTENT**
     The global file system status is not consistent with the local file system status.
   
   * **FLAGS AND LOCAL FLAGS ARE INCONSISTENT**
     An inconsistency is found in the global and local FLAGS fields.
   
   * **LFSFLAGS AND LOCAL LFSFLAGS ARE INCONSISTENT**
     An inconsistency is found in the global and local LFSFLAGS fields.

*activechk*
   Active check array. This field is for the use by the IBM Support Center.

*pfsnormstat*
   The normal status returned by the physical file system.

*pfsexcpstat*
   The exception status returned by the physical file system.

**System action:**  The system continues processing.

**Operator response:**  None.

Routing Code: -
Descriptor Code: 4,8

BPXF038I NO FILE SYSTEMS FOUND.

Explanation: No file systems exist in the file system hierarchy that match the specified search criteria.

System action: The MODIFY processing is complete.
Operator response: None.
System programmer response: None.
BPXF039I  FILE SYSTEM ANALYSIS IS DELAYED DUE TO CONTENTION FOR THE MOUNT LATCH, LATCH NUMBER latchnum.

Explanation: This message is issued in response to a previously issued MODIFY BPXOINIT,FILESYS system command, or a similar file system diagnostic function. The requested function is delayed because the file system mount latch cannot be obtained. The latch in contention is in latch set SYS.BPX.A000.FSLIT.FILESYS.LSN.

In the message text:

latchnum

The latch number in contention (in decimal).

System action: File system diagnostic processing will wait for the latch to become available.

Operator response: Contact the system programmer.

System programmer response: If processing is delayed for a significant amount of time, issue the DISPLAY GRS,LATCH,C command to review latch contention. If a latch deadlock exists, or the MODIFY processing continues to be delayed, then a restart of this system may be necessary.

Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

BPXF040I  MODIFY BPXOINIT,FILESYS PROCESSING IS COMPLETE.

Explanation: This message is issued in response to a previously issued MODIFY BPXOINIT,FILESYS command. The requested function has completed.

System action: The MODIFY processing is complete.

Operator response: A new MODIFY BPXOINIT command for a FILESYS function may be issued.

System programmer response: None.

Chapter 12. BPX messages  315
In response to a MODIFY BPXINIT,FILESYS=DISPLAY,GLOBAL command, this message displays system information about the z/OS UNIX System Services member status of each system in the SYSBPX sysplex group.

In the message text:

- **timestamp**: The date and local time for the MODIFY command output. The date is represented as year/month/day, and the time is represented as hours (00–23), minutes (00–59), and seconds (00–59).

- **system**: The name of the system in the sysplex for which status is being provided.

- **ver**: The LFS functional capability version.

- **pro**: The LFS protocol version.

- **mod**: The LFS protocol modification level.

- **sysstatus**: One of the following:
  - **VERIFIED**: Sysplex and local state are consistent.
  - **SYSTEM NAME INCONSISTENT**: The system name is inconsistent between the sysplex representation and the local representation.
  - **MEMBER TOKEN INCONSISTENT**: The member token is inconsistent between the sysplex representation and the local representation.
  - **SYSTEM ID INCONSISTENT**: The system ID is inconsistent between the sysplex representation and the local representation.

- **action**: One of the following:
  - **NONE**: There is no recommended recovery action to take.
  - **FIX**: There is an inconsistency in the sysplex representation of this system.
  - Use the MODIFY BPXINIT,FILESYS=FIX system command to further diagnose and possibly correct this inconsistency.
  - After performing the FIX function, if the inconsistency persists, a restart of the named system may be required to correct the error.

- **cdsver**: The version of the type BPXMCDS couple dataset.

- **brlmsysname**: The name of the system in a z/OS UNIX System Services sysplex that is functioning as the Byte Range Lock Manager server. `brlmsysname = 'N/A'` when either no z/OS UNIX System Services sysplex is active, or when the distributed BRLM function is active in z/OS UNIX System Services sysplex.

- **lastmountdevice**: The device number of the last file system mounted in the sysplex.

- **maxmounts**: The maximum number of file systems that can be mounted in the active type BPXMCDS couple data set.
value corresponds to the NUMBER parameter specified in the MOUNTS item name statement in the JCL used to format the type BPXMCDS couple data set. See SYS1.SAMPLIB(BPXISCDS) for a sample JCL job.

activemounts
The number of mount entries in the active type BPXMCDS couple data set that are in use.

maxamtrul
The maximum number of automount rules defined for the type BPXMCDS couple data set. This value corresponds to the NUMBER parameter specified in the AMTRULES item name statement in the JCL used to format the type BPXMCDS couple data set. See SYS1.SAMPLIB(BPXISCDS) for a sample JCL job.

amtrulinuse
The number of automount rules in the active type BPXMCDS couple data set that are in use. An automount rule is required for each generic or specific entry in an automount map file.

DISTBRLM ENABLED=YES|NO|N/A
YES indicates that Distributed BRLM is enabled in the shared file system Configuration. This value corresponds to a NUMBER(1) value specified in the DISTBRLM item name statement in the JCL used to format the type BPXMCDS couple data set. See SYS1.SAMPLIB(BPXISCDS) for a sample JCL job.

NO indicates that Distributed BRLM is not enabled in the shared file system configuration. This value corresponds to a NUMBER(0) value specified or defaulted to in the DISTBRLM item name statement in the JCL used to format the type BPXMCDS couple data set. See SYS1.SAMPLIB(BPXISCDS) for a sample JCL job.

N/A indicates that the DISTBRLM indicator in BPXMCDS is ignored.

DISTBRLM ACTIVE=YES|NO
YES indicates that Distributed BRLM is active on all systems in the shared file system configuration.

NO indicates that Distributed BRLM is not active in the shared file system configuration.

serializationcategory
One of the following:

SYSTEM PERFORMING INITIALIZATION
This entry lists the system that is performing file system initialization.

SYSTEM PERFORMING MOVE
This entry lists the system that is in the process of moving ownership of a file system to another system.

SYSTEM PERFORMING QUIESCE
This entry lists the system that is in the process of quiescing a file system that it serves.

SYSTEMS PERFORMING UMOUNT
This entry lists the systems that are in the process of unmounting one or multiple file systems that they serve.

SYSTEMS PERFORMING MOUNT RESYNC
This entry lists the systems that are in the process of updating their local file system hierarchy to be consistent with the file system hierarchy.

SYSTEMS PERFORMING LOCAL FILE SYSTEM RECOVERY
This entry lists the systems that are in the process of performing local file system recovery resulting from a system exiting the SYSBPX sysplex group.

SYSTEMS PERFORMING FILE SYSTEM TAKEOVER RECOVERY
This entry lists the systems that are in the process of performing file system takeover recovery resulting from a system exiting the SYSBPX sysplex group.

SYSTEMS RECOVERING UNOWNED FILE SYSTEMS
This entry lists the systems that are in the process of performing file system takeover recovery for one or more unowned file systems.

SYSTEMS PERFORMING REPAIR UNMOUNT
This entry lists the systems that are in the process of performing a repair unmount, which is initiated as a result of MODIFY BPXOINIT,FILESYS=FIX or FILESYS=UNMOUNTALL system command, or a similar file system diagnostic function.

SYSTEM PERFORMING REMOUNT
This entry lists the system that is in the process of remounting a file system.
**BPXF041I**

*datetime*

The date (year/month/day) and time in hours (00–23) minutes (00–59), and seconds (00–59) that this category of processing was started.

*sysname*

The name of the system associated with the event.

*fsname*

The name of the file system associated with this event.

*numunmounts*

The number of file systems that are in the process of being unmounted.

*queue name*

One of the following:

- **ACTIVE QUEUE**: This entry lists the active serialization categories.
- **PENDING QUEUE**: This entry lists the pending serialization categories.

*cattype*

One of the following:

- **MOUNT RESYNC**: One or more systems are in the process of updating their local file system hierarchy to be consistent with the sysplex hierarchy.
- **UNMOUNT**: One or more systems are in the process of unmounting one or more file systems.
- **UNOWNED RECOVERY**: One or more systems are in the process of recovering unowned file systems.
- **MOVE**: A system is in the process of moving ownership of one or more file systems to another system.
- **UNMOUNT SUBTREE**: One or more file systems are in the process of being unmounted.
- **RECOVERY**: One or more systems are in the process of recovering file systems. This is performed as part of partition recovery.
- **INTERVAL**: One or more systems are waiting for an interval when there is no serialized shared file system activity in progress.
- **REMT**

- **INVALID**

An invalid value was found.

*execution*

One of the following:

- **EXCLUSIVE**: One operation in this serialization category is allowed.
- **SHARED**: Multiple, concurrent operations in this serialization category are allowed.

**System action**: The system continues processing.

**Operator response**: None.

**System programmer response**: None.

**Module**: BPXTXRDA
BPXF042I POSSIBLE CONTENTION FOR THE FILE SYSTEM MOUNT LATCH EXISTS ON SYSTEM system, LATCH NUMBER latchnum.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS=FIX system command, or a similar shared file system diagnostic function. Contention for the file system mount latch exists on the named system. Contention for the mount latch affects file system functions such as mount, unmount, move and file system server recovery.

In the message text:

- system The name of the system that has possible latch contention.
- latchnum The latch number in contention.

System action: The analysis and repair of the shared file system hierarchy continues.

Operator response: Contact the system programmer.

System programmer response: Issue the “D GRS,LATCH,C” command on the specified system to review latch contention. File system latches belong to latch set SYS.BPX.A000.FSLIT.FILESYS.LSN. If contention exists and persists, a restart of this system may be required to clear hierarchical file system delays.

---

BPXF043I AN SVC DUMP OF FILE SYSTEM RESOURCES IS BEING CAPTURED. THE DUMP TIMESTAMP=timestamp.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS system command, or a similar shared file system diagnostic function. An SVC dump is being captured as a normal part of the diagnostic function.

In the message text:

- timestamp The date and local time when the dump is captured. The time stamp is included in the dump title. The date is represented as year/month/day, and the time is represented as hours (00–23), minutes (00–59), and seconds (00–59).

System action: The system is capturing file system data for subsequent analysis. The file system diagnostic function that initiated the dump will continue once the capture phase is complete.

Operator response: None.

System programmer response: None.

Module: BPXTXCDR

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 4,8
BPXF044I  THE FUNCTION DID NOT COMPLETE DUE TO ACTIVE LOCAL FILE SYSTEM RECOVERY.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS system command. The function ended prematurely because local file system recovery or the F OMVS,NEWROOT command is in progress on at least one system in the sysplex. Performing the FILESYS function now can cause erroneous processing.

System action: The MODIFY command ends prematurely.

Operator response: Use the “MODIFY BPXOINIT,FILESYS=DISPLAY,GLOBAL” command to determine which systems are performing “Local Filesystem Recovery”. If this processing does not complete within a reasonable timeframe, further analysis of these systems may be necessary.

System programmer response: None.

Module: BPXTXFIX

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 4,8

BPXF045A  THE LOCAL SYSBPX MEMBER REPRESENTATION IS INCORRECT.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS system command, or a similar shared file system diagnostic function. The processing ended prematurely because the local SYSBPX member list is inconsistent with the XCF representation. This error may also cause unpredictable file system processing for functions that require cross system communication.

System action: The file system diagnostic processing ends prematurely.

Operator response: This system should be restarted.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center to report this problem. An SVC dump should have been captured as a part of the file system diagnostic processing. Provide this dump to IBM for problem analysis.

Module: BPXTXFIX

Descriptor Code: 2

BPXF046I  FILE SYSTEM fsname AND ALL DEPENDENT FILE SYSTEMS ARE BEING UNMOUNTED.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS system command, or a similar shared file system diagnostic function. The named file system and dependent file systems are being unmounted. An inconsistency was detected for the named file system.

In the message text:

fsname

  The name of the file system that is being unmounted.

System action: The named file system and all dependent file systems are being unmounted. File system analysis and repair continues.

Operator response: None.

System programmer response: None.

Module: BPXTXFIX

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 4,8
BPXF047I  FILE SYSTEM *fsname* AND ALL DEPENDENT FILE SYSTEMS COULD NOT BE UNMOUNTED.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS system command, or a similar shared file system diagnostic function. The named file system and all dependent file systems need to be unmounted because an inconsistency was detected. Attempts to unmount the file systems failed due to ongoing file system activity.

In the message text:

*fsname*

The file system name.

System action: File system analysis and repair continues.

Operator response: Unmount the specified file system and all dependent file systems using the MODIFY BPXOINIT,FILESYS=UNMOUNT,FILESYSTEM=filesysname command. The dependent file systems must be unmounted first. Alternately, the MODIFY BPXOINIT,FILESYS=UNMOUNTALL command can be used to unmount the complete file system hierarchy. Once this is done, use the “MODIFY BPXOINIT,FILESYS=REINIT” command to re-mount the initial file system hierarchy.

System programmer response: None.

Module: BPXTXFIX

Source: z/OS UNIX System Services kernel (BPX)

Descriptor Code: 4,8

BPXF048I  A CORRECTIVE ACTION WAS PERFORMED TO THE FILE SYSTEM HIERARCHY: *action*

DIAGNOSTIC DATA = *eventdata*

Explanation: This message is issued as part of the MODIFY BPXOINIT,FILESYS system command, or a similar shared file system diagnostic function. A corrective action was taken for the file system hierarchy. This message is provided primarily for analysis by the IBM Support Center.

In the message text:

*action*

Description of the corrective action performed.

*eventdata*

Event-specific data for IBM problem analysis.

System action: The described change was made to the file system hierarchy. Processing continues.

Operator response: Contact the system programmer.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center to report the defect identified by this message. The console log containing this message and any corresponding dump should be provided.

Module: BPXTXFIX

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 4,8, HARDCOPY ONLY

BPXF049I  type PROCESSING FOR FILE SYSTEM *fsname* REQUIRES RESPONSSE FROM THE FOLLOWING SYSTEMS: *sysnames*

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS system command, or a similar shared file system diagnostic function. The named file system is in the process of unmounting, quiescing, or remounting, and the processing appears to be delayed. For quiesce processing, the quiesce actually may be a part of file system move processing. The message identifies the systems that have not yet performed the specified operation locally.
In the message text:

**type**
One of the following:

- **UNMOUNT**
  Unmount processing is delayed.

- **QUIESCE**
  Quiesce processing is delayed.

- **RE_MOUNT**
  Remount processing is delayed.

**fsname**
The name of the file system that is being unmounted or quiesced.

**sysnames**
The names of the systems that have not completed the function.

**System action:** File system diagnostic analysis continues.

**Operator response:** Issue the “D GRS,LATCH,C” command on each named system to determine if file system latch contention exists. The file system latch set is SYS.BPX.A000.FSLIT.FILES.S.LSN. If latch contention does exist and persists, the named system should be restarted.

**System programmer response:** None.

**Module:** BPXTXSTS

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 4,8

---

**BPXF050I**  THE FIX FUNCTION DID NOT PERFORM ALL ANALYSIS DUE TO CONTINUOUS SERIALIZATION TIMEOUTS.

**Explanation:** This message is issued as a part of the MODIFY BPXOINIT,FILESYS=FIX system command. The FIX function ended prematurely because serialized access to the active type BPXMCDs couple dataset could not be maintained.

**System action:** The FIX operation ends prematurely.

**Operator response:** Reissue the “MODIFY BPXOINIT,FILESYS=FIX” command. If the problem persists, contact the System Programmer.

**System programmer response:** Verify that the active type BPXMCDs couple dataset is operational and is not experiencing any I/O errors. If no problem can be identified, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:** BPXTXFIX

**Source:** z/OS UNIX System Services kernel (BPX)

---

**BPXF051I**  THE MODIFY FUNCTION CANNOT BE PERFORMED BECAUSE ALL SYSTEMS ARE NOT AT A COMPATIBLE SOFTWARE LEVEL.

**Explanation:** This message is issued in response to a MODIFY BPXOINIT,FILESYS system command. The requested function cannot be performed because cross-system messaging is required for the function, and not all systems in the sysplex are at a compatible software level.

**System action:** The MODIFY command is rejected.

**Operator response:** Issue the MODIFY BPXOINIT,FILESYS=DISPLAY,GLOBAL system command to view the active
systems in the SYSBPX sysplex group. The minimum LFS VERSION of each system to perform the requested FILESYS function is 1.1.0.

System programmer response: Upgrade the OS/390© software level so that the minimum LFS VERSION on each system is 1.1.0.

BPXF052I THE REPRESENTATION FOR SYSTEM sysname IS INCONSISTENT. FIX PROCESSING ENDS PREMATURELY.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS=FIX system command, or a similar shared file system diagnostic function. There is an inconsistency in the representation of the named system. The file system representation does not agree with the XCF representation. The most probable cause of this condition is that a failure occurred during the partition cleanup of the named system.

Partition cleanup occurs when an active system exits the SYSBPX sysplex group, presumably due to a system failure or system restart.

In the message text:

sysname
The name of the system that is inconsistent.

System action: The analysis and repair of the file system hierarchy ends prematurely. Partition cleanup is initiated for the named system.

Operator response: Contact the system programmer.

System programmer response: Issue the MODIFY BPXOINIT,FILESYS=DISPLAY,GLOBAL system command to determine if partition cleanup processing is complete. Partition cleanup is complete when there are no systems performing LOCAL FILE SYSTEM RECOVERY or FILE SYSTEM TAKEOVER RECOVERY. When partition cleanup has completed, re-issue the MODIFY BPXOINIT,FILESYS=FIX command to resume and complete file system diagnostic and repair processing.

If the inconsistency persists for the named system, a sysplex restart may be required.

Module: BPXTXFIX
Source: z/OS UNIX System Services kernel (BPX)

Descriptor Code: 4,8

BPXF053I UNMOUNT PROCESSING FOR FILE SYSTEM fsname IS DELAYED. FIX PROCESSING CONTINUES.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS=FIX system command. The named file system is being unmounted, and processing appears to be delayed. A previous message indicated which systems did not yet complete the unmount processing.

In the message text:

fsname
The name of the file system that is in the process of unmounting.

System action: File system analysis and repair continues.

Operator response: Issue the D GRS,LATCH,C command on each named system to determine if file system latch contention exists. The file system latch set is SYS.BPX.A000.FSLIT.FILESYS.LSN. If latch contention does exist and persists, the named system should be restarted.

System programmer response: None.
BPXF054I - BPXF055I

Module: BPXTXFIX

Descriptor Code: 4,8

BPXF055I  MODIFY PROCESSING FOR FILESYS=FIX IS COMPLETE. status CHECK THE HARD COPY LOG
OF EACH SYSTEM FOR CORRECTIVE ACTIONS TAKEN.

Explanation: The MODIFY processing is complete. The message indicates whether or not corrections were made
during the MODIFY command processing on this system. Note that corrective actions could have occurred on other
systems.

In the message text:

status
  One of the following:

    NO CORRECTIONS WERE MADE LOCALLY.
    CORRECTIONS WERE MADE LOCALLY.

System action: The MODIFY command is complete.

Operator response: None.

System programmer response: Determine if the file system is again operational. If latch contention or delayed file
system processing was identified during the file system analysis, pursue resolving identified problems. Any
corrections that were made by the FIX function were identified by messages written to the hard copy log. Note that
corrections could have occurred on another system asynchronously to this command processing. The hard copy log
on each system should always be reviewed to determine if any corrections were performed. Example corrective
action messages are BPXF046I and BPXF048I. Search problem reporting databases for a fix for the problem. If no fix
exists, contact the IBM Support Center and provide the original dump captured as a part of FIX processing and the
hard copy log of each system that identifies the corrections that were performed.

BPXF057I  POSSIBLE LATCH CONTENTION EXISTS ON SYSTEM \textit{system} FOR FILE SYSTEM \textit{fsname}, LATCH NUMBER \textit{latchnum}.

Explanation: This message is issued as a part of the MODIFY BPXOINIT,FILESYS=FIX system command, or a similar shared file system diagnostic function. Latch contention on the named file system exists. The contention may impact any file system operation that references the named file system.

In the message text:

\textit{system}

The name of the system that has latch contention.

\textit{fsname}

The name of the file system that has latch contention.

\textit{latchnum}

The latch number in the file system latchset (in decimal).

System action: The analysis and repair of the shared file system hierarchy continues.

Operator response: Contact the system programmer.

System programmer response: Issue the “D GRS,LATCH,C” command on the specified system to review latch contention. File system latches belong to latch set SYS.BPX.A000.FSLIT.FILESYS.LSN. If contention exists and persists, a restart of this system may be required to clear file system delays.

BPXF060I  LOGGED BY SYSLOGD FROM A {LOCAL | REMOTE} SOURCE text [xxxx BYTES OF INPUT DATA HAS BEEN TRUNCATED]

Explanation: This message was received by a local or remote (z/OS or non-z/OS system) UNIX environment. Remote systems can be any system that allows forwarding syslog daemon (syslogd) messages to remote z/OS hosts. You can see the hostname/IPaddress of the originating system from the header of the actual syslogd message, which is displayed as **text**.

In the message text:

- **text**
  - The actual syslogd message text which is displayed with 70 characters per line. If the actual message text has more than 48 lines, it is ended by the optional line of **xxxx** BYTES OF INPUT DATA HAS BEEN TRUNCATED, indicating the remaining text is omitted.

- **xxxx**
  - The up to 4-digit decimal number that represents the total number of omitted text bytes from the message.

System action: The message is logged in OPERLOG.

Operator response: If the text contains a message id, refer to the proper documentation for that message to further determine the cause of the message.

System programmer response: None.

Module: BPXBDOPL
Source: Syslog Daemon (syslogd)

**BPXF062I**  
**WAITING FOR THE FOLLOWING SYSTEM(S) TO COMPLETE** *activity: syslist*

**Explanation:** This message is issued as a part of MODIFY BPXOINIT, FILESYS=FIX,UNMOUNTALL or REINIT command. The message indicates that sysplex-wide mount or unmount activity is in progress for the function, and one or more systems have not yet completed the activity.

In the message text:

- **activity** mounts or unmounts
- **syslist**
  - The specified systems which are still performing the activity.

**System action:** For FIX or REINIT, this message will be displayed for a finite period of time, after which it will timeout. For UNMOUNTALL, it will not timeout, and the MODIFY command will not complete until the identified systems have completed their unmounts. This may require a restart.

**Operator response:** The systems identified may require a system restart. Issue the D GRS,LATCH,C command on the specified system to review latch contention. File system latches belong to latch set SYS.BPX.A000.FSLIT.FILESYS.LSN. If contention exists and persists, a restart of this system may be required.

**System programmer response:** None.

Descriptor Code: 4,8

BPXF067I AN SVC DUMP OF FILE SYSTEM RESOURCES ENDED WITH REASON CODE = sdumpx_rsn_code

Explanation: This message was issued in response to the MODIFY (F) BPXOINIT FILESYS command with the FIX or DUMP parameter. SDUMPX processing has failed with a return code of 8. In the message text:

REASON CODE = sdumpx_rsn_code
For the explanation of the SDUMPX reason code, see z/OS MVS Programming: Authorized Assembler Services Reference LLA-SDU.

System action: Processing ends for the DUMP option, but continues for the FIX option.

Operator response: None.

System programmer response: None.

Module: BPXTXCDR
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4,8
**BPXF068I**  THE REPRESENTATION FOR SYSTEM `sysname` IS INCONSISTENT. FIX PROCESSING CONTINUES.

**Explanation:** This message is issued as a part of the MODIFY BPXOINIT,FILESYS=FIX system command, or a similar shared file system diagnostic function. There is an inconsistency in the representation of the named system. The file system representation does not agree with the XCF representation. The most possible cause of this condition is that a failure occurred during the Member Gone recovery processing of the named system, or that Member Gone processing is currently active. Member Gone processing occurs when an active system exits the SYSBPX sysplex group, presumably resulting from a system failure or OMVS SHUTDOWN.

In the message text:

- `sysname` The name of the system that is inconsistent.

**System action:** The analysis and repair of the shared file system serialization data continues, but individual file system verification is not performed. Member Gone processing is initiated for the named system

**Operator response:** Contact the system programmer.

**System programmer response:** Issue the MODIFY BPXOINIT,FILESYS=DISPLAY,GLOBAL system command to determine if Member Gone recovery is in progress. Member Gone recovery is in progress if there is either LOCAL FILE SYSTEM RECOVERY or FILE SYSTEM TAKEOVER RECOVERY in progress.

If the inconsistency persists for the named system, the system might need to be recycled.

**Module:** BPXTXFIX

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 4,8

---

**BPXF076I**  FILE SYSTEM INITIALIZATION IS DELAYED DUE TO CONFLICTING ACTIVITY ON ANOTHER SYSTEM.

**Explanation:** This message is issued when file system initialization enters a delay because a conflicting function that is being performed by another system is in progress.

**System action:** Initialization will delay indefinitely until the conflicting activity completes. The F BPXOINIT,FILESYS=DISPLAY,GLOBAL system command is internally issued.

**Operator response:** Contact the system programmer.

**System programmer response:** Message BPXF041I is issued subsequent to this message. Review the active file system activity in the sysplex. If the conflicting activity persists, it might indicate a latch deadlock or a problem updating the mount table. Issue the D GRS,LATCH,C command to review latch contention on the other systems in the sysplex. If a latch deadlock exists, or if file system initialization continues to be delayed, then you may need to restart the violating system to clear the conflicting activity.

**Module:** BPXTXRMT

**Routing Code:** 1,10

**Descriptor Code:** 1
BPXF080I  THE SOFTWARE SERVICE LEVEL OF THE FOLLOWING SYSTEMS ARE INCOMPATIBLE WITH
   THIS SYSTEM:sysname sysname sysname sysname

Explanation: This message is issued in conjunction with message BPXF079S. The systems listed here are configured
for z/OS UNIX shared file system support and are executing at a software service level that is incompatible with the
software service level of this system.

In the message text:

sysname
   The names of the systems with the incompatible software service level.

System action: See message BPXF079S.

Operator response: Contact the system programmer.

System programmer response: Review z/OS Planning for Installation for the list of z/OS UNIX coexistence and
fallback PTFs that must be applied on each system that is configured with shared file system support.

Module: BPXTXRMT

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2,10

Descriptor Code: 12

BPXF083I  THE FOLLOWING FILE SYSTEM HAS BEEN QUIESCED FOR MORE THAN 10 MINUTES:
   filesys_name QUIESCING SYSTEM=sysname JOB=jobname PID=pid LATCH=latnum

Explanation: The file system is quiesced and will not be usable until it is unquiesced.

In the message text:

filesys_name
   The file system name.

sysname
   The name of the system that executed the job.

jobname
   The name of the job that quiesced the file system.

pid
   The process ID that quiesced the file system.

latnum
   The latch number on this system used to quiesce the file system. z/OS UNIX System Services uses the specified
   GRS latch in latchset SYS.BPX.A000.FSLIT.QUIESCE.LSN to prevent I/O operations from being processed by the
   physical file system.

System action: The file system can't be used.

Operator response: If the condition persists, contact the system programmer.

System programmer response: The file system can only be unquiesced by an authorized user. To unquiesce the file
system, use the ISPF Shell (ISHELL) to Reset unmount or quiesce from the Work with Mounted File Systems panel
(BPXWP20).

Note that for a shared file system configuration, the attempt to unquiesce a quiesced sysplex root file system will fail
if the authorized user ID you use was defined with an OMVS HOME directory, and the user ID is not already active
(logged in and dubbed).

Use the D OMVS,=userid system command to determine if the authorized user is dubbed. In a RACF environment,
issue the following RACF command from the TSO command line to alter a userid to have no HOME directory.
alu userid omvs(home(''))

Additionally, the ISPF Shell (ISHELL) cannot be used to unquiesce the sysplex root because it attempts to access the
root file system resources during its initialization processing. The following REXX exec can be executed from the TSO
command line to unquiesce the sysplex root HFS file system with name 'ZOS17.SYSPLEX.ROOT.HFS'. Note that the user ID you use must be a superuser ID (UID=0) with NO HOME directory specified:

/* REXX */
address syscall
call syscalls('ON')
unquiesce ZOS17.SYSPLEX.ROOT.HFS 1

Alternatively, you can use a non-UID 0 user (with NO HOME directory specified) to unquiesce the file system if the user is permitted to the BPX.SUPERUSER facility class. In this case, the REXX exec must also include a seteuid 0 call, as follows:

/* REXX */
address syscall
call syscalls('ON')
seteuid 0
unquiesce ZOS17.SYSPLEX.ROOT.HFS 1

Another possible reason that this message is issued is because a backup is currently in progress. If the reason for the quiesce is unknown, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

BPXF107E  THE RECORD FORMAT OF THE INPUT DATA SET WITH DDNAME ddname IS NOT VALID.

Explanation: The only record formats that are valid are F (fixed), V (variable), and U (undefined).

This condition can occur when a U format data set is specified as the receiver of a copy of a text HFS file. This is not supported.

In the message text:

*ddname*
   The data definition name specified on the command.

System action: Processing for the command ends.

Operator response: None.

System programmer response: None.

User response: Check the record format of the data set, and correct it before entering the command again.

Module: BPXFUCPC

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 5

BPXF108E  THE RECORD FORMAT OF THE OUTPUT DATA SET WITH DDNAME ddname IS NOT VALID.

Explanation: The only record formats that are valid are F (fixed), V (variable), and U (undefined). Sometimes the user may not specify the record format in the data set. For example, when the user allocates the terminal as output, he must specify the record format as something instead of just empty.

The other time that this condition can occur when a U format data set is specified as the receiver of a copy of a text HFS file. This is not supported.
In the message text:

**ddname**

The data definition name specified on the command.

**System action:** Processing for the command ends.

**Operator response:** None.

**System programmer response:** None.

**User response:** Check the record format of the data set, and correct it before entering the command again.

**Module:** BPFUCPC

**Source:** z/OS UNIX System Services kernel (BPX)

---

**BPXF111E**  COPY FAILED. **RETURN CODE** return_code **WAS RECEIVED DURING THE COPY.**

**Explanation:** The copy operation failed for the reason described by the return code.

In the message text:

**return_code**

The return code received during the copying operation. For an explanation of the return code, see [z/OS MVS System Codes](https://www.ibm.com/support/knowledgecenter/en/SSLVMB_2.2.0/com.ibm.zos.r22/iosrv_zmshelp_0100.htm).

**System action:** Processing for the command ends.

**Operator response:** None.

**System programmer response:** None.

**User response:** Correct the problem and reenter the command.

**Module:** BPFUCPC

---
BPXF112W  THE RECORD SIZE IN THE OUTPUT DATA SET IS SMALLER THAN A LINE IN THE INPUT FILE. SOME RECORDS HAVE BEEN TRUNCATED.

Explanation: The record size of the output data set is smaller than the size of a line in the input HFS file. This caused records to be truncated. A line is delimited by a ‘\n’ new line character in the input file.

System action: Processing of the command continues, truncating records when required.

Operator response: None.

System programmer response: None.

User response: Should the result of the copy be unsatisfactory, create an output data set with a larger record size and reenter the command.

Module: BPXFUCPC

BPXF157E  RETURN CODE $return_code$ RECEIVED DURING STACKING OF THE MESSAGE OUTPUT DATA SET WITH DDNAME $ddname$.

Explanation: An error occurred during the STACK of the message output $ddname$.

In the message text:

$return_code$

The return code received from IKJSTCK. For an explanation of the return code, see the appropriate topic for the failing service in $z/OS TSO/E Programming Services$.

$ddname$

The data definition name specified for the message output.

System action: Processing for BPXCOPY ends, without copying.

Operator response: None.

System programmer response: None.

User response: Verify that the specified message output $ddname$ is allocated. Correct the problem as identified by the return code and reenter the request.

Module: BPXFUCPY

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 2

---

BPXF158E  RETURN CODE $return_code$ RECEIVED DURING THE STACK DELETE OF THE MESSAGE OUTPUT DATA SET ELEMENT FOR DDNAME $ddname$.

Explanation: An error occurred during the STACK DELETE of the message output $ddname$ element.

In the message text:

$return_code$

The return code received from IKJSTCK. For an explanation of the return code, see the appropriate topic for the failing service in $z/OS TSO/E Programming Services$.

$ddname$

The data definition name specified for the message output.

System action: Processing for BPXCOPY ends, without copying.

Operator response: None.

System programmer response: None.

User response: Verify that the specified message output $ddname$ is allocated. Correct the problem as identified by the return code and reenter the request.
**BPXF159E • BPXF160E**

**System action:** Processing for BPXCOPY ends. The copy may or may not have been done. The message output data set may not be closed.

**Operator response:** None.

**System programmer response:** Find and correct the problem that caused the error; then inform the user so that he or she can reenter the command.

**User response:** Correct the problem as identified by the return code from IKJSTCK and reenter the request. If the problem persists, refer this problem to the system programmer.

Descriptor Code:  2

BPXF165E  GROUP NAME groupname IS NOT DEFINED.
Explanation:  GID(groupname) is not defined in the security data base.
In the message text:
  groupname
    The group name.
System action:  Processing for the request ends.
Operator response:  None.
System programmer response:  None.
User response:  Reenter the request, specifying a defined group name or GID.

Module:  BPXFUCPY
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  2
Descriptor Code:  2

BPXF166E  GID gid IS NOT DEFINED.
Explanation:  GID(gid) is not defined in the security data base.
In the message text:
  gid
    The groupID.
System action:  Processing for the request ends.
Operator response:  None.
System programmer response:  None.
User response:  Reenter the request, specifying a defined group name or GID.
BPXF167E  RETURN CODE return_code, REASONCODE reason_code, UID and GID COULD NOT BE SET FOR FILE pathname.

Explanation:  The system was unable to change the owner and/or the group owner of the file because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
  The return code received from chattr.

reason_code
  The reason code received from chattr. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

pathname
  The name of the file. If the name is longer than 64 characters, it is truncated.

System action:  Processing for the request ends.

Operator response:  None.

System programmer response:  None.

User response:  Correct the condition indicated by the return code and reenter the request.

BPXF168E  RETURN CODE return_code, REASONCODE reason_code, UID and GID COULD NOT BE SET FOR SYMLINK pathname.

Explanation:  The system was unable to change the owner and/or the group owner of the symlink because of the condition indicated by the return code and reason code shown.

In the message text:

return_code
  The return code received from lchown.

reason_code
  The reason code received from lchown. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

pathname
  The pathname of the symbolic link. If the pathname is longer than 64 characters, it is truncated.

System action:  Processing for the request ends.

Operator response:  None.

System programmer response:  None.

User response:  Correct the condition indicated by the return code and reenter the request.
BPXF169E • BPXF170E • BPXF171E

Descriptor Code:  2

BPXF169E  SYMPATH VALUE IS MISSING FOR SYMLINK pathname.
Explanation: Either SYMPATH was not specified OR no SYMPATH path name was specified for the SYMLINK linkname.
In the message text:

pathname
    The pathname of the symbolic link. If the pathname is longer than 64 characters, it is truncated.

System action: Processing for the request ends.
Operator response: None.
System programmer response: None.
User response: Reenter the request, specifying at least one SYMPATH path name.
Module: BPXFUCPY
Source: z/OS UNIX System Services kernel (BPX)
Routing Code:  2
Descriptor Code:  2

BPXF170E  RETURN CODE return_code, REASON CODE reason_code. A SYMLINK FAILED FOR LINK NAME linkname.
Explanation: The BPXCOPY utility was unable to create a symbolic link with the specified name.
In the message text:

return_code
    The return code received from the symlink request.
reason_code
    The reason code received from the symlink request. For an explanation of the return code and reason code, see [z/OS UNIX System Services Messages and Codes]
linkname
    The name of the symlink. If the name is longer than 64 characters, it is truncated.

System action: Processing for the request ends.
Operator response: None.
System programmer response: None.
User response: The return code and reason code that were returned with this message indicate what caused the problem with the symlink request. Correct the error, and then reenter the request.
Module: BPXFUCPY
Source: z/OS UNIX System Services kernel (BPX)
Routing Code:  2
Descriptor Code:  2

BPXF171E  RETURN CODE return_code, REASON CODE reason_code. CANNOT REPLACE EXISTING SYMLINK linkname.
Explanation: The BPXCOPY utility was unable to create a symbolic link with the specified name. The name exists, but is different than the requested symbolic link, or not readable.
In the message text:

return_code
    The return code received from the readlink request.
**reason_code**

The reason code received from the readlink request. For an explanation of the return code and reason code, see "z/OS UNIX System Services Messages and Codes".

**linkname**

The name of the symlink. If the name is longer than 64 characters, it is truncated.

**System action:** Processing for the request ends.

**Operator response:** None.

**System programmer response:** None.

**User response:** The return code and reason code that were returned with this message indicate what caused the problem with the readlink request. Correct the error, and then reenter the request.

**Module:** BPXFUCPY

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 2

---

**BPXF172E** CANNOT REPLACE EXISTING SYMLINK linkname.

**Explanation:** The BPXCOPY utility was unable to create a symbolic link with the specified name. The name exists as a symlink, but the path name in the existing symbolic link is different from the path name requested.

In the message text:

**linkname**

The name of the symlink. If the name is longer than 64 characters, it is truncated.

**System action:** Processing for the request ends.

**Operator response:** None.

**System programmer response:** None.

**User response:** Remove the existing symbolic link, or specify a different SYMLINK linkname, and reenter the request.

**Module:** BPXFUCPY

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 2

---

**BPXF173E** RETURN CODE return_code, REASON CODE reason_code. attr ATTRIBUTE CANNOT BE SET FOR FILE pathname.

**Explanation:** The BPXCOPY utility was unable to set the indicated attribute on the HFS file.

In the message text:

**return_code**

The return code received from the chattr request.

**reason_code**

The reason code received from the chattr request. For an explanation of the return code and reason code, see "z/OS UNIX System Services Messages and Codes".

**attr**

The attribute requested. One of the following: APF, NOAPF, PROGCTL, NOPROGCTL, SHAREAS, NOSHAREAS.

**pathname**

The pathname of the HFS file. If the pathname is longer than 64 characters, it is truncated.
System action: Processing for the request ends.
Operator response: None.
System programmer response: None.
User response: The return code and reason code that were returned with this message indicate what caused the problem with the chattr request. Correct the error, and then reenter the request.

Module: BPXFUCPY
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 2

BPXF174E  RETURN CODE return_code, REASON CODE reason_code, OBTAINING STATUS OF FILE pathname.

Explanation: The system was unable to obtain the status of the file because of the condition indicated by the return code and the reason code shown.

In the message text:

return_code
The return code received from the stat request.

reason_code
The reason code received from the stat request. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

pathname
The path name of the HFS file. If the pathname is longer than 64 characters, it is truncated.

System action: Processing for the command ends.
Operator response: None.
System programmer response: None.
User response: The return code and reason code that were returned with this message indicate what caused the problem. Correct the error, and then reenter the request.

Module: BPXFUCPY
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 2

BPXF175E  THE attr ATTRIBUTE WAS NOT SET FOR FILE pathname.

Explanation: The BPXCOPY utility was unable to set the indicated attribute on the HFS file. No return code was returned from the chattr system call.

In the message text:

attr
The attribute requested. One of the following: APF, NOAPF, PROGCTL, NOPROGCTL, SHAREAS, NOSHAREAS.

pathname
The path name of the HFS file. If the pathname is longer than 64 characters, it is truncated.

System action: Processing for the request ends.
Operator response: None.
System programmer response: None.
User response: Check that the file system containing the file supports the requested attribute, and that you have the security permissions required to set the attribute. Correct the error, and then reenter the request.
BPXF176E  SYMLINK VALUE IS MISSING FOR SYMPATH pathname.

Explanation: Either SYMLINK was not specified OR no SYMLINK linkname was specified for the SYMPATH path name.

In the message text:

pathname
   The path name to be the contents of the symbolic link. If the path name is longer than 64 characters, it is truncated.

System action: Processing for the request ends.

Operator response: None.

System programmer response: None.

User response: Reenter the request, specifying at least one SYMLINK linkname for each SYMPATH path name.

BPXF177I THE CALL TO GETPWUID FAILED FOR UID uid. THE FAILING RETURN CODE IS retcode, AND THE REASON CODE IS reasoncode.

Explanation: An error was detected on the call to getpwuid. The uid, return code, and reason code of the failing request are displayed, which should allow for problem determination.

In the message text:

uid
   The uid specified on the getpwuid request.

retcode
   The return code received from the getpwuid request. For an explanation of the return code, see z/OS UNIX System Services Messages and Codes.

reasoncode
   The reason code received from the getpwuid request. For an explanation of the reason code, see z/OS UNIX System Services Messages and Codes.

System action: Processing for the BPXCOPY ends.

Operator response: None.

System programmer response: None.

User response: The return code and reason code that were returned with this message indicate what caused the problem. Correct the error, and then reenter the request.
BPXF178I  FILE pathname WAS SUCCESSFULLY COPIED INTO FILE pathname.

Explanation: This is a success message. Processing completed successfully.

In the message text:

pathname
  The path name of the file.

System action: Processing continues.
Operator response: None.
System programmer response: None.
User response: None.
Module: BPXFUCPY
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 5

BPXF201I  DOMAIN domain-name WAS NOT ACTIVATED. FILE SYSTEM TYPE type, SPECIFIED IN member-name, IS NOT ACTIVE.

Explanation: During z/OS UNIX initialization, the system could not activate the specified domain. The file system type named on the NETWORK statement is not initialized.

In the message text:

domain-name
  The domain name specified on the NETWORK statement in the BPXPRMxx parmlib member.

type
  The value specified on the TYPE operand in the specified parmlib member.

member-name
  The member name processed as a result of the START OMVS command.

System action: The domain is not activated. The system continues to process other NETWORK statements.
Operator response: Contact the system programmer.
System programmer response: Verify that the FILESYSTYPE statement in the BPXPRMxx parmlib member defines the file system specified with the TYPE parameter on the NETWORK statement. Ask the operator to correct the problem in BPXPRMxx. IPL the system to start z/OS UNIX with the revised member.
Module: BPXVSINT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2,10
Descriptor Code: 4

BPXF202I  DOMAIN domain-name WAS NOT ACTIVATED FOR FILE SYSTEM TYPE type. RETURN CODE = return_code, REASON CODE = reason_code

Explanation: During z/OS UNIX initialization, the system could not activate the specified domain.

In the message text:

domain-name
  The domain name specified on a NETWORK statement in the BPXPRMxx parmlib member.

type
  The value specified on the TYPE operand in the specified parmlib member.
return_code
The return code from the NETWORK request.

reason_code
The reason code from the NETWORK request. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The domain is not activated. The system continues to process other SYS1.PARMLIB statements.

Operator response: Contact the system programmer.

System programmer response: Find the cause of the problem by looking at the return code and reason code. If there is a problem with SYS1.PARMLIB, correct it. IPL the system to start z/OS UNIX with the revised member.

Module: BPXVSINT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

__________________________
BPXF203I   DOMAIN domain-name WAS SUCCESSFULLY ACTIVATED.

Explanation: During z/OS UNIX initialization, a domain was successfully activated.

In the message text:

domain-name
The domain name specified on the NETWORK statement in the BPXPRMxx parmlib member.

System action: The domain was activated. The system continues to process other SYS1.PARMLIB statements.

Operator response: None.

System programmer response: None.

Module: BPXVSINT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

__________________________
BPXF204I   TCP/IP ROUTING INFORMATION UNAVAILABLE FOR TRANSPORT DRIVER tdname. RETURN CODE = return_code, REASON CODE = reason_code.

Explanation: While attempting to retrieve routing information from TCP/IP, an error was detected.

In the message text:

tdname
The name supplied on the SUBFILESYSTYPE parmlib entry that refers to the specific INET sockets physical file system that detected the error.

return_code
The return code obtained when attempting to retrieve routing information.

reason_code
The reason code obtained when attempting to retrieve routing information. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The transport provider will be used in a degraded state.

Operator response: Contact your system administrator.

System programmer response: Ensure that the version of the transport provider supports the use of multiple transport drivers by z/OS UNIX. After the correct versions are established, z/OS UNIX routing information retrieval may be initiated by restarting the transport provider, or, in the case of IBM's TCP/IP, the OBEYFILE command may be issued to cause TCP/IP to reread the TCP/IP profile dataset.
BPXF205I • BPXF206I

Explanation: A general error occurred when z/OS UNIX attempted to make a connection to the transport driver named for the retrieval of routing information.

In the message text:

*tdname*  
The name supplied on the SUBFILESYSTYPE parmlib entry that refers to the specific INET sockets physical file system that detected the error.

*return_code*  
The return code obtained when attempting to retrieve routing information.

*reason_code*  
The reason code obtained when attempting to retrieve routing information. For an explanation of the return code and reason code, see [z/OS UNIX System Services Messages and Codes](#).

System action: The transport provider will be used in a degraded state.

Operator response: Contact your system administrator.

System programmer response: Ensure that the version of the transport provider supports z/OS UNIX’s support of multiple transport drivers. After the correct versions are established, either the transport provider must be restarted, or the system IPLed in order to start z/OS UNIX.

BPXF206I  ROUTING INFORMATION FOR TRANSPORT DRIVER *tdname* HAS BEEN INITIALIZED OR UPDATED.

Explanation: z/OS UNIX Common INET support maintains simple routing information for each transport provider connected to Common INET. This message is issued after z/OS UNIX has obtained and stored routing information for the named transport driver.

Some transport providers, such as IBM’s TCP/IP, allow routing information to be updated without shutting down TCP/IP. If routing information is updated, z/OS UNIX will update stored routing information and issue this message.

In the message text:

*tdname*  
The name supplied on the SUBFILESYSTYPE parmlib entry that refers to the specific INET sockets physical file system for which routing information was obtained.

System action: The transport provider is fully functional through z/OS UNIX Common INET support.

Operator response: None

System programmer response: None

Module: BPXTCTBL
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
BPXF207I ROUTING INFORMATION HAS BEEN DELETED FOR TRANSPORT DRIVER tdname.

Explanation: z/OS UNIX Common INET support maintains simple routing information for each transport provider connected to Common INET. This message is issued after z/OS UNIX has deleted routing information for the named transport driver.

This message is issued when one of the following events occurs:
- The connection between a transport provider and z/OS UNIX is severed.
- A software error occurs in the Common INET routing information manager.

In the message text:

*tdname*

The name supplied on the SUBFILESYSTYPE parmlib entry that refers to the specific INET sockets physical file system for which routing information has been deleted.

System action: The transport provider will be used in a degraded state or not used at all.

Operator response: This message is expected if a transport provider is canceled or otherwise terminates. If this message is seen in conjunction with a z/OS UNIX software error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

System programmer response: This message is expected if a transport provider is canceled or otherwise terminates. If this message is seen in conjunction with a z/OS UNIX software error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: BPXTCTBL

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 4

---

BPXF210I A BIND REQUEST COULD NOT BE PROCESSED. NO PORT 0, INADDR_ANY PORTS WERE RESERVED.

Explanation: A bind request that specified port number 0 and Internet Protocol (IP) address INADDR_ANY failed because there are no port numbers reserved for those bind.

System action: The bind request failed. The system continues processing.

Operator response: Contact your system programmer.

System programmer response: To reserve port numbers that will be assigned for port 0, INADDR_ANY binds, use the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK parmlib statement. The same port numbers must also be reserved on each of the transport providers specified on a SUBFILESYSTYPE parmlib statement. See the documentation for those transport providers to determine how the port numbers are reserved.

After changing these values, you must reIPL your system in order for the new numbers to take effect.

Module: BPXTCBND

BPXF211I A DUPLICATE NETWORK STATEMENT WAS FOUND FOR DOMAINNAME domain-name. THE DUPLICATE ENTRY WAS FOUND IN PARMLIB MEMBER member-name AND SPECIFIED A TYPE OF type. THE DUPLICATE WAS IGNORED

Explanation: During z/OS UNIX initialization, the system found two NETWORK statements with the same DOMAINNAME specified. The second is a duplicate and is ignored.
**BPXF212I • BPXF213E**

In the message text:

- **domain-name**
  - The domain name specified on the NETWORK statement in the BPXPRMxx parmlib member.

- **member-name**
  - The member name processed as a result of the START OMVS command.

- **type**
  - The value specified on the TYPE operand in the specified parmlib member.

**System action:** The duplicate record is ignored. The system continues to process.

**Operator response:** Contact the system programmer.

**System programmer response:** Verify that only one NETWORK statement has been created for each DOMAINNAME. Correct the error. IPL the system to start z/OS UNIX with the revised member.

**Module:** BPXTVSINT

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2,10

**Descriptor Code:** 4

---

**BPXF212I**  NEITHER INADDRANYPORT NOR INADDRANYCOUNT WAS SPECIFIED ON THE NETWORK COMMAND FOR TYPE **type** IN MEMBER **member-name**. THESE VALUES HAVE BEEN DEFAULTED TO INADDRANYPORT(63000) AND INADDRANYCOUNT(1000).

**Explanation:** During z/OS UNIX initialization, the system found a NETWORK statement for common Inet in the named member which did not specify either INADDRANYPORT or INADDRANYCOUNT. Therefore default values will be assigned.

In the message text:

- **type**
  - The value specified on the TYPE operand in the specified parmlib member.

- **member-name**
  - The member name processed as a result of the START OMVS command.

**System action:** Processing will continue with the newly assigned default values.

**Operator response:** Contact the system programmer.

**System programmer response:** Verify that the NETWORK statement correctly reflects the values required for INADDRANY and INADDRANYCOUNT. Specify the values needed and re-IPL the system to start z/OS UNIX with the revised member.

**Module:** BPXTCNWK

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2,10

**Descriptor Code:** 4

---

**BPXF213E** FILE SYSTEM **name** IS NO LONGER ACCESSIBLE.

**Explanation:** This condition only occurs in a sysplex environment. The file system owner has failed and another owner for this file system could not be established. Recovery was attempted, but either no other system in the sysplex has connectivity to the file system, or no other systems are permitted to take ownership of the file system. If the file system is the sysplex root and it became unowned after the owner left the sysplex, then an SVC dump of each active system in the shared file system configuration will be captured.

In the message text:

- **name**
  - The file system name specified either on a MOUNT statement in the BPXPRMxx parmlib member or on a MOUNT command.
**BPXF214E • BPXF215E**

**System action:** The file system remains mounted, but all operations issued against this file system will fail until a new owner is established, or the file system is unmounted.

**Operator response:** Contact your system administrator.

**System programmer response:** If the file system ownership was restricted to a specific system by the NOAUTOMOVE parameter on the MOUNT command, then the owning system must be active in the sysplex. Otherwise, connectivity to the file system must be available on another system.

**Module:** BPXTXMGE

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 1,2

**Descriptor Code:** 3

---

**BPXF214E**  UNIX SYSTEM SERVICES IS UNABLE TO ACCESS ITS COUPLE DATA SET. THE DATA SET IS NOT AVAILABLE.

**Explanation:** An attempt was made to read from the z/OS UNIX System Services couple data set. The data set is not available to be read.

**System action:** All services requiring access to the data set will be delayed until a data set is made available. For example, one or more of the following file system functions may be delayed: file system initialization, mount processing, unmount processing or partition recovery. Access to the couple data set will be attempted every 10 seconds until successful. Once access to the couple data set is restored, the delayed operation will resume.

**Operator response:** Contact the system programmer.

**System programmer response:** Make a couple data set available. z/OS UNIX System Services uses a type BPXMCDS couple data set. Refer to [z/OS UNIX System Services Planning](#) for the procedure to create an OMVS couple data set. Use the D XCF,COUPLE,TYPE=BPXMCDS system command to display the status of the z/OS UNIX System Services couple data set. Once the couple data set is defined and online, use the SETXCF COUPLE system command to enable the couple data set.

**Module:** BPXTXCDS

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 11

---

**BPXF215E**  UNIX SYSTEM SERVICES IS UNABLE TO ACCESS ITS COUPLE DATA SET. AN ATTEMPT TO READ FROM THE DATA SET ENDED WITH A RETURN CODE OF retcode AND A REASON CODE OF reason.

**Explanation:** An error occurred when attempting to access the z/OS UNIX System Services couple data set. Access to the type BPXMCDS couple data set is required in order for z/OS UNIX System Services sysplex operations to continue.

In the message text:

**retcode**

The return code received from the IXCXCDSI macro.

**reason**

The reason code obtained from the invocation of the macro. The following table explains the possible return and reason codes:

System action: All services requiring access to the data set will be delayed until the data set is made available. For example, one or more of the following file system functions may be delayed: file system initialization, mount processing, unmount processing or partition recovery. Access to the couple data set will be attempted every 10 seconds until successful. Once access to the couple data set is restored, the delayed operation will resume.

Operator response: Contact your system programmer.

System programmer response: Review the return code and reason code, correct the error and make a couple data set available. z/OS UNIX System Services uses a type BPXMCDS couple data set. Refer to z/OS UNIX System Services Planning for the procedure to create an OMVS couple data set. Use the D XCF,COUPLE,TYPE=BPXMCDS system command to display the status of the z/OS UNIX System Services couple data set. Once the couple data set is defined and online, use the SETXCF COUPLE system command to enable the couple data set.

BPXF216E FILE SYSTEM PARTITION CLEANUP IS DELAYED DUE TO text

Explanation: File system recovery cannot proceed with takeover of file systems served by the failed system until critical resources held by the identified system in the sysplex are released.

In the message text:

text

One of the following:

MOUNT PROCESSING ON SYSTEM name.
Indicates that a file system mount operation is in progress.

NEWROOT PROCESSING ON SYSTEM name.
Indicates that a file system NEWROOT command is in progress.

UNMOUNT PROCESSING ON SYSTEM name.
Indicates that a file system unmount operation is in progress.

MOVE PROCESSING ON SYSTEM name.
Indicates that a file system move operation is in progress.

INITIALIZATION PROCESSING ON SYSTEM name.
Indicates that file system initialization is in progress.

RECOVERY PROCESSING ON SYSTEM name.
Indicates that file system partition recovery is in progress.
UNMOUNTALL PROCESSING ON SYSTEM name.
Indicates that file system forced unmount is in progress.

UNOWNED RECOVERY PROCESSING ON SYSTEM name.
Indicates that file system partition recovery of unowned file systems is in progress.

TAKEOVER PROCESSING ON SYSTEM name.
Indicates that specific file system takeover processing is not completing.

REMOUNT PROCESSING ON SYSTEM name.
Indicates that a file system remount is in progress.

RECYCLE PROCESSING ON SYSTEM name.
Indicates that a physical file system recycle is in progress.

(UNKNOWN) PROCESSING ON SYSTEM name.
Indicates that the delay in recovery cannot be determined.

name
The name of the system that is holding critical file system resources.

System action: File system server takeover processing is delayed until either the critical resource is released or the maximum delay time limit is reached.

Operator response: Notify the system programmer.

System programmer response: The pending file system operation identified by this message must complete. If the pending condition cannot be cleared then the identified system must be re-IPLed in order for file system recovery to complete successfully.

Module: BPXTXFSR

Routing Code: 1,2
Descriptor Code: 3

BPXF217E FILE SYSTEM PARTITION CLEANUP FAILED DUE TO text

Explanation: File system recovery could not proceed with takeover of file systems served by the failed system. Those file systems will become inaccessible.

In the message text:

text
One of the following:

MOUNT PROCESSING ON SYSTEM name.
Indicates that a file system mount operation is in progress.

NEWROOT PROCESSING ON SYSTEM name.
Indicates that OMVS,NEWROOT is in progress or not completing.

UNMOUNT PROCESSING ON SYSTEM name.
Indicates that a file system unmount operation is in progress.

MOVE PROCESSING ON SYSTEM name.
Indicates that a file system move operation is in progress.

INITIALIZATION PROCESSING ON SYSTEM name.
Indicates that file system initialization is in progress.

RECOVERY PROCESSING ON SYSTEM name.
Indicates that file system partition recovery is in progress.

UNMOUNTALL PROCESSING ON SYSTEM name.
Indicates that file system forced unmount is in progress.

UNOWNED RECOVERY PROCESSING ON SYSTEM name.
Indicates that file system partition recovery of unowned file systems is in progress.
**BPXF218I**

**REMTON PROCESSING ON SYSTEM name.**
Indicates that a file system remount is in progress.

**TAKEOVER PROCESSING ON SYSTEM name.**
Indicates that specific file system takeover processing is not completing.

**RECYCLE PROCESSING ON SYSTEM name.**
Indicates that a physical file system recycle is in progress.

**UNKNOWN PROCESSING ON SYSTEM name.**
Indicates that the failure in recovery cannot be determined.

**name**
The name of the system that is holding critical file system resources.

**System action:** File system server takeover processing did not complete as a part of partition cleanup. The affected file systems will remain inaccessible until a new server can be established. The sysplex will attempt to recover the affected file systems periodically. An SVC dump of each active system in the Shared File System configuration is also being captured.

**Operator response:** Notify the system programmer.

**System programmer response:** File system recovery processing will continue to attempt recovery. If recovery does not occur, the following actions can be taken to recover each affected file system:
- The file system should be recovered when the failed system re-initializes and joins the sysplex.
- Use the TSO UNMOUNT command to unmount the affected file system. This command must be issued on each active system in the sysplex. Once the file system is unmounted, use the TSO MOUNT command to mount the file system on the desired server system.

**Module:** BPXTXFSR

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 1,2

**Descriptor Code:** 3

**BPXF218I** 

**ONE OR MORE FILE SYSTEMS DID NOT MOUNT DUE TO INCONSISTENT FILESYSTYPE STATEMENTS.**

**Explanation:** This error condition only applies to sysplex configurations. This system could not mount a file system that was mounted by another system in the sysplex because there is no active Physical File System that matches the Physical File System TYPE that was specified on the original MOUNT request. There are inconsistent FILESYSTYPE statements in the BPXPRMxx parmlib members. All systems in the sysplex must specify the same FILESYSTYPE statements.

This message might be issued when a Colony Physical File System such as ZFS is stopped or canceled, and not yet restarted.

**System action:** Each file system that does not have an active Physical File System of the TYPE that was specified on the original MOUNT command is not mounted on this system. System processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Verify that each system in the sysplex is configured with the Physical File Systems required by the mount hierarchy. The D OMVS,P system command can be issued on each system in the sysplex to identify the active Physical File Systems on each system. The D OMVS,F system command can also be issued on each system in the sysplex to identify the file systems mounted on each system. The output from these commands can then be compared across all systems in the sysplex to determine if any differences exist.

No action is required if the message follows the termination of the Physical File System.

BPXF219I A SOCKETS PORT ASSIGNMENT CONFLICT EXISTS BETWEEN UNIX SYSTEM SERVICES AND name.

Explanation: A bind request that specified port number 0 and Internet Protocol (IP) address INADDR_ANY failed because a port number that is reserved for use by z/OS UNIX Common INET is currently being used by the named transport provider.

In the message text:

name

The name of the transport provider using the reserved port. This name was specified on a SUBFILESYSTYPE statement on the BPXPRMxx parmlib member that was used to start z/OS UNIX.

System action: The bind service failed. The system continues processing.

Operator response: Contact your system programmer.

System programmer response: The port numbers assigned for binds that specify port number 0 and IP address INADDR_ANY are reserved for use in z/OS UNIX with the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK statement for Common INET in the parmlib. The same port numbers must also be reserved on the named transport provider so they can be assigned by z/OS UNIX. See the documentation for the named transport provider to determine how the port numbers are reserved.

If port numbers are specified for z/OS UNIX, the same port numbers must be specified to the named transport provider.

If ports were reserved on the named transport provider for use with z/OS UNIX, the same port numbers must be specified to z/OS UNIX using the INADDRANYPORT and INADDRANYCOUNT parameters on the NETWORK statement.

After changing these values, you must reIPL your system in order for the new numbers to take effect.

Module: BPXTCBND

BPXF22II FILE SYSTEM name FAILED TO MOUNT LOCALLY RETURN CODE =xxxxxxxx, REASON CODE = yyyyyyyyy. THE FILE SYSTEM IS ACCESSIBLE ON THIS SYSTEM THROUGH A MOUNT ON A REMOTE SYSTEM.

Explanation: This condition only occurs in a sysplex environment. The file system was intended to be mounted locally but the local mount failed. The file system is made available through a remote mount on the owning system.

In the message text:

name
The file system name specified either on a MOUNT statement in the BPXPRMxx parmlib member or on a MOUNT command.

xxxxxxx
The return code from the mount or vget operation.

yyyyyyyy
The reason code from the mount or vget operation. For an explanation of the return code and reason code, see [z/OS UNIX System Services Messages and Codes](#).

System action: The file system is available through the remote mount and all local requests for this file system will be sent to that remote system for processing.

Operator response: Contact your system administrator.

System programmer response: If there is a reason for this file system to be mounted locally, determine the reason that the local mount failed. This might be due to the file system not being accessible from the local system. Once the original problem is corrected, unmount the file system and mount it again.

BPXF223I  THE address_space_type ADDRESS SPACE, a_name, DID NOT START BECAUSE THE ASCRE MACRO ENDED WITH DECIMAL RETURN CODE return_code AND DECIMAL REASON CODE reason_code.

Explanation: An attempt to start either the RESOLVER address space or a COLONY address space did not complete successfully because the ASCRE macro ended with a failing return code and reason code.

In the message text:

address_space_type
One of the following:

   COLONY
   A colony address space was being started.

   RESOLVER
   The resolver address space was being started.

a_name
The address space name.

return_code
A decimal return code. For an explanation of the return code, see the description of the ASCRE macro in the z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN.

reason_code
A decimal reason code. For an explanation of the reason code, see the description of the ASCRE macro in the z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN.

System action: The address space did not start.

Operator response: Contact your system programmer.

System programmer response: Look at the ASCRE macro in z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN and follow the instructions for the displayed return and reason codes.

Module: BPXFSLIT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

BPXF224I  THE RESOLVER_PROC, a_name, IS BEING STARTED.

Explanation: The resolver address is being started.

In the message text:

a_name
The name of the procedure that was specified with the RESOLVER_PROC statement in a BPXPRMxx parmlib member.

System action: The address space will start unless an error occurs.

Operator response: None.

System programmer response: None.

Module: BPXFSLIT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4
BPXF225I  THE RESOLVER_PROC, a_name, WAS NOT STARTED. THERE IS NO AF_INET OR AF_INET6 DOMAIN TO SUPPORT THE RESOLVER FUNCTION.

Explanation: The RESOLVER_PROC statement was specified in a BPXPRMxx parmlib member; however, there is no AF_INET or AF_INET6 domain to support the specified RESOLVER_PROC.

In the message text:

a_name
- The name of the procedure that was specified with the RESOLVER_PROC statement in a BPXPRMxx parmlib member.

System action: The resolver address space is not started. The system continues processing.

Operator response: Contact your system programmer.

System programmer response: The resolver address space is used by applications for host name-to-host address or host address-to-host name resolution. If your applications require that support, then you must configure your system with a physical file system that supports an AF_INET or AF_INET6 domain. You can do this by adding either a FILESYSTEMS or a SUBFILESYSTEMS statement to your BPXPRMxx member. If you do not require that support, you can remove the RESOLVER_PROC specification from your BPXPRMxx parmlib member.

BPXF226E  UNIX SYSTEM SERVICES HAS REJECTED text

Explanation: An attempt was made to activate a primary or alternate type BPXMCDXS couple data set. z/OS UNIX System Services has rejected the request because the couple data set was defined with a version that is not compatible with the current system requirements.

In the message text:

text
- One of the following:

  PRIMARY COUPLE DATA SET dataset ON VOLUME volume. COUPLE DATA SET VERSION version IS NOT SUPPORTED.
  - Indicates the PRIMARY type BPXMCDXS couple data set.

  ALTERNATE COUPLE DATA SET dataset ON VOLUME volume. COUPLE DATA SET VERSION version IS NOT SUPPORTED.
  - Indicates the ALTERNATE type BPXMCDXS couple data set.

dataset
- The name of the couple data set.

volume
- The volume that contains the specified couple data set.

version
- The formatted version of the couple data set.

System action: The attempt to activate the specified couple data set failed. System processing continues.

Operator response: Contact your system programmer.

System programmer response: If you have SYSPLEX=NO defined in your BPXPRMxx member, ignore this message. Otherwise, see z/OS UNIX System Services Planning to determine what versions of the type BPXMCDXS couple data set are supported by this version of z/OS, and review the procedure to define the type BPXMCDXS couple data set.

---

**BPXF228I** ERROR CREATING DIRECTORY FOR PATHNAME *pathname* RETURN CODE= *rc* REASON CODE= *rsn*.

**Explanation:** During z/OS UNIX initialization, the path name constructed using the MOUNTPOINT and MKDIR keywords of the ROOT or MOUNT statement in the BPXPRMxx parmlib member could not be created.

In the message text:

*pathname*  
The path name specified on the MKDIR keyword on the ROOT or MOUNT statement of the BPXPRMxx parmlib member. This name may be truncated.

*rc*  
The return code from the MKDIR request.

*rsn*  
The reason code from the MKDIR request.

**System action:** The file system is mounted, and processing continues.

**Operator response:** Contact your system programmer.

**System programmer response:** Use the return and reason codes to determine if the problem can be corrected. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes. If you are not able to correct the problem, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center to report the defect identified by this message. Provide the console log containing this message, and any corresponding dump.

**Module:** BPXFSLIT  
**Source:** z/OS UNIX System Services kernel (BPX)

---

**BPXF229I** PHYSICAL FILE SYSTEM *type* IS NOW RECYCLING.

**Explanation:** The Physical File System is recycling, which includes refreshing its storage and re-establishing the file system hierarchy.

In the message text:
**type**
The file system type from the FILESYSTYPE statement in the BPXPRMxx parmlib member.

**System action:** The Physical File System (PFS) will refresh its storage and then re-establish the file system hierarchy. Each file system mount will be completed asynchronously and directories will be reconnected. While refreshing, file requests for file systems in this PFS will either suspend or fail. When all file system mounts are complete, file requests can resume.

**Operator response:** If the condition persists, contact the system programmer. D OMVS,PFS will show the recycle status of the PFS. D OMVS,F will show the mount status of individual file systems.

**System programmer response:** D OMVS,PFS will show the start time of a recycle. Use MODIFYOMVS,STOPPFS=pfsname to terminate the PFS and stop the recycle.

**Module:** BPXVOCTL

**Source:** z/OS UNIX System Services kernel (BPX)

---

**BPXF230I** BPXF230I UNIX SYSTEM SERVICES HAS REJECTED ALTERNATE COUPLE DATA SET data set name ON VOLUME volume name, THE COUPLE DATA SET VERSION IS alternate version, THE ACTIVE PRIMARY COUPLE DATA SET VERSION is primary version.

**Explanation:** An attempt was made to activate an alternate type BPXMCDS couple data set. UNIX System Services has rejected the request because the couple data set was defined with a version that is less than the active primary couple data set. The version of the alternate couple data set must be equal to or greater than the version of the primary couple data set.

In the message text:

- **data set name**
  - The name of the couple data set rejected by UNIX System Services.

- **volume name**
  - The name of the volume on which the rejected couple data set resides.

- **alternate version**
  - The version of the couple data set rejected by UNIX System Services.

- **primary version**
  - The version of the active primary couple data set.

**System action:** The attempt to activate the specified couple data set failed. System processing continues.

**Operator response:** Contact your system programmer.

**System programmer response:** Use the SETXCF COUPLE system command to enable a type BPXMCDS alternate couple data set that is formatted at a version equal to or greater than the version of the active type BPXMCDS primary couple data set.

**Module:** BPXMCDSF

---

**BPXF232E** ERROR MOVING FILE SYSTEM fsname FILE filename INODE inodeno RETURN CODE = retcode, REASON = reason

**Explanation:** This message is issued as part of moving a filesystem. Processing involving a particular file caused the move to fail. The return and reason codes identify the cause of the problem. This message may be issued with BPXO037E.

In the message text:

- **fsname**
  - The file system which was being moved.
The file name in the file system which was processed at the time of the error. Note that there may be more than one file with this name in the file system. The file name may not be available in some cases. The inode can be used to identify the file.

The Inode number of file name, in case the file name 'is missing or is a duplicate.

Return code that stopped this move request.

Reason code that stopped this move request. The code may be internal only.

File system processing continues. Depending on the command, another system may be selected for this move request.

Contact the system programmer.

Interpret the return and reason codes. A likely cause would involve setting a byte range lock for the file on the new target system. An EMVSERR is likely an internal error, in which case a system dump should occur. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. If contacting the IBM Support Center is necessary, the console log and a dump including a z/OS UNIX component file trace should be provided.

BPXPRMxx parmlib member name processed as a result of the START request.

The name of the file system that was already mounted at the mount point. The file system name is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

The system could not mount the specified file system either during z/OS initialization or in response to the SET OMVS=xx command because the mount point specified for the file system on the MOUNT statement in SYS1.PARMLIB is the root for another mounted file system. A file system cannot be mounted on a root.

In the message text:

The system does not mount file system failed_filesysname. The system continues to process other MOUNT statements in the BPXPRMxx parmlib member.

Contact the system programmer.

Verify that two mount statements don't specify the same MOUNTPOINT.

Do one of the following:

BPXF236I FILE SYSTEM failed_filesysname WAS NOT MOUNTED.
THE MOUNT POINT SPECIFIED IN
member-name ALREADY HAS
FILE SYSTEM mounted_filesysname
MOUNTED ON IT.

Explanation: The system could not mount the specified file system either during z/OS initialization or in response to the SET OMVS=xx command because the mount point specified for the file system on the MOUNT statement in SYS1.PARMLIB is the root for another mounted file system. A file system cannot be mounted on a root.

In the message text:

failed_filesysname
The file system name specified on the MOUNT statement in the BPXPRMxx parmlib member is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

member-name
The BPXPRMxx parmlib member name processed as a result of the START request.

mounted_filesysname
The name of the file system that was already mounted at the mount point. The file system name is either the name of the file system (FILESYSTEM parameter), or the name of the DD statement (DDNAME parameter) used to allocate it. For the HFS file system, FILESYSTEM refers to the name of the HFS data set containing the file system.

System action: The system does not mount file system failed_filesysname. The system continues to process other MOUNT statements in the BPXPRMxx parmlib member.

Operator response: Contact the system programmer.

System programmer response: Verify that two mount statements don't specify the same MOUNTPOINT.

Do one of the following:
BPXF237I • BPXF242I

- Ask the operator to correct the problem in BPXPRMxx. IPL the system to start z/OS UNIX with the revised member.
- Ask a superuser to enter the corrected information using the TSO/E MOUNT command.

Verify that two mount statements don't specify the same MOUNTPOINT.

Module: BPXFSLIT, BPXTXRIN

serializationcategory
(Since datetime)

sysname sysname sysname sysname sysname sysname sysname
FILESYSTEM NAME=fsname
NUMBER OF UNMOUNTS IN PROGRESS=numunmounts
In response to a MODIFY BPXOINIT,FILESYS=DISPLAY,GLOBAL command, this message displays system information about the z/OS UNIX System Services member status of each system in the SYSBPX sysplex group.

In the message text:

timestamp
The date and local time for the MODIFY command output. The date is represented as year/month/day, and the time is represented as hours (00–23), minutes (00–59), and seconds (00–59).

system
The name of the system in the sysplex for which status is being provided.

ver
The LFS functional capability version.

pro
The LFS protocol version.

mod
The LFS protocol modification level.

sysstatus
One of the following:

VERIFIED
Sysplex and local state are consistent.

SYSTEM NAME INCONSISTENT
The system name is inconsistent between the sysplex representation and the local representation.

MEMBER TOKEN INCONSISTENT
The member token is inconsistent between the sysplex representation and the local representation.

SYSTEM ID INCONSISTENT
The system ID is inconsistent between the sysplex representation and the local representation.

action
One of the following:

NONE
There is no recommended recovery action to take.

FIX
There is an inconsistency in the sysplex representation of this system.

Use the MODIFY BPXOINIT,FILESYS=FIX system command to further diagnose and possibly correct this inconsistency.

After performing the FIX function, if the inconsistency persists, a restart of the named system may be required to correct the error.

cdsver
The version of the type BPXMCDS couple dataset.

lastmountdevice
The device number of the last file system mounted in the sysplex.

maxmounts
The maximum number of file systems that can be mounted in the active type BPXMCDS couple data set. This value corresponds to the NUMBER parameter specified in the MOUNTS item name statement in the JCL used to format the type BPXMCDS couple data set. See SYS1.SAMPLIB(BPXISCDS) for a sample JCL job.

activemounts
The number of mount entries in the active type BPXMCDS couple data set that are in use.
**BPXF242I**

*maxamtrul*

The maximum number of automount rules defined for the type BPXMCDS couple data set. This value corresponds to the NUMBER parameter specified in the AMTRULES item name statement in the JCL used to format the type BPXMCDS couple data set. See SYS1.SAMPLIB(BPXISCDS) for a sample JCL job.

*amtrulinuse*

The number of automount rules in the active type BPXMCDS couple data set that are in use. An automount rule is required for each generic or specific entry in an automount map file.

*serializationcategory*

One of the following:

- **SYSTEM PERFORMING INITIALIZATION**
  Lists the system that is performing file system initialization.

- **SYSTEM PERFORMING MOVE**
  Lists the system that is in the process of moving ownership of a file system to another system.

- **SYSTEM PERFORMING QUIESCE**
  Lists the system that is in the process of quiescing a file system that it serves.

- **SYSTEMS PERFORMING UNMOUNT**
  Lists the systems that are in the process of unmounting one or multiple file systems that they serve.

- **SYSTEMS PERFORMING MOUNT RESYNC**
  Lists the systems that are in the process of updating their local file system hierarchy to be consistent with the file system hierarchy.

- **SYSTEMS PERFORMING LOCAL FILE SYSTEM RECOVERY**
  Lists the systems that are in the process of performing local file system recovery resulting from a system exiting the SYSBPX sysplex group.

- **SYSTEM PERFORMING NEWROOT**
  Lists the system that is performing the F OMVS,NEWROOT command. The file system name might not be known yet.

- **SYSTEMS PERFORMING FILE SYSTEM TAKEOVER RECOVERY**
  This entry lists the system that is performing the F OMVS,NEWROOT command. The file system name might not be available yet.

- **SYSTEMS RECOVERING UNOWNED FILE SYSTEMS**
  Lists the systems that are in the process of performing file system takeover recovery for one or more unowned file systems.

- **SYSTEMS PERFORMING REPAIR UNMOUNT**
  Lists the systems that are in the process of performing a repair unmount, which is initiated as a result of MODIFY BPXOINIT,FILESYS=FIX or FILESYS=UNMOUNTALL system command, or a similar file system diagnostic function.

- **SYSTEM PERFORMING REMOUNT**
  Lists the system that is in the process of remounting a file system.

- **SYSTEM PERFORMING RECYCLE**
  Lists the system that is performing PFS recycle.

*datetime*

The date (year/month/day) and time in hours (00–23) minutes (00–59), and seconds (00–59) that this category of processing was started.

*sysname*

The name of the system associated with the event.

*fsname*

The name of the file system associated with this event.

*numunmounts*

The number of file systems that are in the process of being unmounted.

*queueuname*

One of the following:
**ACTIVE QUEUE**
This entry lists the active serialization categories.

**PENDING QUEUE**
This entry lists the pending serialization categories.

cattypes
One of the following:

**MOUNT RESYNC**
One or more systems are in the process of updating their local file system hierarchy to be consistent with the sysplex hierarchy.

**UNMOUNT**
One or more systems are in the process of unmounting one or more file systems.

**UNOWNED RECOVERY**
One or more systems are in the process of recovering unowned file systems.

**MOVE**
A system is in the process of moving ownership of one or more file systems to another system.

**UNMOUNT SUBTREE**
One or more file systems are in the process of being unmounted.

**RECOVERY**
One or more systems are in the process of recovering file systems. This is performed as part of partition recovery.

**INTERVAL**
One or more systems are waiting for an interval when there is no serialized shared file system activity in progress.

**REMTOUNT**
A system is in the process of remounting a file system.

**INVALID**
An invalid value was found.

execution
One of the following:

**EXCLUSIVE**
One operation in this serialization category is allowed.

**SHARED**
Multiple, concurrent operations in this serialization category are allowed.

System action: The system continues processing.
Operator response: None.
System programmer response: None.

Descriptor Code: 5,8

BPXF243E  F OMVS,NEWROOT COMMAND HAS BEEN TERMINATED DUE TO THE FOLLOWING
REASON(S): text

Explanation: The request to switch the sysplex root file system has been terminated. One or more of the system environment conditions for changing the sysplex root file system needs to be corrected before continuing the sysplex root replacement.

The text can be one or more of the following:
CURRENT SYSPLEX ROOT FILE SYSTEM IS UNAVAILABLE
Indicates that the current root file system is not available. To replace an unowned current sysplex root file system, use the COND=FORCE option.

NO FILE SYSTEM IS MOUNTED ON THE SYSPLEX ROOT
Indicates that no file system is mounted on the current sysplex root.

CURRENT SYSPLEX ROOT FILE SYSTEM IS QUIESCED
Indicates that the current sysplex root file system is quiesced or super-quiesced by other activities.

CURRENT SYSPLEX ROOT FILE SYSTEM IS MOUNTED RDWR
Indicates that the current root file system is mounted in read/write mode.

CURRENT SYSPLEX ROOT FILE TYPE IS INVALID
Indicates that the current sysplex root file system PFS type is not HFS or zFS.

CURRENT SYSPLEX ROOT HAS FUNCTION SHIPPING CLIENTS
Indicates that a current sysplex root file system contains function shipping clients.

CURRENT SYSPLEX ROOT IS EXPORTED
Indicates that the current sysplex root file system directories are exported by programs. Two possible programs are DFS and SMB servers.

NEW SYSPLEX ROOT FILE SYSTEM DATASET IS NOT FOUND
Indicates that the new data set in the sysplex root file system specified cannot be found.

NEW SYSPLEX ROOT FILE SYSTEM IS DFHSM MIGRATED
Indicates that the new sysplex root file system is migrated.

NEW SYSPLEX ROOT FILE TYPE IS INVALID
Indicates that the new sysplex root file system type is neither HFS nor zFS.

NEW SYSPLEX ROOT UID, GID OR MODE IS INVALID
Indicates that new sysplex root UID, GID, or permission bits do not match the current sysplex root UID, GID, or permission bits.

BYTE RANGE LOCKS ARE HELD IN CURRENT SYSPLEX ROOT
Indicates that byte range locks are held in the current sysplex root file system.

SYSTEM IS NOT CONFIGURED AS SHARED FILE SYSTEM
Indicates that this system is not in the shared file system (sysplex) configuration.

ONE OR MORE SYSTEM IS NOT AT THE REQUIRED LFS VERSION
Indicates that at least one or more system is below the minimum LFS version level required for the NEWROOT command support.

NEW SYSPLEX ROOT FILE SYSTEM IS CURRENTLY MOUNTED
Indicates that the new sysplex root file system is currently mounted.

NEW SYSPLEX ROOT FILE SYSTEM MOUNT FAILED
RETURN CODE = retcode REASON CODE = rsncode
Indicates that the new sysplex root file system mount failed on at least one system in the shared file system configuration.

NEW SYSPLEX ROOT FILE SYSTEM DOES NOT CONTAIN THE FOLLOWING MOUNT POINT
NAME: pathname
RETURN CODE = retcode REASON CODE = rsncode
Indicates that the new sysplex root file system does not contain all the mount points required. The new sysplex root file system at minimum must contain all the mount points defined on the current sysplex root file system.

ANOTHER INSTANCE OF THE COMMAND IS ALREADY RUNNING
Indicates that the F OMVS,NEWROOT command was already issued by another system on the shared file system configuration and is being processed.

SYSPLEX ROOT FILE SYSTEM PFS TERMINATED
Indicates that the current sysplex root file system PFS or new sysplex root file system PFS has terminated. The current sysplex root file system’s PFS or new sysplex root file system’s PFS has terminated. The current sysplex root file system’s PFS and the new sysplex root file system’s PFS must be up in all systems in the sysplex in order to continue the sysplex root migration processing.
NEW SYSPLEX ROOT FILE SYSTEM DOES NOT CONTAIN THE FOLLOWING SYMLINK

NAME: pathname

RETURN CODE = retcode
REASON CODE = rsncode

Indicates that the new sysplex root file system does not contain the symlinks required. The new sysplex root file
system at minimum must contain all the symlinks defined on the existing sysplex root file system.

FOLLOWING SYMLINK CONTENT DOES NOT MATCH

NAME: pathname

Indicates that the symlink contents in the new sysplex root file system does not match the symlink contents in
the existing sysplex root file system. The new sysplex root file system at minimum must contain all the symlinks
defined on the existing sysplex root file system and the contents must be the same.

F O MV S, NEWROOT COMMAND NOT COMPLETED ON ONE OR MORE SYSTEMS

SYSTEM NAME: systemname

Indicates that the new sysplex root file system update failed for some internal reason. At minimum the sysplex
root filesystem in this system is in incomplete state.

System action: The sysplex root file system is not replaced. The processing stopped due to constraint violations.

Operator response: Contact your system administrator.

System programmer response: Verify that all the indicated requirements are met on all the systems in the shared
file system configuration, and issue the request again.

For reason:
CURRENT SYSPLEX ROOT FILE SYSTEM IS UNAVAILABLE

Issue D OMVS,F command to identify the cause. To replace an unowned current sysplex root file system, use the
COND=FORCE option.

For reason:
CURRENT SYSPLEX ROOT HAS FUNCTION SHIPPING CLIENTS

Issue D OMVS,F command on all systems to identify systems that do not have the sysplex root mounted locally.

For reason:
NEW SYSPLEX ROOT FILE SYSTEM IS DFHSM MIGRATED

HRECALL the data set for the sysplex root file system.

For reason:
NEW SYSPLEX ROOT UID, GID, or MODE is invalid

Temporarily mount the desired new sysplex root and change the mode via the chmod shell command, or change the
UID or GID via the chown shell command as needed. The new sysplex root must be unmounted before retrying the
NEWROOT command.

For reason:
NEW SYSPLEX ROOT FILE SYSTEM FAILED

Review the failing return and reason code for the mount.

For reason:
NEW SYSPLEX ROOT FILE SYSTEM PFS TERMINATED

Issue the D OMVS,P command on each system to verify that the PFS is running. If the problem persists and the
return and reason codes suggest an internal error, search problem reporting databases for a fix for the problem. If no
fix exists, contact the IBM Support Center.

Module: BPXTXROT

Source: z/OS UNIX System Services kernel (BPX)
BPXF244E  •  BPXF245I

Routing Code: 2
Descriptor Code: 5,8

BPXF244E  F OMVS,NEWROOT COMMAND FAILED. RETURN CODE=retcode  REASON CODE=rsncode

Explanation: The request to switch the sysplex root file system has been terminated. This can occur for various error conditions such as the system owning the root has terminated. This message is only issued on the system that owns the sysplex root.

In the message text:

retcode  The return code.
rsncode  The reason code.

System action: The sysplex root file system is not replaced. F OMVS,NEWROOT processing has terminated.

Operator response: Contact your system administrator.

System programmer response: Determine whether the current root file system is still active through the D OMVS,F command, and whether any z/OS UNIX System Services file system work has not completed through the D OMVS,W command.

For a system failure, it might be possible to reissue the command on another system in the sysplex. If the return and reason codes suggest that the problem is not permanent, reissue the command. If the return and reason codes suggest an internal error, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: BPXTXROT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 5

BPXF245I  LIST OF ACTIVITIES IN THE CURRENT SYSPLEX ROOT FILE SYSTEM:

Path Name: pathname  INODE: InodeNumber

Explanation: This is a list of files or directories with activity in the current sysplex root file system at the time of F OMVS,NEWROOT command processing. This message is issued from every system that contains file activity that prevents the F OMVS,NEWROOT command from completing successfully.

In the message text:

pathname  The path name (up to the first 64 characters) of the file or directory that has the activity. If the path name cannot be determined, only the file or directory name is displayed (up to the first 16 characters).

InodeNumber  Inode number of the file or directory that has activity. This is only displayed if the path name of the file cannot be determined. The inode refers to the path name directly above it.

Operator response: Contact your system administrator.

System programmer response: Sysplex root file system resources are currently being used by active workloads. Wait until the current active workloads to complete or cancel the active workloads, and reissue the command. You can also issue the F OMVS,NEWROOT command with COND=NO parameter to proceed unconditionally even if activities are found in the current sysplex root file system. All the activities using the resources in the current sysplex root file system will be broken on replacement of the new sysplex root file system and might get EIO error code. To determine which users are using files in the sysplex root, use the z/OS UNIX zlsof command. The following will display usage information for the files: "zlsof /".

Module: BPXTXROT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
BPXF246I  THE SYSPLEX ROOT FILE SYSTEM MIGRATION PROCESSING COMPLETED SUCCESSFULLY.

Explanation: The replacement of the sysplex root file system completed successfully. You can resume your normal workloads on the system.

System action: The sysplex root file system is replaced with the file system specified.

Operator response: None.

System programmer response: Update the BPXPRMxx member with the new sysplex root file system if necessary.

Module: BPXTXROT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 5

BPXF247I  SYSPLEX ROOT MOUNT PARMS ARE DROPPED ON REPLACEMENT.

Explanation: Mount parameters for the sysplex root file system are not preserved when replacing the sysplex root file system with another file system type through the F OMVS,NEWROOT command. If the sysplex root file system types are the same, the mount parameters are preserved.

Operator response: Contact your system administrator.

System programmer response: Verify whether the dropping of mount parameters is acceptable for your installation.

Module: BPXTXROT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 5

BPXF248I  THE NEW SYSPLEX ROOT FILE SYSTEM IS MISSING THE FOLLOWING MOUNT POINT:
NAME: filesysname
PATH: pathname

Explanation: The new sysplex root file system is missing the specified mount point. The new sysplex root file system must contain the mount point in order to mount the specified file system that was mounted on the existing sysplex root file system.

In the message text:
filesysname
The file system name that is mounted on the mount point.

pathname
The path name that does not exist on the new root.

System action: The sysplex root file system is not replaced. The processing stopped.

Operator response: Contact your system programmer.

System programmer response: Correct the condition that caused the problem, and reissue the request.

Module: BPXTXROT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 5
BPXF249I THE MOUNT POINT PATH FOR THE FOLLOWING FILE SYSTEM EXCEEDS THE MAXIMUM LENGTH:NAME: filesysname

Explanation: The path name of the mount point for the indicated file system is more than 64 characters. The current restriction for NEWROOT with COND=FORCE or for ALTROOT support is that the path name of the mount point in the sysplex root for child file systems cannot exceed 64 characters.

In the message text:

filesysname
  The name of the file system that is mounted.

System action: The sysplex root file system is not replaced. The processing stopped.

Operator response: Contact your system programmer.

System programmer response: Correct the condition that caused the problem, and reissue the request.

Module: BPXTXROT

Routing Code: 2
Descriptor Code: 4
BPXF252I  ALTROOT FILE SYSTEM \textit{fsname} WAS NOT MOUNTED. RETURN CODE=\textit{retcode}, REASON CODE=\textit{rsncode}

**Explanation:** The system could not mount the specified alternate sysplex root file system. See the return code and reason code for further details. For detailed description of the return and reason codes, see \textit{z/OS UNIX System Services Messages and Codes}.

In the message text:

\textit{fsname}

The file system name specified on an ALTROOT statement in the BPXPRMxx parmlib member.

\textit{retcode}

The return code explaining the failure.

\textit{rsncode}

The reason code explaining the failure.

**System action:** The specified alternate sysplex root file system is not mounted. The system continues processing.

The alternate sysplex root file system is not established by this instance, but previously established alternate sysplex root file system can still be active and is not affected by outcome of this instance. Issue the D OMVS,O command to find out whether the alternate sysplex root file system is active in the sysplex.

**Operator response:** Contact your system programmer.

**System programmer response:** Correct the conditions reported by the return code and the reason code. Issue the SET OMVS command to establish the alternate sysplex root file system again.

**Module:** BPXTXRIN

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 4

---

BPXF253E  ALTROOT INACTIVE

**Explanation:** The alternate sysplex root file system support is inactive because of the indicated condition. Note that this message only indicates one possible problematic condition and multiple conditions might exist.

In the message text, \textit{reason} is one of the following lines:

**ALTROOT FILE SYSTEM IS NOT MOUNTED OR IS UNMOUNTED.**

An error occurs during mounting the alternate sysplex root file system, or the alternate sysplex root file system is unmounted.

**ALTROOT FILE SYSTEM IS CURRENTLY UNOWNED.**

The alternate sysplex root file system is currently unowned and not available for replacement.

**NOT ALL SYSTEMS ARE AT REQUIRED RELEASE.**

Down level release systems are in the OMVS sysplex group.

**ALTROOT IS NOW ACTIVE AS CURRENT SYSPLEX ROOT.**

The current sysplex root file system has been replaced with the alternate sysplex root file system. The sysplex no longer has an alternate sysplex root file system.

**ALTROOT MOUNT FAILED ON SOME SYSTEMS.**

The alternate sysplex root file system mount failed to mount on one or more systems in the shared file system configuration. Check the BPXF259I message to identify the system name, return code, and reason code.

**System action:** The sysplex no longer has an alternate root file system.

**Operator response:** Notify the system programmer.

**System programmer response:** Check the hardcopy log for any mount errors related to the alternate sysplex root file system. Correct the errors or problematic conditions, and use the SET OMVS command to establish the alternate sysplex root file system again.

**Module:** BPXTXRIN

BPXF256I  fsname IS NOW ACTIVE AS CURRENT SYSPLEX ROOT.

Explanation:  The current sysplex root file system is replaced with the alternate sysplex root file system.

In the message text:

fsname
    The file system name specified on the ALTROOT statement in the BPXPRMxx parmlib member.

System action:  The alternate sysplex root file system is now active as the sysplex root in the shared file system configuration. The sysplex no longer has an alternate sysplex root file system.

Operator response:  Notify the system programmer.

System programmer response:  Issue the SET OMVS command to establish an alternate sysplex root file system.

Module:  BPXTXRA2
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  2
Descriptor Code:  4
BPXF257I SYSPLEX ROOT REPLACEMENT FAILED: RETURN CODE = return_code REASON CODE = reason_code

Explanation: The system failed to make the alternate sysplex root file system as the current sysplex root file system due to processing errors. See the return code and reason code for further details. If this message is issued when ALTROOT processing was automatically invoked after dead system takeover of the root failed, then an SVC dump of each active system in the shared file system configuration will be captured.

In the message text:

- **return_code**
  - The return code.
- **reason_code**
  - The reason code.

**System action:** The alternate sysplex root file system might not be established, or it is established but not active.

**Operator response:** Notify the system programmer.

**System programmer response:** Issue the D OMVS,O command and verify whether the alternate sysplex root file system is active. Check the BPXF253E message for further details.

- If the established the alternate root file system is unmounted by the system processing, correct the errors identified by the return code and reason code, and then issue the F OMVS,NEWROOT command specifying alternate sysplex root file system with the COND=FORCE option.
- If the alternate sysplex root file system is not established or active, issue the SET OMVS command to establish an alternate sysplex root file system.

**Module:** BPXTXROT

BPXF270I THE MAXPIPEUSER LIMIT OF <nnn> HAS BEEN REACHED BY USER <cccccccc>, UID=
<nnnnnnnnnn>

Explanation: This message is issued to hardcopy only. The specified user has reached the MAXPIPEUSER limit. Additional pipe() or FIFO open() requests will fail for this user.

In the message text:

maxpipeuser
The current MAXPIPEUSER value for this user. For UID=0 users, the MAXPIPEUSER value of 8730 is always used. For all other users, the current MAXPIPEUSER parmlib value is used

user
The user login name.

uid
The user ID, in decimal, who has reached the MAXPIPEUSER limit. A value of 4,294,967,295 is used if the UID cannot be determined. (This value is not within the valid UID range used by the system.

System action: The system continues processing.
Operator response: Contact the system programmer.

System programmer response: Use the D OMVS,PIPES system command to review pipe usage by this user. Use the D OMVS,PIPES,U= system command to review the active processes for the user. Use the SETOMVS or SET OMVS command to increase the MAXPIPEUSER value if needed.

You can use the D OMVS,PIPES,RESET system command to reset all user pipe highwater usage counts. This will result in this message being reissued if the MAXPIPEUSER limit is reached again.

BPXF271I FILE SYSTEM filesysname FAILED TO UNMOUNT BECAUSE IT CONTAINS MOUNTPOINT
DIRECTORIES FOR ONE OR MORE OTHER FILE SYSTEMS WHICH MUST BE UNMOUNTED
FIRST, INCLUDING FILE SYSTEM childfilesysname

Explanation: This message is issued when an unmount failed because the file system contains mountpoints for one or more other file systems which must be unmounted first.

In the message text:

filesysname
The name of the file system being unmounted.

childfilesysname
The name of one of the file systems mounted on the file system being unmounted.

System action: The unmount fails.
Operator response: None.

System programmer response: Unmount the child file system identified in the message, and then retry the original unmount. Only the first child file system found is identified, but there may be additional mounted file systems that must also be unmounted first. D OMVS,F or MODIFY BPXINIT,FILESYS=DISPLAY,ALL commands may be issued
BPXF272I • BPXF273I

to determine if there are other mounted file systems whose mountpoints are in the file system.

**Descriptor Code:** 4, HARDCOPY ONLY

---

**BPXF272I** THE FILESYSTEM FAILED TO UNMOUNT BECAUSE IT CONTAINS MOUNTPOINTS FOR ONE OR MORE OTHER FILE SYSTEMS WHICH MUST BE UNMOUNTED, INCLUDING FILE SYSTEM <childfilesysname>

**Explanation:** This message is issued when the file system specified on the MODIFY BPXOINIT,FILESYS=UNMOUNT command cannot be unmounted due to other file systems mounted under it.

In the message text:

<childfilesysname>

The name of one of the file systems mounted on the file system being unmounted.

**System action:** The MODIFY command is rejected.

**Operator response:** None.

**System programmer response:** Unmount the child file system identified in the message, and then retry the command. Only the first child file system found is identified, but there may be additional mounted file systems that must also be unmounted. D OMVS,F or MODIFY BPXOINIT,FILESYS=DISPLAY,ALL commands may be issued to determine if there are other mounted file systems whose mountpoints are in the file system.

BPX274I • BPX275E

BPX274I  FILE SYSTEM <filesysname> FAILED TO MOUNT. RETURN CODE = <returncode>, REASON CODE = <reason code>

Explanation: The mount of the file system failed.

In the message text:
filesysname
The name of the file system being mounted.
returncode
The return code from the mount.
reasoncode
The reason code from the mount.

System action: None.
Operator response: None.
System programmer response: None.
Module: BPXTSMFU
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4, HARDCOPY ONLY

BPX275E  PFS RECOVERY COULD NOT COMPLETE FOR PROCESS pid ASID asid. PFSES WHICH MAY HAVE LOST RESOURCES INCLUDE: pfsname pfsname

Explanation: The PFS (Physical File System) could not complete its recovery for a call in progress during user address space end of memory and the results may be unpredictable. Resources or locks may be lost and the PFS may have to be recycled if other users begin to hang up while using it.

In the message text:
pid
The process ID, in decimal, of the process containing the terminating thread.
asid
The address space ID, in hexadecimal, of the address space containing the terminating thread.
pfsname
The name of up to 3 PFSes associated with the tasks hung in EOM.

System action: ABEND EC6 Reason RRETIME (xxxx0585) is issued. An SDUMP is also captured.
Operator response: None.
System programmer response: Contact the IBM support center and provide the SDUMP for problem analysis. Lost locks may result in hangs; use the D GRS,C system command to review resource contention. Use the D OMVS,W system command to determine if any PFS operations are hung in the PFS. For example, the D OMVS,W,A command will display all tasks waiting more than 5 minutes. Refer to the PFS documentation for PFS-specific recovery procedures:
• For zFS, if there is a hung thread then one of the following messages may be subsequently issued: IOEZ00524I, IOEZ00660I or IOEZ00661I. Refer to z/OS Distributed File Service zFS Administration for guidance on detecting hung threads. If there is a hung thread then zFS will need to be canceled. Normal zFS recovery procedures for hung threads will not correct this EOM recovery failure.
• For NFS procedures refer to z/OS Network File System Guide and Reference.
• For Communications Server procedures, refer to z/OS Communications Server: IP Diagnosis Guide.

If there are hung users or applications that have operations outstanding in one of the named PFSes, recycle the PFS, recycle OMVS, or reIPL the system. To recycle the PFS:
• Use the MODIFY OMVS,STOPPFS= system command if the PFS supports it. STOPPFS for zFS will not correct this problem; zFS must be canceled.
BPXF900I • BPXF901I

- If the PFS is executing in a colony PFS address space, you can CANCEL the colony. Use the D OMVS,PFS system command to determine if the PFS is executing in a colony.
- For a Communications Server TCPIP stack, use the STOP <jobname> command. For example, STOP TCPIP.

OMVS can be recycled using the F OMVS,SHUTDOWN and F OMVS,RESTART system commands.

Once the analysis of the impact of the problem is complete, delete this message using the CONTROL C system command.

Programmer response: None.

Descriptor Code: 4

BPXF901I  ERROR CREATING DIRECTORY dirname RETURN CODE = retcode REASON CODE = rsncode

Explanation: While mounting the sysplex root file system, the creation of the system root or version root directory failed. This usually indicates a full file system.

In the message text:

- dirname
  The directory for the system root or version root.

- retcode
  The return code from the mkdir request.

- rsncode
  The reason code from the mkdir request. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The file system was mounted, and processing continues. The specified directory was not created.

Operator response: None.
System programmer response: Review return code and reason code in z/OS UNIX System Services Messages and Codes to determine the appropriate action.
Module: BPXFSMNT
BPXF902I • BPXF903I

BPXF902I  dirname CANNOT BE CREATED BECAUSE FILE SYSTEM filesys IS MOUNTED IN READ-ONLY MODE

Explanation: While mounting the sysplex root file system as read-only, it was detected that the system root or version root directory does not exist.

In the message text:

dirname
  The directory for the system root or version root.

filesys
  The name of the sysplex root file system.

System action: The file system was mounted, and processing continues.

Operator response: None.

System programmer response: Use either of the following procedures:

• Procedure 1:
  1. Issue F OMVS,SHUTDOWN command to shut down all systems.
  2. Change the ROOT statement in the BPXPRMxx parmlib member to a mode of RDWR.
  3. Issue F OMVS,RESTART command to restart all systems.
  4. (Optional) Remount the sysplex root as READ.

• Procedure 2:
  1. Remount the sysplex root as RDWR.
  2. Create the system root and version root with the TSO MKDIR command.
  3. (Optional) Remount the sysplex root as READ.

Module: BPXFSMNT

BPXF903I THE ATTRIBUTE RETRIEVAL CALL (IGWASMS) FOR FILE SYSTEM fsname FAILED. RC = retcode, RSN = rsncode, DIAG = diagcode

Explanation: The system could not obtain attribute information for the specified file system because of an unexpected error from the IGWASMS service.

In the message text:

fsname
  The name of the file system associated with this request.

retcode
  The return code from the data set attribute retrieval call (IGWASMS).

rsncode
  The reason code from the data set attribute retrieval call (IGWASMS).

diagcode
  The diagnostic code from the data set attribute retrieval call (IGWASMS).

For an explanation of the return, reason and diagnostic codes, see z/OS DFSMSdfp Advanced Services.

System action: The file system attributes could not be determined. The system continues processing without attribute information.
BPXF904I • BPXF905I

Operator response: Contact the system programmer.

System programmer response: Use the return, reason and diagnostic codes to determine the cause of the IGWASMS failure and the action to take to resolve the issue. Retry the request after the problem has been corrected.

Module: BPXVRGEX

Source: z/OS UNIX System Services file system

Descriptor Code: 4

BPXF904I THE SPECIFIED PARAMETER STRING ON THE MOUNT STATEMENT OR COMMAND FOR FILE SYSTEM fsname HAS BEEN IGNORED. THE SPECIFIED FILE SYSTEM TYPE IS fstype BUT THE ACTUAL TYPE IS actualfstype.

Explanation: The file system type specified for the mount was different from the actual type of the file system. The specified parameter (option) string is ignored.

In the message text:

fsname
The name of the file system associated with this request.

fstype
The file system type specified for the mount.

actualfstype
The actual file system type.

System action: The file system is mounted without the specified mount parameter (option) string.

Operator response: None.

System programmer response: Review the parameter (option) string on the mount statement. If the parameter string is desired, change the file system type to the actual type, unmount the file system and then mount again the file system with the parameter string. Note that this message is not issued for automounted file systems.

Module: BPXFSMNT

Source: z/OS UNIX System Services file system

Routing Code: 2

Descriptor Code: 4

BPXF905I REMOUNT FAILED FOR FILE SYSTEM fsname.

Explanation: An unmount with the remount option was issued on the file system and failed. The file system cannot be mounted back to its original state.

In the message text:

fsname
The name of the file system associated with this request.

System action: The file system is not active. A mount failure record is created.

Operator response: Contact the system programmer.

System programmer response: Review the mount failure record with the DOMVS,MF command and take corrective action. Once the issue is resolved, the access to the file system can be regained by reissuing the UNMOUNT command with the REMOUNT option.

Module: BPXFTCLN

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 2

Descriptor Code: 4
BPXF906I  FILE SYSTEM fsname IS NOT ACTIVE. RETURN CODE = retcode, REASON CODE = rsncode

Explanation: An error has occurred during file system move, remount or recovery processing for the named file system. The file system is in a NOT ACTIVE state. No access to the file system can occur from this system.

In the message text:

fsname
The name of the file system that is now in the NOT ACTIVE state.

retcode
The return code from the vfs_Mount operation issued as a part of file system move, remount or recovery processing.

rsncode
The reason code from the vfs_Mount operation. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The named file system is NOT ACTIVE but remains mounted on the system. Any attempt to access the file system from this system will fail. This may be a temporary state.

Operator response: Contact the system programmer.

System programmer response: Use the D OMVS,FILE,NAME=fsname system command to verify that the file system is still in the NOT ACTIVE state. If the file system is still in the NOT ACTIVE state, use the F BPXOINIT,FILESYS=FIX system command to recover the file system. (This command only needs to be issued on one system to correct the problem on all systems in the shared file system configuration.) If the file system cannot be recovered on this system, then unmount the file system using, for example, the TSO/E UNMOUNT command on any system where the file system is active. You may need to specify the FORCE option.

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

keyword-name1
The name of the first keyword.

keyword-name2
The name of the second keyword.

parm-name
The name of the parmlib parameter containing the keyword.
BPX012I • BPX013I

\textit{detmod}  
- The name of the module that detected the error.

\textit{input-line}  
- The text of the line containing the error.

\textbf{System action:} The system ignores the erroneous statement and checks the rest of the parmlib member to find any other errors.

\textbf{Operator response:} None.

\textbf{System programmer response:} Correct the error in the parmlib member before using it again.

\textbf{Module:} BPXIPMX1
\textbf{Source:} z/OS UNIX System Services kernel (BPX)
\textbf{Routing Code:} -
\textbf{Descriptor Code:} 4

---

BPX012I ERRORS IN PARMLIB MEMBER=\textit{memname}, REFER TO HARDCOPY LOG.

\textbf{Explanation:} The system encountered errors in a parmlib member.

In the message text:

\textit{memname}  
- The name of the parmlib member containing the error.

\textbf{System action:} The system wrote the error messages to the hardcopy log. Processing continues. The operator is prompted for a new OMVS= system parameter specification.

\textbf{Operator response:} None. In order to have the system complete the IPL, it is necessary to provide a valid OMVS= specification. If you know of a valid BPXPRMxx parmlib member, then specify it when prompted. If no valid BPXPRMxx members are available, then specify OMVS=DEFAULT.

\textbf{System programmer response:} Look in the hardcopy log for messages explaining the errors in the parmlib member. Correct the errors in the parmlib member before using it again.

BPXI019I  proname IS TERMINATING DUE TO AN ERROR IN A KERNEL FUNCTION

Explanation:  z/OS UNIX processing is beginning to terminate in response to an error in one of its functions.

In the message text:

proname

The name of the z/OS UNIX cataloged procedure.

System action:  z/OS UNIX terminates.

Operator response:  None.

System programmer response:  See the error messages associated with the error.

Module:  BPXPRIT

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  2

Descriptor Code:  4

BPXI020I  proname IS TERMINATING BECAUSE THE INIT PROCESS (PID = 1) HAS ENDED

Explanation:  z/OS UNIX processing is beginning to terminate, because the initialization process has terminated.

In the message text:

proname

The name of the z/OS UNIX cataloged procedure.

System action:  z/OS UNIX terminates.

Operator response:  None.

System programmer response:  See the error messages associated with the error.

Module:  BPXPRIT

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  2

Descriptor Code:  4
BPXI021I  •  BPXI022I

BPXI021I  AN ERROR OCCURRED WHILE SEARCHING FOR SYSTEM MODULE = modulename.

UNEXPECTED RETURN CODE return_code FROM CSVQUERY.

Explanation: The system encountered an error while attempting to locate the identified system module during z/OS UNIX initialization.

In the message text:

modulename
  The name of the missing system module

return_code
  The unexpected error return code from CSVQUERY. For an explanation of the return code, see the description of the CSVQUERY macro in z/OS MVS Programming: Authorized Assembler Services Reference ALE-DYN

System action: The system ends the z/OS UNIX initialization.

Operator response: Contact the system programmer.

System programmer response: The missing module must reside in SYS1.LPALIB. Determine why the identified module cannot be located in SYS1.LPALIB. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

BPXI022I  ERROR IN PARMLIB MEMBER memname ON LINE line-number, POSITION position-number. text

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
  The name of the parmlib member containing the error.

line-number
  The number of the member line containing the error.

position-number
  The position of the error in the line. The position number is the number of columns from the left.

INPUT PARAMETER VALUE IS NOT NUMERIC. THE VALUE IS IGNORED.
  The specified parameter value contains nonnumeric characters.

INPUT PARAMETER VALUE IS INCORRECT. THE VALUE IS IGNORED.
  The specified parameter value is incorrect or is null.

System action: The system ignores the erroneous parameter. The system checks the rest of the parmlib member to find any other errors.

Operator response: None.

System programmer response: Correct the error in the parmlib member before using it again.

Module:  BPXIPMX1

Descriptor Code:  4
BPXI023I ERROR IN PARMLIB MEMBER *memname* ON LINE line-number, POSITION position-number. INPUT PARAMETER VALUE IS OUT OF THE ALLOWED RANGE OF minimum-number TO maximum-number. THE VALUE IS IGNORED.

**Explanation:** The system encountered an error in a parmlib member.

In the message text:

*memname*  
The name of the parmlib member containing the error.

*line-number*  
The number of the member line containing the error.

*position-number*  
The position of the error in the line. The position number is the number of columns from the left.

*minimum-number*  
The low value of the allowed range.

*maximum-number*  
The high value of the allowed range.

**System action:** The system ignores the erroneous statement. The system checks the rest of the parmlib member to find any other errors.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the error in the parmlib member before using it again.

BPXI025I

BPXI025I  ERROR IN PARMLIB MEMBER=memname ON LINE line-number. PARTITIONED DATASET IS INCORRECT. REASON: text

Explanation: The system encountered an error in a parmlib member. The input length of a keyword or parameter partitioned dataset was incorrect.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

text
One of the following:

MEMBER LENGTH IS NOT 1-8. DETECTING MODULE IS detmod. INPUT LINE: input-line
The member length is not 1-8.

INVALID CHARACTER DETECTED IN MEMBER NAME. DETECTING MODULE IS detmod. INPUT LINE: input-line
An invalid character was detected in the member name.

FIRST CHARACTER IN MEMBER NAME NOT VALID. DETECTING MODULE IS detmod. INPUT LINE: input-line
The first character in the member name is not valid.

INVALID CHARACTER DETECTED IN DATASET NAME. DETECTING MODULE IS detmod. INPUT LINE: input-line
An invalid character was detected in the dataset name.

FIRST CHARACTER IN DATASET NAME NOT VALID. DETECTING MODULE IS detmod. INPUT LINE: input-line
The first character in the dataset name is not valid.

FIRST CHARACTER IN A DATASET SEGMENT NOT VALID. DETECTING MODULE IS detmod. INPUT LINE: input-line
The first character in a dataset segment is not valid.

A DATASET SEGMENT LENGTH IS NOT 1-8. DETECTING MODULE IS detmod. INPUT LINE: input-line
A dataset segment length is not 1-8.

DATASET NAME LENGTH IS NOT 1-44. DETECTING MODULE IS detmod. INPUT LINE: input-line
The dataset name length is not 1-44.

MISSING RIGHT PARENTHESIS. DETECTING MODULE IS detmod. INPUT LINE: input-line
The partition dataset name is missing a right parenthesis.

detmod
The name of the module that detected the situation.

input-line
The text of the line containing the error.

System action: The system may ignore the erroneous statement or it may stop initialization after parsing completes. The system checks the rest of the parmlib member to find any other errors.

Operator response: None.

System programmer response: Correct the error in the parmlib member before using it again.

BPXI029I  AN OMVS= PARMLIB MEMBER WAS NOT FOUND OR IS IN ERROR.

Explanation:  z/OS UNIX parmlib parsing has encountered one of the following problems:
  • There was a syntax error in one of the specified parmlib members
  • A specified parmlib member does not exist.
  • The operator hit Enter without specifying a parmlib member when replying to message IEA341I, which directs
    OMVS to come up in DEFAULT(MINIMUM) mode.

Once the system is IPLed, check the hardcopy log for additional information.

System action:  The system prompts for a new OMVS= parmlib specification.

Operator response:  Specify a new OMVS= parmlib specification or take the system default by specifying
    OMVS=DEFAULT. Hitting enter at the prompt without specifying a value also causes the system to take the default
    (OMVS=DEFAULT).

System programmer response:  Correct the parmlib member that caused the failure. Ask the operator to re-IPL the
    system.

Module:  BPXINRIM
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  1,2,10
Descriptor Code:  12

BPXI030I  THE OMVS= PARAMETER WAS FOUND TO HAVE A SYNTAX ERROR.

Explanation:  z/OS UNIX parmlib parsing has encountered a syntax error in the OMVS= parmlib parameter.

System action:  The system prompts for a new OMVS= parmlib specification.

Operator response:  Specify a new OMVS= parmlib specification or take the system default by specifying
    OMVS=DEFAULT.

System programmer response:  Correct the OMVS= parmlib parameter in the IEASYSPxx member used to IPL the
    system.

Module:  BPXINRIM
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  1,2,10
Descriptor Code:  12

BPXI031E  BPXOINIT FAILED TO INITIALIZE. RETURN CODE return_code REASON CODE reason_code

Explanation:  The system encountered an error while initializing the BPXOINIT process.

In the message text:

return_code
  The failure return code.

reason_code
  The failure reason code. For an explanation of the return code and reason code, see z/OS UNIX System Services
  Messages and Codes.

System action:  OMVS will fail to initialize.

Operator response:  Contact the system programmer.

System programmer response:  Examine the return and reason code for why the BPXOINIT process could not be
    initialized. Once the error is corrected the system must be re-IPLed to get OMVS started.
BPXI032E FORK SERVICE HAS BEEN SHUTDOWN SUCCESSFULLY. ISSUE F BPXOINIT,RESTART = FORKS TO RESTART FORK SERVICE.

Explanation: This message is in response to a MODIFY BPXOINIT, SHUTDOWN = FORKS system command and indicates that the SHUTDOWN of FORKS was successful.

System action: All forked processes are terminated. Any new attempts to FORK will be suspended until a MODIFY BPXOINIT, RESTART = FORKS has been requested.

Operator response: Perform any tasks that required the FORKS to be suspended, such as recycling JES2. Then issue MODIFY BPXOINIT, RESTART = FORKS to restore FORKS service.

System programmer response: None.

Module: BPXINSHU
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 1,10
Descriptor Code: 11

BPXI033E FORK SERVICE SHUTDOWN HAS FAILED. ISSUE F BPXOINIT,RESTART = FORKS TO RESTART FORK SERVICE; OR RE-IPL.

Explanation: This message is in response to a MODIFY BPXOINIT, SHUTDOWN = FORKS system command and indicates that the SHUTDOWN of FORKS could not terminate all FORKed processes.

System action: An attempt was made to terminate all FORKed processes. Not all FORKed processes were terminated. Any new attempts to FORK will be suspended until a MODIFY BPXOINIT, RESTART = FORKS has been requested.

Operator response: Perform D OMVA,A = All to determine which FORKed processes must be canceled by the operator.

System programmer response: Try to determine why all FORKed processes were not terminated. If cause cannot be found, have operator either issue a MODIFY BPXOINIT, RESTART = FORKS to restore FORK service, or schedule a re-IPL of the system resources that prompted the shutdown of the FORK service.

BPX039I SYSTEM LIMIT limname HAS REACHED limperc% OF ITS CURRENT CAPACITY OF limtot

Explanation: The z/OS UNIX System Services System Limit has reached a critical value.

In the message text:

limname
One of the following:

MAXPIPES
Maximum number of pipes and FIFOs.

MAXPROCYS
Maximum number of processes in system.

MAXUIDS
Maximum number of used UIDS in system.

MAXPTYS
Maximum number of pseudo-terminal sessions that can be active concurrently.

MAXMMAPAREA
Maximum number of MMAP areas in system used for memory mappings of HFS files. This message does not apply to processes that have their own processes limit (OMVS segment MMAPAREAMAX value) greater than the MAXMMAPAREA value. This message is suppressed when these processes are consuming mmap.
Because processes with OMVS segment MMAPAREAMAX value, greater than the BPXPRMxx MAXMMAPAREA value, contribute to the total amount of mmap pages in use, the limperc% value might be shown as greater than 100%.

**MAXSHAREPAGES**
Maximum number of system shared storage pages that can concurrently be active using the fork(), ptrace, shmat, and mmap services.

**IPCMSGNIDS**
Maximum number of unique message queues.

**IPCSEMNIDS**
Maximum number of unique semaphore sets.

**IPCSSHMNIDS**
Maximum number of unique shared memory segments.

**IPCSHMSPAGES**
Maximum number of pages for shared memory segments.

**SHRLIBRGNFSIZE**
Maximum size of the system shared library region. This is where the system library modules are loaded.

**SHRLIBMAXPAGES**
Amount of data space storage pages that can be allocated for non-system shared library modules.

**IPCMSGQBYTES**
Maximum number of bytes in a single message queue.

**IPCMSGQNUM**
Maximum number of messages per queue.

**IPCSHMMPAGES**
Maximum number of pages for a shared memory segment.

**INET MAXSOCKETS**
Maximum number of AF_INET sockets.

**UNIX MAXSOCKETS**
Maximum number of AF_UNIX sockets.

**INET6 MAXSOCKETS**
Maximum number of AF_INET6 sockets.

`limperc` The percentage value in steps: 85%-90%-95%-100%. For the MAXSHAREPAGES resource, the percentage starts at 60%.

`limtot` The absolute current value.

**System action:** The system will continue, but UNIX processes might encounter problems soon.

**Operator response:** None.

**System programmer response:** Consider raising the specified value with a SETOMVS or SET OMVS command.

**Module:** BPXMSLIM

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 1

**Descriptor Code:** 11

---

**BPX040I**  
PROCESS LIMIT `limname` HAS REACHED `limperc%` OF ITS CURRENT CAPACITY OF `limtot` FOR PID=`pid` IN JOB `name` RUNNING IN ADDRESS SPACE `asid`

**Explanation:** The z/OS UNIX System Services process limit has reached a critical level.

In the message text:
One of the following:

**MAXFILEPROC**
Maximum number of files which can be opened by one process.

**MAXPROCU0SER**
Maximum number of processes for one UserID. This is unlimited for the superuser ID with UID=0. This is also unlimited for users dubbed with the default OMVS segment. (In this case, the user is dubbed due to a request to use a kernel resource, as is the case with FTP sessions.)

**MAXQUEUEDSIGS**
Maximum number of signals which can be queued for a single process by a user.
Note: Signals queued by the system are not subject to the MAXQUEUEDSIGS limit but are included in the user limit. The system uses queued signals for asynco. When asynco is being used then up to $2^\text{(MAXQUEUEDSIGS+MAXFILEPROC)}$ signals can be queued by the system to a process.

**MAXTHREADS**
Maximum number of threads to be active concurrently for a single process.

**MAXTHREADTASKS**
Maximum number of threads to be active concurrently for a single process.

**IPCSHNMSEGS**
Maximum number of shared memory segments attached per address space.

The percentage value in steps: 85%-90%-95%-100%

BPXIO40I is first issued when a limit reaches 85% and then in 5% increments thereafter. This value can go beyond 100% in certain circumstances. For example, processes blind dubbed with the default OMVS segment.
This value can go beyond 100% in certain circumstances. For example, processes blind dubbed with the default OMVS segment.

The absolute current value.

The process ID, in decimal, of the process.

The jobname of the process where limit was reached.

The address space ID for the process.

The process will continue, but might encounter problems soon.

None.

Consider raising the specified value with a SETOMVS PID=, <LIMITNAME> command.

The BPXPRMxx parmlib member can be updated for a specific process limit for future IPLs. However this will have effect on the resource limit for all processes, not just the specific process.

**BPXI057I**  
*proname* SHUTDOWN REQUEST REJECTED  

Explanation:  
F OMVS,SHUTDOWN rejected.  

In the message text:
BPX058I • BPX060I

**procname**

The name of the z/OS UNIX System Services cataloged procedure.

**System action:** F OMVS,SHUTDOWN processing fails.

**Operator response:** None.

**System programmer response:** See additional messages for the reason for the request being rejected.

**Module:** BPXINIT

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 4

---

**BPX058I procname RESTART REQUEST ACCEPTED**

**Explanation:** z/OS UNIX System Services processing is beginning to restart in response to a system command F OMVS,RESTART.

In the message text:

**procname**

The name of the z/OS UNIX System Services cataloged procedure.

**System action:** z/OS UNIX System Services restarts. Reinitialization occurs for the z/OS UNIX System Services environment.

**Operator response:** None.

**System programmer response:** None.

**Module:** BPXINIT

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 11

**Descriptor Code:** 1

---

**BPX059I procname RESTART REQUEST REJECTED**

**Explanation:** z/OS UNIX System Services restart processing cannot proceed because z/OS UNIX System Services has not been shutdown.

In the message text:

**procname**

The name of the z/OS UNIX System Services cataloged procedure.

**System action:** F OMVS,RESTART fails.

**Operator response:** None.

**System programmer response:** z/OS UNIX System Services must be shutdown before a restart can be processed.

**Module:** BPXINIT

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 4

---

**BPX060I jobname RUNNING IN ADDRESS SPACE asid IS BLOCKING SHUTDOWN OF OMVS**

**Explanation:** z/OS UNIX System Services shutdown processing cannot proceed because the referenced job has requested to block shutdown.

In the message text:
BPX061E  •  BPX062I

jobname
   The name of the JOB blocking z/OS UNIX System Services shutdown processing.

asid
   The address space ID for the JOB.

System action:  F OMVS,SHUTDOWN is delayed.
Operator response:  None.
System programmer response:  In order for the z/OS UNIX System Services shutdown to continue, the job identified in this message must first be shutdown.
Module:  BPXQRSDS
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  2,10
Descriptor Code:  4

BPX061E  procname SHUTDOWN REQUEST ABORTED
Explanation:  F OMVS,SHUTDOWN failed.
In the message text:

procname
   The name of the z/OS UNIX System Services cataloged procedure.

System action:  F OMVS,SHUTDOWN processing fails.
Operator response:  None.
System programmer response:  See additional messages for the exact reason for failure.
Module:  BPXINIT
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  11
Descriptor Code:  1

BPX062I  jobname RUNNING IN ADDRESS SPACE asid IS PREVENTING THE SHUTDOWN OF OMVS FROM COMPLETING
Explanation:  z/OS UNIX System Services shutdown processing cannot proceed because the referenced job is not ending. The job is likely in a hung state.
In the message text:

jobname
   The name of the JOB blocking z/OS UNIX System Services shutdown processing.

asid
   The address space ID for the JOB.

System action:  F OMVS,SHUTDOWN fails.
Operator response:  None.
System programmer response:  In order for the z/OS UNIX System Services shutdown to continue, the job identified in this message must first be shutdown.
Module:  BPXQRSDS
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  2,10
Descriptor Code:  4
**BPXI063I**  •  **BPXI065E**

**BPXI063I  proname MODIFY COMMAND REJECTED DUE TO SYNTAX ERROR**

Explanation:  F OMVS command rejected due to syntax error.

In the message text:

proname

The name of the z/OS UNIX System Services cataloged procedure.

System action:  F OMVS command processing fails.

Operator response:  None.

System programmer response:  Reissue the MODIFY command with the correct syntax.

Module:  BPXINIT

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  2

Descriptor Code:  4

**BPXI064E  proname SHUTDOWN REQUEST DELAYED**

Explanation:  z/OS UNIX System Services processing has been delayed in shutdown.

In the message text:

proname

The name of the z/OS UNIX System Services cataloged procedure.

System action:  z/OS UNIX System Services waits for some address spaces to end or unblock shutdown.

Operator response:  None.

System programmer response:  See additional BPXI060I messages for the jobs that are causing the delay of the shutdown.

Module:  BPXINIT

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  11

Descriptor Code:  1

**BPXI065E  proname SHUTDOWN HAS ENCOUNTERED A NON-RETRYABLE FAILURE**

Explanation:  z/OS UNIX System Services processing has failed severely during shutdown.

In the message text:

proname

The name of the z/OS UNIX System Services cataloged procedure.

System action:  z/OS UNIX System Services waits for the system to be re-IPLed to resolve this problem.

Operator response:  None.

System programmer response:  Re-IPL the system to reactivate z/OS UNIX System Services.

Module:  BPXINIT

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  11

Descriptor Code:  1
BPXI066E  proname SHUTDOWN COULD NOT MOVE OR UNMOUNT ALL FILE SYSTEMS

Explanation:  z/OS File System move or unmount processing has failed during shutdown.

In the message text:

proname
   The name of the z/OS UNIX System Services cataloged procedure.

System action:  z/OS UNIX continues on to the next phase of shutdown.

Operator response:  None.

System programmer response:  No action is required.

Module:  BPXINIT

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  11

Descriptor Code:  1

BPXI067E  OMVS= PARAMETER IS SPECIFIED IN ERROR. RESPECIFY OMVS= PARAMETER

Explanation:  The OMVS= parameter on F OMVS,RESTART specified a parmlib member that was either not found or contained a syntax error.

System action:  The system waits for a reply.

Operator response:  Reply with a OMVS= parameter that specifies a valid BPXPRMxx parmlib members.

System programmer response:  No action is required.

Module:  BPXINIT

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  2

Descriptor Code:  2

BPXI068I  jobname RUNNING IN ADDRESS SPACE asid IS USING text

Explanation:  z/OS UNIX System Services shutdown processing cannot proceed because the referenced job holds a resource that prevents it from continuing. The identified job has registered for permanent status and thus will not be shutdown by z/OS UNIX System Services shutdown processing. This likely indicates a problem with the identified job.

In the message text:

jobname
   The name of the JOB blocking z/OS UNIX System Services shutdown processing.

asid
   The address space ID for the JOB.

text
   Where:

   SHARED LIBRARIES, PREVENTING SHUTDOWN OF OMVS
      Indicates that z/OS UNIX System Services shutdown processing cannot proceed because the referenced job is using shared library support.

   MAP SERVICES, PREVENTING SHUTDOWN OF OMVS
      Indicates that z/OS UNIX System Services shutdown processing cannot proceed because the referenced job is using __map services.

   SRB SERVICES, PREVENTING SHUTDOWN OF OMVS
      Indicates that z/OS UNIX System Services shutdown processing cannot proceed because the referenced job is using services requiring the use of z/OS UNIX System Services SRBs.
BPXI069I • BPXI070E

SHARED MEMORY SERVICES, PREVENTING SHUTDOWN OF OMVS
Indicates that z/OS UNIX System Services shutdown processing cannot proceed because the referenced job is using shared memory services.

SEMAPHORE SERVICES, PREVENTING SHUTDOWN OF OMVS
Indicates that z/OS UNIX System Services shutdown processing cannot proceed because the referenced job is using semaphores.

MEMORY MAPPED FILE SERVICES, PREVENTING SHUTDOWN OF OMVS
Indicates that z/OS UNIX System Services shutdown processing cannot proceed because the referenced job is using memory mapped file services.

MESSAGE QUEUES, PREVENTING SHUTDOWN OF OMVS
Indicates that z/OS UNIX System Services shutdown processing cannot proceed because the referenced job is using message queue services.

System action: F OMVS,SHUTDOWN fails.
Operator response: None.
System programmer response: In order for z/OS UNIX System Services shutdown to continue, the job identified in this message must first be shutdown.
Module: BPXQRSDS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2,10
Descriptor Code: 4

BPXI070E USE SETOMVS ON ANOTHER SYSTEM TO MOVE NEEDED FILE SYSTEMS, THEN REPLY WITH ANY KEY TO CONTINUE SHUTDOWN.

Explanation: z/OS File System unmount processing has failed during shutdown. All file systems that are owned by this system could not be moved or unmounted.
System action: The system waits for a reply.
Operator response: Use another system in the sysplex to issue SETOMVS commands to move file systems that are owned by this system to a different system. Reply to continue with shutdown.
System programmer response: No action is required.
Module: BPXINIT
Source: z/OS UNIX System Services kernel (BPX)
BPXI071I  ERROR IN PARMLIB MEMBER=member ON LINE line-number, POSITION position-number. MKDIR VALUE CAN NOT BEGIN WITH /.

Explanation: The system encountered an error in a parmlib member. The MKDIR parameter value can not begin with a slash(/). In the message text:

- **member**: The name of the parmlib member containing the error.
- **line-number**: The parmlib member line number containing the error.
- **position-number**: The position of the error in the line. The position number is the number of columns from the left.
- **input-line**: The text of the line containing the error.

System action: The system may ignore the erroneous statement or it may stop initialization after parsing completes. The system checks the rest of the parmlib member to find any other errors.

Operator response: None.

System programmer response: Remove the slash (/) from the beginning of the MKDIR value on the ROOT or MOUNT statement of the named BPXPRMxx parmlib member before using it again.

Module: BPXIPMX1
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: -
Descriptor Code: 4

BPXI072I  ERROR IN PARMLIB MEMBER=member ON LINE line-number, POSITION position-number. LENGTH OF MKDIR(mkdir-length) PLUS LENGTH OF MOUNTPOINT(mountpt-length) MUST BE LESS THAN pathmax.

Explanation: The path name that resulted from the resolution of the MKDIR and MOUNTPOINT keywords exceeds the allowable length for a path name. The MOUNTPOINT value plus the MKDIR value, separated by a slash(/), must be less than the maximum of 1023 characters. In the message text:

- **member**: The name of the parmlib member containing the error.
- **line-number**: The parmlib member line number containing the error.
- **position-number**: The position of the error in the line. The position number is the number of columns from the left.
- **mkdir-length**: The length of the MKDIR operand.
- **mountpt-length**: The length of the MOUNTPOINT operand.
- **pathmax**: The PATH_MAX value, which should be 1023.

System action: The system may ignore the erroneous statement or it may stop initialization after parsing completes. The system checks the rest of the parmlib member to find any other errors.

Operator response: None.

System programmer response: Shorten the path name specified on the MKDIR keyword on the ROOT or MOUNT statement of the BPXPRMxx parmlib member before using it again.

Module: BPXIPMX1
Source: z/OS UNIX System Services kernel (BPX)
BPXI073I • BPXI075E

Routing Code:  -  
Descriptor Code:  4

BPXI073I  DATA SET dataset IS NOT CATALOGED.

Explanation:  A catalog check for the named data set failed. The check was performed because the SETOMVS SYNTAXCHECK console command was issued against a parmlib member. In the message text:

dataset  
The data set name specified on the ROOT, MOUNT, or ALTROOT statement in the BPXPRMxx parmlib member.

System action:  This check occurs for SETOMVS SYNTAXCHECK only. Parmlib processing continues.

Operator response:  None.

System programmer response:  Ensure that the data set exists and is cataloged before initializing z/OS UNIX System Services.

Module:  BPXIPMX1

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  -  
Descriptor Code:  4

BPXI074I  LOAD LIBRARY loadlib IS NOT ON THE SPECIFIED VOLUME v0ln

Explanation:  While processing SETOMVS, SET OMVS, F OMVS,RESTART, or OMVS initialization, the system encountered a SERV_LPALIB or SERV_LINKLIB parameter in the BPXPRMxx parmlib member which referenced a load library name that is not on the specified volume.

In the message text:

LOAD LIBRARY loadlib  
loadlib is the name of the load library that the system could not find.

VOLUME v0ln  
v0ln is the number of the volume where the system expected to find the load library.

System action:  SETOMVS, SET OMVS, F OMVS,RESTART or OMVS Initialization processing fails.

System programmer response:  Do one of the following, as appropriate, to correct the problem:

• If the system issued this message system during initialization or during F OMVS,RESTART command processing, respecify a corrected BPXPRMxx parmlib member.

• Correct the SERV_LPALIB or SERV_LINKLIB BPXPRMxx parmlib keyword in error and then retry the SETOMVS or SET OMVS command.

Module:  BPXIPMZ1

Source:  z/OS UNIX System Services kernel (BPX)

Routing Code:  -  
Descriptor Code:  4

BPXI075E  TASK procname HAS ABNORMALLY ENDED. text

Explanation:  The z/OS UNIX task abnormally ended and cannot be recovered. The end of task exit routine (ETXR) failed to reattach it after a preset number of attempts.

In the message text:

procname  
The name of the z/OS UNIX task.

text  
One of the following
MEMORY MAP PROCESSING IS SUSPENDED.
Indicates that z/OS UNIX memory map processing is being suspended until the next IPL or shutdown.

MODIFY BPXOINIT PROCESSING IS SUSPENDED.
Indicates that z/OS UNIX MODIFY BPXOINIT console commands are being suspended until the next IPL or shutdown.

NETWORK DISPATCHER WORKLOAD BALANCING IS SUSPENDED.
Indicates that the z/OS UNIX network dispatcher workload balancing function is being suspended until the next IPL or shutdown.

System action: The system continues. The identified z/OS UNIX task has ended.
Operator response: None.
System programmer response: The identified z/OS UNIX task has ended. The function becomes unavailable until the next IPL. A z/OS UNIX System Services shutdown/restart might be able to recover the function. The system might have presented other information that identifies the cause of the task failure.
Module: BPXQETXR
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 1,10
Descriptor Code: 11

BPXI075I  ERROR IN PARMLIB MEMBER=memname ON LINE  line-number
Explanation: The system encountered an error in a parmlib member. The number of supported MKDIR statements (50) for this ROOT or MOUNT have been exceeded.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

System action: The system stops initialization after parsing completes. The system checks the rest of the parmlib member to find any other errors.
Operator response: None.
System programmer response: Correct the error in the parmlib member before using it again.
Module: BPXIPLEX
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: _
Descriptor Code: 4

BPXI076E  LATCH CONTENTION EXISTS THAT MUST BE RESOLVED PRIOR TO SHUTDOWN
Explanation: F OMVS,SHUTDOWN processing could not proceed due to latch contention. Shutdown processing cannot proceed until this contention is resolved.

System action: The F OMVS,SHUTDOWN command fails.
Operator response: Message BPXM056E was issued indicating that severe z/OS UNIX System Services latch contention exists. Determine if this message is still outstanding. If this message is no longer outstanding, then reissue the F OMVS,SHUTDOWN command. If this message remains outstanding, then contact the system programmer to determine if the contention can be resolved.
System programmer response: Determine the nature of the latch contention by issuing the D GRS,C command. If possible, cancel or force the termination of the address spaces causing the contention. If the contention cannot be resolved, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.
Module: BPXINIT
Source: z/OS UNIX System Services kernel (BPX)

Descriptor Code: 3

BPX077I THE PFS NAME IS INVALID OR THE PFS DOES NOT SUPPORT STOPPFS OR IS ALREADY STOPPED

Explanation: The STOPPFS= parameter on FOMVS,STOPPFS specified a PFS that is either not active or does not support STOPPFS.

System action: The FOMVS command processing fails.
Operator response: None.
System programmer response: None.

Module: BPXINIT, BPXMIMST
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 4
Descriptor Code: 2

BPX078D STOP OF NLSname_type REQUESTED, REPLY 'Y' TO PROCEED. ANY OTHER REPLY WILL CANCEL THIS STOP.

Explanation: The named file system type is about to be stopped.

In the message text:

NLSname_type
The file system type from the FILESYSTYPE statement in the BPXPRMxx parmlib member.

System action: The system waits for a reply. If the operator replies 'Y' to the prompt, processing continues. Any other reply ends the command.

Operator response: Reply 'Y' to continue, anything else to terminate.
System programmer response: None.

Module: BPXINIT, BPXMIMST
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 2

BPX078I THE PRIMARY CDS SUPPORTS A LIMIT OF mountval MOUNTS AND A LIMIT OF amtrules AUTOMOUNT RULES. THE CDS VERSION IS cdsver.

Explanation: Information about couple data values after a SETXCF COUPLE,PSWITCH,TYPE=BPXMCDS has occurred. This message is issued when the value of the MOUNTS of the new CDS is greater than the one it replaced.

In the message text:

mountval
The current value of the MOUNTS parameter.
amtrules
The current value of the AMTRULES parameter.
cdsver
The CDS version as defined by the format exit routine.

System action: The system will use these limits.
BPXI080I  INITTAB ENTRY  initab_entry  STARTED WITH ACTION  action

Explanation: The inittab entry identified by  initab_entry  was started with the specified  action.

In the message text:

initab_entry
The identifier field (up to the first 7 characters) in the inittab file for the entry started.

action
One of the following:

•   RESPAWN
•   ONCE
•   WAIT
•   RESPFRK

System action: When the  action  is WAIT, the system waits for the process to end and then continues processing the inittab file. Otherwise, the system continues processing the inittab file.

Operator response: None.

System programmer response: None.

Module:       BPXPRITR
Source:       z/OS UNIX System Services kernel (BPX)
Routing Code: 2, 10
Descriptor Code: 10

BPXI081I  INITTAB ENTRY  initab_entry  NOT STARTED.  reason

Explanation: In the message text:

initab_entry
The identifier field (up to the first 7 characters) in the inittab file for the entry that had the error.

reason
The reasons why the process could not be started, which could be one of the following:

•   MAXIMUM ENTRY SIZE ERROR
•   IDENTIFIER SYNTAX ERROR
•   COMMAND PATH NOT FOUND
•   INCORRECT RUNLEVEL
•   INCORRECT ACTION
•   MISSING ACTION
•   DUPLICATE JOBNAME
•   MISSING A FIELD
•   NO ENTRIES FOUND
•   IDENTIFIER MUST START IN COLUMN ONE

System action: The identified inittab entry is ignored and processing continues to the next entry in the inittab file.

Operator response: None.
BPXI082E • BPXI084E

System programmer response: To start the identified process, either manually start the process, or correct the error identified and restart OMVS to start the process with initab.

Module: BPXPRITR
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2, 10
Descriptor Code: 10

BPXI082E INITTAB ERROR - ONE OR MORE ENTRIES COULD NOT BE STARTED

Explanation: At least one entry in the initab file had an error that prevented it from being started.

System action: The other entries in the initab file are still processed. This message is not deleted until OMVS is restarted.

Operator response: None.

System programmer response: See the BPXI081I error messages for the exact entries in error and actions to take. The system issues one BPXI081I message for each entry in error.

Module: BPXPRITR
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2, 10
Descriptor Code: 11

BPXI083D RESPAWNABLE PROCESS job_name ENDED. REPLY R TO RESTART THE PROCESS. ANYTHING ELSE TO END THE PROCESS.

Explanation: The identified process ended again within 15 minutes from the prior ending of the process.

In the message text:

job_name
The jobname of the process that will be respawned. If the process was started from the initab file, job_name is the identifier field specified in the initab entry for the process.

System action: None.

Operator response: Notify the system programmer.

System programmer response: Try to correct the problem and direct the operator to reply R to restart the process, or reply anything else to end it.

Module: BPXPREC
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2, 10
Descriptor Code: 2

BPXI084E OMVS SHUTDOWN IS STALLED IN FILE SYSTEM TERMINATION

Explanation: OMVS,SHUTDOWN is delayed while attempting to terminate file systems. One or more physical file systems are not completing their termination processing.

System action: Shutdown processing continues to wait for all file system terminations to complete.

Operator response: None.

System programmer response: If OMVS,SHUTDOWN does not eventually complete, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Module: BPXINIT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 1, 10
Descriptor Code: 11

BPXI085D REPLACEMENT OF CURRENT SYSPLEX ROOT IS REQUESTED. REPLY 'Y' TO PROCEED, OR ANY OTHER TO CANCEL.

Explanation: The current sysplex root file system is to be replaced with the new sysplex root file system without verifying whether the current mount points and symlinks exist in the new sysplex root file system.

System action: The system waits for a reply. If the operator replies 'Y' to the prompt, processing continues. Any other reply ends the processing.

Operator response: Reply 'Y' to continue, or anything else to cancel.

System programmer response: None.

Module: BPXINIT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 2

BPXI086I ERROR IN PARMLIB MEMBER memname ON LINE line-number, POSITION position-number. INPUT PARAMETER VALUE IS OUT OF THE ALLOWED RANGE OF minimum-number TO maximum-number. A SYSTEM VALUE OF parm-value IS USED. DETECTING MODULE IS detmod.

Explanation: The system encountered an error in a parmlib member.

In the message text:

memname
The name of the parmlib member containing the error.

line-number
The number of the member line containing the error.

position-number
The position of the error in the line. The position number is the number of columns from the left.

minimum-number
The low value of the allowed range.

maximum-number
The high value of the allowed range.

parm-value
The value that the system is using for the input parameter.

detmod
The module that detected the error.

input-line
The text of the line containing the error.

System action: The system ignores the erroneous statement. The system checks the rest of the parmlib member to find any other errors.

Operator response: Contact the system programmer.

System programmer response: Correct the error in the parmlib member before using it again.

Module: BPXIPMX1
Source: z/OS UNIX System Services kernel (BPX)

Descriptor Code: 4

BPXI088I ERROR IN PARMLIB MEMBER memname ON LINE line-number POSITION position-number, text THE SYSTEM DEFAULT VALUE of default-value is USED. DETECTING MODULE is detmod. INPUT LINE: inline

Explanation: The system encountered an error in the BPXDIAG parmlib statement in the specified BPXPRMxx parmlib member. The system uses the default value for this parameter. The system checks the rest of the parmlib member to find any other errors.

BPXDIAG is an IBM internal BPXPRMxx parmlib statement and should only be used at the direction of an IBM Service representative. Contact your IBM Service representative for more information about the BPXDIAG statement.

In the message text:

memname
   The name of the parmlib member containing the error.

line-number
   The number of the member line containing the error.

position-number
   The position of the error in the line. The position number is the number of columns from the left.

text
   One of the following:
   • INPUT PARAMETER VALUE IS NOT HEXADECIMAL.
   • INPUT PARAMETER VALUE IS INCORRECT.

default-value
   The system default value for the erroneous parameter.

detmod
   The module that detected the error.

input-line
   The text of the line containing the error.

System action: The system ignores the erroneous parameter. The system uses the default value for this parameter. The system checks the rest of the parmlib member to find any other errors.

Operator response: None.

System programmer response: None.

BPXM001I  BPXBATCH FAILED DUE TO AN INCORRECT ddname ALLOCATION WITH A PATH OPTION
WRITE OR READ/WRITE SPECIFIED.

Explanation: You specified an incorrect allocation path option for the indicated ddname. BPXBATCH requires either a
path option of read only or no path options for the specified ddname.

In the message text:

ddname
One of the following:

STDENV
   DDNAME STDENV

STDERR
   DDNAME STDERR

STDOUT
   DDNAME STDOUT

STDPARM
   DDNAME STDPARM

System action: The system ends the program.
Operator response: None.
System programmer response: None.
Programmer response: Change the allocation for the specified ddname to path option ORDONLY or remove the path
option.
Module: BPXMBATC
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 11
Descriptor Code: 6
BPXM002I  BPXBATCH FAILED DUE TO AN ERROR IN ALLOCATION OF ddname. ALLOCATION PATH OPTIONS MUST BE WRITE ONLY.

Explanation: You specified an incorrect allocation path option for STDOUT or STDERR. BPXBATCH requires either a path option of WRITE or no path options for STDOUT and STDERR.

In the message text:

- ddname
  - One of the following:
    - STDOUT
      - DDNAME STDOUT
    - STDERR
      - DDNAME STDERR

System action: The system ends the program.
Operator response: None.
System programmer response: None.
Programmer response: Change STDOUT or STDERR allocation to path option OWRONLY, or remove the path option.

Module: BPXMBATC
Source: z/OS UNIX System Services kernel (BPX)

Descriptor Code: 6

BPXM007I BPXBATCH FAILED DUE TO AN ERROR FROM OPENMVS CALLABLE SERVICE system_call WITH RETURN CODE return_code REASON CODE reason_code

Explanation: BPXBATCH encountered an error while attempting to use an z/OS UNIX callable service.

In the message text:

system_call
  The callable service that failed.

return_code
  The failure return code.

reason_code
  The failure reason code. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The system ends the program.

Operator response: None.

System programmer response: None.

Programmer response: Look up the return code and reason code in z/OS UNIX System Services Messages and Codes to determine why the z/OS UNIX callable service failed.

Module: BPXMBATC

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 11

Descriptor Code: 6

BPXM008I BPXBATCH FAILED BECAUSE EXEC (BPX1EXC) OF THE PROGRAM NAME FAILED WITH RETURN CODE return_code REASON CODE reason_code.

Explanation: BPXBATCH encountered an error when trying to issue an EXEC (BPX1EXC) callable service to the program name specified. An incorrect program name may have been specified.

In the message text:

return_code
  The failure return code.

reason_code
  The failure reason code. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The system ends the program.

Operator response: None.

System programmer response: None.

Programmer response: Look up the return code and reason code to determine why the BPX1EXC callable service (EXEC) failed. Verify the program name exists in the path specified.

Module: BPXMBATC

Source: z/OS UNIX System Services kernel (BPX)
BPXM009I  BPXM010I

Routing Code:  11
Descriptor Code:  6

BPXM009I  BPXBATCH FAILED BECAUSE OPEN (BPX1OPN) FOR ddname FAILED WITH RETURN CODE return_code REASON CODE reason_code

Explanation:  BPXBATCH encountered an error while attempting to open the specified ddname.

In the message text:

ddname
  One of the following:
    STDOUT
      DDNAME STDOUT
    STDERR
      DDNAME STDERR
    STDENV
      DDNAME STDENV
    STDPARM
      DDNAME STDPARM

return_code
  The failure return code.

reason_code
  The failure reason code. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action:  The system ends the program.

Operator response:  None.

System programmer response:  None.

Programmer response:  Look up the return code and reason code to determine why the z/OS UNIX callable service open (BPX1OPN) failed. Examine either the TSO/E ALLOCATE commands, JCL DD statements, or dynamic allocation that defined STDERR, STDENV, STDOUT, or STDPARM. A PATH that does not exist may have been specified or you may not have authorization to access the file. Authorization failure may have been caused by specifying OCREAT without specifying PATHMODE. If a file path was not specified, verify that the default file path /dev/null exists.

Routing Code:  11
Descriptor Code:  6

BPXM010I  BPXBATCH FAILED BECAUSE THE PARAMETERS DID NOT START WITH SH OR PGM.

Explanation:  If a parameter list is used for BPXBATCH, then SH or PGM must be the first parameters specified.

System action:  The system ends the program.

Operator response:  None.

System programmer response:  None.

Programmer response:  BPXBATCH requires that parameters start with SH or PGM. Reissue BPXBATCH with either no parameters or parameters that start with SH or PGM.

Module:  BPXMBATC
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  11
BPXM011I  BPXBATCH FAILED BECAUSE THE PARAMETERS SPECIFIED PGM WITHOUT A PROGRAM NAME AFTER PGM.

Explanation: If a BPXBATCH parameter list is specified with PGM first, a program name must be specified after PGM.

System action: The system ends the program.

Operator response: None.

System programmer response: None.

Programmer response: BPXBATCH requires that a program name be specified after PGM.

Module: BPXMBATC

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 11

Descriptor Code: 6

BPXM012I  BPXBATCH FAILED BECAUSE OPEN FOR ddname FAILED WITH RETURN CODE return_code

Explanation: BPXBATCH encountered an error while attempting to open the specified DD which describes an MVS data set.

In the message text:

*ddname*

One of the following:

- **STDENV**
  - DDNAME STDENV
- **STDERR**
  - DDNAME STDERR
- **STDOUT**
  - DDNAME STDOUT
- **STDPARM**
  - DDNAME STDPARM

*return_code*

The failure return code from OPEN.

System action: The system ends the program.

Operator response: None.

System programmer response: None.

Programmer response: Look up the return code to determine why the data set OPEN failed. Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined the *ddname*. Ensure that the DCB attributes of the data set are correct.

Module: BPXMBATC

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 11

Descriptor Code: 6
BPXM013I  BPXBATCH FAILED DUE TO AN INCORRECT text FOR ddname.

Explanation: BPXBATCH detected a format error for the specified DD which describes an MVS data set.

In the message text:

text
  One of the following:
  DATA SET ORGANIZATION
    Indicates that a data set organization other than sequential or PDS was specified for the DD.
  RECORD FORMAT
    Indicates that a record format other than fixed or variable (non-spanned) was specified for the DD.

ddbname
  One of the following:
  STDENV
    DDNAME STDENV
  STDERR
    DDNAME STDERR
  STDOUT
    DDNAME STDOUT
  STDPARM
    DDNAME STDPARM

System action: The system ends the program.

Operator response: None.

System programmer response: None.

Programmer response: Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined the ddname. Ensure that the associated data set is a fixed or variable (non-spanned) sequential data set or PDS member.

Module: BPXMBATC

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 11

Descriptor Code: 6

BPXM014I  BPXBATCH FAILED BECAUSE READ (BPX1RED) FOR ddname FAILED WITH RETURN CODE return_code REASON CODE reason_code

Explanation: BPXBATCH encountered an error while attempting to read the specified DD.

In the message text:

ddbname
  One of the following:
  STDENV
    DDNAME STDENV
  STDPARM
    DDNAME STDPARM

return_code
  The failure return code.

reason_code
  The failure reason code. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: The system ends the program.
BPX015I  BPXBATCH FAILED BECAUSE RETURN CODE return_code WAS RECEIVED DURING AN ATTEMPT TO OBTAIN STORAGE FOR A BUFFER.

Explanation: BPXBATCH made a request to obtain storage. The request failed for the reason identified by the return code.

In the message text:

return_code

The return code received when storage was requested.

System action: The system ends the program.

Operator response: None.

System programmer response: None.

Programmer response: If the problem persists, increase the region size for BPXBATCH. This may also indicate that an excessively large environment variable file is specified by STDENV or STDPARM. If this is the case, try to reduce the size of the environment variable file.

Module: BPXMBATC

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 11

Descriptor Code: 6

BPX016I  BPXBATCH FAILED BECAUSE AN MVS PDS WITH NO MEMBER NAME WAS SPECIFIED FOR STDENV.

Explanation: BPXBATCH cannot use STDENV, because it specifies an MVS PDS with no member name.

System action: The system ends the program.

Operator response: None.

System programmer response: None.

Programmer response: Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined STDENV. Ensure that a member name is specified for the associated PDS.

Module: BPXMBATC

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: 11

Descriptor Code: 6

BPX017I  BPXBATCH FAILED BECAUSE THE PATH SPECIFIED FOR dname IS A DIRECTORY.

Explanation: BPXBATCH cannot use the specified DD, because the path it specifies is a directory instead of a text file.

In the message text:
**ddname**

One of the following:

**STDENV**

DDNAME STDENV

**STDPARM**

DDNAME STDPARM

**System action:** The system ends the program.

**Operator response:** None.

**System programmer response:** None.

**Programmer response:** Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined the specified DD. Ensure that the path name specifies a text file and not a directory.

---

**BPXM018I**  
BPXBATCH FAILED BECAUSE SPAWN (BPX1SPN) OF /BINLOGIN FAILED WITH RETURN CODE return_code REASON CODE reason_code

**Explanation:** The system encountered an error while running BPXBATCH.

In the message text:

- **return_code**
  The failure return code.

- **reason_code**
  The failure reason code. For an explanation of the return code and reason code, see [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/pages/z-os-unix-system-services-messages-codes).

**System action:** The system ends the program.

**Operator response:** None.

**System programmer response:** BPXBATCH requires program /bin/login.

**Programmer response:** Look up the return and reason code to determine why the z/OS UNIX system services callable service spawn (BPX1SPN) failed. For a SH request through either the BPXBATSIL entry point or BPXBATCH with _BPX_SHAREAS=MUST, the user must be a superuser (UID=0). This is important because some processes, including running the shell, use programs like /bin/login that require a UID=0. Programs requiring superuser access can only run in shared address space mode if the address space itself is running UID=0.

Descriptor Code:  4

BPXM024I  CONFLICTING PARAMETERS ON MODIFY COMMAND

Explanation:  Conflicting parameters were used on the modify command. For more information, see MODIFY command in z/OS MVS System Commands.

System action:  None.
Operator response:  Correct the parameters and reissue the MODIFY command.
System programmer response:  None.
Module:  BPXMRCCS
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  2
Descriptor Code:  4
BPXM025I  PID MUST BE IN THE RANGE 2 - 4294967294.
Explanation: User entered a PID that is outside range of valid PIDs.
System action: None.
Operator response: Correct the PID and reissue the command.
System programmer response: None.
Module: BPXMRCCS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

BPXM026I  THE TARGET OF `keyword`, `identifier`, WAS NOT FOUND.
Explanation: The process and/or thread specified on the MODIFY command was not found.
In the message text:

- `keyword`  The keyword specified on MODIFY command.
- `identifier`  Pid or pid.tid specified on MODIFY command.
System action: None.
Operator response: Reenter the command with the correct pid or pid.tid. Process and thread identifiers can be displayed via the DISPLAY OMVS command.
System programmer response: None.
Module: BPXMRCCS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

BPXM027I  COMMAND ACCEPTED.
Explanation: The command was accepted.
System action: System will initiate the requested action.
Operator response: None.
System programmer response: None.
Module: BPXMRCCS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

BPXM028I  STOP REQUEST WAS IGNORED BY `name`.
Explanation: A stop request was received by a process that OMVS needs to continue running. Therefore the stop request was ignored.
In the message text:

- `name`  jobname of the process where the STOP was attempted.
BPXM029I  APPL= KEYWORD WAS IGNORED BY name.

Explanation: A MODIFY command with the APPL= keyword was received by a process that did not expect it. The command was ignored.

In the message text:

name
    jobname of the process on MODIFY command.

BPXM30I  ERROR PROCESSING THE USERIDALIASTABLE - aliasfile functionstatus return_code REASON CODE reason_code text

Explanation: During z/OS UNIX userid/group alias table processing, an error occurred trying to access the new or changed alias file.

In the message text:

aliasfile
    The USERIDALIASTABLE file name (up to the first 44 characters).

functionstatus
    One of the following:

    STAT FAILED - RETURN CODE
        STAT failed against the specified file.

    OPEN FAILED - RETURN CODE
        OPEN failed against the specified file.

    READ FAILED - RETURN CODE
        READ failed against the specified file.

    LSEEK FAILED - RETURN CODE
        LSEEK failed against the specified file.

return_code
    The return code from the SYSCALL.

reason_code
    The reason code from the SYSCALL. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.
BPXM031I  ERROR PROCESSING THE USERIDALIASTABLE - aliasfile errorfound line-number text

Explanation:  During z/OS UNIX userid/group alias table processing, a syntax error was found in the specified alias file.

In the message text:

- aliasfile
  The USERIDALIASTABLE file name (up to the first 44 characters).

- errorfound
  One of the following:

  SYNTAX ERROR IN FILE - INVALID COMMENT AT LINE
  A comment line has incorrect delineators.

  SYNTAX ERROR IN FILE - INVALID TAG AT LINE
  The tag must be either :USERIDS or :GROUPS

  SYNTAX ERROR IN FILE - NAME NOT IN CORRECT COLUMN ON LINE
  MVS names start in column 1, alias names in 10.

  SYNTAX ERROR IN THE MVS USERID ON LINE
  The MVS USERID must follow standard MVS naming.

  SYNTAX ERROR IN THE MVS GROUPNAME ON LINE
  The MVS groupname must follow standard MVS naming.

  SYNTAX ERROR IN THE ALIAS USERID ON LINE
  The alias USERID must be XPG compliant.

  SYNTAX ERROR IN THE ALIAS GROUPNAME ON LINE
  The alias groupname must be XPG compliant.

- line-number
  The line number in the useridaliastable file where the error occurred.

THE PREVIOUS ALIAS TABLE WILL CONTINUE TO BE USED
NO ALIAS TABLE IS IN USE AT THIS TIME.

System action:  The contents of the old table are used. If there was no table previously, no table is used.

Operator response:  Contact the system programmer.

System programmer response:  Correct the error in the alias file and then issue the SETOMVS USERIDALIASTABLE to start using the corrected alias file.

---

BPXM048I  BPXOINIT FILESYSTEM SHUTDOWN INCOMPLETE. **notshutdown** FILESYSTEM(S) ARE STILL OWNED BY THIS SYSTEM. **mounted** FILESYSTEM(S) WERE MOUNTED DURING THE SHUTDOWN PROCESS.

**Explanation:** The is a status message reporting that the SHUTDOWN=FILESYS was not able to shutdown all file systems on this system. This can be caused by the occurrence of an unintended situation such as a local mount being performed while the shutdown was in progress.

In the message text:

**notshutdown**
The number of file systems that are still owned by this system.

**mounted**
The number of file systems that were mounted on this system while shutdown was in progress.

**System action:** The system has completed the requested action, but one or more filesystems did not unmount or get moved to another system.

**Operator response:** Try manually unmounting the file system(s) or moving the file system(s) to another system.

**System programmer response:** To identify those filesystem(s) that did not move or unmount, issue the following display command on the source system to observe which filesystems are still owned by this system:

```
D OMVS,F
```

If desired, reattempt individual moves by issuing the following command for each specific filesystem in question and observe the results:

```
SETOMVS FILESYS, FILESYSTEM=filest, SYSNAME=sysname
```

If any move fails here, message BPXO037E will qualify the result.

**Programmer response:** None.

**Module:** BPXMRCCS

BPX050E  ERROR PROCESSING THE AUTHPGMLIST - text

Explanation: An internal error occurred during authorized program name processing.

In the message, text is:

AUTHPGMLIST PROCESSING IS TURNED OFF.
AUTHPGMLIST PROCESSING IS SUSPENDED.

System action: If there was an unrecoverable error, authorized program processing is set off and cannot be used again until the next IPL or restart. Otherwise, authorized program processing is set off and will not be used again until a SETOMVS AUTHPGMLIST or SET OMVS = command is issued.

Operator response: Contact the system programmer.

System programmer response: For unrecoverable errors, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center. For recoverable errors, reissue the SETOMVS or SET OMVS = command for the authorized program list file.

---

BPX051I  ERROR PROCESSING THE AUTHPGMLIST – aliasfile functionstatus return_code REASON CODE reason_code text

Explanation: During z/OS UNIX System Services authorized program sanction list processing, an error occurred trying to access the new or changed sanction list file.

In the message text:

aliasfile
The AUTHPGMLIST file name (up to the first 44 characters).

functionstatus
One of the following:
BPXM052I

STAT FAILED – RETURN CODE
STAT failed against the specified file.

OPEN FAILED – RETURN CODE
OPEN failed against the specified file.

READ FAILED – RETURN CODE
READ failed against the specified file.

LSEEK FAILED – RETURN CODE
LSEEK failed against the specified file.

Return code
The return call from the syscall. For an explanation of the return code, see z/OS UNIX System Services Messages and Codes.

Reason code
The reason call from the syscall. For an explanation of the reason code, see z/OS UNIX System Services Messages and Codes.

Text
One of the following:

THE CONTENTS OF THE PREVIOUS LIST(S) WILL CONTINUE TO BE USED.
NO NEW AUTHPGMLIST IS IN USE AT THIS TIME.

System action: The contents of the old sanction list file will be used. If there was a STAT error, then no table will be used.

Operator response: Contact the system programmer.

System programmer response: Verify that the specified sanction list file exists and is accessible.

BPXM052I  ERROR PROCESSING THE AUTHPGMLIST – aliasfile errorfound line-number actiontaken

Explanation: During z/OS UNIX System Services authorized program sanction list processing, a syntax error was found in the specified sanction list file.

In the message text:

Alias file
The AUTHPGMLIST file name (up to the first 44 characters).

Error found
One of the following:

SYNTAX ERROR IN FILE – INVALID COMMENT AT LINE
A comment line has incorrect delineators.

SYNTAX ERROR IN FILE – INVALID TAG AT LINE
The tag must be either :authpgmpath, :programcontrol_path, or :apfprogram_name.

SYNTAX ERROR IN FILE – EXTRA DATA ON LINE
Extraneous characters found on line.

SYNTAX ERROR IN FILE – ABSOLUTE PATH NAME ON LINE
The hfs path name must follow standard MVS naming conventions.

SYNTAX ERROR IN THE MVS PROGRAM NAME ON LINE
The MVS program name must follow standard MVS naming conventions.

SYNTAX ERROR IN FILE – NO TAGS/ENTRIES FOUND BY LINE
The file contained no tags or entries with tags.
The line number in the authorized program sanction list file where the error occurred.

One of the following:

- **THE PREVIOUS AUTHPGMLIST FILE WILL CONTINUE TO BE USED.**
- **NO AUTHPGMLIST FILE IS IN USE AT THIS TIME.**

**System action:** The contents of the old sanction list will be used. If there was no list previously, no list will be used.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the error in the list file and then issue the SETOMVS AUTHPGMLIST command to start using the corrected sanction list file.

**Module:** BPXMRAPU

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 12

---

**BPXM053I** AUTHPGMLIST NAME CHANGE FOR – aliasfile CANNOT BE PROCESSED AT THIS TIME. TRY AGAIN LATER.

**Explanation:** A command was issued to change the sanction file name while processing of a prior command to change the name is still in progress.

In the message text:

- **aliasfile**
  The AUTHPGMLIST file name (up to the first 44 characters).

**System action:** The new command is ignored.

**Operator response:** Keep issuing the command until it is accepted.

**System programmer response:** None.

**Module:** BPXOTASK

**Descriptor Code:** 12

---

**BPXM054I** FILE SYSTEM name FAILED TO operation. RET CODE = retcode, RSN CODE = reason

**Explanation:** During shutdown, the named file system could not be moved or unmounted.

In the message text:

- **name**
  The file system name specified either on a MOUNT statement in the BPXPRMxx parmlib member or on a MOUNT command.

- **operation**
  One of the following:
  - **MOVE**
    A move operation failed.
  - **UNMOUNT**
    An unmount operation failed.

- **retcode**
  The return code from the file system request.
**BPXM055D • BPXM056E**

**reason**
The reason code from the file system request. For an explanation of the return code and reason code, see [z/OS UNIX System Services Messages and Codes](#).

**System action:** None. File system shutdown processing continues on this system.

**Operator response:** Use the return code and reason code to determine the cause of the error. For failures to move, check physical connectivity or, if used, the contents of the automove system list. For unmount failures, the failing file system may contain the mount point for another file system. If necessary, contact the system programmer.

**System programmer response:** Determine the cause of the error. Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

**Module:** BPXVFPC

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2,10

**Descriptor Code:** 12

---

**BPXM055D** THIS SYSTEM WILL BE DISABLED AS A FILESYSTEM OWNER. REPLY 'Y' TO CONTINUE OR ANY OTHER KEY TO EXIT.

**Explanation:** The system issues the message in response to an F BPXOINIT, SHUTDOWN=FILEOWNER command. In addition to moving and unmounting the filesystems that are owned by this system, this operation will prevent this system from becoming a filesystem owner by means of future filesystem move operations.

**System action:** The system waits for a reply.

**Operator response:** Reply "Y" if this is the desired behavior. Use a different key to abort the operation. If disabling filesystem ownership is not desired, use 'f bpxoinit,shutdown=filesys' to move/unmount filesystems from this system.

**System programmer response:** No action is required

**Module:** BPXMRCCS

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 2

---

**BPXM056E** UNIX SYSTEM SERVICES LATCH CONTENTION DETECTED

**Explanation:** The system detected a z/OS UNIX System Services latch contention situation that has existed for an excessive amount of time. As a result this task is not progressing as expected nor are the tasks waiting on the held resources.

**System action:** Processing continues, and latch contention continues until the operator or system programmer take action to relieve the latch contention situation.

**Operator response:** Notify the system programmer.

**System programmer response:** Issue the D GRS console command to gather information regarding the latch resource, latch owner(s) and latch waiter(s). If the contention persists and the owning unit(s) of work cannot be terminated through normal operations (for example, Cancel or Force commands), consider issuing a F BPXOINIT,RECOVER=LATCHES console command to resolve the contention. This command can take several minutes to resolve the latch contention, but if MVS cannot resolve the latch contention within a reasonable time interval, MVS eventually displays action message BPXM057E. If necessary, refer to that message for further action.

**Note:** If successful, the F BPXOINIT,RECOVER=LATCHES command causes the abnormal termination of user tasks holding latches, generates one or more address space dumps, and can result in the termination of an entire process. Refer to [z/OS MVS System Commands](#) before issuing this command.

**Module:** BPXFILE

**Source:** z/OS UNIX System Services kernel (BPX)
Routing Code:  11
Descriptor Code:  11

**BPXM057E  UNIX SYSTEM SERVICES LATCH CONTENTION NOT RESOLVING**

**Explanation:** The F BPXOINIT,RECOVER=LATCHES command did not resolve z/OS UNIX System Services latch contention.

**System action:** Processing continues but requires the attention of the system programmer to eliminate the contention situation.

**Operator response:** Notify the system programmer.

**System programmer response:** Reissue the F BPXOINIT,RECOVER=LATCHES command to again attempt to resolve the contention. If the contention still persists, search problem reporting databases for a fix for the problem. If no fix exists, collect dumps, D GRS data, and all other relevant documentation and contact the IBM Support Center.

**Module:** BPXMFILE

**Source:** z/OS UNIX System Services kernel (BPX)

Routing Code:  11
Descriptor Code:  1

**BPXM058I  MODIFY BPXOINIT RECOVER COMMAND REJECTED**

**Explanation:** An unsupported operand was specified for the F BPXOINIT,RECOVER= command.

**System action:** The command request is rejected.

**Operator response:** Notify the system programmer.

**System programmer response:** Reissue the command using supported operands.

**Module:** BPXMFILE

**Source:** z/OS UNIX System Services kernel (BPX)

Routing Code:  2
Descriptor Code:  4

**BPXM059I  ACTIVATE=SERVICE REQUEST FAILED, reason**

**Explanation:** The F OMVS,ACTIVATE=SERVICE command failed. In the message text, *reason* is one of the following:
- ERROR OPENING LPALIB LIBRARY
- ERROR OPENING LINKLIB LIBRARY
- ERROR LOADING MODULES
- TOO MANY SERVICE ITEMS FOUND (50 is the maximum number of service items allowed in a single activation)
- MAXIMUM NUMBER OF ACTIVATIONS (You can only have up to 50 activation sets concurrently active)
- DYNAMIC SERVICE ITEM IN ERROR
- MODULE BUILD PROBLEM FOUND
- UNEXPECTED ERROR OCCURRED
- ENVIRONMENTAL ERROR DETECTED
- INPUT PARAMETER ERROR DETECTED
- NO TARGET LIBRARIES FOUND (Neither LPA nor LINKLIB Libraries were specified on SERV_LPALIB or SERV_LINKLIB)
- LPALIB LIBRARY NOT APF AUTHORIZED
- LINKLIB LIBRARY NOT APF AUTHORIZED

**System action:** The F OMVS,ACTIVATE=SERVICE command ends without activating any service items.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the problem based on the *reason* displayed in the message text and the additional error messages displayed. Additional messages displayed might include BPXM064I and various IEW and IKJ error messages that describe module load or data set allocation errors.
• If the reason text displayed is one of the following, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center for a fix for the problem:
  – UNEXPECTED ERROR OCCURRED
  – ENVIRONMENTAL ERROR DETECTED
  – INPUT PARAMETER ERROR DETECTED

• If the reason text displayed is MODULE BUILD PROBLEM FOUND, this indicates that the target load modules are not compatible with the current modules on the running system. Try rerunning the SMP/E build jobs for the target service items to correct this problem. This message will be issued when dynamically activating a PTF if any module included in the new PTF is included in a ++APAR or ++USERMOD currently installed on the system.

• If the reason text displayed is DYNAMIC SERVICE ITEM IN ERROR, look for accompanying message BPXM064I which explains the error.

Module: BPXINIT

Routing Code: 2
Descriptor Code: 4

**BPXM060I**  NO DYNAMIC SERVICE ITEMS FOUND TO ACTIVATE

**Explanation:** The system could not activate any service items in response to the F OMVS,ACTIVATE=SERVICE command because it could not find any service items in the target service libraries that were eligible for dynamic activation. See [dynamically activating the z/OS UNIX System Services component service items](https://www.ibm.com) in **z/OS UNIX System Services Planning**.

**System action:** The F OMVS,ACTIVATE=SERVICE command ends without activating any service items.

**Operator response:** Contact the system programmer.

**System programmer response:** Install service eligible for dynamic activation in the target service library and retry the command.

Module: BPXINACT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

**BPXM061D**  REPLY "Y" TO PROCEED WITH ACTIVATION. ANY OTHER REPLY ENDS THE COMMAND.

**Explanation:** In response to an F OMVS,ACTIVATE=SERVICE command, this message prompts the operator to decide whether to dynamically activate the service items listed in the prior message BPXM061I.

**System action:** The system waits for a reply. If the operator answers Y to the prompt, the system dynamically activates the service items listed. For any other reply, the F OMVS,ACTIVATE=SERVICE command ends without activating service.

**Operator response:** Before replying Y to this message, look at the list of service items to ensure that these are the service items that you intended to activate. In addition, evaluate the amount of storage that will be consumed in both ECSA and in the OMVS address space private area to make sure you have enough storage to perform the dynamic activation.

Any other reply besides Y will end the F OMVS,ACTIVATE=SERVICE command, and none of the service items will be activated.

Module: BPXINACT
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: -
Descriptor Code: -
BPXM061I THE FOLLOWING SERVICE ITEMS WILL BE ACTIVATED serviceitem1 serviceitem2 ... ECSA STORAGE BYTES: ecsabytes AND OMVS PRIVATE STORAGE BYTES: prvbytes WILL BE CONSUMED FOR THIS ACTIVATION.

Explanation: In response to an F OMVS,ACTIVATE=SERVICE command, this message displays the service items that will be dynamically activated.

In the message text:

-serviceitemn
   The name of a service item that was activated.

-ecsabytes
   The number of bytes of ECSA storage consumed by the activation of these service items.

-prvbytes
   The number of bytes in the OMVS address space private area consumed by the activation of these service items.

System action: The system issues message BPXM061D.

Operator response: None.

BPXM063I  THE FOLLOWING SERVICE ITEMS WILL BE DEACTIVATED: serviceitem1 serviceitem2 ...

Explanation: In response to an FMVS,DEACTIVATE=SERVICE command, this message displays the service items that will be dynamically deactivated.

In the message text:

serviceitem
  The name of the service item to be deactivated.

System action: The system issues accompanying message BPXM063D.

Operator response: None.

Module: BPXINDEA

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: -

Descriptor Code: -

BPXM064I  serviceitem CANNOT BE action DUE TO reason

Explanation: The system could not activate or deactivate the specified service items in response to the FMVS,ACTIVATE=SERVICE or FMVS, DEACTIVATE=SERVICE command due to the indicated reason. See dynamically activating the z/OS UNIX System Services component service items in z/OS UNIX System Services Planning for more information.

In the message text:

serviceitem
  The name of the service item in error.

action
  The name of the service item in error.

ACTIVATED
  The requested action is to activate the service items, and the message is in response to the FMVS,ACTIVATE=SERVICE command.

DEACTIVATED
  The requested action is to deactivate the service items, and the message is in response to the FMVS,DEACTIVATE=SERVICE command.

reason
  The reason that the service item was in error. reason is one of the following:
  • DOWNLEVEL SERVICE - indicates that one or more modules in the service item are not at a high enough level to support dynamic activation on the current system.
  • INCORRECT NUMBER OF PARTS - Either the number of parts found for this service item does not match the required number of parts, or one or more modules for this dynamic service item in the target load library has been compiled with subsequent non-dynamic service.
  • SYSTEM NOT IN OMVS SHUTDOWN - z/OS UNIX System Services must be shutdown through an FMVS,SHUTDOWN command in order to activate or deactivate this service item on the system.

System action: The FMVS,ACTIVATE=SERVICE or FMVS, DEACTIVATE=SERVICE command ends without functioning the requested actions to any service items.

Operator response: Correct the condition described in the message.

**BPXM077I  BPXBATCH FAILED BECAUSE A MVS PDS OR PDSE WITH NO MEMBER WAS SPECIFIED ON ddname**

**Explanation:** BPXBATCH cannot use the indicated data set definition DD because it specifies an MVS PDS or PDSE without a member name.

In the message text:

`ddname`

One of the following:

- STDENV
  - DDNAME STDENV
- STDERR
  - DDNAME STDERR
- STDOUT
  - DDNAME STDOUT
- STDPARM
  - DDNAME STDPARM

**System action:** The system ends the BPXBATCH command or job.

**Operator response:** None.

**System programmer response:** None.

**Programmer response:** Examine either the TSO/E ALLOCATE command, JCL DD statement, or dynamic allocation that defined the `ddname` in error. Ensure that a member name is specified for the associated PDS or PDSE.

**Module:** BPXMBATC

**Routing Code:** 11  
**Descriptor Code:** 6
BPXM078I  BPXBATCH FAILED BECAUSE THE STD Parm DATA SET CONTAINED GREATER THAN THE MAXIMUM SUPPORTED PARAMETER DATA

Explanation:  BPXBATCH encountered an STDPARM definition greater than the maximum size allowed. The maximum size is 64K (65536) and the parameter string can not be greater than this size.

System action:  The system ends the BPXBATCH command or job.

Operator response:  None.

System programmer response:  None.

Programmer response:  Reconstruct the STDPARM data set to contain fewer characters than the maximum size permitted. Rerun the BPXBATCH job or command.

Module:  BPXMBATC
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  11
Descriptor Code:  6

BPXM079I  BPXBATCH PROCESSING IS USING THE STDPARM DD RATHER THAN parm

Explanation:  BPXBATCH encountered a PARM= or STDIN DD and a STDPARM definition. The STDPARM DD overrides the use of PARM= and STDIN DD, therefore the system uses the STDPARM DD.

In the message:
parm
The input parameter string or the STDIN DD.

System action:  Processing continues with the STDPARM specification.

Operator response:  None.

System programmer response:  None.

Programmer response:  Remove either the PARM=, STDIN DD or the STDPARM DD from the JCL to prevent this warning message from being issued from BPXBATCH.

Module:  BPXMBATC
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  11
Descriptor Code:  6

BPXM080I  THE RECORD SIZE OF THE ddname DATA SET IS SMALLER THAN A LINE OF OUTPUT, TRUNCATION HAS OCCURRED

Explanation:  BPXBATCH encountered one or more lines of output from the job that is larger than the record size of the output data set for the specified ddname. The line or lines have been truncated in the output data set.

In the messages:

ddbname
STDOUT or STDERR.

System action:  Processing continues within the job.

Operator response:  None.

System programmer response:  None.

Programmer response:  To get all output without truncation, rerun the BPXBATCH job or command with a STDOUT or STDERR data set with a larger LRECL. Specify at least 255 for LRECL.

Module:  BPXMBATC
Source:  z/OS UNIX System Services kernel (BPX)
BPXM081I • BPXM083I

Routing Code: 11
Descriptor Code: 6

BPXM081I  ddname_1 IS TO BE REDIRECTED TO ddname_2

Explanation: BPXBATCH encountered a problem with the output DD specified by ddname_1. The data set type specified is not supported, such as DD Dummy, Terminal or SYSIN, or the specified data set can not be opened.

In these cases, BPXBATCH redirects the output for the specified DD to the location specified by ddname_2.
- When the STDOUT DD is in error, the system redirects the output to /dev/null.
- When the STDERR DD is in error, the system redirects the output to STDOUT if STDOUT is valid. If STDOUT is not valid, the system redirects STDERR to /dev/null.

In the messages:

ddname-1
STOUT or STDERR.

ddname-2
/dev/null or STDOUT.

System action: Processing continues within the job or command with the output to the specified DD being redirected to the specified location.

Operator response: None.
System programmer response: None.

Programmer response: If you intended to have the output for the specified DD go to the data set specified by dd_name1, then correct the problem with the data set and rerun the BPXBATCH command or job.

Descriptor Code:  4

BPXM106I  UNIX SYSTEM SERVICES WAS NOT STARTED IN SYSPLEX MODE. THE MODIFY FUNCTION
          CANNOT BE PERFORMED.
Explanation:  The FILESYS functions for the MODIFY command can only be performed if z/OS UNIX System
Services is started in sysplex mode.
System action:  The MODIFY command is ignored.
Operator response:  Only issue this MODIFY command if z/OS UNIX System Services is started in sysplex mode.
System programmer response:  None.
Module:  BPXMFILE
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code:  2
Descriptor Code:  4
**BPXM107I** THE MODIFY COMMAND IS REJECTED. A PREVIOUS MODIFY COMMAND FOR A FILESYS OPERATION IS IN PROGRESS.

**Explanation:** Only one MODIFY command for a FILESYS operation can be active, unless the OVERRIDE parameter is specified.

**System action:** The MODIFY command is rejected.

**Operator response:** Either reissue the MODIFY command after the previous MODIFY command completes, or specify the OVERRIDE parameter.

**System programmer response:** None.

**Module:** BPXMFILE

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 4

---

**BPXM120D** F BPXOINIT,FILESYS=funcname SHOULD BE USED WITH CAUTION. REPLY 'Y' TO CONTINUE. ANY OTHER REPLY TERMINATES.

**Explanation:** The identified MODIFY command should only be used to attempt to correct problems in a sysplex when the alternative is a sysplex-wide IPL. It is potentially disruptive and should be used with caution.

In the message text:

`funcname`
The function name.

**System action:** Waits for a reply. If the operator replies Y to the prompt, processing will continue. Otherwise, it will terminate.

**Operator response:** Reply Y to continue, anything else to terminate.

**System programmer response:**

**Module:** BPXMFILE

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** 2

**Descriptor Code:** 2

---

**BPXM121I** MODIFY COMMAND TERMINATED AT OPERATOR REQUEST.

**Explanation:** This message is issued when response to a prompt is to terminate a MODIFY BPXOINIT,FILESYS system command.

**System action:** The MODIFY processing is terminated.

**Operator response:** None.

**System programmer response:** None.

**Module:** BPXMFILE

**Routing Code:** 2

**Descriptor Code:** 4,8
**BPXM122I**  MMAP ERROR FOR FILE SYSTEM *fsname* PATH *pathname* INODE *inodeno* RETURN CODE = *retcode*
REASON = *reason*

**Explanation:** This hardcopy message is issued because of a file operation error during memory map I/O processing. It identifies the file and file error that are involved in a failed operation.

In the message text:

*fsname*
The name of the file system that contains the file.

*pathname*
The path name in the file system that was involved in the error. Note that there might be more than one file with this name in the file system. This path name might be truncated on the left. The inode number can also be used to identify the file.

*inodeno*
The inode number of file name in hexadecimal, in case the file name is missing or truncated.

*retcode*
Return code from the failing operation. See [z/OS UNIX System Services Messages and Codes](#).

*reason*
Reason code from the failing operation. See [z/OS UNIX System Services Messages and Codes](#).

**System action:** There might be an associated abend code EC6 with this error. Otherwise, the memory map access fails and processing returns to the calling application.

**Operator response:** Contact the system programmer.

**System programmer response:** The return and reason codes might help identify whether the memory map access can be repaired. It is possible, however, that file or file system access has been lost. If so, determine whether the file or file system can be made available again. In a networked or shared file system configuration, the application using memory map might be running in a different system rather than the system performing the file I/O.

**Module:** BPXGYFLT

**Routing Code:** Hardcopy only

**Descriptor Code:** 4

---

**BPXM123E**  z/OS UNIX HAS DETECTED THAT A GRS LATCH HAS BEEN HELD BY JOB *jjjjjjjj* FOR AN EXTENDED PERIOD OF TIME

**Explanation:** z/OS UNIX processing has detected a potential latching problem. A UNIX System Services GRS latch has been held (without contention) by the specified job for an extended period of time.

In the message text:

*jjjjjjjjjj*
The name of the job that holds a UNIX System Services GRS latch.

**System action:** None.

**Operator response:** None.

**System programmer response:** If the JOB listed in the message text is UNKNOWN, then the job that obtained the latch is no longer active. This may indicate an application error. If contention develops for this latch, it will eventually be cleaned up and no intervention is necessary.

If the JOB listed is something other than UNKNOWN, issue the D GRS,LATCH,JOB= command to gather information regarding which z/OS UNIX latch the job owns. For a latch in the SYS.BPX.A000.FSLIT.FILESYS.LSN or SYS.BPX.A000.FSLIT.FILESYS.LSN.xx latch set, issue the D OMVS,WAITERS command for additional information about the latch. Collect LOGREC, SYSLOG, and a CONSOLE DUMP of the ASID associated with the JOB holding the latch, the zFS address space, the OMVS address space, and the OMVS dataspaces.

If it is determined that the latch is being held in error, use the CANCEL command to attempt to free it.
**BPXM124E • BPXN004I**

**Note:**
1. Some jobs cannot be cancelled, for example OMVS and BPXINIT.
2. Some jobs provided services to many users (servers). Consider the impact of cancelling those types of job before using the CANCEL command.

---

**BPXN004I**  **LOST MESSAGE DETECTED FROM sysname - SEQNO seqno**

**Explanation:** z/OS UNIX System Services XCF processing received a message with an invalid sequence number, implying that a cross-system message has been dropped.

In the message text:

*sysname*

The sysplex member name of the system sending the message.
seqno

The 4-byte hexadecimal expected sequence number identifying the message that was lost. The number is of the form \textit{xxyyyyyy} where \textit{xx} is the system ID of the sender, and \textit{yyyyyy} is the expected sequence number suffix. This number can be used to correlate with the sequence number reported via D OMVS,W (message BPXO063I) on the sending system, if it exists.

\textbf{System action:} An EC6 abend causing a two-system dump will be started.

\textbf{Operator response:} Issue D OMVS,W on the sending system (\textit{sysname}) and contact the system programmer.

\textbf{System programmer response:} Depending on the type of lost message, there can be application errors as well as one or more \textit{z/OS UNIX} latches not being released. D OMVS,W output on the sending system (\textit{sysname}) would show this. Look for a match of \textit{seqno} in this message with \textit{seqno} in BPXO063I on the sending system (\textit{sysname}). If a match exists, the application has been identified and it might be possible to recover without a shutdown by canceling the application or by issuing F BPXOINIT,RECOVER=LATCHES. If a match does not exist, and \textit{z/OS UNIX} on the sending system appears hung, a F OMVS,SHUTDOWN (or IPL) of \textit{sysname} might be required. Regardless, contact IBM Service with the dumps provided.

\textbf{Source:} \textit{z/OS UNIX} System Services kernel (BPX)

\textbf{Routing Code:} 10

\textbf{Descriptor Code:} 12

---

\textbf{BPXN005I}  \ \textbf{DUPLICATE MESSAGE DETECTED FROM} \textit{sysname} - \textbf{SEQNO} \textit{seqno}

\textbf{Explanation:} \textit{z/OS UNIX} System Services XCF processing received a message with a duplicate sequence number, implying that a cross-system message has been sent twice.

In the message text:

\textit{sysname}

The sysplex member name of the system sending the message.

\textit{seqno}

The 4-byte hexadecimal expected sequence number identifying the message that duplicated. The number is of the form \textit{xxyyyyyy} where \textit{xx} is the system ID of the sender, and \textit{yyyyyy} is the expected sequence number suffix. This number can be used to correlate with the sequence number reported via D OMVS,W (message BPXO063I) on the sending system, if it exists.

\textbf{System action:} An EC6 abend causing a two-system dump will be started. To prevent a possible system integrity exposure, the duplicate message will be dropped on this system.

\textbf{Operator response:} Issue D OMVS,W on the sending system (\textit{sysname}) and contact the system programmer.

\textbf{System programmer response:} This should be a rare event that \textit{z/OS UNIX} should recover from. To verify that there is no problem, issue D OMVS,W output on the sending system (\textit{sysname}). Look for match of \textit{seqno} in this message with \textit{seqno} in BPXO063I on the sending system (\textit{sysname}). If a match exists, the application identified should be verified that it is not hung. If a match does not exist, \textit{z/OS UNIX} has probably recovered from this temporary problem. Regardless, contact IBM Service with the dumps provided.

Descriptor Code: 4

BPXN003E  UNIX SYSTEM SERVICES WORKER TASK MANAGER FOR THE SYSPLEX ENDED DUE TO AN INTERNAL ERROR. RESTART Z/OS UNIX AS SOON AS PRACTICABLE.

Explanation: The z/OS UNIX task that manages communications between sysplex members has ended. z/OS UNIX Services in this system has stopped all file sharing with other z/OS UNIX members of the sysplex. This system may still hold file locks that block applications running in other members of the sysplex.

System action: This system leaves the XCF SYSBPX group, which is the group of sysplex members sharing z/OS UNIX files. z/OS UNIX system services stops processing shared file system requests.

Operator response: Before contacting the system programmer, gather any error indications that precede this message, such as diagnostic messages or dump messages. If practical, recycle z/OS UNIX System Services using the MODIFY OMVS command as described in the z/OS MVS System Commands If recycling z/OS UNIX System Services does not clear the condition, you must re-IPL this system to resume normal file sharing across the sysplex.

System programmer response: The z/OS UNIX System Services recovery routine for the sysplex worker task manager requested a dump of the error that caused the problem. Additional diagnostic messages might also be issued before the error. Use the dump and any additional messages to diagnose the problem. If this does not work, search the problem reporting database for a fix. If no fix exists, contact the IBM Support Center.

BPXO001I  \( hh.mm.ss \) DISPLAY OMVS

**Explanation:** The following material is part of the message text:

```
procname  status  parmmembername

USER  JOBNAME ASID  PID  PPID  STATE  START  CT.SECONDS
user  jobname asid  pid  ppid  state  shh.mss  ct.secs

[LATCHWAITPID=latchwaitpid  CMD=command]
[SERVER=servername  AF=activefiles  MF=maxfiles  TYPE=servertype]
```

In response to a DISPLAY OMVS, ASID=, DISPLAY OMVS, U=, or DISPLAY OMVS, VSERVER operator command, this message displays information about the state of z/OS UNIX and its processes. The line beginning with user appears one or more times for each process.

In the message text:

- **hh.mm.ss**
  The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

- **procname**
  The name of the z/OS UNIX cataloged procedure.

- **status**
  One of the following:
  
  - **ACTIVE**
    z/OS UNIX is currently active.
  
  - **NOT STARTED**
    z/OS UNIX was not started.
  
  - **INITIALIZING**
    z/OS UNIX is initializing.
  
  - **TERMINATING**
    z/OS UNIX is terminating.
  
  - **TERMINATED**
    z/OS UNIX has terminated.
  
  - **ETC/INIT WAIT**
    z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.
  
  - **FORK SHUTDOWN**
    FORK Service has been shutdown.
  
  - **SHUTTING DOWN**
    z/OS UNIX is shutting down.
  
  - **SHUTDOWN**
    z/OS UNIX is shut down.
  
  - **RESTARTING**
    z/OS UNIX is restarting after a shut down.

- **parmmembername**
  The parmlib member name specified on START OMVS.

- **user**
  The user ID of the process.

- **jobname**
  The job name of the process.
asid
The address space ID for the process or zero when states are Z or L.

pid
The process ID, in decimal, of the process.

ppid
The parent process ID, in decimal, of the process.

state
The state of the process or of the most recently created thread in the process as follows:
- 1 Single-thread process
- A Message queue receive wait
- B Message queue send wait
- C Communication system kernel wait
- D Semaphore operation wait
- E Quiesce frozen
- F File system kernel wait
- G MVS Pause wait
- H Process state is for multiple threads and pthread_create was used to create one of the threads. Process state is obtained from the Initial Pthread created Task (IPT).
- I Swapped out
- K Other kernel wait (for example, pause or sigsuspend)
- L Canceled, parent has performed wait, and still session or process group leader
- M Process state is for multiple threads and pthread_create was not used to create any of the multiple threads. Process state is obtained from the most recently created thread.
- P Ptrace kernel wait
- Q Quiesce termination wait
- R Running (not kernel wait)
- S Sleeping
- T Stopped
- W Waiting for child (wait or waitpid callable service)
- X Creating new process (fork callable service is running)
- Z Canceled and parent has not performed wait (Z for zombie)

shhmmss
The time, in hours, minutes, and seconds, when the process was started.

cr_secs
The total execution time for the process in seconds in the format sssssss.hhh. The value displayed is an approximate value, which may be less than a previously displayed value. When this value exceeds 11.5 days of execution time this field will overflow. When an overflow occurs the field is displayed as ******.***
latchwaitpid
Either zero or the latch process ID, in decimal, for which this process is waiting.

cr_command
The command that created the process truncated to 40 characters. It can be converted to uppercase using the CAPS option.

cr_servername
The name of the server process. It can be converted to uppercase using the CAPS option.
activefiles
   The number of active server file tokens.

maxfiles
   The maximum number of active server file tokens allowed.

servertype
   One of the following:
     FILE
       A network file server
     LOCK
       A network lock server
     FEXP
       A network file exporter
     SFDS
       A shared file server

In response to a DISPLAY OMVS,FILE command, this message displays information about z/OS UNIX and its file systems. The line beginning with type appears one or more times for each file system.

In the message text:

hh.mm.ss
   The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
   The name of the z/OS UNIX cataloged procedure.

status
   One of the following:
     ACTIVE
       z/OS UNIX is currently active.
     NOT STARTED
       z/OS UNIX was not started.
BPXO002I

INITIALIZING
z/OS UNIX is initializing.

TERMINATING
z/OS UNIX is terminating.

TERMINATED
z/OS UNIX has terminated.

ETC/INIT WAIT
z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

parmmembername
The parmlib member name specified on the START OMVS command.

type
File system type as defined by the FILESYSTYPE statement.

device
The device value to uniquely identify the device.

filestatus
One of the following:

FORCE UNMOUNT
An unmount with force is in progress.

DRAIN UNMOUNT
A file system drain unmount is in progress.

IMMEDIATE UNMOUNT
An immediate unmount is in progress.

NORMAL UNMOUNT
A normal unmount is in progress.

RESET UNMOUNT
An unmount was reset.

IMMEDIATE UNMOUNT ATTEMPTED
An immediate unmount was attempted

ACTIVE
File system is active.

QUIESCED
File system is quiesced.

NOT ACTIVE
File system is not active.

MOUNT IN PROGRESS
File system is being mounted.

ASYNC MOUNT IN PROGRESS
File system is being mounted asynchronously.

qjobname
The jobname that quiesced the file system.

qpid
The process ID that quiesced the file system.

filesysname
The name of the file system.

pathname
The name of the directory where the file system is mounted truncated to 60 characters. You can convert it to uppercase by using the CAPS option.
mountparm
The parameter specified to the mount callable service, truncated to 57 characters. You can convert it to uppercase by using the CAPS option.

\textbf{Explanation:} The issuer of the SETOMVS command does not have Master Console Authority.

\textbf{System action:} No SETOMVS parameters were set.

\textbf{Operator response:} Reissue the SETOMVS command from the master console.

\textbf{System programmer response:} None.

\textbf{Module:} BPXOSETO

\textbf{Source:} z/OS UNIX System Services kernel (BPX)

BPXO027I  SETOMVS COMMAND PROCESSOR IS CURRENTLY NOT AVAILABLE. \textbf{REASON CODE:} reason\_code

\textbf{Explanation:} The SETOMVS command processor had an unrecoverable error. No SETOMVS commands can be processed.

1. The SETOMVS initialization routine BPXOSETO could not establish addressability to the general recovery routine BPXMIPCE.
2. The SETOMVS initialization routine BPXOSETO could not establish ESTAE recovery via BPXMIPCE.
3. The SETOMVS processing routine BPXOTASK is currently not processing commands.
4. OMVS is not up at this time.
5. OMVS is not completely initialized.

In the message text:

\textit{reason\_code}  
Explains why the SETOMVS command processor is not available.

\textbf{System action:} The SETOMVS command is not processed.
BPXO028I  SET OMVS COMMAND PROCESSOR IS CURRENTLY NOT AVAILABLE. REASON CODE:

Example: The SET OMVS command processor had an unrecoverable error. No SET OMVS commands can be processed.
1. The SET OMVS initialization routine BPXOSETX could not establish addressability to the general recovery routine BPXMIPCE.
2. The SET OMVS initialization routine BPXOSETX could not establish ESTAE recovery via BPXMIPCE.
3. The SET OMVS processing routine BPXOTASK is currently not processing commands.

In the message text:

reason_code

Explanation: The reason codes are explained in z/OS UNIX System Services Messages and Codes.

System programmer response: Try the command later, the processor will probably re-establish itself.

Operator response: Contact the system programmer.

Module: BPXOSETX

BPXO030I  SYNTAX ERRORS ENCOUNTERED WHILE PROCESSING PARMLIB MEMBERS ON SET OMVS COMMAND. REASON: reason_code

Explanation: Syntax errors were found in the parmlib member(s) specified on the SET OMVS command. The correct format is xx, (xx), or (xx,yy,...).

In the message text:

reason_code
   Explains why the SET OMVS command was not executed. The reason codes are explained in z/OS UNIX System Services Messages and Codes.

System action: The SET OMVS command is not processed.
Operator response: Enter valid parmlib member suffix(es) on SET OMVS=.
System programmer response: None.
Module: BPXOTASK
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 5

BPXO031I  ERRORS IN PARMLIB MEMBER=memname REFER TO THE HARD COPY LOG. SET OMVS COMMAND FAILED.

Explanation: The system encountered errors in a parmlib member.

In the message text:

memname
   The name of the parmlib member containing the error.

System action: The system wrote the error messages to the hard copy log. Error checking for other parmlib members continues.
Operator response: None.
System programmer response: Look in hard copy log at the previous messages explaining the errors in the parmlib member. Correct the errors in the parmlib member before using it again.
Module: BPXINPRM
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2,10
Descriptor Code: 4

BPXO032I  THE SET OMVS COMMAND WAS SUCCESSFUL.

Explanation: The SET OMVS command was successful.
System action: The SET OMVS parmlib members values were set.
Operator response: None.
System programmer response: None.
Module: BPXINPRM

Descriptor Code:  4

BPXO036I  PARMLIB OPTIONS IGNORED WHILE PROCESSING PARMLIB MEMBER = memname settype.

Explanation: Not all parmlib commands are accepted by the various parmlib processing operations. This is usually not an error. Consult the documentation for additional details.

In the message text:

memname
   The name of the parmlib member containing the ignored commands.

settype
   One of the following:

   SETOMVS RESET = IGNORES CTRACE RUNOPTS SWA.
       Parmlib options ignored by the SETOMVS RESET = command.

   SET OMVS = IGNORES CTRACE FILESYSTYPE RUNOPTS SWA.
       Parmlib options ignored by the SET OMVS command.

   UNKNOWN PARMLIB OPTIONS IGNORED DURING INITIALIZATION.
       Parmlib options have been ignored during initialization.

System action: The processing of the command continues.

Operator response: None.

System programmer response: None.

Module: BPXINPRM

Descriptor Code:  5

BPXO037E  UNABLE TO PERFORM FILESYS REQUEST FOR movetype movebuffer. THIS OPERATION FAILED WITH RETURN CODE return_code REASON CODE reason_code.

Explanation: It is not always possible to move a filesystem from one system to another. Check the return and reason code for additional information. If a file was part of the problem, check the hardcopy log for BPXF232E.

In the message text:

movetype
   One of the following:

   FILESYSTEM
       A file system can not be moved.

   MOUNTPOINT
       The mountpoint can not be moved.

   FROM SYSTEM
       The system that the files can not be moved from.

movebuffer
   The name of either the file system, mountpoint, or system with the failure. If a mountpoint was given, it has been truncated to the first 57 characters only.

return_code
   The failure return code.

reason_code
   The failure reason code. For an explanation of the return code and reason code, see z/OS UNIX System Services Messages and Codes.

System action: Processing for the command ends.
**Operator response:** Consult the system programmer.

**System programmer response:** Refer to the actions suggested for the return code received.

**Module:** BPXOTASK

**Source:** z/OS UNIX System Services kernel (BPX)

**Descriptor Code:** 5

---

**BPX0038I SUCCESSFULLY MOVED moveoks FILESYSTEMS TO SYSTEM movesys.**

**Explanation:** This is a status message reporting what happened when the move request to move a collection of file systems from one system to another was processed.

In the message text:

- **moveoks**
  - The number of file systems successfully moved.

- **movesys**
  - The system where the file systems were moved.

**System action:** Processing for the command ends.

**Operator response:** None.

**System programmer response:** To verify that all filesystems moved, enter command `D OMVS,F` on either the target system, source system, or both systems, and observe filesystem ownership. If there are filesystems that did not move, try moving them individually with the following command and observe the results:

```
SETOMVS FILESYS,FILESYSTEM=filesystem,SYSNAME=sysname
```

If a move fails, the system issues message BPX0037E to describe the error.

---

**BPX0039I SETOMVS SYNTAXCHECK COMMAND SUCCESSFUL.**

**Explanation:** The SYNTAXCHECK of the parmlib member requested was successful.

**System action:** None.

**Operator response:** None.

**System programmer response:** None.

---

- `status`  
- `parmmemberlist`  

```
USER  JOBNAME  ASID  PID  PPID  STATE R  START  CT_SECS
user  jobname  asid  pid  ppid  state r  sibmnss  ctsecs
```

---

Chapter 12. BPX messages 485
In response to a DISPLAY OMVS,ASID=, DISPLAY OMVS,U=, DISPLAY OMVS,VSERVER or DISPLAY OMVS,PID= operator command, this message displays information about the state of z/OS UNIX and its processes. The line beginning with user appears one or more times for each process. In response to a DISPLAY OMVS,PID=,BRL command, this message displays information about a possible Byte Range Lock situation, where a byte range of a file is locked by another thread for exclusive use only.

In response to a DISPLAY OMVS,ASID=DUBW command, this message displays jobs waiting to become processes.

In the message text:

- **hh.mm.ss**
  - The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

- **procname**
  - The name of the z/OS UNIX cataloged procedure.

- **kernelasid**
  - The address space id of the Kernel.

- **status**
  - One of the following:
    - **ACTIVE**
      - z/OS UNIX is currently active.
    - **NOT STARTED**
      - z/OS UNIX was not started.
    - **INITIALIZING**
      - z/OS UNIX is initializing.
    - **TERMINATING**
      - z/OS UNIX is terminating.
    - **TERMINATED**
      - z/OS UNIX has terminated.
    - **ETC/INIT WAIT**
      - z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.
    - **FORK SHUTDOWN**
      - FORK Service has been shutdown.
    - **SHUTTING DOWN**
      - z/OS UNIX is shutting down.
    - **SHUTDOWN BLOCKED**
      - z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.
SHUTDOWN
   z/OS UNIX is shut down.

RESTARTING
   z/OS UNIX is restarting after a shut down.

parmmemberlist
   The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

user
   The user ID of the process.

jobname
   The job name of the process.

asid
   The address space ID for the process or zero when states are Z or L.

pid
   The process ID, in decimal, of the process; or "-" if no process id has been assigned yet.

ppid
   The parent process ID, in decimal, of the process.

state r
   A 6-character field showing the state of either the process or the most recently created thread in the process. This
   field includes a 5-character state field and a 1-character r field that contains the restart state.

state is one or the combination of the following codes:
- Column is not being used.
1 Single-thread process.
A Message queue receive wait.
B Message queue send wait.
C Communication system kernel wait.
D Semaphore operation wait; or, when there is no process id assigned yet, D means the job is waiting to
   become a process.
E Quiesce frozen.
F File system kernel wait.
G MVS Pause wait.
H Process state is for multiple threads and pthread_create was used to create one of the threads. Process
   state is obtained from the Initial Pthread created Task (IPT).
I Swapped out.
K Other kernel wait (for example, pause or sigsuspend).
L Ended and parent has performed wait. The process is the session or process group leader of a process
   that is still active, but will be removed from the process table after the last session or process group
   member terminates. (L is for latent zombies.)
M Process state is for multiple threads and pthread_create was not used to create any of the multiple
   threads. Process state is obtained from the most recently created thread.
P Ptrace kernel wait.
Q Quiesce termination wait.
R Running (not kernel wait).
S Sleeping.
T Stopped.
W Waiting for child (wait or waitpid callable service).
Creating new process (fork callable service is running).

Ended and parent has not performed wait. (Z is for zombies.)

$r$ is the 1 character restart status:

- Column is not being used

B  Blocked

P  Permanent

$hhmmss$

The time, in hours, minutes, and seconds, when the process was started.

$ct$ secs

The total execution time for the process in seconds in the format $ssssss.hh$. The value displayed is an approximate value, which may be less than a previously displayed value. When this value exceeds 11.5 days of execution time this field will overflow. When an overflow occurs the field is displayed as $******.***$.

$latchwaitpid$

Either zero or the latch process ID, in decimal, for which this process is waiting.

$command$

The command that created the process truncated to 40 characters. You can convert it to uppercase by using the CAPS option.

$servername$

The name of the server process. You can convert it to uppercase by using the CAPS option.

$activefiles$

The number of active server file tokens.

$maxfiles$

The maximum number of active server file tokens allowed.

$servertype$

One of the following:

FILE  A network file server

LOCK  A network lock server

FEXP  A network file exporter

SFDS  A shared file server

$threadid$

The thread ID, in hexadecimal, of the thread.

$tcbaddr$

The address of the TCB that represents the thread.

$prijob$

The job name from the current primary address space if different from the home address space, otherwise blank. This is only accurate if the thread is in a wait, otherwise it is from the last time that status '.' was saved. When the data is not available the field will be displayed as $******$.

$username$

The username of the thread if a task level security environment created by pthread_security_np exists, otherwise blank. When the data is not available the field will be displayed as $******$.

$ac$ secs

The accumulated TCB time in seconds in the format $ssssss.hh$. When this value exceeds 11.5 days of execution time this field will overflow. When an overflow occurs the field is displayed as $******.***$. When the data is not available the field will be displayed as $******$. 
The current or last syscall request.

**thdstate**
The state of the thread as follows:
A Message queue receive wait
B Message queue send wait
C Communication system kernel wait
D Semaphore operation wait
E Quiesce frozen
F File system kernel wait
G MVS Pause wait
J The thread was pthread created rather than dubbed
K Other kernel wait (for example, pause or sigsuspend)
N The thread is medium weight
O The thread is asynchronous and medium weight
P Ptrace kernel wait
Q Quiesce termination wait
R Running (not kernel wait)
S Sleeping
U Initial process thread (heavy weight and synchronous)
V Thread is detached
W Waiting for child (wait or waitpid callable service)
X Creating new process (fork callable service is running)
Y Thread is in an MVS wait

**tagdata**
The tag data associated with the thread, if present. From 1 to 65 EBCDIC characters

**devicenumber**
The Device number for which the Byte Range Lock (BRL) Wait occurred.

**inodenumber**
The Inode number of the file owning the BRL.

**filename**
The name of the file. If the filename has more than 16 characters, the first 15 are displayed followed by a plus sign (+).

**lockpidid**
The PID of the process locking that file. This is usually the owner (or one of the owners) of a lock on the same range, but sometimes it is another process that is also waiting.

**progresscounter**
An increasing progress counter.

**The blocking process is on system: sys**
Displays the name of the system where the blocking process is when the command is issued in a sysplex configuration and the blocking process is from a different system in the sysplex than the system where the command was issued.

**System action:** The system continues processing.

**Operator response:** Resolve the Byte Range Lock situation in order to keep the waiting process running.

**System programmer response:** None.

### BPXO041I  hh.mm.ss DISPLAY OMVS

**Explanation:** The following material is part of the message text:

<table>
<thead>
<tr>
<th>procname</th>
<th>kernelasid</th>
<th>status</th>
<th>parmmemberlist</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE</td>
<td>DEVICE</td>
<td>------</td>
<td>STATUS---------</td>
</tr>
<tr>
<td>NAME=</td>
<td>device</td>
<td>filestatus</td>
<td>QJOBNAME</td>
</tr>
<tr>
<td>MOUNT PARM=mountparm</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In response to a DISPLAY OMVS,FILE command, this message displays information about z/OS UNIX and its file systems. The line beginning with type appears one or more times for each file system.

In the message text:

- **hh.mm.ss**  
  The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

- **procname**  
  The name of the z/OS UNIX cataloged procedure.

- **kernelasid**  
  The address space id of the Kernel.

- **status**  
  One of the following:

  - **ACTIVE**  
    z/OS UNIX is currently active.

  - **NOT STARTED**  
    z/OS UNIX was not started.

  - **INITIALIZING**  
    z/OS UNIX is initializing.

  - **TERMINATING**  
    z/OS UNIX is terminating.

  - **TERMINATED**  
    z/OS UNIX has terminated.

  - **ETC/INIT WAIT**  
    z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

- **parmmemberlist**  
  The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

- **type**  
  The file system type as defined by the FILESYSTYPE statement.

- **device**  
  The device value to uniquely identify the device.

- **filestatus**  
  One of the following:
**FORCE UNMOUNT**
An unmount with force is in progress.

**DRAIN UNMOUNT**
A file system drain unmount is in progress.

**IMMEDIATE UNMOUNT**
An immediate unmount is in progress.

**NORMAL UNMOUNT**
A normal unmount is in progress.

**RESET UNMOUNT**
An unmount was reset.

**IMMEDIATE UNMOUNT ATTEMPTED**
An immediate unmount was attempted

**ACTIVE**
File system is active.

**QUIESCED**
File system is quiesced.

**NOT ACTIVE**
File system is not active.

**MOUNT IN PROGRESS**
File system is being mounted.

**ASYNCH MOUNT IN PROGRESS**
File system is being mounted asynchronously.

- **qjobname**
  The jobname that quiesced the file system.

- **qpid**
  The process ID that quiesced the file system.

- **filesysname**
  The name of the file system.

- **pathname**
  The name of the directory where the file system is mounted truncated to 60 characters. You can convert it to uppercase by using the CAPS option.

- **mountparm**
  The parameter specified to the mount callable service, truncated to 57 characters. You can convert it to uppercase by using the CAPS option.

**System action:** The system continues processing.

**Operator response:** None.

**System programmer response:** None.

**Module:** BPXOMAST

**Source:** z/OS UNIX System Services kernel (BPX)

**Descriptor Code:** 5,8,9

---

**BPXO042I hh.mm.ss DISPLAY OMVS**

**Explanation:** The following material is part of the message text:

```
proclname  kernelasid  status  parmmemberlist
```
This message is displayed under the following circumstances:

- In response to a DISPLAY OMVS operator command where process data was not able to be collected.
- In response to a DISPLAY OMVS,ASID=, DISPLAY OMVS,U=, DISPLAY OMVS,VSERVER or DISPLAY OMVS,PID= operator command when the process specified could not be found.
- In response to a DISPLAY OMVS,FILE operator command when the specified filtering is used and the file systems could not be found.
- DISPLAY OMVS,ASID=DUBW when there are no jobs waiting to be dubbed. The following message text is displayed to indicate no jobs are waiting:

  NO JOBS WAITING FOR UNIX SYSTEM SERVICES INITIALIZATION

In the message text:

- **hh.mm.ss**
  - The time in hours (00—23), minutes (00—59), and seconds (00—59) for the DISPLAY OMVS command.

- **procnam**
  - The name of the member in SYS1.PROCLIB used to start z/OS UNIX.

- **kernelasid**
  - The address space id of the Kernel.

- **status**
  - One of the following:
    - **ACTIVE**
      - z/OS UNIX is currently active.
    - **NOT STARTED**
      - z/OS UNIX was not started.
    - **INITIALIZING**
      - z/OS UNIX is initializing.
    - **TERMINATING**
      - z/OS UNIX is terminating.
    - **TERMINATED**
      - z/OS UNIX has terminated.
    - **ETC/INIT WAIT**
      - z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.
    - **FORK SHUTDOWN**
      - FORK Service has been shutdown.
    - **SHUTTING DOWN**
      - z/OS UNIX is shutting down.
    - **SHUTDOWN BLOCKED**
      - z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.
    - **SHUTDOWN**
      - z/OS UNIX is shut down.
    - **RESTARTING**
      - z/OS UNIX is restarting after a shut down.

- **parmmemberlist**
  - The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

- **valuespecified**
  - The DISPLAY OMVS ASID=, U=, PID= or FILE,criteria= value specified on DISPLAY OMVS.
progresscounter
An increasing progress counter.

System action: The system continues processing.
Operator response: None.
System programmer response: None.

Chapter 12. BPX messages 493
In response to a DISPLAY OMVS,OPTIONS operator command, this message displays current values of parmlib options. Some values are able to be set using the SET OMVS or SETOMVS commands.

In the message text:

- **hh.mm.ss**
  - The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

- **proclename**
  - The name of the member in SYS1.PROCLIB used to start z/OS UNIX.

- **kernelasid**
  - The address space id of the kernel.

- **status**
  - One of the following:
    - **ACTIVE**
      - z/OS UNIX is currently active.
    - **NOT STARTED**
      - z/OS UNIX was not started.
    - **INITIALIZING**
      - z/OS UNIX is initializing.
    - **TERMINATING**
      - z/OS UNIX is terminating.
    - **TERMINATED**
      - z/OS UNIX has terminated.
    - **ETC/INIT WAIT**
      - z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.
    - **FORK SHUTDOWN**
      - FORK service has been shutdown.
    - **SHUTTING DOWN**
      - z/OS UNIX is shutting down.
    - **SHUTDOWN BLOCKED**
      - z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.
    - **SHUTDOWN**
      - z/OS UNIX is shut down.
    - **RESTARTING**
      - z/OS UNIX is restarting after a shut down.

- **parmmemberlist**
  - The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

- **maxprocsys**
  - Maximum processes on the system.

- **maxprocuser**
  - Maximum processes per User ID.

- **maxfileproc**
  - Maximum number of allocated files for a single process.

- **maxfilesize**
  - Maximum file size.

- **maxfilesizemult**
  - Maximum file size multiplier.

- **maxcputime**
  - Maximum CPU time.
maxuids
  Maximum number of users on the system.

maxptys
  Maximum number of pseudo-terminal sessions.

max mmaparea
  Maximum size of memory map area in PAGES.

max mmapareamult
  Maximum memory map area multiplier.

max assize
  Maximum address space size.

max asizemult
  Maximum address space multiplier.

max threads
  Maximum number of threads.

max threadtasks
  Maximum number of tasks running pthreads per process.

max coresize
  Maximum core size.

max coresizemult
  Maximum core size multiplier.

max share pages
  Maximum number of pages that can be in a shared relationship in the system.

max shrapages mult
  Maximum shared pages multiplier.

max user mount sys
  Maximum number of nonprivileged user mounts for the system or for the shared file system configuration environment.

max user mount user
  Maximum number of nonprivileged user mounts for each nonprivileged user.

max pipe user
  User limit for named and unnamed pipes.

ipc msg bytes
  Maximum bytes per message queue.

ipc msg qnum
  Maximum messages per queue.

ipc msg nids
  Maximum system queue IDs.

ipc sem nids
  Maximum system semaphore IDs.

ipc sem nops
  Maximum number of operations per BPX1SOP (SEMOP) call.

ipc sem nsems
  Maximum number of semaphores per semaphore set.

ipc shm mpages
  Maximum system shared memory pages for all segments.

ipc shm mpages mult
  Maximum system shared memory pages multiplier.

ipc shm nids
  Maximum system shared memory IDs.
**BPXO043I**

*ipcshtmsegs*
- Maximum shared memory segments per process.

*ipcshtmspages*
- Maximum system shared memory pages for all segments.

*ipcshtmspagesmult*
- Maximum system shared memory pages multiplier.

*superuser*
- Userid of the superuser.

*forkcopy*
- One of the following:
  - **COPY**
    - Copy parent data to child at the time of the fork.
  - **COW**
    - Use Copy-on-Write for the parent data (Default).

*stepliblist*
- Name of STEPLIB dataset, truncated to 50 characters.

*useridalias*
- Name of Userid table, truncated to 50 characters.

*priorgpstatus*
- One of the following:
  - **NONE**
    - PRIORITYPG values are not currently set.
  - **PROPAGATED**
    - The last PRIORITYPG value was propagated.

*priortypg*
- Performance group numbers for compatibility mode.

*priorgoalstatus*
- One of the following:
  - **NONE**
    - PRIORITYGOAL values are set.
  - **PROPAGATED**
    - The last PRIORITYGOAL value was propagated.

*noargs*
- Argument suppression list.

*priortypgoal*
- Service classes for goal mode.

*maxqueuedsigs*
- Maximum queued signals.

*shrlibrgnsize*
- Shared library region size.

*shrlibmaxpages*
- Shared library maximum pages.

*versvalue*
- Version directory value.

*syscallcount*
- One of the following:
  - **YES**
    - Indicates tracing of syscall information is being done.
NO Indicates tracing for this is turned off.

ttygroup
Group name for terminals.

sysplexmode
One of the following:

NO Indicates that the system has been IPLed as a local system.

YES Indicates that the system has been IPLed as a SYSPLEX.

brlmvalue
The name of the system in a z/OS UNIX sysplex that is functioning as the Byte Range Lock Manager server. 
brlmvalue = 'N/A' when either sysplexmode=NO, or when the distributed BRLM function is active.

limmsg
Indicates the Level of Limits Messaging.

autocvt
Indicates conversion of I/O data.

ALL Unicode Service conversion

OFF No conversion

ON Enhanced ASCII conversion

maxiobufsize
Maximum amount of persistent I/O buffer storage above the 2 G bar.

resproc
The name of the TCP/IP resolver started procedure.

lostmsg
Lost message detection setting (ON or OFF)

authpgmlist
Name of the APF/Program control list, truncated to 50 characters.

progresscounter
An increasing progress counter.

swamode
One of the following options:

ABOVE Indicates that all SWA control blocks are to be allocated above the 16 megabyte line.

BELOW Indicates that all SWA control blocks are to be allocated below the 16 megabyte line.

serv_lpalib
The LPA library from which the dynamic service is activated.

serv_lpalibvol
The volume where the LPA library resides.

serv_linklib
The LINKLIB library from which the dynamic service is activated.

serv_linklibvol
The volume where the LINKLIB library resides.

progresscounter
An increasing progress counter.

altrootfs
If the alternate sysplex root file system is mounted successfully and is active, the name of the alternate sysplex
root file system specified in ALTROOT keyword of the BPXPRMxx parmlib member is displayed. If the alternate sysplex root file system is not mounted nor active, blanks are displayed. See the BPXF253E message explanation for reasons that the alternate sysplex root file system becomes inactive.

nonemptymountpt
Specifies how the system is to mount any file system on a mount point when it is a non-empty directory. It is one of the following:

DENY
Does not mount any file system when the mount point is a non-empty directory.

NOWARN
Mounts on any file system on the mount point without any warning message when the mount point is a non-empty directory. The contents of that directory are hidden for the duration of the mount.

WARN
Mounts any file system on the mount point with a warning message when the mount point is a non-empty directory. The contents of that directory are hidden for the duration of the mount.

KERNELSTACKS
One of the following options:

ABOVE
Indicates that the display shows threads instead of stack cells.

BELOW
Indicates that the display shows stack cells instead of threads.

System action: The system continues processing.
Operator response: None.
System programmer response: None.

BPXO044l  hh.mm.ss DISPLAY OMVS text
Explanation: Where text is:

procname  kernelasid  status  parmmemberlist
TYPE NAME  DEVICE  ----STATUS------  MODE  QJOBNAME  QPID

In response to a DISPLAY OMVS,FILE command, this message displays information about z/OS UNIX and its file systems. The line beginning with type appears one or more times for each file system.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procmame
The name of the z/OS UNIX cataloged procedure.

kernelasid
The address space id of the Kernel.
status
One of the following:

ACTIVE
z/OS UNIX is currently active.

NOT STARTED
z/OS UNIX was not started.

INITIALIZING
z/OS UNIX is initializing.

TERMINATING
z/OS UNIX is terminating.

TERMINATED
z/OS UNIX has terminated.

ETC/INIT WAIT
z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

FORK SHUTDOWN
FORK Service has been shutdown.

SHUTTING DOWN
z/OS UNIX is shutting down.

SHUTDOWN
z/OS UNIX is shut down.

RESTARTING
z/OS UNIX is restarting after a shut down.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

type
The file system type as defined by the FILESYSTYPE statement.

device
The device value to uniquely identify the device.

filestatus
One of the following:

FORCE UNMOUNT
An unmount with force is in progress.

DRAIN UNMOUNT
A file system drain unmount is in progress.

IMMEDIATE UNMOUNT
An immediate unmount is in progress.

NORMAL UNMOUNT
A normal unmount is in progress.

RESET UNMOUNT
An unmount was reset.

IMMEDIATE UNMOUNT ATTEMPTED
An immediate unmount was attempted

ACTIVE
File system is active.

QUIESCED
File system is quiesced.

NOT ACTIVE
File system is not active.
### BPXO045I

**MOUNT IN PROGRESS**
File system is being mounted.

**ASYNCH MOUNT IN PROGRESS**
File system is being mounted asynchronously.

**filemode**
One of the following:

- **RDWR**
The file system is mounted for read/write access.

- **READ**
The file system is mounted for read only access.

**qjobname**
The jobname that quiesced the file system.

**qpid**
The process ID that quiesced the file system.

**filesysname**
The name of the file system.

**pathname**
The name of the directory where the file system is mounted truncated to 60 characters. You can convert it to uppercase by using the CAPS option.

**mountparm**
The parameter specified to the mount callable service, truncated to 57 characters. You can convert it to uppercase by using the CAPS option.

**System action:** The system continues processing.

**Operator response:** None.

**System programmer response:** None.

*z/OS V2R2 MVS System Messages, Vol 3 (ASB-BPX)*
In response to a DISPLAY OMVS,FILE command, this message displays information about z/OS UNIX and its file systems. The line beginning with type appears one or more times for each file system.

In the message text:

*hh.mm.ss*  
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

*procnname*  
The name of the z/OS UNIX cataloged procedure.

*kernelasid*  
The address space id of the Kernel.

*status*  
One of the following:

  **ACTIVE**  
z/OS UNIX is currently active.

  **NOT STARTED**  
z/OS UNIX was not started.

  **INITIALIZING**  
z/OS UNIX is initializing.

  **TERMINATING**  
z/OS UNIX is terminating.

  **TERMINATED**  
z/OS UNIX has been terminated.

  **ETC/INIT WAIT**  
z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

  **FORK SHUTDOWN**  
FORK service has been shutdown.

  **SHUTTING DOWN**  
z/OS UNIX is shutting down.

  **SHUTDOWN BLOCKED**  
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

  **SHUTDOWN**  
z/OS UNIX is shut down.

  **RESTARTING**  
z/OS UNIX is restarting after a shut down.

*parmmemberlist*  
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

*type*  
The file system type as defined by the FILESYSTYPE statement.

*device*  
The device value to uniquely identify the device.

*filestatus*  
One of the following:

  **FORCE UNMOUNT**  
   An unmount with force is in progress.
**BPXO045I**

**DRAIN UNMOUNT**
A file system drain unmount is in progress.

**IMMEDIATE UNMOUNT**
An immediate unmount is in progress.

**NORMAL UNMOUNT**
A normal unmount is in progress.

**RESET UNMOUNT**
An unmount was reset.

**IMMEDIATE UNMOUNT ATTEMPTED**
An immediate unmount was attempted.

**ACTIVE**
File system is active.

**QUIESCED**
File system is quiesced.

**NOT ACTIVE**
File system is not active.

**MOUNT IN PROGRESS**
File system is being mounted.

**ASYNCH MOUNT IN PROGRESS**
File system is being mounted asynchronously.

**IN RECOVERY**
File system is in recovery processing.

**UNOWNED**
File system has no server or owner.

**SUPERQUIESCED**
File system has been superquiesced.

**RECYCLING**
The physical file system is recycling.

**RECYCLING, ASYNCH MOUNTING**
The physical file system is recycling, and this file system is in an asynchronous mount waiting for mount completion.

**RECYCLING, NOT ACTIVE**
The physical file system is recycling, and this file system failed to mount successfully.

**filemode**
One of the following:

**RDWR**
The file system is mounted for read/write access.

**READ**
The file system is mounted for read only access.

**mount_date**
The date that the file system was mounted.

**mount_time**
The time that the file system was mounted.

**L=1**
The latch number for this file system

**Q=q**
The quiesce latch number for this file system or 0 if the file system has never been quiesced by z/OS UNIX System Services.
filesysname
   The name of the file system.

LATCH=latch
   The latch number for the file system.

QL=ql

pathname
   The name of the directory where the file system is mounted truncated to 60 characters. You can convert it to
   uppercase by using the CAPS option.

usermtnUID
   The effective UID of the nonprivileged user who mounted this file system.

mountparm
   The parameter specified to the mount callable service, truncated to 57 characters. You can convert it to
   uppercase by using the CAPS option.

fsowner
   The system that owns this file system.

automove
   This information will only be displayed if the system is running SYSPLEX(YES). One of the following:

   AUTOMOVE=Y
      The file system will be automatically moved during recovery operations.

   AUTOMOVE=N
      The file system will NOT be automatically moved during recovery operations.

   AUTOMOVE=U
      The file system will be automatically unmounted during recovery operations.

   AUTOMOVE=I
      The file system will be automatically moved using an include system list during recovery operations.

   AUTOMOVE=E
      The file system will be automatically moved using an exclude system list during recovery operations.

client
   One of the following:

   CLIENT=Y
      This file system is a client.

   CLIENT=N
      This file system is not a client.

fsqsystem
   The system that quiesced this file system.

fsqowner
   The jobname that quiesced the file system.

qpid
   The pid that quiesced the file system.

textflag
   One of the following:

   TEXT
      Auto-conversion of untagged files is allowed.

   NOTEXT
      Auto-conversion of untagged files is not allowed.

ccsid
   The implicit CCSID for untagged files in the file system.

sltype
   The type of the system list in use (include/exclude).
BPXO046I

```
systemname
The name of a system in the automove system list.

progresscounter
An increasing progress counter.

rosecl
The name of the read only seclabel assigned to the file system.

pfssstatus
The status returned by the physical file system.

pfsexcpstat
The exception status returned by the physical file system.

Note: When a zFS file system that is mounted RWSHARE get quiesced, zFS will update pfsexcpstat so it
displays QUIESCED. filestatus will not display QUIESCED.

System action: The system continues processing.

BPXO046I  hh.mm.ss DISPLAY OMVS text

Explanation: Where text is:

```
procname  kernelasid  status  parmmemberlist

PFS CONFIGURATION INFORMATION
PFS TYPE  DESCRIPTION  ENTRY  MAXSOCK  OPNSOCK  HIGHUSED
        type           description  entrypoint  maxsock  opnssock  hwmsock

PFS NAME  DESCRIPTION  ENTRY  STATUS  FLAGS
        name           description  entrypoint  pfsstatus  pfsflags

PFS TYPE  PARAMETER INFORMATION
        type  parms
        type  CURRENT VALUES: FIXED(fixed) VIRTUAL(virtual)

```

In response to the DISPLAY OMVS,PFS command, this message displays information about the z/OS UNIX physical
file systems.

In the message text:

```
hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the z/OS UNIX cataloged procedure.

kernelasid
The address space id of the Kernel.

status
One of the following:
```
**ACTIVE**

z/OS UNIX is currently active.

**NOT STARTED**

z/OS UNIX was not started.

**INITIALIZING**

z/OS UNIX is initializing.

**TERMINATING**

z/OS UNIX is terminating.

**TERMINATED**

z/OS UNIX has terminated.

**ETC/INIT WAIT**

z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

**FORK SHUTDOWN**

FORK service has been shutdown.

**SHUTTING DOWN**

z/OS UNIX is shutting down.

**SHUTDOWN BLOCKED**

z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

**SHUTDOWN**

z/OS UNIX is shut down.

**RESTARTING**

z/OS UNIX is restarting after a shut down.

**parmmemberlist**

The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

**type**

The data specified with the TYPE operand on the FILESYSTYPE statement.

**Note:** If a dash (-) appears as the first character of PFS TYPE, it means the PFS is inactive.

**description**

A brief description of the physical file system.

**entrypoint**

The name of the load module specified with the ENTRYPOINT operand on the FILESYSTYPE or SUBFILESYSTYPE statements.

**maxsock**

This is the MAXSOCKETS operand of a NETWORK statement for a sockets physical file system. It specifies the maximum number of sockets that can be open at one time for the address family.

**opnsock**

The number of sockets that are currently opened for this sockets physical file system.

**hwmsock**

The highest number of sockets opened at one time for this sockets physical file system.

**name**

The data specified with the NAME operand on the SUBFILESYSTYPE statement. If a dash (-) should appear as the first character for any PFS name, it means that the PFS is inactive.

**pfsstatus**

**ACT** — The PFS is active.

**INACT** — The PFS is inactive.

**pfsflags**

**CD** — Current® Default transport provider: The system is currently using this PFS as the default transport provider although it was not specified as the default with the SUBFILESYSTYPE statement.
**SD** — Specified Default transport provider: This PFS was specified as the default transport provider with the `SUBFILESYSTYPE` statement. However, it is currently not being used as the default.

**SC** — Specified is Current transport provider: This PFS was specified as the default transport provider with the `SUBFILESYSTYPE` statement and the system is currently using it as the default.

**parms**

The data specified with the `PARM` operand on the `FILESYSTYPE` or the `SUBFILESYSTYPE` statements. For the HFS, the current settings for the `FIXED` and `VIRTUAL` parameters will also be displayed.

**Note:** Although you may specify up to 1024 bytes with the `PARM` operand, only the first 165 bytes will be displayed.

**fixed**

The amount of virtual storage (in megabytes) that is fixed at HFS initialization time.

**virtual**

The amount of virtual storage (in megabytes) that HFS data and meta data buffers should use.

**pfstatus**

One of the following status:

- **RECYCLING**
  The PFS is recycling.

- **RECYCLING, MOUNTING**
  The PFS is recycling and remounting file systems.

- **RECYCLING, MOUNTS PENDING**
  The PFS is recycling and mounts are pending.

- **SHUTTING DOWN**
  z/OS UNIX is shutting down.

**progresscounter**

An increasing progress counter.

**System action:** The system continues processing.

**Operator response:** None.

**System programmer response:** None.

**Module:** BPXOMAST

**Source:** z/OS UNIX System Services kernel (BPX)

**Routing Code:** -

tpname    hostaddress      rtype  metric

IPV6 NETWORK ROUTE INFORMATION
TP NAME  NET DESTINATION  NET MASK  TYPE  METRIC
tpname    net address      netmask  rtype  metric

In response to the DISPLAY OMVS,CINET command, this message displays information about the routes contained in the Common Inet (CINET) physical file system. CINET routing includes the following information:

- Home routes,
- Implicit NON-DVIPA host routes
- Active host routes
- Active network routes with route type, route metric and net mask information.

During request routing, these displayed routes participate in the CINET prerouter route selection.

Note: When the Common Inet Pre-Router cannot find a specified IP address in its routing tables, it passes the request to a transport provider that has an active default route with the best route type and metric. The active default routes are now displayed along with other network routes for each TCPIP stack. If no transport provider has an active default route, then the request is routed to the default TCPIP stack.

The information displayed in this message is similar to information that can be displayed with the NETSTAT GATE and the NETSTAT HOME commands.

In the message text:

hh.mm.ss
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
The name of the z/OS UNIX cataloged procedure.

c Kernelasid
The address space id of the Kernel.

status
One of the following:

ACTIVE
z/OS UNIX is currently active.

NOT STARTED
z/OS UNIX was not started.

INITIALIZING
z/OS UNIX is initializing.

TERMINATING
z/OS UNIX is terminating.

TERMINATED
z/OS UNIX has terminated.
ETC/INIT WAIT
z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

FORK SHUTDOWN
FORK Service has been shutdown.

SHUTTING DOWN
z/OS UNIX is shutting down.

SHUTDOWN BLOCKED
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

SHUTDOWN
z/OS UNIX is shut down.

RESTARTING
z/OS UNIX is restarting after a shut down.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

tpname
The name of the transport provider for which the information is being displayed.

homeaddress
The internet protocol (IP) address of this transport provider.

flags
None.

hostaddress
The internet protocol (IP) address of a host system.

rtype
The name of the route type. When selecting a route, if two transport providers can access the same route, the Common Inet Pre-Router will select the route with the best precedence value based on the route type.

metric
When selecting a route, if two transport providers can access the same route, Common Inet Pre-Router will select the route with the best metric. The higher the number, the better the route.

netaddress
When a transport provider supplies network routing information to the Common Inet Pre-Router, the network destination is the IP address that can be accessed through the transport provider.

netmask
A mask that is applied to destination IP addresses to separate the network number from the host number.

progresscounter
An increasing progress counter.

System action: The system continues processing.

Operator response: None.

System programmer response: None.

BPX0048I  ERROR IN SETOMVS COMMAND.  bad-parameter  VERSION VALUE MAY BE A SINGLE SLASH OR A STRING THAT DOES NOT CONTAIN ANY BLANKS OR SLASHES.

Explanation:  A SETOMVS command parameter should have been either a single slash (/) or a string that did not contain any blanks or slashes.

In the message text:

bad-parameter
  Parameter that must be a single slash or not contain any blanks or slashes.

System action:  The system ignores the parameter in error, keeps the current value and continues to process the rest of the SETOMVS command.

Operator response:  Issue a SETOMVS command with this parameter corrected.

System programmer response:  None.

Module:  BPXIPMU1

Routing Code:  2
Descriptor Code:  5

BPX0049I  ERROR IN PARMLIB MEMBER  memname  ON LINE  line-number, POSITION  position-number, INPUT PARAMETER MAY ONLY BE A SINGLE / OR A STRING THAT MUST NOT CONTAIN ANY SLASHES OR BLANKS.  THE SYSTEM DEFAULT VALUE OF  default-value  IS USED.  DETECTING MODULE IS  detmod.  INPUT LINE:  input-line

Explanation:  The system encountered an error in a parmlib member.

In the message text:

memname
  The name of the parmlib member containing the error.

line-number
  The number of the member line containing the error.

position-number
  The position of the error in the line. The position number is the number of columns from the left.

default-value
  The system default value for the erroneous parameter.

detmod
  The module that detected the error.

input-line
  The text of the line containing the error.

System action:  The system ignores the erroneous parameter. The system uses the default value for this parameter. The system checks the rest of the parmlib member to find any other errors.

Operator response:  None.

System programmer response:  Correct the error in the parmlib member before using it again.

Module:  BPXIPMU1

DISPLAY OMVS text

Explanation: Where text is:

[System Wide Limits: limmsg=limitval]
[Process Limits: limmsg=limitval]

In response to a DISPLAY OMVS, LIMITS operator command, this table displays current, highwater, and maximum limit values from most of the z/OS UNIX System Services–wide settings. The commands:

- DISPLAY OMVS
- DISPLAY OMVS,LIMITS
- DISPLAY OMVS,LIMITS,PID=pid

will display either system-wide or process wide-limit information. The following is an example of a system limit table, which appears in the first case.

Note: This is an example; the actual values will differ from this display.

<table>

</tr>
</tbody>
</table>

Note:

1. An * at the end of a row indicates that this value has been changed by a SETOMVS or SET OMVS command. For the sysplex-wide limits, the command can be issued from any of the systems in the shared file system configuration environment, and the change can also be caused by the subsequent OMVS initialization on the other systems.

2. A SYSTEM LIMIT with a alphabetic suffix indicates a denomination (multiplier) value. Refer to z/OS MVS Initialization and Tuning Reference for allowed values on BPXPRMxx statements.
3. Three dashes (---) indicate that the system cannot provide a meaningful value for this limit.

The following is an example of a process limit table, which appears in the second case.

Note: This is an example; the actual values will differ from this display.

<table>
<thead>
<tr>
<th>CURRENT</th>
<th>HIGHWATER</th>
<th>PROCESS</th>
<th>USAGE</th>
<th>USAGE LIMIT</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td>MAXMEMLIMIT</td>
<td>0</td>
<td>0</td>
<td>10M,16383G</td>
<td></td>
</tr>
</tbody>
</table>

For a description of all these limits, see the BPXPRMXX parmlib member.

Note:
1. For MAXCORESIZE, MAXFILESIZE, MAXPROFILE, and MAXMEMLIMIT it is possible to have different values for the SOFT and HARDLIMIT; see setrlimit(). Only one value will be displayed in the LIMIT column when they are the same. When they are different, the first displayed value is the SOFTLIMIT followed by a comma and then the HARDLIMIT.
2. Whenever one limit is unlimited, the text NOLIMIT will be displayed.

In the message text:

*hh.mm.ss*

- The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

*limitval*
- Either NONE, SYSTEM, or ALL.

*limit_name*
- The name of the system-wide limit whose values (nnnn) are displayed in this row. This limit is valid for all running and future processes.

System action: The system continues processing.

Operator response: None.

System programmer response: None.

Module: BPX0MAST

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: -

Descriptor Code: 5,8,9

BPXO052I  THE SYSNAME PARM VALUE MUST CONTAIN ONLY ALPHABETIC, NUMERIC, OR NATIONAL CHARACTERS

Explanation: An error occurred in the specifications of SYSNAME. A character was used in SYSNAME that was not in the Alphabetic, Numeric, or National character sets.

System action: The system ignores the parameter and continues to process the rest of the command.

Operator response: Use only Alphabetic, Numeric, or National character sets for SYSNAME.

System programmer response: Correct the SYSNAME and issue the command again.
BPX0053I  THE MOUNT PARAMETERS: AUTOMOVE, NOAUTOMOVE, AND UNMOUNT ARE MUTUALLY EXCLUSIVE. SPECIFY ONLY ONE PER MOUNT.

Explanation: An error occurred in the specification of the MOUNT parameters. AUTOMOVE, NOAUTOMOVE and UNMOUNT are mutually exclusive.

System action: The system ignores this parameter and continues to process the rest of the command.

Operator response: Only specify one per mount statement.

System programmer response: Only specify one per mount statement and issue it again.

BPX0054I  SETOMVS SYNTAX ERROR; PID= was expected

Explanation: An error occurred in the specification of the SETOMVS command because the command contained a parameter requiring a PID (process ID) and none was specified.

System action: The system ignores this command and processing continues.

Operator response: Reenter the command with a valid PID= value.

System programmer response: None.

BPX0055I  ERROR IN SETOMVS COMMAND. AT LEAST ONE SYSNAME MUST BE SPECIFIED ON THE AUTOMOVE SYSTEM LIST

Explanation: The system encountered an error in the SETOMVS command. The AUTOMOVE=YES specification followed by a system list requires an indicator and at least one SYSNAME.

System action: The system ignores this parameter and continues to process the rest of the command.

Operator response: Reissue the SETOMVS command after correcting this parameter.

System programmer response: None.
ERROR IN SETOMVS COMMAND. THE \textit{parmname} PARAMETER VALUE IS OUT OF THE ALLOWED RANGE OF \textit{minlimit} TO \textit{maxlimit}

**Explanation:** The system encountered an error in the SETOMVS command. The value specified for \textit{parmname} is not within the valid range.

In the message text:

\textit{parmname}

The SETOMVS parameter on which the system detected an out-of-range value.

\textit{minlimit}

The minimum value allowed for this parameter.

\textit{maxlimit}

The maximum value allowed for this parameter

**System action:** The system ignores this parameter and continues to process the rest of the command.

**Operator response:** Reissue the SETOMVS command to reset this parameter value within the range noted. Most likely, you specified \textit{parmname} with a denomination (multiplier) suffix that caused the specification value to be above the maximum allowed value. If necessary, review \textit{z/OS MVS System Commands} or \textit{z/OS MVS Initialization and Tuning Reference} for syntax and restrictions on the use of multipliers on SETOMVS commands the BPXPARMxx members, respectively.

**System programmer response:** None.

**Chapter 12. BPX messages**

**BPXO057I**  

\textit{Display} procmname kernalasid status parnmemblist

**OMVS UNIX SERIALIZATION REPORT**

\textit{text}

**Explanation:** \textit{text} is either:

NO RESOURCE CONTENTION EXISTS

Or a report, as follows:

**UNIX SERIALIZATION REPORT**

RESOURCE 

\texttt{NAME= object DATA: SHMID=n nnnnnnn OFFS/ADDR=n nnnnnnnnnnnnnnn}

\texttt{JOBNAME ASID TCB PID USER DATA EXC/SHR OWN/WAIT}

\texttt{...}

RESOURCE 

\texttt{NAME= object DATA: SHMID=n nnnnnnn OFFS/ADDR=n nnnnnnnnnnnnnnn}

\texttt{JOBNAME ASID TCB PID USER DATA EXC/SHR OWN/WAIT}

\texttt{...}

RESOURCE \textit{nnnn} IS LOCKED BY

\texttt{NAME= object DATA: SHMID=n nnnnnnn OFFS/ADDR=n nnnnnnnnnnnnnnn}

In response to a \texttt{D OMVS,SER} command, the system returns message \textbf{NO RESOURCE CONTENTION} when \texttt{no} resource contention exists for the ownership of shared-memory mutexes (mutual exclusion locks) or condition variables.
If there is resource contention for the ownership of shared-memory mutexes (mutual exclusion locks) or condition variables the response to a D OMVS,SER command includes the detailed form of this message.

In the message text:

\[ hh.mm.ss \]

The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

\[ proname \]

The name of the z/OS UNIX cataloged procedure.

\[ status \]

One of the following:

\[ ACTIVE \]

z/OS UNIX is currently active.

\[ NOT STARTED \]

z/OS UNIX was not started.

\[ INITIALIZING \]

z/OS UNIX is initializing.

\[ TERMINATING \]

z/OS UNIX is terminating.

\[ TERMINATED \]

z/OS UNIX has terminated.

\[ ETC/INIT WAIT \]

z/OS UNIX is waiting for the \[ /etc/init \] or \[ /usr/sbin/init \] program to complete initialization.

\[ FORK SHUTDOWN \]

FORK Service has been shutdown.

\[ SHUTTING DOWN \]

z/OS UNIX is shutting down.

\[ SHUTDOWN BLOCKED \]

z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

\[ SHUTDOWN \]

z/OS UNIX is shut down.

\[ RESTARTING \]

z/OS UNIX is restarting after a shut down.

\[ parmlist \]

The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

\[ RESOURCE \]

An indication to separately identify specific shared objects (mutex or condition variable) within the message table.

\[ NAME=object \]

The type of object (MUTEX or condition variable (CONDVAR) for which the lock is held

\[ SHMID=nnnnnnnn \]

The shared memory ID of the task control block holding or waiting on the held object.

\[ OFFS / ADDR=nnnnnnnnnnnnnnnn \]

For objects in an above-the-bar memory segment: the address the object

For segments below the bar: the offset within the shared memory segment because an address space below the bar can map it at a different virtual address.

\[ JOBNAME \]

The job name of the job holding or waiting on the held object.
**ASID**
The address space ID (ASID) of the task control block holding or waiting on the held object.

**TCB**
The hexadecimal address of the task control block (TCB) holding or waiting on the held object.

**USER DATA**
The 16-digit address of the user data.

**EXC/SHR**
The job (jobname) is the exclusive owner (EXE) of the shared object (mutex or condition variable) or is sharing (SHR) it with another task.

**OWN/WAIT**
The job (jobname) is the current owner (OWN) of the shared object (mutex or condition variable) or the task waiting (WAIT) to gain access to it.

**System action:** Processing continues.

**Operator response:** None.

**System programmer response:** None. Unless you have determined a specific job has held a shared object for an excessive length of time (and possibly in a stalled or looping condition) to the detriment of overall job processing. If such is the case, consider cancelling the offending job.

BPXO058I  hh.mm.ss DISPLAY OMVS text

**Explanation:** In the message, text is as follows:

```
procname kernalasid status parmmemberlist
SHORT LIST OF FAILURES:
TIME=time DATE=date MOVE RC=rccc RSN=rsncode
NAME=filesystem PATH=path
SYSNAME=sysname
TIME=time DATE=date MOUNT RC=rccc RSN=rsncode
NAME=filesystem TYPE=fstype PATH=path
```

In response to a DISPLAY OMVS,MF operator command, this message displays information about the last MOUNT or MOVE failures. If the command issued is D OMVS,MF, this message displays 'PLIB=' and 'DDNAME=' statements. The 'PLIB=' statement indicates the BPXPRMxx parmlib member that contains the failing MOUNT statement, and the 'DDNAME=' statement indicates the name of a DD statement in a z/OS UNIX System Services PROC.

In the message text:

**hh.mm.ss**
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

**procname**
The name of the z/OS UNIX cataloged procedure.

**status**
One of the following:

**ACTIVE**
z/OS UNIX is currently active.

**NOT STARTED**
z/OS UNIX was not started.
INITIALIZING
z/OS UNIX is initializing.

TERMINATING
z/OS UNIX is terminating.

TERMINATED
z/OS UNIX has terminated.

ETC/INIT WAIT
z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

FORK SHUTDOWN
FORK Service has been shutdown.

SHUTTING DOWN
z/OS UNIX is shutting down.

SHUTDOWN BLOCKED
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

SHUTDOWN
z/OS UNIX is shut down.

RESTARTING
z/OS UNIX is restarting after a shut down.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

TIME=time
Displays the time that the move or mount failure occurred.

DATE=date
Displays the date that the move or mount failure occurred.

RC=rccc
The return code for the move or mount failure.

RSN=rsncode
The reason code for the move or mount failure.

NAME=filesystem
The name of the file system that was being moved or mounted.

TYPE=type
The type of filesystem that was being moved or mounted.

PATH=path
The path for the file system.

SYSNAME=sysname
The name of the system where the file system resides.

OMVS STORAGE: omvsbytes
The number of bytes in the OMVS address space private area consumed by all dynamically activated service items.

System action: The system continues processing.
Operator response: None
System programmer response: None.
Module: BPXOMAST
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: -
Descriptor Code: -
In response to a DISPLAY OMVS,ACTIVATE=SERVICE operator command, this message displays information about service items that have been activated dynamically.

In the message text:

`hh.mm.ss`  
The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

`proname`  
The name of the z/OS UNIX cataloged procedure.

`status`  
One of the following:

**ACTIVE**  
z/OS UNIX is currently active.

**NOT STARTED**  
z/OS UNIX was not started.

**INITIALIZING**  
z/OS UNIX is initializing.

**TERMINATING**  
z/OS UNIX is terminating.

**TERMINATED**  
z/OS UNIX has terminated.

**ETC/INIT WAIT**  
z/OS UNIX is waiting for the `/etc/init` or `/usr/sbin/init` program to complete initialization.

**FORK SHUTDOWN**  
FORK Service has been shutdown.

**SHUTTING DOWN**  
z/OS UNIX is shutting down.

**SHUTDOWN BLOCKED**  
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

**SHUTDOWN**  
z/OS UNIX is shut down.
RESTAURING

z/OS UNIX is restarting after a shut down.

cparmemb

The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

LINKLIB=linklib_dataset

Displays the target LINKLIB target data set from which the service items were activated.

VOL=volume

The volume from which the service item was activated.

LPALIB=lpalib_dataset

Displays the target LPALIB target data set from which the service items were activated.

serviceitem

Displays dynamically activated service items.

ECSA STORAGE: ecsabytes

The number of bytes of ECSA storage consumed by by all dynamically activated service items.

OMVS STORAGE: omvsbytes

The number of bytes in the OMVS address space private area consumed by all dynamically activated service items.

System action: The system continues processing.

Operator response: None

System programmer response: None.

In response to a DISPLAY OMVS Sockets (D OMVS,SO) operator command, this message displays information about the AF_UNIX family of sockets along with their users and sessions.

In the message text:

hh.mm.ss

The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname

The name of the z/OS UNIX cataloged procedure.
**status**
One of the following:

**ACTIVE**
z/OS UNIX is currently active.

**NOT STARTED**
z/OS UNIX was not started.

**INITIALIZING**
z/OS UNIX is initializing.

**TERMINATING**
z/OS UNIX is terminating.

**TERMINATED**
z/OS UNIX has terminated.

**ETC/INIT WAIT**
z/OS UNIX is waiting for the `/etc/init` or `/usr/sbin/init` program to complete initialization.

**FORK SHUTDOWN**
FORK Service has been shutdown.

**SHUTTING DOWN**
z/OS UNIX is shutting down.

**SHUTDOWN BLOCKED**
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

**SHUTDOWN**
z/OS UNIX is shut down.

**RESTARTING**
z/OS UNIX is restarting after a shut down.

**parmmemberlist**
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

**jobname**
The job name of the process that owns the socket.

**id**
The inode number of the socket, in hexadecimal.

**peerid**
The inode number of a connected socket's peer socket.

**state**
The socket state, which is one of the following:

**LISTEN**
A server TCP stream socket that accepts connections.

**DGRAM**
A UDP datagram socket.

**ACP**
An accepted stream socket.

**CONN**
a connected stream socket

**STRM**
an unconnected stream socket

**readbyte**
The number of bytes read on this socket, in hexadecimal. For a server socket, this value is the number of connections that have been accepted. After 4G, this value wraps.

**writebyte**
The number of bytes written on this socket, in hexadecimal. After 4G, this value wraps.
Socket name: socketname
   The name this socket was bound to, if any.

Peer name: peersocketname
   The name of the socket this socket is connected to, if it is connected and if the peer socket has a name.

System action: The system continues processing.

Operator response: None

System programmer response: None.

BPXO062I  NONEMPTYMOUNTPT WAS CHANGED FROM oldvalue TO newvalue

Explanation: The system-wide value for NONEMPTYMOUNTPT was changed from the previous value to a new value.

In the message text:

oldvalue
   One of the following:

   NOWARN
       A warning message is not issued when mounting on a non-empty mount point. (Default.)

   WARN
       A warning message is issued when mounting on a non-empty mount point.

   DENY
       Fails the mount when mounting on a non-empty mount point.

newvalue
   One of the following:

   NOWARN
       A warning message is not issued when mounting on a non-empty mount point. (Default.)

   WARN
       A warning message is issued when mounting on a non-empty mount point.
DENY

Fails the mount when mounting on a non-empty mount point.

System action: The NONEMPTYMOUNTPT value has been changed successfully.

System programmer response: None.

Chapter 12. BPX messages 521
In response to a DISPLAY OMVS,WAITERS (D OMVS,W) operator command, this message displays information about delays caused by:

- Mount latch contention.
- Outstanding sysplex messages. When a system sends a sysplex messages to another sysplex member, the sending system then waits for the outstanding reply message. If the reply is not sent, the user or system task on the sending system hangs.
- File system contention.
- File latch contention
- Other reasons.

You can use the information displayed to figure out what tasks are hung, and what they are waiting for.

In the message text:

**hh.mm.ss**

The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

**procname**

The name of the z/OS UNIX cataloged procedure.

**status**

One of the following:
ACTIVE
  z/OS UNIX is currently active.

NOT STARTED
  z/OS UNIX was not started.

INITIALIZING
  z/OS UNIX is initializing.

TERMINATING
  z/OS UNIX is terminating.

TERMINATED
  z/OS UNIX has terminated.

ETC/INIT WAIT
  z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

FORK SHUTDOWN
  FORK Service has been shutdown.

SHUTTING DOWN
  z/OS UNIX is shutting down.

SHUTDOWN BLOCKED
  z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

SHUTDOWN
  z/OS UNIX is shut down.

RESTARTING
  z/OS UNIX is restarting after a shut down.

parmmlerlist
  The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

MOUNT LATCH ACTIVITY:
USER ASID TCB REASON AGE
  This section shows what user and task is holding the mount latch (HOLDERS:), and what users are waiting for it (WAITERS).

user
  The user ID of the address space.

asid
  The address space ID.

tcb
  The task.

reason
  A short description of what the end user action that the user or task is doing. reason is one of the following:

| Accessing CDS | FileSys Quiesce | Module Cleanup |
| AutoMnt vnLookup | FileSys UnQuiesce | Mount Catchup |
| BHR Async Mount | FileSys Export | Move Filesystem |
| Blocking Utility | FileSys UnExport | PFS Termination |
| Check FS Latches | FiSys Diag & Fix | Post MXRH Waiter |
| Couple DS Switch | FileSys Re-Init | ReMount Filesys |
| Diag & Fix CDS | Get BRLM locks | Sysplex Scheduler |
| FileSys Mount | Inact Cycle | Unknown |
| FileSys Unmount | Init PFS Control | Update Client VFS |
| FileSys Sync yes | MemberGone Rcvry | VerifyServiceLvl |
The amount of time the user has held the mount latch for HOLDERS, or the amount of time users have waited for the mount latch for waiters. If the time exceeds 99 hours, two asterisks (**) appear in the hour position.

**TIME:** yyyy/mm/dd hh.mm.ss

The date and time when the activity started.

**IS DOING:** activity / [pfs_qualifier]

- **activity**
  - Description of what the holding task is doing. *activity* is displayed as either:
    - A wait, such as a Latch Wait
    - The type of physical file system (PFS) and the operation that the task was called to do, such as READ, WRITE, MOUNT, or FSINCH

- **pfs_qualifier**
  - If the *activity* field shows a PFS, the *pfs_qualifier* field shows what the PFS is doing. For example, *pfs_qualifier* might show:
    - Running - If the *pfs_qualifier* field shows Running for very long, it probably indicates that the thread is in a PFS wait that cannot be detected by DISPLAY OMVS.
    - OsI Wait
    - XSYS Message to: *sysname*

**FILE SYSTEM:** file_system_name

The name of the file system involved, if any.

**HOLDING:** File System Latch *latchno* SHR|EXCL

A file system latch is held by this thread.

- **latchno**
  - The latch number that corresponds to the latch shown by DISPLAY GRS.

  SHR|EXCL
  - Whether the latch is held in shared or exclusive mode.

**FILE SYSTEM LATCH ACTIVITY:**

**USER ASID TCB SHR|EXCL AGE**

This section shows information for file system latches. It shows what user and task is holding the latch (HOLDERS), and what users are waiting for it (WAITERS).

**LATCH** *latchno*

A file system latch is held by this thread.

- **latchno**
  - The latch number that corresponds to the latch shown by Display GRS.

**FILE SYSTEM:** file_system_name

The name of the file system involved, when available.

**HOLDER(S):** *user asid tcb SHR|EXCL age*

The file system holding the latch:

- **user**
  - The user ID of the address space.

- **asid**
  - The address space ID.

- **tcb**
  - The task.

  SHR|EXCL
  - Whether the latch is held in shared or exclusive mode.

- **age**
  - The amount of time the user has held the file system latch for HOLDERS. If the time exceeds 99 hours, two asterisks (**) appear in the hour position.

**TIME:** yyyy/mm/dd hh.mm.ss

The date and time when the activity started.
IS DOING: activity / [pfs_qualifier]

activity
   Description of what the holding task is doing. activity is displayed as either:
   • A wait, such as a Latch Wait
   • The type of physical file system (PFS) and the operation that the task was called to do, such as READ, WRITE, MOUNT, or FSYNCH

pfs_qualifier
   If the activity field shows a PFS, the pfs_qualifier field shows what the PFS is doing. For example, pfs_qualifier might show:
   • Running - If the pfs_qualifier field shows Running for very long, it probably indicates that the thread is in a PFS wait that cannot be detected by DISPLAY OMVS.
   • Osi Wait
   • XSYS Message to: sysname

FILE: file_name (devno,ino)
   For operations on a specific file, this line shows the following information:

   file_name
      Up to 16 characters of the file name when this information is available.
   devno
      The device number of the file.
   ino
      The inode number of the file.

WAITER(S): user asid tcb SHR|EXCL age
   The file system holding the latch:
   user
      The user ID of the address space.
   asid
      The address space ID.
   tcb
      The task.
   SHR|EXCL
      Whether the latch is held in shared or exclusive mode.
   age
      The amount of time users have waited for the file system latch for waiters. If the time exceeds 99 hours, two asterisks (**) appear in the hour position.

TIME: yyyy/mm/dd hh.mm.ss
   The date and time when the activity started.

IS DOING: activity / [pfs_qualifier]

activity
   Description of what the holding task is doing. activity is displayed as either:
   • A wait, such as HSM recall when the task is waiting on an HSM recall
   • The type of physical file system (PFS) and the operation that the task was called to do, such as READ, WRITE, MOUNT, or FSYNCH

pfs_qualifier
   If the activity field shows a PFS, the pfs_qualifier field shows what the PFS is doing. For example, pfs_qualifier might show:
   • Running - If the pfs_qualifier field shows Running for very long, it probably indicates that the thread is in a PFS wait that cannot be detected by DISPLAY OMVS.
   • Osi Wait
   • XSYS Message to: sysname

FILE: file_name (devno,ino)
   For operations on a specific file, this line shows the following information:
The device number of the file.

The inode number of the file.

When the waiter is waiting on an HSM recall, the file_name will show the directory created by automount, but the devno and ino are unavailable because these numbers are not known until the file system is mounted.

FILE SYSTEM: file_system_name
The name of the file system involved, when available.

HOLDING: File System Latch latchno SHR|EXCL
A file system latch is held by this thread.

latchno
The latch number that corresponds to the latch shown by DISPLAY GRS.

SHR|EXCL
Whether the latch is held in shared or exclusive mode.

FILE LATCH ACTIVITY:
USER ASID TCB SHR/EXCL AGE
This section shows information for file latches. It shows what user and task is holding the latch (HOLDERS), and what users are waiting for it (WAITERS).

LATCH latchno
A file latch is held by this thread.

latchno
The latch number that corresponds to the latch shown by Display GRS.

LSET lset
Indicates the identifier of the latch set.

lset
The identifier that corresponds to the latch. File latches are created in the SYS.BPX.A000.FSLIT.FILESYS.LSN.xx latch set where xx corresponds to LSET.

devno devno
Indicates the device number of the file.

devno
The device number that corresponds to the file.

ino ino
Indicates the inode number of the file.

ino
The inode number that corresponds to the file.

TYPE filetype
Indicates the file type.

file_type
Indicates the file type (DIR, CHARSPEC, REGFILE, FIFO)

FILE: file_name
The name of the file (if known) involved in the operation.

file_name
Up to 16 characters of the file name when this information is available.

FILE SYSTEM: file_system_name
The name of the file system that owns the file involved in the operation.

HOLDER(S): user asid tcb SHR|EXCL age
The file system holding the latch:
user
  The user ID of the address space.

asid
  The address space ID.

tcb
  The task.

SHR|EXCL
  Whether the latch is held in shared or exclusive mode.

age
  The amount of time the user has held the file system latch for HOLDERS. If the time exceeds 99 hours, two asterisks (**) appear in the hour position.

TIME: yyyy/mm/dd hh.mm.ss
  The date and time when the activity started.

IS DOING: activity / [pfs_qualifier]
  Description of what the holding task is doing. activity is displayed as either:
  • A wait, such as a Latch Wait
  • The type of physical file system (PFS) and the operation that the task was called to do, such as READ, WRITE, MOUNT, or FSYNCH

pfs_qualifier
  If the activity field shows a PFS, the pfs_qualifier field shows what the PFS is doing. For example, pfs_qualifier might show:
  • Running - If the pfs_qualifier field shows Running for very long, it probably indicates that the thread is in a PFS wait that cannot be detected by DISPLAY OMVS.
  • Osi Wait
  • XSYS Message to: sysname

FILE: file_name (devno,ino)
  For operations on a specific file, this line shows the following information:

  file_name
    Up to 16 characters of the file name when this information is available.

  devno
    The device number of the file.

  ino
    The inode number of the file.

When the waiter is waiting on an HSM recall, the file name will show the directory created by automount, but the devno and ino are unavailable because these numbers are not known until the file system is mounted.

WAITER(S): user asid tcb SHR|EXCL age
  The file system holding the latch:

  user
    The user ID of the address space.

  asid
    The address space ID.

  tcb
    The task.

SHR|EXCL
  Whether the latch is held in shared or exclusive mode.

age
  The amount of time users have waited for the file system latch for waiters. If the time exceeds 99 hours, two asterisks (**) appear in the hour position.
OTHER WAITING THREADS: USER ASID TCB PID AGE

This section shows the remaining waiters that are waiting for reasons other than the mount latch, outstanding sysplex messages, or file system latch.

user
The user ID of the address space.

asid
The address space ID.

tcb
The task.

pid
The process ID.

age
The amount of time the user has been waiting. If the time exceeds 99 hours, two asterisks (**) appear in the hour position.

TIME: yyyy/mm/dd hh.mm.ss
The date and time when the activity started.

IS DOING: activity / [pfs_qualifier]

activity
Description of what the holding task is doing. activity is displayed as either:
- A wait, such as HSM recall when the task is waiting on an HSM recall
- The type of physical file system (PFS) and the operation that the task was called to do, such as READ, WRITE, MOUNT, or FSYNCH

pfs_qualifier
If the activity field shows a PFS, the pfs_qualifier field shows what the PFS is doing. For example, pfs_qualifier might show:
- Running - If the pfs_qualifier field shows Running for very long, it probably indicates that the thread is in a PFS wait that cannot be detected by DISPLAY OMVS.
- Osi Wait
- XSYS Message to: sysname

FILE: file_name (devno,ino)
For operations on a specific file, this line shows the following information:

file_name
Up to 16 characters of the file name when this information is available.

devno
The device number of the file.

ino
The inode number of the file.

When the waiter is waiting on an HSM recall, the file_name will show the directory created by automount, but the devno and ino are unavailable because these numbers are not known until the file system is mounted.

FILE SYSTEM: file_system_name
The name of the file system involved, when available.

HOLDING: File SystemLatch \latchno \SHR|EXCL
A file system latch is held by this thread.

\latchno
The latch number that corresponds to the latch shown by DISPLAY GRS.

\SHR|EXCL
Whether the latch is held in shared or exclusive mode.

OUTSTANDING CROSS SYSTEM MESSAGES:
SENT SYSPLEX MESSAGES:
**USER ASID TCB FCODE MEMBER REQID MSG TYPE AGE**

This section displays information about the broadcast messages sent to another system in the sysplex for which no reply was yet received.

- **user**
  - The user ID of the address space.

- **asid**
  - The address space ID.

- **tcb**
  - The task.

- **fcode**
  - The function code being sent.

- **member**
  - The sysplex member name of the system or systems that sent the message and from which a reply is outstanding. As replies are received for broadcast messages, member names are removed from the list.

- **reqid**
  - The unique request ID of this message. You can use this value to find the message in the display of RECEIVED SYSPLEX MESSAGES on the system that received the message.

- **seqno**
  - The 4-byte hexadecimal sequence number identifying the unique message buffer. The number is of the form `xxyyyyyy`, where `xx` is the system ID of the sender, and `yyyyyy` is the expected sequence number suffix. This number may be used to correlate with output from message BPXN004I or BPXN005I, if they exist. In some cases, it may be 0.

- **msg_type**
  - The function that the message is performing.

- **age**
  - The amount of time the task has been waiting for a reply. If the time exceeds 99 hours, two asterisks (`**`) appear in the hour position.

**FILE: file_name (devno,ino)**

For operations on a specific file, this line shows the following information:

- **file_name**
  - Up to 16 characters of the file name when this information is available.

- **devno**
  - The device number of the file.

- **ino**
  - The inode number of the file.

**HOLDING: File System Latch latchno SHR|EXCL**

A file system latch is held by this thread.

- **latchno**
  - The latch number that corresponds to the latch shown by Display GRS.

- **SHR|EXCL**
  - Whether the latch is held in shared or exclusive mode.

**RECEIVED SYSPLEX MESSAGES:**

- **on_tcb asid tcb fcode member reqid msg_type age**
  - This section displays the sysplex messages that have arrived at this system, but that were not yet responded to.

- **on_tcb**
  - The worker's task TCB address in the OMVS address space.

**FROM asid**

- The address space ID of the message sender.

**FROM tcb**

---

Chapter 12. BPX messages  529
BPXO063I

fcode
The function code that arrived to be processed. If preceded by an asterisk(*), the received message is an ASYNC message. Otherwise, the received message is a SYNC message.

FROM member
The sysplex member name of the system sending the message.

reqid
The unique request ID of this message. You can use this value to find the message in the display of SENT SYSPLEX MESSAGES on the system that sent the message.

msg_type
The function that the message is performing.

age
The amount of time the worker task has been processing the message. If the time exceeds 99 hours, two asterisks (**) appear in the hour position.

TIME: yyyy/mm/dd hh.mm.ss
The date and time when the activity started.

IS DOING: activity / [pfs_qualifier]
activity
Description of what the worker task is doing. activity is displayed as either:
- A wait, such as a Latch Wait
- The type of physical file system (PFS) and the operation that the task was called to do, such as READ, WRITE, MOUNT, or FSYNCH

pfs_qualifier
If the activity field shows a PFS, the pfs_qualifier field shows what the PFS is doing. For example, pfs_qualifier might show Running,Osi Wait or XSYS Message to: sysname.

If the pfs_qualifier field shows Running for very long, it probably indicates that the thread is in a PFS wait that cannot be detected by DISPLAY OMVS.

FILE: file_name (devno,ino)
For operations on a specific file, this line shows the following information:

file_name
Up to 16 characters of the file name when this information is available.

devno
The device number of the file.

ino
The inode number of the file.

FILE SYSTEM: file_system_name
The name of the file system involved, when available.

HOLDING: File System Latch latchno SHR|EXCL
A file system latch is held by this thread.

latchno
The latch number that corresponds to the latch shown by Display GRS.

SHR|EXCL
Whether the latch is held in shared or exclusive mode.

System action: The system continues processing.

System programmer response: Use the displayed information to determine if users are hung or waiting for either a mount latch or for replies to sysplex messages. If some tasks appear to be deadlocked, you can use the information in the display to figure out which tasks to cancel, in order to clear up the deadlock.

Module: BPXOMAST
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: -
In response to the DISPLAY OMVS,PFS command, this message displays information about the z/OS UNIX physical file systems. The message contains several sections:

- The header section
- The PFS configuration section
- The socket information for each domain
- The multiple socket file systems defined in the Common INET
- The file system parameter for certain PFS
- The automount status information

In the header section:

- **hh.mm.ss**
  The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.
- **proname**
  The name of the z/OS UNIX cataloged procedure.
- **kernelasid**
  The address space id of the Kernel.
- **status**
  One of the following:
  
  **ACTIVE**
  z/OS UNIX is currently active.
  
  **NOT STARTED**
  z/OS UNIX was not started.
  
  **INITIALIZING**
  z/OS UNIX is initializing.
  
  **TERMINATING**
  z/OS UNIX is terminating.
  
  **TERMINATED**
  z/OS UNIX has terminated.
  
  **ETC/INIT WAIT**
  z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.
FORK SHUTDOWN
FORK service has been shutdown.

SHUTTING DOWN
z/OS UNIX is shutting down.

SHUTDOWN BLOCKED
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

SHUTDOWN
z/OS UNIX is shut down.

RESTARTING
z/OS UNIX is restarting after a shut down.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

In the PFS configuration section:

*type*
The data specified with the TYPE operand on the FILESYSTYPE statement.

If a dash (-) appears as the first character of PFS TYPE, it means the PFS is inactive.

*entrypoint*
The name of the load module specified with the ENTRYPOINT operand on the FILESYSTYPE or SUBFILESYSTYPE statements.

*asname*
The address space name for PFS.

*desc*
A brief description of the physical file system.

*state*
The PFS state and the start or exit time.

A  The PFS is active. The timestamp is the start time of the PFS.

I  The PFS is inactive. When the PFS is inactive with no timestamp, the PFS address space has not yet started. When the PFS is inactive with timestamp, the PFS has stopped at that time.

S  The PFS has stopped. It is waiting for the user to reply to the prompt: enter R to restart or I to terminate the PFS.

U  The PFS is unavailable. To restore the PFS, if you did not remove the definition from BPXPRMxx, shut down and restart OMVS. Or to add another FILESYSTYPE definition to BPXPRMxx and issue the SETOMVS RESET=(xx) command.

*timestamp*
The start or exit time of the PFS, displayed in the format of yyyy/mm/dd hh.mm.ss.

In the socket information section:

*type*
The data specified with the TYPE operand on the FILESYSTYPE statement.

If a dash (-) appears as the first character of PFS TYPE, it means the PFS is inactive.

*domain*
The domain name specified on the DOMAINNAME operand of a NETWORK statement for a sockets physical file system.

*maxsock*
The value specified on the MAXSOCKETS operand of a NETWORK statement for a sockets physical file system. It specifies the maximum number of sockets that can be open at one time for the address family.
opnsock
   The number of sockets that are currently opened for this sockets physical file system.

hwmsock
   The highest number of sockets opened at one time for this sockets physical file system.

For configuration with multiple socket file systems defined in the common INET, there is a section to display each subtype. In this section:

name
   The data specified with the NAME operand on the SUBFILESYSTYPE statement. If a dash (-) should appear as the first character for any PFS name, it means that the PFS is inactive.

pfsstatus
   Either of the following status is shown:
   ACT   The PFS is active.
   INACT The PFS is inactive.
   If the PFS is inactive with no timestamp, the address space of the PFS has not yet started; if the PFS is inactive with a timestamp, the PFS has stopped at that time.

timestamp
   The start or exit time of the PFS, displayed in the format of yyyy/mm/dd hh.mm.ss.

pfsflags
   One of the following flag values is shown:
   CD    Current default transport provider: The system is currently using this PFS as the default transport provider although it was not specified as the default with the SUBFILESYSTYPE statement.
   SD    Specified default transport provider: This PFS was specified as the default transport provider with the SUBFILESYSTYPE statement. However, it is currently not being used as the default.
   SC    Specified is current transport provider: This PFS was specified as the default transport provider with the SUBFILESYSTYPE statement and the system is currently using it as the default.

In the file system parameter section:

type
   The data specified with the TYPE operand on the FILESYSTYPE statement.
   If a dash (-) appears as the first character of PFS TYPE, it means the PFS is inactive.

parms
   The data specified with the PARM operand on the FILESYSTYPE or the SUBFILESYSTYPE statements. For the HFS, the current settings for the FIXED and VIRTUAL parameters will also be displayed.
   Note: Although you may specify up to 1024 bytes with the PARM operand, only the first 165 bytes will be displayed.

fixed
   The amount of virtual storage (in megabytes) that is fixed at HFS initialization time.

virtual
   The amount of virtual storage (in megabytes) that HFS data and meta data buffers should use.

In the automount status section:

timestamp
   the time when the automount was run, displayed in the format of yyyy/mm/dd hh.mm.ss. If automount has been run from a member system at a system level lower than zOS V1R11, the automount status section displays only the time stamp information.

Note:
   Although you may specify up to 1024 bytes with the PARM operand, only the first 165 bytes will be displayed.
BPXO070I

system
   The name of the system on which the automount was run.
user
   The ID of the user that ran automount.
policy
   The path name of the automount policy used.

System action: The system continues processing.
Operator response: None.
System programmer response: None.

[The blocking process is on system: sys]

In response to a DISPLAY OMVS,ASID=, DISPLAY OMVS,U=, DISPLAY OMVS,VSERVER or DISPLAY OMVS,PID= operator command, this message displays information about the state of z/OS UNIX and its processes. The line beginning with user appears one or more times for each process. In response to a DISPLAY OMVS,PID=BRL command, this message displays information about a possible Byte Range Lock situation, where a byte range of a file is locked by another thread for exclusive use only.

In response to a DISPLAY OMVS,ASID=DUBW command, this message displays jobs waiting to become processes.

In the message text:

hh.mm.ss
   The time in hours (00–23), minutes (00–59), and seconds (00–59) for the DISPLAY OMVS command.

procname
   The name of the z/OS UNIX cataloged procedure.

kernelasid
   The address space id of the Kernel.
status
   One of the following:

534 z/OS V2R2 MVS System Messages, Vol 3 (ASB-BPX)
ACTIVE
z/OS UNIX is currently active.

NOT STARTED
z/OS UNIX was not started.

INITIALIZING
z/OS UNIX is initializing.

TERMINATING
z/OS UNIX is terminating.

TERMINATED
z/OS UNIX has terminated.

ETC/INIT WAIT
z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

FORK SHUTDOWN
FORK Service has been shut down.

SHUTTING DOWN
z/OS UNIX is shutting down.

SHUTDOWN BLOCKED
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

SHUTDOWN
z/OS UNIX is shutdown.

RESTARTING
z/OS UNIX is restarting after a shutdown.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

user
The user ID of the process.

jobname
The job name of the process.

asid
The address space ID for the process; or zero when states are Z or L.

pid
The process ID, in decimal, of the process; or "-" if no process id has been assigned yet.

ppid
The parent process ID, in decimal, of the process.

state r aa
An 8-character field showing the state of either the process or the most recently created thread in the process. This field includes a 5-character state field, a 1-character r field that contains the restart state, and a 2-character aa field that contains additional state information for the process or thread.

state is one or the combination of the following codes:
- Column is not being used.
1 Single-thread process.
A Message queue receive wait.
B Message queue send wait.
C Communication system kernel wait.
D Semaphore operation wait; or, when there is no process id assigned yet, D means that the job is waiting to become a process.
BPXO070I

E  Quiesce frozen.
F  File system kernel wait.
G  MVS Pause wait.
H  Process state is for multiple threads and pthread_create was used to create one of the threads. Process state is obtained from the Initial Pthread created Task (IPT).
I  Swapped out.
K  Other kernel wait (for example, pause or sigsuspend).
L  Ended and parent has performed wait. The process is the session or process group leader of a process that is still active, but will be removed from the process table after the last session or process group member terminates. (L is for latent zombies.)
M  Process state is for multiple threads and pthread_create was not used to create any of the multiple threads. Process state is obtained from the most recently created thread.
P  Ptrace kernel wait.
Q  Quiesce termination wait.
R  Running (not kernel wait).
S  Sleeping.
T  Stopped.
W  Waiting for child (wait or waitpid callable service).
X  Creating new process (fork callable service is running).
Z  Ended and parent has not performed wait. (Z is for zombies.)

r is the 1-character restart status:
–  Column is not being used.
B  Blocked.
P  Permanent.

aa is the additional state information:
–  Column is not being used.
t  User syscall tracing is on for the process.

shhmms
  The time, in hours, minutes, and seconds, when the process was started.

c古怪s
  The total execution time for the process in seconds in the format sssss.hhh. The value displayed is an approximate value, which might be less than a previously displayed value. When this value exceeds 11.5 days of execution time, this field overflows and is displayed as ******.*.

latchwaitpid
  Either zero or the latch process ID, in decimal, for which this process is waiting.

command
  The command that created the process truncated to 40 characters. You can convert it to uppercase by using the CAPS option.

servername
  The name of the server process. You can convert it to uppercase by using the CAPS option.

activefiles
  The number of active server file tokens.

maxfiles
  The maximum number of active server file tokens allowed.
server type
   One of the following:

   FILE
       A network file server

   LOCK
       A network lock server

   FEXP
       A network file exporter

   SFDS
       A shared file server

thread id
   The thread ID, in hexadecimal, of the thread.

tcb addr
   The address of the TCB that represents the thread.

pri job
   The job name from the current primary address space if different from the home address space, otherwise blank.
   This is only accurate if the thread is in a wait, otherwise it is from the last time that status '.' was saved. When
   the data is not available, the field is displayed as ********.

user name
   The user name of the thread if a task level security environment created by pthread_security_np exists, otherwise
   blank. When the data is not available, the field is displayed as ********.

ac secs
   The accumulated TCB time in seconds in the format sssss.s. When this value exceeds 11.5 days of execution
   time, this field overflows and is displayed as ******.**. When the data is not available, the field is displayed as
   **********.

sc
   The current or last syscall request.

thd state
   The state of the thread as follows:
   A  Message queue receive wait.
   B  Message queue send wait.
   C  Communication system kernel wait.
   D  Semaphore operation wait.
   E  Quiesce frozen.
   F  File system kernel wait.
   G  MVS Pause wait.
   J  The thread was pthread created rather than dubbed.
   K  Other kernel wait (for example, pause or sigsuspend).
   N  The thread is medium weight.
   O  The thread is asynchronous and medium weight.
   P  Ptrace kernel wait.
   Q  Quiesce termination wait.
   R  Running (not kernel wait).
   S  Sleeping.
   U  Initial process thread (heavy weight and synchronous).
   V  Thread is detached.
BPX0071I

W   Waiting for child (wait or waitid callable service).
X   Creating new process (fork callable service is running).
Y   Thread is in an MVS wait.

tagdata
   The tag data associated with the thread, if present. From 1 to 65 EBCDIC characters.
devicenumber
   The device number for which the byte range lock (BRL) wait occurred.
inodenumber
   The Inode number of the file owning the byte range lock (BRL).
filename
   The name of the file. If the file name has more than 16 characters, the first 15 are displayed followed by a plus
   sign (+).
lockpidid
   The PID of the process locking that file. This is usually the owner (or one of the owners) of a lock on the same
   range, but sometimes it is another process that is also waiting.
progresscounter
   An increasing progress counter.

The blocking process is on system: sys
    Displays the name of the system where the blocking process is when the command is issued in a sysplex
    configuration and the blocking process is from a different system in the sysplex than the system where the
    command was issued.

System action: The system continues processing.
Operator response: Resolve the byte range lock situation in order to keep the waiting process running.
System programmer response: None.

BPX0071I  MAXUSERMOUNTUSER was changed from oldvalue TO newvalue

Explanation: The system-wide value for MAXUSERMOUNTUSER has been changed.

In the message text:

oldvalue
   The old value for MAXUSERMOUNTUSER.
newvalue
   The new value for MAXUSERMOUNTUSER.

System action: The MAXUSERMOUNTUSER value has been changed.
Operator response: None
System programmer response: You can use D OMVS,O to check the current value.
Module: BPXFSLIT, BPXTXRIN

Descriptor Code: 4
In response to a DISPLAY OMVS,USERMOUNTS operator command, this table displays the user UID and the number of nonprivileged user mounts that the user currently has.

In the message text:

**hh.mm.ss**
- The time in hours (00-23), minutes (00-59), and seconds (00-59) for the DISPLAY OMVS command.

**procname**
- The name of the z/OS UNIX cataloged procedure.

**kernelasid**
- The address space ID of the kernel.

**status**
- One of the following:
  - **ACTIVE**
    - z/OS UNIX is currently active.
  - **NOT STARTED**
    - z/OS UNIX was not started.
  - **INITIALIZING**
    - z/OS UNIX is initializing.
  - **TERMINATING**
    - z/OS UNIX is terminating.
  - **TERMINATED**
    - z/OS UNIX has terminated.
  - **ETC/INIT WAIT**
    - z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.
  - **FORK SHUTDOWN**
    - The fork service has been shut down.
  - **SHUTTING DOWN**
    - z/OS UNIX is shutting down.
  - **SHUTDOWN BLOCKED**
    - z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.
  - **SHUT DOWN**
    - z/OS UNIX is shut down.
  - **RESTARTING**
    - z/OS UNIX is restarting after a shutdown.

**parmmemberlist**
- The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

**useruid**
- Nonprivileged user UID.

**currentmounts**
- Nonprivileged user mounts.

**System action:** The system continues processing.

BPXO073I hh.mm.ss DISPLAY OMVS text

Explanation: In the message, text is as follows:

<table>
<thead>
<tr>
<th>pipeowner</th>
<th>kernelasid</th>
<th>status</th>
<th>paramemberlist</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIPE OWNER SUMMARY</td>
<td>MAXPIPEUSER=maxpipeuser</td>
<td>CURRENT</td>
<td>HIGHWATER</td>
</tr>
<tr>
<td>USERID</td>
<td>UID</td>
<td>USAGE</td>
<td>USAGE</td>
</tr>
<tr>
<td>loginame</td>
<td>uid</td>
<td>curusage</td>
<td>curhwusage</td>
</tr>
<tr>
<td>HIGHWATER USER:</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>USERID=hwuser</td>
<td>UID=hwuid</td>
<td>HIGHWATER USAGE=hwusage</td>
<td></td>
</tr>
</tbody>
</table>

In response to a DISPLAY OMVS,PIPES operator command, this table displays the current and highwater pipe usage information.

In the message text:

hh.mm.ss
The time in hours (00-23), minutes (00-59), and seconds (00-59) for the DISPLAY OMVS command.

procname
The name of the z/OS UNIX cataloged procedure.

kernelasid
The address space ID of the kernel.

status
One of the following:

ACTIVE
z/OS UNIX is currently active.

NOT STARTED
z/OS UNIX was not started.

INITIALIZING
z/OS UNIX is initializing.

TERMINATING
z/OS UNIX is terminating.

TERMINATED
z/OS UNIX has terminated.

ETC/INIT WAIT
z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

FORK SHUTDOWN
The fork service has been shut down.

SHUTTING DOWN
z/OS UNIX is shutting down.

SHUTDOWN BLOCKED
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.
SHUTDOWN

z/OS UNIX is shut down.

RESTARTING

z/OS UNIX is restarting after a shutdown.

parmmemberlist

The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

maxpipeuser

Current MAXPIPEUSER value

loginame

User login name. If not known a single asterisk will be displayed.

uid

User ID of the user that created the pipe or fifo.

curusage

The number of current pipe or fifos in use that were created by the user.

curhwusage

The highwater number of pipe or fifos that were created by the user.

hwuser

The User login name of the highwater pipe user.

hwuid

The real UID of the highwater pipe user. Note that the HIGHWATER USER information does not include UID0 usage.

hwusage

The highwater usage for the highwater pipe user.

System action: The system continues processing.

Operator response: None.

System programmer response: None.

BPXO074I hh.mm.ss DISPLAY OMVS text

Explanation: In the message, text is as follows:

procname kernelasid status parmmemberlist

TOTAL CURRENT USAGE=totalpipeusage

CURRENT SYSTEM

PID USAGE NAME

pid CurrentUsage sysname

In response to a DISPLAY OMVS,PIPES,UID=<uid> operator command, this message displays the current pipe usage for the high-use processes for the specified UID. At most, the top 10 high-use processes are displayed.

In the message text:

hh.mm.ss

The time in hours (00-23), minutes (00-59), and seconds (00-59) for the DISPLAY OMVS command.

procname

The name of the z/OS UNIX cataloged procedure.
BPXO074I

Kernel address space ID of the kernel.

Status
One of the following:

- **ACTIVE**: z/OS UNIX is currently active.
- **NOT STARTED**: z/OS UNIX was not started.
- **INITIALIZING**: z/OS UNIX is initializing.
- **TERMINATING**: z/OS UNIX is terminating.
- **TERMINATED**: z/OS UNIX has terminated.
- **ETC/INIT WAIT**: z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.
- **FORK SHUTDOWN**: The fork service has been shut down.
- **SHUTTING DOWN**: z/OS UNIX is shutting down.
- **SHUTDOWN BLOCKED**: z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.
- **SHUTDOWN**: z/OS UNIX is shut down.
- **RESTARTING**: z/OS UNIX is restarting after a shutdown.

Parameter list
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

PID
The user process ID that created the pipe or FIFO.

Current usage
The number of pipes or FIFOs in use that were created by the specified PID.

System name
The system name associated with the user PID.

System action
The system continues processing.

Operator response
None.

System programmer response
Use the zlsof command to view detailed file usage for a specific user or process. For usage information about zlsof, see z/OS UNIX System Services Command Reference.

Module
BPXOMAST

Source
z/OS UNIX System Services kernel (BPX)

Routing Code
-2

Descriptor Code
5,8
Explanation: When the KERNELSTACKS(BELOW) parmlib option is used, the display looks like the following example:

```
procname   kernelasid   status   parmmemberlist
BPXO075I 09.06.04 DISPLAY OMVS 405
OMVS      000F ACTIVE  OMVS=(SY)

PRIVATE STORAGE:
CURRENT USAGE       MAXIMUM AVAILABLE       HIGH WATER       REGION SIZE
curpvtstg           maxpvtstg               hwpvtstg           regionize
STACK CELLS:
CURRENT USAGE       MAXIMUM CELLS           HIGH WATER
curstacks           maxstacks               hwstacks

PROCESS STACK CELL USAGE
USER   JOBNAME   ASID   PID   PPID   STATE   THREADS   STACKS
user   jobname   asid   pid   ppid   stateraa   pthreads   procstacks
```

Or if no processes are displayed:

NO PROCESSES FOUND USING 50 OR MORE SPACE SWITCHED STACK CELLS.

When the KERNELSTACKS(ABOVE) parmlib option is used, the display shows threads instead of stack cells and looks as follows:

```
BPXO075I 11.01.17 DISPLAY OMVS 678
OMVS      000F ACTIVE  OMVS=(D3,DN,D4)

PRIVATE STORAGE:
CURRENT USAGE       MAXIMUM AVAILABLE       HIGH WATER       REGION SIZE
curpvtstg           maxpvtstg               hwpvtstg           regionize
THREADS:
CURRENT USAGE       MAXIMUM THREADS          HIGH WATER
curthreads          maxthreads               hwthreads

PROCESS THREAD USAGE
USER   JOBNAME   ASID   PID   PPID   STATE   THREADS
user   jobname   asid   pid   ppid   stateraa   threads
```

Or if no processes have more than 50 threads, you will get the following message instead of a list:

NO PROCESSES FOUND USING 50 OR MORE THREADS.

In response to a DISPLAY OMVS,STORAGE operator command, this message displays information about z/OS UNIX kernel private storage usage and stack usage for processes using 50 or more stacks. The line beginning with user appears one or more times for each process.

In the message text:

```
hh.mm.ss
   The time in hours (00-23), minutes (00-59), and seconds (00-59) for the DISPLAY OMVS command.

asid
   The address space ID for the process; or zero when states are Z and L.

curpvtstg
   The number of bytes of kernel private storage, excluding stack cells, that are currently allocated in the kernel address space.

curstacks
   The current system wide count of kernel stack cells in use. The number stack cells currently available for new work is equal to maxstacks - curstacks.

curthreads
   The current system wide count of threads that are in use. The number of threads that are available for new work is equal to maxthreads - curthreads.
```
hwpvtstg
The highest record usage (in bytes) of kernel private storage, excluding stack cells. This value can be reset to the
current usage by specifying the RESET option on DISPLAY OMVS command (D OMVS,STORAGE,RESET).

hwstacks
The highest recorded system wide usage of kernel stack cells. This value can be reset to the current usage by
specifying the RESET option on the DISPLAY OMVS command (D OMVS,STORAGE).

hwthreads
The highest recorded system wide usage of threads. This value can be reset to the current usage by specifying
the RESET option on the DISPLAY OMVS command (D OMVS,STORAGE).

jobname
The job name of the process.

kernelasid
The address space ID of the kernel.

maxpvtstg
The maximum number of bytes of kernel private storage, excluding stack cells, that can be allocated in the
kernel without impacting the number of stack cells that can be created. This value is approximately 20% of the
kernel region size.

maxstacks
The maximum number of cells defined for the kernel stack cell pool at kernel initialization. The maximum
number of bytes that can be used for stack cells is approximately 80% of the region size of the kernel address
space.

maxthreads
The maximum number of threads that are defined for the system. The maximum amount of threads allowed is
500000 but can be smaller depending on the region size.

parmmemberlist
The parmlib member name list specified on the SET OMVS command or on the initialization of OMVS.

pid
The process ID, in decimal, of the process; or "." if no process ID has been assigned yet.

ppid
The parent process ID, in decimal, of the process.

procname
The name of the z/OS UNIX cataloged procedure.

pthreads
The number of threads created with pthread_create() (BPX1PTC/BPX4PTC) currently in the process.

procstack
The number of kernel autodata stacks currently in use by the process.

regionsize
The kernel address space private region size in bytes.

threads
The number of threads in the process.

status
One of the following:

ACTIVE
z/OS UNIX is currently active.

ETC/INIT WAIT
z/OS UNIX is waiting for the /etc/init or /usr/sbin/init program to complete initialization.

FORK SHUTDOWN
The fork service has been shut down.

INITIALIZING
z/OS UNIX is initializing.
NOT STARTED
z/OS UNIX was not started.

RESTARTING
z/OS UNIX is restarting after a shutdown.

TERMINATED
z/OS UNIX has terminated.

TERMINATING
z/OS UNIX is terminating.

SHUTTING DOWN
z/OS UNIX is shutting down.

SHUTDOWN BLOCKED
z/OS UNIX shutdown processing is blocked by one or more jobs, and it waits for all of the blockers to unblock or terminate.

SHUTDOWN
z/OS UNIX is shut down.

**state r aa**
An 8-character field showing the state of either the process or the most recently created thread in the process.
This field includes a 5-character state field, a 1-character r field that contains the restart state, and a 2-character aa field that contains additional state information for the process or thread. state is one or the combination of the following codes:

- Column is not being used.
1 Single-thread process.
A Message queue receive wait.
B Message queue send wait.
C Communication system kernel wait.
D Semaphore operation wait; or, when there is no process ID assigned yet, D means that the job is waiting to become a process.
E Quiesce frozen.
F File system kernel wait.
G MVS Pause wait.
H Process state is for multiple threads and pthread_create was used to create one of the threads. Process state is obtained from the Initial Pthread created Task (IPT).
I Swapped out.
K Other kernel wait (for example, pause or sigsuspend).
L Ended and parent has performed wait. The process is the session or process group leader of a process that is still active, but will be removed from the process table after the last session or process group member terminates. (L is for latent zombies.)
M Process state is for multiple threads and pthread_create was used to create one of the threads. Process state is obtained from the Initial Pthread created Task (IPT).
P Ptrace kernel wait.
Q Quiesce termination wait.
R Running (not kernel wait).
S Sleeping.
T Stopped.
W Waiting for child (wait or waitpid callable service).
X Creating new process (for callable service is running).
Z Ended and parent has not performed wait. (Z is for zombies.)

**r** is the 1-character restart status:
- Column is not being used.
B Blocked.
P Permanent.

**aa** is the 1-character restart status:
- Column is not being used.

**t** User syscall tracing is on for the process.

**System action:** The system continues processing.

Descriptor Code: 5

BPXP002I  OPENMVS INIT PROCESS CANNOT BE CREATED. FAILURE REASON CODE = reason_code.

APP/C/MVS RETURN CODE = return_code.

Explanation: The system encountered an error while creating the first z/OS UNIX process, which is the INIT process.

In the message text:

reason_code
The failure reason code from z/OS UNIX.

return_code
The return code from APP/C/MVS. The APP/C/MVS return code may be 0 if the failure is not related to APP/C/MVS. See z/OS MVS Programming: Writing Transaction Programs for APP/C/MVS for information on the return code.

System action: The system ends the z/OS UNIX initialization.
Operator response: None.
System programmer response: Examine the failure reason code and APP/C/MVS return code. If the failure is related to APP/C/MVS, verify that APP/C/MVS and the APP/C/MVS scheduler are operating. Correct the problem before restarting z/OS UNIX.
Module: BPXPRFC, BPXPRFK
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4
The return code from APPC/MVS. The APPC/MVS return code may be 0 if the failure is not related to APPC. See z/OS MVS Programming: Writing Transaction Programs for APPC/MVS for information on the return code.

**System action:** The system ends the z/OS UNIX initialization.

**Operator response:** None.

**System programmer response:** Examine the failure reason code and APPC/MVS return code. If the failure is related to APPC/MVS, verify that APPC/MVS and the APPC/MVS scheduler are operating. Correct the problem before restarting z/OS UNIX.

**Module:** BPXRFC, BPXRFK

**Source:** z/OS UNIX System Services kernel (BPX)

<table>
<thead>
<tr>
<th>Routing Code</th>
<th>Descriptor Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>4</td>
</tr>
</tbody>
</table>

**Explanation:** An error was reported by APPC/MVS during initialization of z/OS UNIX. The error may be caused by one or more of the following reasons:

1. APPC/MVS is not operating.
2. The APPC/MVS scheduler is not operating.
3. The APPC/MVS scheduler is malfunctioning.
4. APPC/MVS configuration work was not done correctly when z/OS UNIX was installed. The ASCHPMxx members may not have been updated to define the APPC/MVS scheduler class name used for z/OS UNIX, or the APPC/MVS scheduler may have been started with an incorrect member that does not have the class name.

In the message text:

**returncode**

The error return code from APPC/MVS. z/OS MVS Programming: Writing Transaction Programs for APPC/MVS provides more details on the APPC/MVS return code.

**jobname**

The name of the job by which z/OS UNIX will be terminated with the FORCE ARM command.

**System action:** The system waits for the APPC/MVS error condition to be corrected, or until the operator issues the FORCE ARM command to terminate the START z/OS UNIX request.

**Operator response:** Issue the FORCE ARM command to terminate the z/OS UNIX START request, if necessary.

**System programmer response:** Verify that APPC/MVS is operating by issuing a DISPLAY APPC command. Verify that the APPC/MVS scheduler is operating by issuing a DISPLAY ASCH command. If the scheduler is operating, verify that it has been started correctly with the proper member name.

If this is the first time you are initializing z/OS UNIX, verify that the ASCHPMxx member has been updated to define the APPC/MVS scheduler class name used for z/OS UNIX.

If the problem cannot be resolved quickly, end the initialization by asking the operator to issue the FORCE ARM command against z/OS UNIX. Ask the operator to start z/OS UNIX after the problem is resolved.

**Module:** BPXRFK

**Source:** z/OS UNIX System Services kernel (BPX)

</table>
BPXP004E FORK PROCESSING FAILED. AN ERROR OCCURRED DURING APPC PROCESSING. APPC RETURN CODE = \texttt{returncode}. VERIFY THAT APPC AND APPC SCHEDULER ARE OPERATIVE.

Explanation: APPC/MVS reported an error during fork processing. The error may be caused by one or more of the following reasons:

1. APPC/MVS is not operating.
2. The APPC/MVS scheduler is not operating.
3. The APPC/MVS scheduler is malfunctioning.
4. APPC/MVS configuration work was not done correctly when z/OS UNIX was installed. The ASCHPMxx members may not have been updated to define the APPC/MVS scheduler class name used for z/OS UNIX, or the APPC/MVS scheduler may have been started with an incorrect member that does not have the class name.

In the message text:

\textit{returncode}

The error return code from APPC/MVS. \cite{zOS MVS Programming: Writing Transaction Programs for APPC/MVS} provides more details on the APPC/MVS return code.

System action: The system requires APPC/MVS to be functioning in order to process fork requests.

Operator response: Contact the system programmer.

System programmer response: Verify that APPC/MVS is operating by issuing a DISPLAY APPC command. Verify that the APPC/MVS scheduler is operating by issuing a DISPLAY ASCH command. If the scheduler is operating, verify that it has been started correctly with the proper member name.

If this is the first time you are initializing z/OS UNIX, verify that the ASCHPMxx member has been updated to define the APPC/MVS scheduler class name used for z/OS UNIX.

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: -

Descriptor Code: 4
BPXP006E  procname IS text

Explanation:  z/OS UNIX initialization processing seems to be taking an excessive amount of time to complete. The message identifies the last initialization step to have been successfully started and therefore, the one most likely responsible for any delays or hangs.

In the message text:

procname
  The name of the z/OS UNIX cataloged procedure.

text
  One of the following:

INITIALIZING THE FILE SYSTEM
  Indicates that z/OS UNIX initialization has started the initialization of the file system, but the file system initialization has not yet completed.

CREATING THE BPXOINIT ADDRESS SPACE
  Indicates that z/OS UNIX initialization has issued a system request to create the BPXOINIT address space, but the address space has not yet started.

PROCESSING IN BPXOINIT
  Indicates that BPXOINIT has started processing but BPXOINIT has not yet started the initialization process (either the initialization REXX EXEC, /etc/init, or /usr/sbin/init).

STARTING THE INITIALIZATION PROCESS
  Indicates that BPXOINIT is attempting to fork an address space in which to run the initialization process (either the initialization REXX EXEC, /etc/init, or /usr/sbin/init) but the fork has not yet completed.

RUNNING THE INITIALIZATION PROCESS
  Indicates that BPXOINIT has started the initialization process (either the initialization REXX EXEC, /etc/init, or /usr/sbin/init) but the initialization process has not yet completed.

Some commands can cause hangs in the /etc/rc process, invoked from /etc/init, thus resulting in the issuance of this message. If the set -v -x command has been added to /etc/rc (it is shipped in the sample /etc/rc), the system programmer may view /etc/log during a hang in /etc/rc by starting the shell from a superuser and issuing the command cat /etc/log. Note that it must be a superuser; a user having permission to BPX.SUPERUSER is not enough. The last command listed in /etc/log is most likely the one causing the hang or delay.

WAITING FOR SECURITY PRODUCT INITIALIZATION
  Indicates that z/OS UNIX initialization is waiting for the security product to complete initialization.

WAITING FOR CATALOG ADDRESS SPACE INITIALIZATION
  Indicates that z/OS UNIX initialization is waiting for the catalog address space to complete initialization.

WAITING FOR JOB ENTRY SUBSYSTEM INITIALIZATION
  Indicates that z/OS UNIX initialization is waiting for the job entry subsystem (JES) to complete initialization.

OMVS IS UNABLE TO CREATE THE BPXOINIT ADDRESS SPACE
  The address space create of the BPXOINIT address space failed because there were not enough system resources to complete the process. The OMVS address space initialization could not complete.

System action:  The initialization process is allowed to continue, unless the message indicates that the BPXOINIT address space could not be initialized. In this case, initialization processing is discontinued.

Operator response:  If the condition persists, contact the system programmer.

System programmer response:  If the message indicates that the BPXOINIT address space cannot be created, shutdown OMVS and attempt to correct the system resource problem that could be causing the failure. Restart OMVS after correcting the problem. Otherwise, search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

Descriptor Code: 11

BPXP007E STARTING PHYSICAL FILE SYSTEM pfspname IN ADDRESS SPACE spacename

Explanation: z/OS UNIX file system initialization processing seems to be taking an excessive amount of time to complete. The message identifies the physical file system currently being processed.

In the message text:

pfspname
    The name associated with the physical file system.

IN ADDRESS SPACE
    spacename
        The name of the address space processing the physical file system initialization, if it is other than the kernel. If it is the kernel, this field is blank.

System action: No action is taken. Initialization processing is allowed to continue.

Operator response: If the specified physical file system is configured to execute in a colony address space, ensure that the JES address space has been started. The physical file system requires JES if the BPXPRMxx FILESYSTYPE statement specifies the ASNAME key and does not contain the optional 'SUB=MSTR' parameter. If the condition persists, contact the system programmer.

System programmer response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

BPXP009I THREAD threadid, IN PROCESS pid, ENDED ABNORMALLY WITH COMPLETION CODE compcode, REASON CODE reasoncode.

Explanation: This message is written to the hardcopy log when a task terminates abnormally. This message may be captured to a joblog in the HFS by using the _BPXK_JOBLOG environment variable.

In the message text:
threadid
The thread ID, in hexadecimal, of the terminating thread.

pid
The process ID, in decimal, of the process containing the terminating thread.

compcode
The task completion code and indicator flags, in hex, from the TCBCMP field of the terminating TCB. This field has the form of ffsssuuu, where ff are the indicator flags, sss is the system completion code and uuu is the user completion code.

reasoncode
The reason code, in hexadecimal, associated with task completion code. For an explanation of the reason code, see [z/OS MVS System Codes](https://www.ibm.com/support/knowledgecenter/en/SSDS88_2.2.0/com.ibm.o22e.cc01388a/gsa8l100.htm).

System action: No action is taken. Termination processing continues.

Operator response: None.

System programmer response: None.

User response: If the abnormal condition is unexpected, use the completion code and associated reason code to determine the cause of the abnormal termination.

**BPXP010I**  THREAD threadid1, IN PROCESS pid1, WAS TERMINATED BY SIGNAL signal, SENT FROM THREAD threadid2, IN PROCESS pid2, UID uid.

Explanation: This message is written to the hardcopy log when a task terminates due to a signal. This message may be captured to a joblog in the HFS by using the _BPXK_JOBLOG environment variable.

In the message text:

threadid1
The thread ID, in hexadecimal, of the terminating thread.

pid1
The process ID, in decimal, of the process containing the terminating thread.

signal
The name of the signal causing the termination.

threadid2
The thread ID, in hexadecimal, of the thread sending the terminating signal, or zero if not available.

pid2
The process ID, in decimal, of the process containing the thread sending the terminating signal, or zero if not available.

uid
The real user ID, in decimal, associated with the process containing the thread sending the terminating signal, or zero if not available.

System action: No action is taken. The terminating signal is delivered.

Operator response: None.

System programmer response: If the terminating

User response: If the terminating signal is unexpected, use the thread and process IDs to determine the cause of the signal.

**Explanation:** This message is written to the hardcopy log when fork child processing terminates due to an error. This message may be captured to a job log in the HFS by using the _BPXK_JOBLOG environment variable.

In the message text:

- **returncode**
  - The return code, in hexadecimal, associated with the fork error.

- **reasoncode**
  - The reason code, in hexadecimal, associated with the fork error. For an explanation of the return code and reason code, see [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/docview.wss?uid=swg21279925).

- **pid1**
  - The process ID, in decimal, of the child process.

- **asid1**
  - The address space ID, in hexadecimal, of the child process.

- **pid2**
  - The process ID, in decimal, of the parent process, or zero if not available.
uid
The real user ID, in decimal, associated with the parent process, or zero if not available.

asid2
The address space ID, in hexadecimal, of the parent process, or zero if not available.

System action: No action is taken. The child process terminates.
Operator response: None.
System programmer response: None.
User response: Use the return code and reason code to determine the cause of the fork error.

BPXP013I THREAD threadid, IN PROCESS pid, WAS TERMINATED BY SIGNAL signal, DUE TO CPU TIME OUT.

Explanation: This message is written to the hardcopy log when a task terminates due to a CPU time out signal. This message may be captured to a joblog in the HFS by using the _BPXK_JOBLOG environment variable.

If running a batch job, CPU Time is inherited from the TIME=JCL Parm. If running from OMVS, the Time value is inherited from the parent task and is subject to BPXPRMxx MAXCPUTIME or the RACF OMVS segment CPUTIMEMAX. Please see z/OS UNIX System Services Planning for more information about System limits and process limits.

In the message text:
threadid
The thread ID, in hexadecimal, of the terminating thread.

pid
The process ID, in decimal, of the process containing the terminating thread.

signal
The name of the signal causing the termination.

System action: No action is taken. The terminating signal is delivered.
Operator response: None.
System programmer response: None.
User response: If the terminating signal is unexpected, use the thread and process IDs to determine the cause of the CPU time out.
Module: BPXNSDLV

BPXP014I ENVIRONMENT MUST envirstate CONTROLLED FOR text PROCESSING.

Explanation: The program environment was incompatible with the operation attempted. The environment must stay controlled because sensitive processing and or data may exist. There was an attempt to load a program that is not program controlled. Only program controlled programs are allowed to be loaded or executed.

In the message text:
envirstate
BPXP015I

REMAIN
The environment was controlled and required to remain controlled for sensitive (server or daemon) processing. An operation was attempted that would have caused the environment to become uncontrolled.

BE
The environment was uncontrolled and an operation was attempted that required the environment to be controlled (server or daemon processing).

text
One of the following:

SERVER (BPX.SERVER)
Environment must remain or be controlled for server processing.

DAEMON (BPX.DAEMON)
Environment must remain or be controlled for daemon processing.

SMF (BPX.SMF.xxx.yyy)
Environment must remain or be controlled for SMF processing.

System action: The request is denied.
Operator response: None.
System programmer response: None.
User response: Check for additional messages that identify the uncontrolled program and the reason it is considered uncontrolled. Try another environment that does not require program control or make the program controlled (see message "BPXP015I").

Module: BPXMRCCHK

Descriptor Code: -

BPXP015I HFS PROGRAM pathname IS text.

Explanation: The HFS program specified by path was not program controlled. If the environment must remain controlled, the program could not be loaded or executed. If the environment was not required to remain controlled the program was loaded or executed but caused the environment to become uncontrolled.

In the message text:

pathname
The path name, truncated to 150 characters (truncation occurs from the left), of the program that caused or would have caused the environment to become uncontrolled.

text
One of the following:

NOT MARKED PROGRAM CONTROLLED.
The HFS program specified by path does not have the PROGCTL extended attribute.

FROM A FILE SYSTEM MOUNTED WITH THE NOSETUID ATTRIBUTE
The file system containing the program specified by the path name is mounted with the NOSETUID attribute and is considered uncontrolled.

NOT A TRUSTED MAIN PROGRAM
The program that is running is not defined to SAF as a trusted main program.

System action: The request is denied.
Operator response: None.
System programmer response: None.
User response:
• If the HFS program is not marked program controlled, have an authorized user (permitted to BPX.FILEATTR.PROGCTL) mark the program as program controlled.
If the HFS program is from a file system mounted with the NOSETUID attribute (considered untrusted) copy it to
a file system mounted with the SETUID attribute or contact a superuser to remount the file system with the
SETUID attribute.

BPX016I  ENVIRONMENT IS UNCONTROLLED BECAUSE IT IS BEING DEBUGGED (DBX) BY AN
UNTRUSTED DEBUGGER

Explanation: The environment is considered uncontrolled because an untrusted debugger (not permitted to
BPX.DEBUG) is attached to the environment.

System action: The request is denied.

Operator response: None.

User response: 
• Try the request again without an untrusted debugger (dbx) attached to the environment.
• Report the message to your security administrator.

Module: BPXNPREQ

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: -

Descriptor Code: -

Security Administrator Response: The user attempted a function that required the environment to be program
trolled. The environment is considered uncontrolled because an untrusted debugger is debugging the user’s
environment. Determine if the debugger should be allowed to perform this action and if so permit them to the
BPX.DEBUG facility class profile with READ access.

BPX017I  DEBUGGER IS UNTRUSTED AND IS NOT ALLOWED TO DEBUG A PROGRAM CONTROLLED
ENVIRONMENT.

Explanation: The debugger is untrusted (not permitted to BPX.DEBUG) and attempted to debug an environment
that must stay program controlled, but is not allowed.

System action: The request is denied.

Operator response: None.

User response: Report the message to your security administrator.

Module: BPXPRECP

Source: z/OS UNIX System Services kernel (BPX)

Routing Code: -

Descriptor Code: -

Security Administrator Response: The untrusted user attempted to debug a program controlled environment.
Determine if the debugger should be allowed to debug a program controlled environment and if so permit them to
the BPX.DEBUG facility class profile with READ access.

BPX018I  THREAD threadid, IN PROGRESS pid, ENDED WITHOUT BEING UNDUBBED WITH
COMPLETION CODE comcode, AND REASON CODE reasoncode.

Explanation: This message is written to the hardcopy log when a task terminates without being undubbed. See z/OS
UNIX System Services Planning for an explanation of dubbing and undubbing. This message may be captured to a
joblog in the HFS by using the _BPXK_JOBLOG environment variable.
BPXP019I

In the message text:

threadid
The thread ID, in hexadecimal, of the terminating thread.

pid
The process ID, in decimal, of the process containing the terminating thread.

compcode
The task completion code and indicator flags, in hex, from the TCBCMP field of the terminating TCB. This field has the form of ffsssuuu, where ff are the indicator flags, sss is the system completion code and uuu is the user completion code.

reasoncode
The reason code, in hex, from the TCBARC field of the terminating TCB, that is associated with task completion code. For an explanation of the reason code, when the system completion code is nonzero, see z/OS UNIX System Services Messages and Codes. When the user completion code is nonzero, see documentation for the component, subsystem, or product that issued the user completion code for an explanation of the user completion code and associated reason code.

When the completion code (compcode) is EC6, refer to z/OS MVS System Codes.

System action: No action is taken. Termination processing continues.

Operator response: None.

System programmer response: If the termination without being undubbed is unexpected, use the completion code and associated reason code to determine the cause of the termination.

User response: None.

Descriptor Code: 6

BPXP019I  HFS PROGRAM pathname IS text

Explanation: The HFS program specified by the path was not listed in the APF sanction list. The path name must be added to this list to be loaded or executed.

In the message text:

pathname
The path name, truncated to 150 characters (truncation occurs from the left), of the program that caused or would have caused the environment to become uncontrolled.

text
One of the following:

NOT IN THE PROGRAM CONTROLLED PATH LIST.
The hfs program specified by path name is not listed in the AUTHPGMLIST sanction file under program-controlled entries.

NOT IN THE AUTHORIZED PROGRAM PATH LIST.
The hfs program specified by path name is not listed in the AUTHPGMLIST sanction file under authorized program path entries.

System action: The request is denied.

Operator response: None.

System programmer response: None.

User response: Take the following actions:
• Determine the filename of the sanction list file. (Perform a D OMVS, O and check the AUTHPGMLIST option.)
• Update this file by adding the path name to the correct list. For authorized program paths, use the list starting with `authprogram_path`. For program control paths, use the list starting with `programcontrol_path`.

• Force this new list to take effect. One way to do this is to use the console command `SETOMVS AUTHPGMLIST=file`, where `file` is the path name of the sanction list.

Module:  BPXPRECP
Source:  z/OS UNIX System Services kernel (BPX)
Routing Code: -
Descriptor Code: -

**BPXP020I** APF PROGRAM `pathname` IS NOT IN THE APF PROGRAM NAME LIST.

**Explanation:** The program name specified by the name was not listed in the APF sanction list. The program name must be added to this list to be loaded or executed.

In the message text:

`pathname`

The program name or the program that caused or would have caused the program environment to be uncontrolled.

**System action:** The request is denied.

**Operator response:** None.

**System programmer response:** None.

**User response:** You should:

• Determine the filename of the sanction list file. (Perform a D OMVS, O and check the AUTHPGMLIST option.)

• Update this file by adding the path name to the correct list. For authorized program NAMEs, use the list starting with `apfprogram_name`.

• Force this new list to take effect. One way to do this is to use the console command `SETOMVS AUTHPGMLIST=file`, where `file` is the path name of the sanction list.

**BPXP021I** WARNING: ENVIRONMENT NEEDS TO `state` CONTROLLED FOR `environment` PROCESSING.

**Explanation:** This message is a warning of a program control problem that is only issued when running in warning mode. The environment needs to stay controlled due to sensitive processing and/or data existing. There was a load done for a program that is not program controlled. Only program controlled programs should be loaded or executed in this address space.

In the message text:

`state`

One of the following:

**REMAIN**

The environment is currently controlled and is not allowed to become uncontrolled. Uncontrolled programs cannot be loaded or executed at this time.

**BE**

The environment is currently uncontrolled and is not allowed to become controlled. Sensitive processing (server or daemon) is not allowed at this time.

`environment`

One of the following:

**SERVER (BPX.SERVER)**

Environment must remain controlled for server processing.
BPXP022E • BPXP022I

DAEMON (BPX.DAEMON)
Environment must remain controlled for daemon processing.

System action: None.
Operator response: None.
System programmer response: None.
User response: Check for additional messages that identify the uncontrolled program and the reason it is considered uncontrolled. Make the identified program controlled to allow the processing that requires a controlled environment to run successfully when running with security checking enabled.

BPXP023I  THREAD threadid1, IN PROCESS pid1, WAS TERMINATED BY SIGNAL signal, SENT FROM
  THREAD threadid2, IN PROCESS pid2, UID uid, IN JOB jobname.

Explanation: This message is written to the hardcopy log when a task terminates due to a signal. This message may
be captured to a joblog in the HFS by using the _BPXK_JOBLOG environment variable.

In the message text:

  threadid1
  The thread ID, in hexadecimal, of the terminating thread.

  pid1
  The process ID, in decimal, of the process containing the terminating thread.

  signal
  The name of the signal causing the termination.

  threadid2
  The thread ID, in hexadecimal, of the thread sending the terminating signal, or zero if not available.

  pid2
  The process ID, in decimal, of the process containing the thread sending the terminating signal, or zero if not
  available.

  uid
  The real user ID, in decimal, associated with the process containing the thread sending the terminating signal, or
  zero if not available.

  jobname
  Jobname of the process containing the thread sending the terminating signal.

System action: No action is taken. The terminating signal is delivered.

Operator response: None.

System programmer response: None.

Programmer response: If the terminating signal is unexpected, use the thread and process IDs to determine the
cause of the signal.

BPXP025I  A FORK OR SPAWN ERROR WAS ENCOUNTERED. A RACROUTE REQUEST=VERIFY FAILURE OCCURRED FOR USERID userid. SAF RETURN CODE safrc, RACF RETURN CODE return_code, RACF REASON CODE reason_code.

Explanation: The system encountered an error verifying the target userid while performing the fork or the spawn.
In the message text:

userid
The target userid of the fork or spawn.
safrc
The error return code from the system authorization facility (SAF).
return_code
The error return code from the resource access control facility (RACF) or other security product.
reason_code
The error reason code from the resource access control facility (RACF) or other security product.

System action: The system ends the process.
Operator response: Contact the system programmer.
System programmer response: Examine the return and reason code for the RACROUTE REQUEST=VERIFY that ended in error to determine the reason for the error.

Module: BPXRJJSR
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2
Descriptor Code: 4

BPXP026E  RESPAWNNABLE PROCESS jjjjjjjj COULD NOT BE RESTARTED. failure textRETURN CODE = rrrrrrrrr, REASON CODE = sssssssss.

Explanation: The respawnable process displayed in the message could not be restarted.
In the message text:

jjjjjjjjjj
The jobname of the process being restarted.

failure text
Description of the error. It can be: Error opening STDIN /dev/null. Error opening STDOUT /etc/log. Error opening STDERR /etc/log.Spawn syscall terminated with.

rrrrrrrr
The return code from the failing syscall.

ssssssss
The reason code from the failing syscall.

System action: The process is not restarted.
Operator response: Contact the system programmer.
System programmer response: Correct the error described in the message. If the failure was because of not being able to open STDIN, STDOUT, or STDERR, ensure that those files exist and can be accessed. If it was a spawn error, check the return code and reason code to determine the failure and correct the problem.

Module: BPXPRITR
BPXP027I  JOBNAME job_name ATTEMPTED TO ISSUE AN EXEC OF THE APF-AUTHORIZED MVS
PROGRAM pgmname WITH A PARAMETER LENGTH OF xxx.

Explanation: An attempt was made to execute an APF-authorized MVS program with an argument length greater than 100 characters.

In the message text:

job_name
   The name of the job that tried to issue the execmvs().

pgmname
   The name of the APF-authorized MVS program.

xxx
   The length in character bytes of the argument.

System action: The job fails.

Operator response: Contact the system programmer.

System programmer response: Correct the error described in the message. If the target APF-authorized MVS program is capable of being called with an argument length of up to 4096 bytes, define a FACILITY class as follows:

BPX.EXECMVSAPF.pgmname

where pgmname is the program name. If the target APF-authorized program cannot handle an argument length of from 101 to 4096, specify an argument of 100 bytes or less.

Module: BPXPRECP

Source: z/OS UNIX System Services Kernel

BPXP028I  SPAWN or EXEC ERROR FOR FILE PATH
pathname  DEVICE ID devid INODE inodeno. THE ASSOCIATED MVS MEMBER NAME IS membername.

Explanation: This message is issued when the invocation of an MVS load library resident program is attempted in a manner that is not permitted. This error is caused by a call to the z/OS UNIX spawn, exec or attach_exec callable service against a z/OS UNIX file or link that does not have the required attributes to allow this type of invocation. The following are the possible z/OS UNIX files or links that can cause this error:

- The z/OS UNIX path name supplied to spawn, exec or attach_exec represents an external link that resolves to the named MVS program found in an APF-authorized library and link-edited with the AC=1 attribute. The external link must have a owning UID of 0 and not be found in a file system mounted as NOSECURITY to allow this type of invocation. You can use the z/OS UNIX chown command to change the file owning UID to 0 for a z/OS UNIX file or link. See z/OS UNIX System Services Command Reference for documentation regarding the use of the chown command.

- The z/OS UNIX pathname supplied to spawn, exec or attach_exec represents a regular file with the sticky bit attribute that resolves to the named MVS program found in an APF-authorized library and link-edited with the AC=1 attribute. A sticky bit file must have an owning UID of 0 or have the APF extended attribute turned on to allow this type of invocation. The APF extended attribute is not honored for a file system mounted as NOSECURITY or NOSETUID. A user must have READ permission to the BPX.FILEATTR.APF RACF Facility Class Profile to update the APF extended attribute of a file. See z/OS UNIX System Services Planning for documentation regarding this profile and setting the APF attribute.

- The z/OS UNIX pathname supplied to spawn, exec or attach_exec represents a symbolic link to a regular file with the sticky bit attribute. The named MVS program is derived from the symbolic link file name. If the sticky bit file has the set-user-id attribute, the symbolic link must have an owning uid of 0 or an owning uid equal to that of the...
sticky bit file. If the sticky bit file has the set-group-id attribute, the symbolic link must have an owning uid of 0 or an owning gid equal to that of the sticky bit file. If the named MVS program is found in an APF-authorized library and is link-edited with the AC=1 attribute, the symbolic link must have a owning UID of 0 regardless of the other attributes of the sticky bit file. In all of these cases, the symbolic link must not be found in a file system mounted as NOSECURITY to allow this type of invocation. It is possible that either the symbolic link itself or the sticky bit file it represents are the cause of the problem. If the symbolic link has the proper attributes, then the sticky bit file it points to must be checked to ensure it has the proper attributes as described previously.

In the message text:

**pathname**
The path name in the z/OS UNIX file system that was supplied to the spawn, exec or attach_exec callable service involved in the error. The path name displayed in this message is limited to 64 characters. Note that this path name might not be a fully qualified path name and may be truncated on the left, or it may represent a symbolic link that resolves to the sticky bit file in error. The inode number and device ID should be used to uniquely identify the fully qualified path name for the file or link that is the cause of the error. Once the fully qualified path name is determined, its file attributes can be viewed using the z/OS UNIX shell `ls` command to determine whether it represents a sticky bit file, a symbolic link or an external link. The following is a `ls` command example against a file with a fully qualified path name of `/u/bin/testpgm` that shows the file's attributes:

```
ls -El /u/bin/testpgm
```

**devid**
The device ID (st_dev) of file system containing the file or link. Use the D OMVS,F console command or the z/OS UNIX shell `df` command to determine the path associated with the device ID. A determination should also be made as to whether the file system is mounted as NOSETUID or NOSECURITY, since this can be the cause of the error. The z/OS UNIX shell `df` command can be used to view the attributes of a file system. The following is a `df` command example against a file system with a path name of `/u/bin/`:

```
df -v /u/bin/
```

**inodeno**
The inode number (st_ino) of file. The z/OS UNIX shell `find` command can be used to determine the fully qualified path name by supplying to the `find` command the path name associated with the device ID to start the search from along with the inode number. The following is a `find` command example where the path name associated with the device ID resolved to `/u/bin/` and the inode number value is 1250:

```
find /u/bin/ -xdev -inum 1250
```

**membername**
The member name of the associated MVS program that was the target of the failing spawn, exec or attach_exec callable service.

**System action:** There will be an associated abend code EC6 reason code xxxxC04A with this error.

**Operator response:** Contact the system programmer.

**System programmer response:** If the identified MVS program is part of an IBM or another vendor's product, contact IBM or the other vendor that owns this program. Otherwise, if the identified MVS program is one of your installation specific programs then you must determine if it is appropriate for the MVS program to be invoked from a z/OS UNIX environment. The various z/OS UNIX environments can include, but are not limited to, invocation from the z/OS UNIX shell, BPXBATCH, the z/OS UNIX System Services ISPF shell, a REXX exec using Address Syscall, or a program using the z/OS UNIX exec, spawn or attach_exec services. If this type of invocation is appropriate for the identified program, then you must change the attributes of the file or link as indicated in the explanation of the error.

**Module:** BPXPRECP

**Source:** z/OS UNIX System Services Kernel

**Routing Code:** 11 (and hardcopy log)

**Descriptor Code:** 6
OPEN ERROR FOR FILE PATH

Explanation: This message is issued when an open is attempted against a path name that does not have the proper attributes to be opened by an APF-authorized program, by a z/OS UNIX set-user-ID or set-group-ID privileged program, or by a program that requires a must stay clean environment. The open may be as a result of the attempted execution or load of a z/OS UNIX program file or the attempt to call a REXX external function or subroutine file. In order for the file to be opened successfully, the file itself and any symbolic links that comprise the specified path name must have one of the following attributes:

- An owning UID of 0 or an owning UID equal to that of the set-user-ID program attempting to open the file, and the file and any associated symbolic links must not be found in a file system mounted as NOSECURITY. You can use the z/OS UNIX chown command to change the file owning UID for a z/OS UNIX file or link. See z/OS UNIX System Services Command Reference for documentation regarding the use of the chown command.
- The program control extended attribute turned on. This will only apply to the file itself not a symbolic link, since a symbolic link does not have extended attributes. The program control extended attribute is not honored for a file system mounted as NOSECURITY or NOSETUID. A user must have READ permission to the BPX.FILEATTR.PROGCTL RACF Facility Class profile to update the Program Control extended attribute of a file. See z/OS UNIX System Services Planning for documentation regarding this profile and setting the APF attribute.

In the message text:

**pathname**
The path name in the z/OS UNIX file system that was supplied to the z/OS UNIX callable service involved in the error. The path name displayed in this message is limited to 64 characters. Note that this path name might not be a fully qualified path name and may be truncated on the left. It also may represent a link to the actual file or an external symbolic link that is the cause of the error. The inode number and device ID should be used to uniquely identify the fully qualified path name for the file or link that is the cause of the error. Once the fully qualified path name is determined, its file attributes can be viewed using the z/OS UNIX shell ls command. The following is a ls command example against a file with a fully qualified path name of /u/bin/testpgm that shows the file's attributes:

```
ls -El /u/bin/testpgm
```

**devid**
The device ID (st_dev) of file system containing the file or link. Use the D OMVS,F console command or the z/OS UNIX shell df -v command to determine the path associated with the device ID. A determination should also be made as to whether the file system is mounted as NOSETUID or NOSECURITY, since this can be the cause of the error. The z/OS UNIX shell df command can be used to view the attributes of a file system. The following is a df command example against a file system with a path name of /u/bin/:

```
df -v /u/bin/
```

**inodeno**
The inode number (st_ino) of file. The z/OS UNIX shell find command can be used to determine the fully qualified path name by supplying to the find command the path name associated with the device ID to start the search from along with the inode number. The following is a find command example where the path name associated with the device ID resolved to /u/bin/ and the inode number value is 1250:

```
find /u/bin/ -xdev -inum 1250
```

System action: There will be an associated abend code EC6 reason code x000E04B with this error.

Operator response: Contact the system programmer.

System programmer response: If the z/OS UNIX file or link is part of an IBM or another vendor's product, contact IBM or the other vendor that owns this file. Otherwise, if the identified file or link is one of your installation specific files, then you must determine if it is appropriate for the file or link to be opened from a privileged or authorized environment. If the open of the identified file or link is appropriate, then you must change the attributes of the file or link as indicated in the explanation of the error.

TFS TERMINATION REQUEST ACCEPTED

Explanation: The entered Stop or Modify command has successfully terminated the specified TFS.

\textbf{System action:} The system terminates the specified TFS.

\textbf{Operator response:} None.

\textbf{System programmer response:} None.
BPXTF002I  TFS TERMINATION REQUEST FAILED DUE TO ACTIVE MOUNTS

Explanation: The entered Modify or Stop command attempting to terminate TFS cannot be performed because TFS currently has active mounts.

System action: The system ignores the command and continues processing.

Operator response: Unmount all TFS file systems and retry the command or use the Modify command to unconditionally terminate TFS.

System programmer response: None.

Module: BPXTFS

Source: z/OS UNIX System Services kernel (BPX)

BPXTF003I  TFS UNCONDITIONAL TERMINATION REQUEST ACCEPTED

Explanation: The entered Modify command to unconditionally terminate TFS has successfully completed.

System action: The system unconditionally terminates the specified TFS.

Operator response: None.

System programmer response: None.

Module: BPXTFS

Source: z/OS UNIX System Services kernel (BPX)

BPXTF004I  UNSUPPORTED MODIFY COMMAND

Explanation: The entered Modify command is not supported by TFS.

System action: The system ignores the command and continues processing.

Operator response: Verify the syntax of the command and reissue it correctly.

System programmer response: None.

Module: BPXTFS

Source: z/OS UNIX System Services kernel (BPX)

BPXTF006I  TFS MOUNTED file_system

Explanation: TFS has successfully completed mount processing for the specified file system.

In the message text:

file_system
The name of a file system

System action: The system mounts the specified TFS.

Operator response: None.

System programmer response: None.

Module: BPXTFS

Source: z/OS UNIX System Services kernel (BPX)

BPXTF007I  FILESYSTEM SIZE=file_system_size MAX FILE SIZE=max_file_size

Explanation: This message follows BPXTF006I. It displays information about the file system from the preceding message.

In the message text:

Chapter 12. BPX messages  565
file_system_size
   The size of the file system.

max_file_size
   The maximum file size supported by the file system.

System action: No action is taken.
Operator response: None.
System programmer response: None.
Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)

BPXTF008I  INVALID MOUNT PARAMETERS IGNORED AT COLUMN n

Explanation: The PARM keyword value on the mount request contained parameter information that TFS does not
support.

In the message text:

   n  The first column that was in error

System action: The mount is processed as though the incorrect text had not been entered.
Operator response: None.
System programmer response: Verify the syntax of the PARM keyword value on the TFS mount command. If any
errors exist, correct them and try again. Also, verify that the mount has appropriate attributes for your needs. If the
mount does not, the file system must be unmounted and the mount request reissued correctly.
Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)

BPXTF009E  FILESYSTEM EXCEEDS percent% full: name

Explanation: The space utilization for the referenced file system exceeds the FSFULL monitoring threshold
established when the file system was mounted and the file system is not able to automatically extend.

In the message text:

   name  The name of the file system
   percent  The percent threshold that has been exceeded

System action: None.
Operator response: Reduce workload in this file system, remove unused files, or extend the file system if it is
allowed to grow.
System programmer response: None.
Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 1,10
Descriptor Code: 11.

BPXTF010E  FILESYSTEM IS FULL: name

Explanation: The referenced file system has no available space.

In the message text:
BPXTF011I  FILES SYSTEM IS NOW BELOW percent% FULL: name

Explanation: The referenced file system is now below the monitoring threshold level that was established at the
time the file system was mounted.

In the message text:

name
The name of the file system

percent
The percent threshold that has been exceeded

System action: None.
Operator response: None.
System programmer response: None.
Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: Default
Descriptor Code: Default

BPXTF012I  GLOBAL SETTINGS: fsfull(threshold,increment) ea growa em growm

Explanation: This message is in response to a modify command to TFS to change the default fsfull setting, the SMF
setting, or a general query. It indicates the current TFS default for these settings.

In the message text:

threshold
The percent full at which message BPXT009E will be issued.

increment
The change in percent at which message BPXT009E will be updated when above threshold or deleted when below
threshold.

growa
Indicates the default for the number of automatic extends allowed.

| growm
Indicates the default for the number of manual extends allowed after autoextends is exhausted.

System action: None.
Operator response: None.
System programmer response: None.
Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)
BPXTF014I • BPXTF016I

Routing Code: Default
Descriptor Code: Default

BPXTF014I  FILESISTEM EXTENDED ea count em count2

Explanation: This message is in response to a modify command to TFS to change the default fsfull setting, the SMF setting, or a general query. It indicates the current TFS default for these settings.

In the message text:

threshold
The percent full at which message BPXT009E will be issued.

increment
The change in percent at which message BPXT009E will be updated when above threshold or deleted when below threshold.

System action: None.
Operator response: None.
System programmer response: None.
Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: Default
Descriptor Code: Default

BPXTF015I  MANUAL EXTENDS EXCEEDED FOR count2

Explanation: This message is in response to a modify command that requested the referenced file system to extend and no more manual extends are allowed.

In the message text:

name
The name of the file system

System action: None.
Operator response: None.
System programmer response: None.
Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: Default
Descriptor Code: Default

BPXTF016I  BPXTF016I fsname

Explanation:

BPXTF016I  31 or 64 bit: fsmode Free blocks: freeblk
BPXTF016I  Block size: bsize Total blocks: totblk
BPXTF016I  Cache hit: cachehit Cache miss: cachemiss
BPXTF016I  Cast out: castout Copy out: copyout
BPXTF016I  fsfull threshold: thr fsfull increment: inc
BPXTF016I  auto extend: growa manual extend: growm

This message is issued in response to the modify command to TFS for a general query. The message is issued for each mounted file system and provides the current attributes. The message is issued multiple times, each line providing different attributes.
The mounted file system name.

Indicates whether the file system is allocated in 31-bit or 64-bit memory.

The number of free blocks.

The file system block size.

The total number of allocated blocks for this file system.

(For IBM Diagnostic use) cache hits in below the bar storage.

(For IBM Diagnostic use) The number of times that the cache had to be loaded from 64-bit high memory.

(For IBM Diagnostic use) The number of times a non-updated block was discarded from the cache.

(For IBM Diagnostic use) The number of times an updated block was discarded from the cache.

The current fsfull threshold.

The current fsfull increment.

The remaining auto-extends allowed.

The remaining manual-extends allowed. Note that the initial value may be higher than the configured value because the calculated initial value consists of the configured value plus any excess block allocation space.

System action: None.

Operator response: None.

System programmer response: None.

Module: BPXTFS

BPXTF017I INVALID FILESYSTYPE PARAMETER IGNORED AT COLUMN column

Explanation: This message is issued in response to an invalid FILESYSTYPE statement. An invalid TFS parameter was detected in the PARM specification.

In the message text:

Is the column of the start of the invalid parameter in the PARM string.

System action: TFS configuration continues for the specified FILESYSTYPE statement.

Operator response: Review the FILESYSTYPE statement and correct the error. If necessary, stop the TFS PFS using the F OMVS,STOPPFS= system command. Start TFS with the corrected FILESYSTYPE statement using the SETOMVS or SET OMVS system command.
BPXTF018I  FILESYSTEM NOT FOUND

Explanation: This message is issued in response to a modify TFS system command to modify a file system attribute. The specified file system is not active.

System action: The modify command fails.

Operator response: Reissue the modify command with the correct file system name.

System programmer response: None.

Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: Default
Descriptor Code: Default

BPXTF019I  TOTAL EXTENDS WOULD EXCEED MAXIMUM ALLOWED

Explanation: This message is in response to a modify command to change the defaults for a number of automatic or manual extends. The requested number would result in exceeding the maximum default of 500 total extends.

System action: No alteration to number of extends is made.

Operator response: None.

System programmer response: None.

Module: BPXTFS
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: Default
Descriptor Code: Default

BPXTF107I  FILESYSTEM SIZE=size MAX FILE SIZE=size2 FSFULL (threshold,increment) EA=growa EM=growb

Explanation: This message is a hardcopy message in response to a successful TFS mount. In the message text:
- size The size in bytes of the file system.
- size2 The maximum size in bytes allowed for any file.
- threshold The percent full at which message BPXT009E will be issued for the file system indicated in the preceding BPXT006I message.
- growa The initial automatic-extend (ea) value.
- growb The initial manual-extend (em) value. Note that the initial value may be higher than the configured value because the calculated initial value consists of the configured value plus any excess block allocation space.

System action: None.

Operator response: None.

System programmer response: None.

BPXU001I VTAM CHANNEL COMMUNICATIONS FAILED. RETURN CODE = return_code VTAM
RESOURCE NAME = resourcename, FUNCTION = function

Explanation: Unable to establish a connection with the remote partner. An error was reported by VTAM during oeifconfig processing, or during data communications between the local entity and its remote partner. If the error occurred during the oeifconfig processing, the system could not configure or activate the connection to the identified VTAM resource.

In the message text:

return_code
The return code from the VTAM function call. Return codes from either the OSA adapter card or VTAM may be listed here. This field contains the OSA adapter return code if the listed FUNCTION call has the “OSA-” prefix. Otherwise it contains the VTAM return code. For more information about the OSA adapter return code, see [1] Systems OSA-Express Customer’s Guide and Reference. For more information about the VTAM return code, see the chapter “Data Link Control (DLC) Status Codes” in [2] z/OS Communications Server: SNA Messages.

resourcename
The name of the VTAM resource specified on the oeifconfig command.

function
The VTAM function call being processed at the time of the error.

System action: The identified VTAM resource is not activated. The system processing continues.

Operator response: Contact the system programmer.

System programmer response: Do the following:
• Verify that the appropriate VTAM TRLE resource definition has been created for the failing VTAM resource.
• Verify that the CTC channel is online and that the “v net,act,xxx” command has been issued for the CTC channel in use.
• Verify that the remote partner has been correctly configured.
• If the problem is an OSA-2 error, correct the error.

After the condition has been rectified, reissue the oeifconfig shell command to activate the VTAM resource.

Module: BPXUIMPC
Source: z/OS UNIX System Services kernel (BPX)
Routing Code: 2,10
Descriptor Code: 4

BPXU002I VTAM CHANNEL COMMUNICATIONS FAILED. RETRY LIMIT EXCEEDED. VTAM RESOURCE NAME = resourcename, FUNCTION = function

Explanation: A retryable error condition was detected during oeifconfig processing. The error was retried. However, the channel initialization process repetitively failed after a preset number of attempts.

In the message text:

resourcename
The name of the VTAM resource specified on the oeifconfig command.

function
The VTAM function call being processed at the time the error occurred.

System action: The identified VTAM resource is not activated. The system processing continues.

Operator response: Contact the system programmer.

System programmer response: Do the following:
• Verify that the appropriate VTAM TRLE resource definition has been created for the failing VTAM resource.
Verify that the CTC channel is online and that the "v net,act,xxx" command has been issued for the CTC channel in use.

Verify that the remote partner is online and ready.

After the condition has been rectified, issue the oeifconfig shell command to activate the VTAM resource.

**Descriptor Code:** 4

**BPXU003I** AN IP LAYER CONFIGURATION ERROR WAS DETECTED. VTAM RESOURCE NAME = resource_name, REASON CODE = reason_code

**Explanation:** An error was detected during oeifconfig connection process. One or more of the IP layer configuration parameters specified by the remote partner cannot be accepted by the local entity. Note that this message may be asynchronous with the issuance of the oeifconfig command.

In the message text:

- **resource_name**
  The name of the VTAM resource specified on the oeifconfig command.

- **reason_code**
  The z/OS UNIX reason code that identifies the error. For an explanation of the reason code, see [z/OS UNIX System Services Messages and Codes](https://www.ibm.com/support/knowledgecenter/SSEPUU_2.2.0/com.ibm.zos.v2r2.cics.doc/infocns_cics333.htm).

**System action:** The identified VTAM resource is not activated. The system processing continues.

**Operator response:** Contact the system programmer.

**System programmer response:** Correct the problem indicated by the reason code and reissue the oeifconfig command.

BPXW0000I Exec not found
Explanation: The REXX program could not be found.
System action: The REXX program is not run.
User response: Check the format of the REXX program and make sure that you have permission to execute the program. Make sure that you specified the name with letters in the correct case (upper or lower). If you specified a relative name, check that the program can be found with the PATH environment variable used to exec the REXX program.

When an external subroutine or function is called, you may see the IRX0043I (routine not found) message. Make sure that the subroutine name is quoted if it contains lowercase or special characters.

BPXW0001I STORAGE ALLOCATION ERROR
Explanation: The z/OS UNIX REXX preprocessor could not allocate enough storage to process the REXX program.
System action: The REXX program is not run.
System programmer response: Ensure that the region size is sufficient for your application.
User response: Check whether the program is looping on a call to an external function or subroutine. Contact your system programmer.

BPXW0002I Unable to read exec
Explanation: The REXX program could not be read. The usual cause for this is that an I/O error occurred on the read operation.
System action: The REXX program is not run.
User response: Ensure that the entire file can be read.

BPXW0003I Improper text file
Explanation: The REXX program is not a compiled exec and contains a line that is not terminated by a <newline> character.
System action: The REXX program is not run.
User response: Check the format of the REXX program. Make sure each line is terminated by a <newline> character.

BPXW0004I Parameter string too long
Explanation: The parameter passed to a REXX program exceeds 4096 characters. This is most likely to occur when you run a REXX program under a shell, using shell wildcards to pass a long file list or passing the output of another command as the parameter.
System action: The REXX program is not run.
User response: Run the REXX program with fewer parameters.

BPXW0005I First argument must be a REXX program name
Explanation: A program was not specified in the first argument.
System action: The REXX program is not run.
User response: Specify the program name as the first argument.

BPXW0006I Parameter arg 0 must match the name of the program you intended to run
Explanation: The program name specified in parameter arg 0 does not match the name of the program you intended to run.
System action: The REXX program is not run.
BPXW9000I • BPXW9007I

<table>
<thead>
<tr>
<th>User response:</th>
<th>Correct the program name in parameter arg 0.</th>
</tr>
</thead>
</table>

BPXW9000I  Wrong number of arguments
Explanation: You specified the wrong number of arguments.
System action: The REXX function fails.
User response: Specify the correct number of arguments.

BPXW9001I  Error allocating result block
Explanation: An error occurred during allocation of a result block. The most common reason for this is an insufficient region size.
System action: The stream function fails.
User response: Increase the region size.

BPXW9002I  DD names not currently supported
Explanation: The stream name begins with DD: and was assumed to be a ddname. ddnames are not supported.
System action: The stream function fails.
User response: Use a different naming convention.

BPXW9003I  Too many arguments
Explanation: You specified too many arguments on a REXX function.
System action: The REXX function fails.
User response: Use the correct number of arguments.

BPXW9004I  Invalid stream name
Explanation: You specified an invalid stream name on the stream function.
System action: The stream function fails.
User response: Use a valid stream name.

BPXW9005I  Invalid start parameter
Explanation: You specified an invalid start parameter on the stream function.
System action: The stream function fails.
User response: Use a valid start parameter.

BPXW9006I  lseek error
Explanation: There was an lseek error. Stream positioning arguments can only be used on a persistent stream.
System action: The stream function fails.
User response: Correct the arguments on the stream function.

BPXW9007I  Invalid I/O length
Explanation: You specified an invalid I/O length on the stream function.
System action: The stream function fails.
User response: Correct the I/O length.
BPXW9008I  read error
Explanation: The system encountered an I/O error while trying to read the stream.
System action: The stream function fails.
User response: Use the stream() function with the D operation on the stream name that failed to obtain detailed error information.

BPXW9009I  write error
Explanation: The system encountered an I/O error while trying to open the stream for write.
System action: The stream function fails.
User response: Use the stream() function with the D operation on the stream name that failed to obtain detailed error information.

BPXW9010I  Invalid line number parameter
Explanation: You specified an invalid line number parameter on the stream function.
System action: The stream function fails.
User response: Correct the line number parameter.

BPXW9011I  Invalid line count parameter
Explanation: You specified an invalid line count parameter on the stream function.
System action: The stream function fails.
User response: Correct the line count parameter.

BPXW9012I  I/O error
Explanation: The system encountered an I/O error while trying to open the stream for read or write.
System action: The stream() function fails.
User response: Use the stream() function with the D operation on the stream name that failed to obtain detailed error information.

BPXW9013I  Invalid command argument
Explanation: You specified an invalid command argument on a REXX function.
System action: The REXX function fails.
User response: Use a valid command argument.

BPXW9014I  Invalid stream command
Explanation: You specified an invalid stream command.
System action: The stream() function fails.
User response: Use a valid stream() command.

BPXW9015I  Unknown stream action argument
Explanation: You specified an unknown stream action argument. The valid arguments are D, S, and C.
System action: The stream() function fails.
User response: Correct the stream action argument.
BPXW9016I Internal error
Explanation: An internal error occurred.
System action: The REXX function fails.
User response: Search problem reporting databases for a fix for the problem. If no fix exists, contact the IBM Support Center.

BPXW9017I Unable to create stream for read
Explanation: The system was unable to create a stream for read. Messages previously issued, such as BPXW9018I, provide details about the error.
System action: The particular stream operation fails.
User response: Use the information provided in the previously issued message to correct any errors.

BPXW9018I open error: d(X) X
Explanation: Open error d(X) X occurred. In the message text:
• d is the error number, in decimal.
• The first X is the error number, in hexadecimal.
• The second X is the reason code.
System action: The stream() function fails.
User response: Use the information provided in the message text to correct the error.

BPXW9019I Missing file name
Explanation: You did not specify a file name. The exists() function requires a file name.
System action: The exists() function fails.
User response: Specify the required file name.

BPXW9020I ioctl error: d(X) X
Explanation: An ioctl error d(X) X occurred. In the message text:
• d is the error number, in decimal.
• The first X is the error number, in hexadecimal.
• The second X is the reason code.
System action: The getpass() function fails.
User response: Use the information provided in the message text to correct the error.

BPXW9021I Invalid position argument
Explanation: You specified an invalid position argument on the stream function.
System action: The stream() function fails.
User response: Use a valid position argument.

BPXW9022I lseek error ignored
Explanation: An lseek error occurred on the stream function with the readpos or writepos command, and was ignored.
System action: Either nothing was done, or the position was set to the beginning of the file.
User response: Use readpos and writepos with persistent streams only.
BPXW9023I  Pipe create failed
Explanation: An internal error occurred. The most likely reason for this error is that the user has too many files open.
System action: The popen command on the stream function fails, or ADDRESS TSO fails while attempting to set up the TSO co-process.
User response: Check to see whether there are too many files open.

BPXW9024I  Wrong use for open type
Explanation: You used the open-type argument incorrectly on the stream function. open-type cannot be changed on explicitly opened streams.
System action: The stream() function fails.
User response: Do not change the open-type on explicitly opened streams.

BPXW9025I  Invalid OPEN argument
Explanation: The open argument you specified on the stream() function is not valid.
System action: The stream() function fails.
User response: Use a valid open argument.

BPXW9026I  Missing argument
Explanation: The REXX function contains a missing argument.
System action: The REXX function fails.
User response: Specify the missing argument.

BPXW9027I  Missing octal digits
Explanation: You specified the mode argument incorrectly. Permission bits must be specified in octal digits (0–7).
System action: The REXX function fails.
User response: Correct the mode argument.

BPXW9028I  Invalid argument
Explanation: You specified an argument that is not valid.
System action: The REXX function fails.
User response: Correct the argument.

BPXW9030I  Insufficient storage
Explanation: There was insufficient region size to read a full line. The most likely reason for this is that the file is not a text file. The linein() function can be used only on text files.
System action: The linein() function fails.
User response: Make sure that the file to be read is a text file. If appropriate, increase the region size.

BPXW9031I  Argument must be in the form mmddyyyyhhmmss
Explanation: You specified the timestamp argument on the convd2e() function incorrectly.
System action: The convd2e() function fails.
User response: Correct the timestamp argument.
BPXW9032I  Year must be between 1970 and 2037
Explanation: You specified the year in the timestamp argument incorrectly.
System action: The convd2e() function fails.
User response: Correct the timestamp argument.

BPXW9040I  Invalid option
Explanation: You specified an option on the rexxopt() function that is not valid.
System action: The rexxopt() function fails.
User response: Correct the invalid option.

BPXW9041I  Missing arguments
Explanation: You did not specify required arguments for the bpxwunix() function.
System action: The bpxwunix() function fails.
User response: Specify the required arguments.

BPXW9043I  Invalid argument length
Explanation: You specified an argument on the outtrap() function that has an incorrect length. The maximum length of the first argument is 254 characters.
System action: The outtrap() function fails.
User response: Correct the argument length.

BPXW9044I  spawn for BPXWRTSO failed
Explanation: You may not have execute access to /bin/bpxwrtso. This is probably an install error, or the user could have too many processes.
System action: ADDRESS TSO fails.
User response: Contact the system programmer.

BPXW9045I  Invalid continue from BPXWRTSO
Explanation: You may have killed the bpxwrtso process, or it may have failed.
System action: ADDRESS TSO fails.
User response: Contact the system programmer.

BPXW9046I  Unable to send command to TSO process
Explanation: You may have killed the bpxwrtso process, or it may have failed.
System action: ADDRESS TSO fails.
User response: Contact the system programmer.

BPXW9047I  select error
Explanation: There was an error in processing input to or output from a TSO command. It is possible that the user closed a file descriptor that ADDRESS TSO was using to communicate with bpxwrtso.
System action: None.
User response: Check to see if a file descriptor that ADDRESS TSO was using to communicate with bpxwrtso was closed. If not, contact the system programmer.
BPXW9048I Stream command argument is missing
Explanation: You used the stream() function with the C operation. The C operation requires a command, but you did not specify one.
System action: The stream() function fails.
User response: Specify the command argument.

BPXW9049I Missing stream name
Explanation: The stream() function requires a stream name. The stream name is missing.
System action: The stream() function fails.
User response: Specify a stream name.

BPXW9050I Token not supported on OPEN
Explanation: You specified a token for the file name on open. Tokens are not supported; a pathname is required.
System action: The stream() function fails.
User response: Specify a pathname for the file.

BPXW9051I Stream not open for read
Explanation: The stream you specified is not open for read (it is open for write).
System action: The stream() function fails.
User response: Correct the stream command.

BPXW9054I Unable to create stream for write
Explanation: The system was unable to create a stream for write. Messages previously issued, such as BPXW9018I, provide details about the error.
System action: The particular stream operation fails.
User response: Use the information provided in the previously issued message to correct any errors.

BPXW9055I Stream not open for write
Explanation: The stream you specified is not open for write (it is open for read).
System action: The stream() function fails.
User response: Correct the stream command.

BPXW9090I Select an immediate command by number: 1 Continue 2 Halt interpretation 3 Start trace 4 End trace 5 Halt type 6 Resume type
Explanation: In response to an interrupt signal, the REXX interrupt handler has suspended execution of the REXX program and is prompting for an immediate command.
System action: The execution of the REXX program is suspended.
User response: Select an immediate command by number.
BPXW9091I  Interrupt ignored for setuid/setgid

Explanation:  REXX programs that are run as setuid or setgid programs cannot be interrupted to issue an immediate command.
System action:  The interrupt is ignored and REXX program continues running.
User response:  None.

BPXW9092I  Command+parms length > 32763 not supported

Explanation:  The Address TSO function does not support the total length of TSO command and command parameter beyond the stated value.
System action:  The Address TSO function stops and returns to the caller program.
User response:  Change the length of TSO command and command parameter to be 32763 characters or less.

BPXWM000  INCORRECT PATHNAME

Explanation:  An incorrect pathname was specified.
System action:  Processing is halted.
System programmer response:  None.
User response:  Reenter the request, supplying the correct pathname.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM001  UNABLE TO CONNECT TO OMVS. ERRNO=varsub var=eno varsub var=rsn. THE ONLY SERVICE AVAILABLE IS "MAKE A FILE SYSTEM". PRESS ENTER TO CONTINUE.

Explanation:  The system could not connect to z/OS UNIX System Services. The only available service is Make a File System. Press ENTER to continue.
In the message text:
varsub var=eno
  The error number.
varsub var=rsn
  The reason code.
System action:  Processing is halted.
User response:  See z/OS UNIX System Services Messages and Codes for detailed information on the error number and reason code.

Descriptor Code:  

BPXWM002  INCORRECT COMMAND

Explanation:  The command entered was not a valid command.
System action:  Processing is halted.
Operator response:  None.
User response:  Correct the input by entering a valid command.
Module:  BPXWISH
BPXWM003 ERRNO=varsub var=eno varsub var=rsn. PRESS ENTER TO CONTINUE.

Explanation: In the message text:

varsub var=eno
  The error number.

varsub var=rsn
  The reason code.

System action: Processing is halted.

User response: See z/OS UNIX System Services Messages and Codes for detailed information on the error number and reason code.

Module: BPXWISH

Source: z/OS UNIX System Services kernel (BPX)

BPXWM004 PRINTED TO THE ISPF LIST DATA SET.

Explanation: The print operation completed and the output was sent to the ISPF list data set.

System action: The request completed successfully.

User response: None.

Module: BPXWISH

Source: z/OS UNIX System Services kernel (BPX)

BPXWM005 (NO ERROR TEXT) REASON=errno

Explanation: It was not possible to convert the errno into an explanation.

In the message text:

errno

System action: Processing returns to the requester.

User response: See z/OS UNIX System Services Messages and Codes for an explanation of the reason code.

Module: BPXWISH

Source: z/OS UNIX System Services kernel (BPX)

BPXWM006 UNABLE TO SET UP USER varsub var=user. PLEASE MAKE SURE THE GROUP HAS BEEN SET UP AND THE USER HAS BEEN DEFINED.

Explanation: The requested user/group has not been created in the z/OS UNIX System Services configuration.

In the message text:

varsub var=user
  The user/group name that is not recognized by z/OS UNIX System Services.

System action: Processing is halted for the user/group.

System programmer response: Investigate why the user/group cannot be created. You may need to contact your system administrator.

Module: BPXWISH

**BPXWM010** SETTING UP GROUP vars ub var= grname WITH GID= vars ub var= gid

**Explanation:** The group ID is being created.

In the message text:

- **vars ub var= grname**  
  the groupname for the group.

- **vars ub var= gid**  
  The group ID for the group.

**System action:** This is an informational message indicating that the request is being successfully handled.

**User response:** None

**Module:** BPXWISH
BPXWM011  varsub var=cmd
Explanation: This is an echo of the command being run.
In the message text:
  varsub var=cmd
  The command being run.
System action: Processing will be returned to the requester when completed.
User response: None.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM012 DATA SET NOT FOUND
Explanation: The requested data set was not found.
System action: Processing is returned to the requester.
User response: Verify that the proper name was specified for the data set.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM013 FILE SYSTEM ALREADY EXISTS
Explanation: The file system specified already exists.
System action: Processing of this request is terminated and control is returned to the requester.
User response: Verify that the correct name was specified on the command.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM014 ALLOCATION FOR FILE SYSTEM FAILED
Explanation: The allocation for the requested file system failed.
System action: Processing of this request terminates.
User response: Check for accompanying error messages that can explain the reason for the allocation failure and correct the values that are causing the error.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM015 UNABLE TO EXECUTE varsub var=pgmname
Explanation: An error was detected when attempting to execute the pathname specified.
System action: Processing of the request terminates.
User response: Determine the reason for the failure and correct it.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)
BPXWM016  •  BPXWM021

BPXWM016  NOTHING FOUND
Explanation:  The search found no matches.
System action:  Processing returns to the requester.
User response:  Correct the input supplied, if needed.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM017  UNABLE TO ACCESS varsub var=msgpath FOR READ
Explanation:  An error was detected when attempting to read from the pathname specified.
System action:  Control is returned to the requester.
User response:  Verify the reason for the access failure. If this access is required, consult with your system
administrator to have the access granted.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM018  FILES ARE IDENTICAL
Explanation:  The two files are identical.
System action:  Processing returns to the requester.
User response:  None
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM019  MISSING ARGUMENT
Explanation:  An argument is missing from the request.
System action:  Control returns to the requester.
User response:  Add the missing argument and retry the request.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM020  TIME LIMIT EXCEEDED
Explanation:  The requested wait time has expired.
System action:  Control is returned to the requester.
User response:  Verify that the request should have completed in the time allotted. If not, consider increasing the
time specified.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM021  EXIT STATUS varsub var=code
Explanation:  The request completed with the specified code.
varsub var=code
The completion code.
System action:  Control is returned to the requester.
User response: If the code is something other than what was requested, determine the cause of the error and correct it. Then reissue the request.

Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM022 ENDED BY SIGNAL varsub var=code
Explanation: The request was interrupted by the signal specified.
System action: Control is returned to the requester.
User response: If this was an unexpected signal, attempt to determine the source of the signal.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM023 STOP SIGNAL varsub var=code
Explanation: The request was stopped by the signal specified.
System action: Control is returned to the requester.
User response: If the signal was unexpected, determine the cause of it and correct the situation.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM024 SOME CHOICES (*) REQUIRE SUPERUSER OR THE 'SPECIAL' ATTRIBUTE FOR FULL FUNCTION, OR BOTH
Explanation: The request that was made requires authority that the requester does not have.
System action: Control returns to the requester.
User response: If the request was validly made, contact your system administrator to have your authority modified.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM025 UNABLE TO ACCESS varsub var=msgpath FOR WRITE
Explanation: The request to write to the pathname specified resulted in an error due to the permissions on part of the pathname.
In the message text:
varsub var=msgpath
The message path specified.
System action: Processing of the request is terminated. Control is returned to the requester.
User response: Attempt to determine which part of the pathname is causing the access failure. If required, contact your system administrator to have the access granted.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM026 TRAILING BLANKS IN DIRECTORY NAMES OR FILENAMES ARE NOT SUPPORTED BY EDIT OR BROWSE
Explanation: During processing of the request, it was found that there were blanks at the end of the name. This is not supported.
System action: The request is terminated.
BPXWM027 • BPXWM031

User response:  Reenter the request without the trailing blanks.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM027  ENTER S TO STOP, ANYTHING ELSE TO CONTINUE
Explanation:  The requester has an opportunity to terminate processing of his request.
System action:  The system waits for a response.
User response:  If you want to stop processing, enter 'S'. If you want to continue processing, enter anything else.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM028  NO MEMBERS WERE SELECTED
Explanation:  No selection was made before 'Enter' was pressed. There is nothing to process.
System action:  Control is returned to the requester.
User response:  If selections were intended to be made, mark them and then press 'Enter'.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM029  DIFFERENCES WERE FOUND
Explanation:  The compare operation found differences between the compared parts.
System action:  Control is returned to the requester.
User response:  Note the differences and handle accordingly.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM030  STRINGS WERE FOUND
Explanation:  During a search operation, the value specified was found.
System action:  Control is returned to the requester.
User response:  Scan through the matching strings to find what you are looking for.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)

BPXWM031  FILE IS NOT A TEXT FILE
Explanation:  The specified file is not a text file. The requested operation requires a text file.
System action:  Processing is terminated and control is returned to the requester.
User response:  Verify that the proper file was specified.
Module:  BPXWISH
Source:  z/OS UNIX System Services kernel (BPX)
BPXWM032  NO FILES WERE COPIED
Explanation: This is an information message to indicate that no copy was done as a result of the request that was made.
System action: Control is returned to the requester.
User response: If a copy was expected, determine why it was not done.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM033  FILES NOT SELECTED
Explanation: No files were selected for the requested operation.
System action: Control is returned to the requester.
User response: Select the files that you would like to have the operation performed on.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM034  DUPLICATE ENTRY IGNORED
Explanation: This is a warning message to indicate that duplicate entries have been found.
System action: Control returns to the requester.
User response: If there were not supposed to be duplicate entries, verify your input.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM035  UNDEFINED UID OR GID
Explanation: The UID or GID specified is undefined.
System action: Processing of the request is terminated. Control returns to the requester.
User response: Verify that the proper UID or GID is specified.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM036  FILE HAS NO ACL
Explanation: The specified file has no Access Control List (ACL).
System action: Control is returned to the requester.
User response: Verify the request that was made. If necessary, contact your system administrator to have an ACL added to the file.
Module: BPXWISH
Source: z/OS UNIX System Services kernel (BPX)

BPXWM037  THIS SERVICE DOES NOT SUPPORT PATHNAMES CONTAINING {}
Explanation: Braces ({}), are not supported by this service.
System action: Control is returned to the requester.
User response: Verify that the braces are appropriate for this service.
Module: BPXWISH
BPXWM999

Source: z/OS UNIX System Services kernel (BPX)

Explanation: This is an informational message showing the copyright information for this product. It is issued when the shell is first entered.

System action: Control is returned to the requester.

User response: None

Module: BPXWISH

Source: z/OS UNIX System Services kernel (BPX)
Chapter 13. BPXH messages

BPXH002E There are inconsistent sysplex parameters. In BPXPRMxx, SYSPLEX(NO) is being used, but the originator specified SYSPLEX for the parameter of check USS_FILESYS_CONFIG in HZSPRMxx.

Explanation: The check parameter is not consistent with the BPXPRMxx sysplex value for this system. If the message indicates the parameter for the check was specified by the owner, the parameter is the default.

In the message text:

originator Can be user or owner.

user The parameter obtained by the user.

owner The parameter is the default.

System action: The system continues processing.

Operator response: Report this to your system programmer.

System programmer response: Ensure that the parameter for check USS_FILESYS_CONFIG is consistent with that of the corresponding SYSPLEX parameter in BPXPRMxx. For example, if BPXPRMxx specifies SYSPLEX(NO), the check should not use SYSPLEX. Either change BPXPRMxx to SYSPLEX(YES) or change the check parameter to NOPLEX.

Problem determination: Not applicable

Module: BPXHCFI1

Source: z/OS UNIX System Services

Reference Documentation: See z/OS MVS Initialization and Tuning Reference and z/OS UNIX System Services Planning for information about specification of the BPXPRMxx parameter. Also, refer to IBM Health Checker for z/OS User’s Guide for information about this check and its parameters.

BPXH011E  There are inconsistent sysplex parameters. In BPXPRMxx, SYSPLEX(YES) is being used, but the parameter specified NOPLEX for the parameter of check check_name in HZSPRMxx. IBM SUGGESTION: NOPLEX reflects a single system image without file system sharing. The HZSPRMxx parameter for this check should be consistent with the BPXPRMxx SYSPLEX parameter.
Explanation:  The HZSPRMxx parameter for this check is not consistent with the BPXPRMxx sysplex value for this system.
System action:  The system continues processing.
Operator response:  Report this problem to the system programmer.
System programmer response:  Ensure that the HZSPRMxx parameter specification for check_name is consistent with what is reflected in BPXPRMxx and with how you intend that this system is configured.
Problem determination:  Not applicable
Module:  BPXHCFI1
Source:  z/OS UNIX System Services
BPXH012E • BPXH014E

Reference Documentation: See z/OS MVS Initialization and Tuning Reference and z/OS UNIX System Services Planning for information about specification of the BPXPRMxx parameter. Also, refer to IBM Health Checker for z/OS User's Guide for information about this check and its parameters.

Automation: Not applicable
Routing Code: Not applicable
Descriptor Code: Not applicable

BPXH012E File system file system is designated as AUTOMOVE, but the parent file system has an automove configuration error.

Explanation: File system file system will not be accessible if it is moved to a new system, in the event of a system failure. The parent file system, parent filesys, has a previously reported automove error.

System action: The system continues processing.
Operator response: Report this problem to the system programmer.
System programmer response: Correct the error that was reported for parent file system, parent filesys, and rerun the check.
Problem determination: Not applicable
Module: BPXHCF3
Source: z/OS UNIX System Services

Reference Documentation: See z/OS UNIX System Services Planning for considerations about specifying automove for file systems.
Automation: Not applicable
Routing Code: Not applicable
Descriptor Code: Not applicable

BPXH013E Service service failed with return code rc and reason code rsn while performing check check_name.

Explanation: This is an internal error. The check cannot continue.

System action: The system continues processing.
Operator response: Report this problem to the system programmer.
System programmer response: Refer to the services documentation.
Problem determination: Not applicable
Module: BPXHCF2,BPXHCF4
Source: z/OS UNIX System Services

Reference Documentation: See z/OS UNIX System Services Messages and Codes and z/OS UNIX System Services Programming: Assembler Callable Services Reference.
Automation: Not applicable
Routing Code: Not applicable
Descriptor Code: Not applicable

BPXH014E The version file system file system is mounted read-write, but it should be mounted read-only.

Explanation: The version file system, in path path, is mounted read-write. The version file system, file system should be mounted read-only for better performance. Mounting read-write can result in poor performance for SYSPLEX operations because file system I/O must be directed between system images in a sysplex.

System action: The system continues processing.
Operator response: Report this problem to the system programmer.
System programmer response: IBM SUGGESTION: Perform all the post-installation actions for mounting the version file system in read-only mode. Then, follow the steps for updating BPXPRMxx to mount the version file system in read-only mode.

Note that the mount mode is changed without warning. A change from read-write to read-only will cause failures in processes that are writing to the file system.

Problem determination: Not applicable
Module: BPXHCFL3
Source: z/OS UNIX System Services
Reference Documentation: See z/OS UNIX System Services Planning for the detailed post-installation steps for changing how the version file system is mounted.
Automation: Not applicable
Routing Code: Not applicable
Descriptor Code: Not applicable

BPXH015E  File system file system is designated as automove_setting, but it should be designated as AUTOMOVE.

Explanation: File system file system in path path should be designated as AUTOMOVE in a sysplex environment. AUTOMOVE specifies that ownership of the file system is automatically moved to another system in the event of a system failure. It is the default. If a failure occurred on the owning system this file will not be moved and would become unavailable. In the message:

automove-setting

NOAUTOMOVE or UNMOUNT.

System action: The system continues processing.
Operator response: Report this problem to the system programmer.
System programmer response: IBM SUGGESTION: file system should be changed to AUTOMOVE in BPXPRMxx. See z/OS UNIX System Services Planning for additional information on customizing BPXPRMxx for shared file systems.
Problem determination: Not applicable
Module: BPXHCFL2,BPXHCFL3
Source: z/OS UNIX System Services
Reference Documentation: See z/OS UNIX System Services Planning for information about configuring a shared file system in a sysplex.
Automation: Not applicable

BPXH024E  The user ID associated with hzsproc is not authorized to file system file system. This report is incomplete.

Explanation:  The Pathname for File System file system cannot be accessed, because hzsproc does not have permission to access it.

System action:  The system continues processing.

Operator response:  Report this problem to the system programmer.

System programmer response:  Verify the user ID associated with the hzsproc has permission to all directories to run the check_name check.

IBM SUGGESTION:  hzsproc should have permission to all directories to complete this report.

Problem determination:  Not applicable

Module:  BPXHCFL3

Source:  z/OS UNIX System Services

Reference Documentation:  For additional information on providing permission to traverse directories see APAR II12593. Also, see z/OS UNIX System Services Planning for additional information on defining z/OS UNIX users to RACF.
BPXH025E • BPXH028E

Automation: Not applicable
Routing Code: Not applicable
Descriptor Code: Not applicable

BPXH025E  File system file system does not support multilevel security. Unpredictable results will occur.

Explanation: file system must be ZFS. ZFS file systems are the only physical file system with support for security labels in a multilevel security environment. Running a multilevel security environment in a mixed sysplex (with systems below z/OS V1R5) will have unpredictable results.

System action: The system continues processing.

Operator response: Report this problem to the system programmer.

System programmer response: IBM SUGGESTION: Limited support allows you to support HFS file systems in this environment; however, this capability is limited to read-only access. When running in a multilevel security environment, use the zFS file system if write access is required.

Problem determination: Not applicable

Automation: Not applicable
Routing Code: Not applicable
Descriptor Code: Not applicable
BPXH040E One or more differences were found between the system settings and the settings in the current BPXPRMxx parmlib members.

Explanation: Check USS_PARMLIB detected changes made to either the system settings or to the BPXPRMxx parmlib members.

System action: The system continues processing.

Operator response: Report this problem to the system programmer.

System programmer response: View the message buffer for information about what values have changed. Use the DISPLAY OMVS,OPTIONS command to view what the current system settings are. The system values can be dynamically changed by using the SETOMVS command. If the current system values are desired, create a permanent definition so the values will be available the next time z/OS UNIX System Services is initialized. To create a permanent definition, edit the BPXPRMxx parmlib members to include the desired values.

Problem determination: See BPXH041I in the message buffer.

For differences on file systems, if the path is not found for the BPXPRMxx value and only the final component is displayed for the system value, the mount point of the file system might not be accessible. This situation can happen if the mount point has been covered up by a subsequent mount, if a directory in the path of the mount point is part of an unowned file system, or for other reasons that can affect accessibility. Check the mount point of the mounted file system to determine why it has become inaccessible.

Module: BPXTHPRM

Check USS_PARMLIB found differences between the system settings and the BPXPRMxx parmlib members. See the message BPXH040E following this one in the message buffer.

In the message text:

opt
   The system option where a difference was found.
parmlibval
   The value found in the BPXPRMxx parmlib members.
sysval
   The current system setting.
pfs
   The name of a physical file system that is currently running but is not specified in the BPXPRMxx parmlib members.
authpgmlist
   The value found for the AUTHPGMLIST option.
stepliblist
   The value found for the STEPLIBLIST option.
UserIdAliasTable
   The value found for the USERIDALIAS option.
pgval
The PRIORITYGOAL value.

ppgval
The PRIORITYPG value.

filesystem
The name of the file system where a change was detected.

mountpoint
The name of the mount point where the file system is mounted.

automovesetting
The automove setting for the file system.

mode
The access mode for the file system.

The following file systems are not active:

- filesystem
  Parmlib Member: parmlib
  Path: mountpoint
  Return Code: retcode
  Reason Code: rsncode

- filesystem
  Parmlib Member: parmlib
  Path: mountpoint
  Return Code: retcode
  Reason Code: rsncode

Explanation: The USS_PARMLIB_MOUNTS check detected file systems that failed to mount during initialization. Look for message BPXH061E following this one in the message buffer.

In the message text:

- filesystem
  The name of the file system that failed to mount.
- parmlib
  The BPXPRMxx parmlib member with the failing MOUNT.
- mountpoint
  The name of the mount point where the file system is mounted.
- retcode
  The failing return code.
- rsncode
  The failing reason code.

System action: The system continues processing.

Operator response: Not applicable

System programmer response: Take appropriate action depending on the return and reason code.

Problem determination: See BPXH061E.

Module: BPXHCFL4

Source: z/OS UNIX System Services

Reference Documentation: See BPXH061E.

Automation: Not applicable

Routing Code: Not applicable

Descriptor Code: Not applicable

One or more file systems specified in the BPXPRMxx parmlib members are not mounted.

Explanation: During the USS_PARMLIB_MOUNTS check, one or more file systems that were specified in the BPXPRMxx parmlib members used for initialization were found not to be active.

System action: The system continues processing.

Operator response: Report this problem to the system programmer.

System programmer response: Review the return code and reason code in the summary message and determine why the file systems are not active. Correct the problem using documented procedures. After the problem has been corrected, mount each file system using one of the following procedures:

Ask a superuser to enter the corrected information using the TSO/E MOUNT command or the mount shell command. If the statement in error was the ROOT statement, specify '/' as the mount point.
Alternatively, the SET OMVS=(xx) system command can be issued, where "xx" is the last two characters of a BPXPRMxx parmlib member that contains the MOUNT statement(s) to re-process.

**Problem determination:** See BPXH059I in the message buffer.

**Module:** BPXHCFL4

**Descriptor Code:** Not applicable

---

**Explanation:** The USS_CLIENT_MOUNTS check detected file systems that are accessed via a remote owner. Look for message BPXH065E following this one in the message buffer.

In the message text:

- `filesystem`
  - The name of the file system that is not mounted locally.

- `mountmode`
  - The mode in which the file system is mounted.

- `PFStype`
  - The physical file system the mounted file system belongs to.

**System action:** The system continues processing.

**Operator response:** Not applicable

---

BPXH065E  One or more file systems that should be locally mounted are available through a remote system.

Explanation: The USS_CLIENT_MOUNTS check found one or more file systems that should be locally mounted. This condition occurs in a shared file system configuration. The file system was intended to be mounted locally but either the local or the owning physical file system has become inactive. The file system is made available through a remote mount on the owning system.

System action: The file system is available through the remote system for processing.

Operator response: Report this problem to the system programmer.

System programmer response: The file system should be accessible through a local mount. Determine why it is not and correct the situation. The original mount of the file system may have failed because the file system is not accessible from the local system. The file system may have been correctly mounted and subsequently converted to a remote mount if the physical file system is no longer active.

If the physical file system is TYPE(NFS), make sure that TCPIP is operational on this system.

Otherwise, it may be necessary to unmount the file system and then mount it again.

Problem determination: See BPXH063I in the message buffer.

Module: BPXHCFL4

**BPXH071E**  
The z/OS UNIX System Services kernel usage of autodata cellpool cells has exceeded the check threshold of `stacksthresholdpct`%. Currently `stacksused` of the maximum `stacksmax` (`stacksusedpct`%) cells are in use.

Explanation: CHECK(IBMUSS,USS_KERNEL_STACKS_THRESHOLD) detected that the percent of kernel autodata stack cell pool cells in use has exceeded the current check threshold.

In the message text:

`stacksthresholdpct`  
The check reporting threshold value specified in percent. The USS_KERNEL_STACK_THRESHOLD check will only issue messages when the percentage of stacks in use exceeds this threshold. The IBM default value is 85%.

The IBM default threshold percentage value can be overridden. For more information, see the USS_KERNEL_STACKS_THRESHOLD check in [IBM Health Checker for z/OS User's Guide](https://www.ibm.com/docs/en/ibm-health-checker-for-zos)

`stacksused`  
The number of kernel autodata stack cell pool cells that are currently in use by the system.

`mountpoint`  
The name of the mount point where the file system is mounted.

`stacksmax`  
The maximum number of kernel autodata stack cellpool cells that can be allocated on the system. The value is determined at IPL time and is based on the amount of kernel private storage available. Once the value is determined it is fixed for the duration of the IPL.

`stacksusedpct`  
The percentage of kernel autodata stack cellpool cells currently in use by the system.

System action: The system continues processing.

Operator response: Report the stack cell usage to the system programmer.
**BPXH072E**

**System programmer response:** Consider quiescing noncritical UNIX workloads to make more kernel stack cells available to prevent a shortage that could impact critical workloads. If the system runs out of stack cells some z/OS UNIX system calls will not be available until cells are available.

Use the DISPLAY OMVS, STORAGE command to determine which processes are using the largest number of stack cells and are the best candidates to be quiesced.

**Problem determination:** Not applicable

**Module:** BPXHCFL4

**Source:** z/OS UNIX System Services

**Reference Documentation:**
- For information about using the DISPLAY OMVS, STORAGE command, see [z/OS MVS System Commands](#).

**Automation:** Not applicable

**Routing Code:** Not applicable

**Descriptor Code:** Not applicable

---

**BPXH072E** The z/OS UNIX System Services kernel usage of monitored below the bar private storage has exceeded the check threshold of thresholdpvtstgpcnt%. Currently allocpvtstg of maxpvtstg bytes (allocpvtstgpcnt%) of monitored private storage has been allocated.

**Explanation:** The USS_KERNEL_PVTSTG_THRESHOLD check determined that the percent of total allocated kernel private storage has exceeded the current check threshold.

If z/OS UNIX is configured using the KERNELSTACKS(BELOW) option, then monitored private storage is considered to be all private storage below the bar that has not been allocated for stack pool cells. During initialization, the kernel designates 80% of the region as the maximum storage that can be allocated for stack cell pool cells and the remaining 20% as the maximum private storage. If the allocated non-stack cell private storage exceeds 20% and overflows into the 80% designated for stack cells it will reduce the maximum number of stack cells that can be allocated. The percent of monitored storage allocated can exceed 100% if it exceeds the 20% designated during kernel initialization and overflows into the 80% designated for stack cells.

If z/OS UNIX is configured using the KERNELSTACKS(ABOVE) option, then monitored private storage is considered to be all below the bar private storage.

In the message text:

- **allocpvtstg**
  - The number of bytes of monitored private storage below the bar that has been allocated in the z/OS UNIX System Services kernel address space.

- **allocpvtstgpcnt**
  - If z/OS UNIX is configured using the KERNELSTACKS(BELOW) option, the percentage of monitored (non-stack) kernel storage that has been allocated. If the percentage exceeds 100%, it is not considered an error but will reduce the maximum number of stack cells that can be allocated and reduce the kernel thread capacity.
  - If z/OS UNIX is configured using the KERNELSTACKS(ABOVE) option, this is the percentage of kernel private storage that has been allocated (allocpvtstg/maxpvtstg).

- **maxpvtstg**
  - If z/OS UNIX is configured using the KERNELSTACKS(BELOW) option, this is the maximum number of bytes of below the bar private storage that can be allocated without overflowing into the storage designated for stack cells at kernel initialization. Overflowing into the stack cell designated area will reduce the maximum number of stack cells that can be allocated and will reduce the kernel thread capacity. This value is approximately 20% of the kernel region size.
  - If z/OS UNIX is configured using the KERNELSTACKS(ABOVE) option, this is the total number of bytes of below the bar private storage that can be allocated.

- **thresholdpvtstgpcnt**
  - The current setting of the monitored private storage usage threshold. The USS_KERNEL_PVTSTG_THRESHOLD check will only issue this message when the percent of allocated storage exceeded this value. The IBM default threshold is 85%.
The IBM default threshold percentage value can be overridden. For more information, see the USS_KERNEL_PVTSTG_THRESHOLD check in IBM Health Checker for z/OS User’s Guide.

**System action:** The system continues processing.

**Operator response:** Report the problem to the system programmer.

**System programmer response:** Continue monitoring private storage usage in the kernel address space using the DISPLAY OMVS,STORAGE command. If the amount of allocated kernel private storage continues to increase consider reducing non-critical UNIX workloads to prevent disruption of critical UNIX workloads. If reducing the system’s UNIX workload does not decrease the amount of allocated kernel private storage contact IBM Support.

Use the DISPLAY OMVS command to determine the system’s current UNIX workload. Quiescing processes with large number of threads will provide the most relief for kernel private storage shortages.

**Problem determination:** Not applicable

**Module:** BPXHCF4

**Source:** z/OS UNIX System Services

**Reference Documentation:**
- For information about using the DISPLAY OMVS command, see [z/OS MVS System Commands](https://www.ibm.com).
BPXH074I The check threshold of z/OS UNIX System Services kernel usage of monitored below the bar private storage is defined as thresholdpvtstgpc1%. Currently allocpvtstg of maxpvtstg bytes (allocpvtstgpc1%) of monitored private storage has been allocated.

Explanation: CHECK(IBMUSS,USS_KERNEL_PVTSTG_THRESHOLD) showed the defined threshold percentage and the current allocation of monitored (non-stack cell pool private storage) kernel private storage.

Monitored private storage is considered all private storage below the bar that has not been allocated for stack cell pool cells. During initialization the kernel designates 80% of the region as the maximum storage that can be allocated for stack cell pool cells and the remaining 20% as the maximum private storage. If the allocated non-stack cell private storage exceeds 20% and overflows into the 80% designated for stack cells it will reduce the maximum number of stack cells that can be allocated. The percent of monitored storage allocated can exceed 100% if it exceeds the 20% designated during kernel initialization and overflows into stack cells.

allocpvtstg

The number of bytes of monitored private storage below the bar that has been allocated in the z/OS UNIX System Services kernel address space.

allocpvtstgpc1

The percentage of monitored (non-stack) kernel storage that has been allocated (allocpvtstg/maxpvtstg).

maxpvtstg

The maximum number of bytes of private storage below the bar that can be allocated without overflowing into the storage designated for stack cells at kernel initialization. Overflowing into the stack cell designated area will reduce the maximum number of stack cells that can be allocated and will reduce the kernel thread capacity. This value is approximately 20% of the kernel region size.

thresholdpvtstgpc1

The current setting of the monitored private storage usage threshold. This check message is only issued when the percent of allocated storage is less than this value. The IBM default threshold is 85%.

BPXH902E The volume on which your root file system is stored has ROOT_FS_VOLSIZE cylinders of unused space at a percentage of ROOT_FS_VOLSIZE_PERCENT free space. This unused space is not expected to be acceptable for migration.

Explanation: The ZOSMIGREC_ROOT_FS_SIZE check detected the root file system ROOT_FS_DATASET resides on volume ROOT_FS_VOLUME. This volume has ROOT_FS_VOLSIZE unused cylinders available on a volume size of ROOT_FS_TOTAL_VOLSIZE cylinders. This is smaller than the minimum of MIN_CYLINDERS at a percentage of ROOT_FS_VOLSIZE_PERCENT free space. It is recommended that a migration action is performed.

System action: Processing continues.
Operator response: Report this error to the system programmer.

System programmer response: Determine how you will accommodate a larger version root file system for installation of subsequent z/OS releases. Take either of the following actions:
- Move your z/OS root file system to a larger DASD volume geometry.
- Use multiple volumes for the z/OS version root file system data set.

Routing Code: Not applicable.
Descriptor Code: Not applicable.

BPXH915E One or more of the directories verified were found to contain post-install customization that is expected to be affected by the new symbolic links added in z/OS V1R13, or there were problems accessing the directory. A migration action is required.
Explanation: During migration verification, the ZOSMIGV1R13_RO_SYMLINKS check reported one or more directories incompatible with the symbolic links introduced beginning with z/OS V1R13, or the check routine had problems accessing a directory.
System action: Processing continues.
Operator response: Report this error to the system programmer.
System programmer response: Review the messages and make the appropriate changes before migrating to z/OS V1R13. See z/OS Migration. If there were authority problems accessing the directory, resolve any permission exceptions.
The user does not have appropriate authority to **DIR_VERIFIED**.

**Explanation:** The ZOSMIGV1R13_RO_SYMLINKS check detected the user has insufficient authority to **DIR_VERIFIED**.

**System action:** Processing continues.

**Operator response:** Not applicable.

**System programmer response:** Review messages and allow sufficient authority for verification. Rerun the check after the proper authority is granted.

**Problem determination:** Not applicable.

The **ENTRY_TYPE DIR_VERIFIED** is customized to the **/var** directory.

**Explanation:** The ZOSMIGV1R13_RO_SYMLINKS check detected the postinstall customization on **ENTRY_TYPE DIR_VERIFIED** is the same symbolic link that z/OS V1R13 contains.

**System action:** Processing continues.

**Operator response:** Not applicable.

**System programmer response:** Not applicable.

**Problem determination:** Not applicable.
Appendix. Accessibility

Accessible publications for this product are offered through IBM Knowledge Center (http://www.ibm.com/support/knowledgecenter/SSLTBW/welcome).

If you experience difficulty with the accessibility of any z/OS information, send a detailed message to the Contact z/OS or use the following mailing address.

IBM Corporation
Attention: MHVRCFS Reader Comments
Department H6MA, Building 707
2455 South Road
Poughkeepsie, NY 12601-5400
United States

Accessibility features

Accessibility features help users who have physical disabilities such as restricted mobility or limited vision use software products successfully. The accessibility features in z/OS can help users do the following tasks:

- Run assistive technology such as screen readers and screen magnifier software.
- Operate specific or equivalent features by using the keyboard.
- Customize display attributes such as color, contrast, and font size.

Consult assistive technologies

Assistive technology products such as screen readers function with the user interfaces found in z/OS. Consult the product information for the specific assistive technology product that is used to access z/OS interfaces.

Keyboard navigation of the user interface

You can access z/OS user interfaces with TSO/E or ISPF. The following information describes how to use TSO/E and ISPF, including the use of keyboard shortcuts and function keys (PF keys). Each guide includes the default settings for the PF keys.

- z/OS TSO/E Primer
- z/OS TSO/E User’s Guide
- z/OS V2R2 ISPF User’s Guide Vol I

Dotted decimal syntax diagrams

Syntax diagrams are provided in dotted decimal format for users who access IBM Knowledge Center with a screen reader. In dotted decimal format, each syntax element is written on a separate line. If two or more syntax elements are always present together (or always absent together), they can appear on the same line because they are considered a single compound syntax element.

Each line starts with a dotted decimal number; for example, 3 or 3.1 or 3.1.1. To hear these numbers correctly, make sure that the screen reader is set to read out punctuation. All the syntax elements that have the same dotted decimal number
(for example, all the syntax elements that have the number 3.1) are mutually
exclusive alternatives. If you hear the lines 3.1 USERID and 3.1 SYSTEMID, your
syntax can include either USERID or SYSTEMID, but not both.

The dotted decimal numbering level denotes the level of nesting. For example, if a
syntax element with dotted decimal number 3 is followed by a series of syntax
elements with dotted decimal number 3.1, all the syntax elements numbered 3.1
are subordinate to the syntax element numbered 3.

Certain words and symbols are used next to the dotted decimal numbers to add
information about the syntax elements. Occasionally, these words and symbols
might occur at the beginning of the element itself. For ease of identification, if the
word or symbol is a part of the syntax element, it is preceded by the backslash (\)
character. The * symbol is placed next to a dotted decimal number to indicate that
the syntax element repeats. For example, syntax element *FILE with dotted decimal
number 3 is given the format 3 * FILE. Format 3* FILE indicates that syntax
element FILE repeats. Format 3* \* FILE indicates that syntax element * FILE
repeats.

Characters such as commas, which are used to separate a string of syntax
elements, are shown in the syntax just before the items they separate. These
characters can appear on the same line as each item, or on a separate line with the
same dotted decimal number as the relevant items. The line can also show another
symbol to provide information about the syntax elements. For example, the lines
5.1*, 5.1 LASTRUN, and 5.1 DELETE mean that if you use more than one of the
LASTRUN and DELETE syntax elements, the elements must be separated by a comma.
If no separator is given, assume that you use a blank to separate each syntax
element.

If a syntax element is preceded by the % symbol, it indicates a reference that is
defined elsewhere. The string that follows the % symbol is the name of a syntax
fragment rather than a literal. For example, the line 2.1 %OP1 means that you must
refer to separate syntax fragment OP1.

The following symbols are used next to the dotted decimal numbers.

? indicates an optional syntax element
The question mark (?) symbol indicates an optional syntax element. A dotted
decimal number followed by the question mark symbol (?) indicates that all
the syntax elements with a corresponding dotted decimal number, and any
subordinate syntax elements, are optional. If there is only one syntax element
with a dotted decimal number, the ? symbol is displayed on the same line as
the syntax element, (for example 5? NOTIFY). If there is more than one syntax
element with a dotted decimal number, the ? symbol is displayed on a line by
itself, followed by the syntax elements that are optional. For example, if you
hear the lines 5 ?, 5 NOTIFY, and 5 UPDATE, you know that the syntax elements
NOTIFY and UPDATE are optional. That is, you can choose one or none of them.
The ? symbol is equivalent to a bypass line in a railroad diagram.

! indicates a default syntax element
The exclamation mark (!) symbol indicates a default syntax element. A dotted
decimal number followed by the ! symbol and a syntax element indicate that
the syntax element is the default option for all syntax elements that share the
same dotted decimal number. Only one of the syntax elements that share the
dotted decimal number can specify the ! symbol. For example, if you hear the
lines 2? FILE, 2.1! (KEEP), and 2.1 (DELETE), you know that (KEEP) is the
default option for the FILE keyword. In the example, if you include the FILE
keyword, but do not specify an option, the default option KEEP is applied. A default option also applies to the next higher dotted decimal number. In this example, if the FILE keyword is omitted, the default FILE(KEEP) is used. However, if you hear the lines 2? FILE, 2.1, 2.1.1! (KEEP), and 2.1.1 (DELETE), the default option KEEP applies only to the next higher dotted decimal number, 2.1 (which does not have an associated keyword), and does not apply to 2? FILE. Nothing is used if the keyword FILE is omitted.

* indicates an optional syntax element that is repeatable
The asterisk or glyph (*) symbol indicates a syntax element that can be repeated zero or more times. A dotted decimal number followed by the * symbol indicates that this syntax element can be used zero or more times; that is, it is optional and can be repeated. For example, if you hear the line 5.1* data area, you know that you can include one data area, more than one data area, or no data area. If you hear the lines 3* , 3 HOST, 3 STATE, you know that you can include HOST, STATE, both together, or nothing.

Notes:
1. If a dotted decimal number has an asterisk (*) next to it and there is only one item with that dotted decimal number, you can repeat that same item more than once.
2. If a dotted decimal number has an asterisk next to it and several items have that dotted decimal number, you can use more than one item from the list, but you cannot use the items more than once each. In the previous example, you can write HOST STATE, but you cannot write HOST HOST.
3. The * symbol is equivalent to a loopback line in a railroad syntax diagram.

+ indicates a syntax element that must be included
The plus (+) symbol indicates a syntax element that must be included at least once. A dotted decimal number followed by the + symbol indicates that the syntax element must be included one or more times. That is, it must be included at least once and can be repeated. For example, if you hear the line 6.1+ data area, you must include at least one data area. If you hear the lines 2+, 2 HOST, and 2 STATE, you know that you must include HOST, STATE, or both. Similar to the * symbol, the + symbol can repeat a particular item if it is the only item with that dotted decimal number. The + symbol, like the * symbol, is equivalent to a loopback line in a railroad syntax diagram.

Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted.
for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

**Minimum supported hardware**

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see: [IBM Lifecycle Support for z/OS](http://www.ibm.com/software/support/systemsz/lifecycle/)
- For information about currently-supported IBM hardware, contact your IBM representative.
