

z/OS

# Cryptographic Services PKI Services Guide and Reference

*Version 2 Release 2*

**Note**

Before using this information and the product it supports, read the information in "Notices" on page 689.

This edition applies to Version 2 Release 2 of z/OS (5650-ZOS) and to all subsequent releases and modifications until otherwise indicated in new editions.

<b>Summary of changes</b> . . . . .	<b>xxi</b>
-------------------------------------	------------

Summary of changes for z/OS Version 2 Release 2 (V2R2) as updated March 2017. . . . .	xxi
Summary of changes for z/OS Version 2 Release 2 (V2R2). . . . .	xxi
Summary of message changes for z/OS Version 2 Release 2 (V2R2) . . . . .	xxii
z/OS Version 2 Release 1 summary of changes . . . . .	xxii

<b>Part 1. Planning</b> . . . . .	<b>1</b>
-----------------------------------	----------

<b>Chapter 1. Introducing PKI Services</b> . . . . .	<b>3</b>
--	----------

What is PKI Services? . . . . .	3
What is a certificate authority? . . . . .	3
What is PKI? . . . . .	4
Basic components of PKI Services and related products. . . . .	4
Component diagram. . . . .	5
Supported standards. . . . .	7
Supported certificate types. . . . .	7
Supported certificate fields and extensions . . . . .	8

<b>Chapter 2. Planning your implementation</b> . . . . .	<b>11</b>
--	-----------

Installing PKI Services. . . . .	11
Requirements for sysplex support . . . . .	11
Determining prerequisite products. . . . .	12
IBM HTTP Server - Powered by Apache (optional) . . . . .	12
WebSphere Application Server (optional) . . . . .	12
LDAP directory server. . . . .	13
OCSF (optional) . . . . .	13
ICSF (optional) . . . . .	13
sendmail (optional). . . . .	13
OCEP (optional). . . . .	13
DB2 (optional) . . . . .	13
Identifying skill requirements . . . . .	13
Team members . . . . .	14

Skills for setting up prerequisite products . . . . .	14
Skills for setting up PKI Services . . . . .	16
Creating an implementation plan . . . . .	17
Planning considerations for installing and configuring PKI Services . . . . .	18
Task roadmap for implementing PKI Services . . . . .	22

<b>Chapter 3. Installing and configuring prerequisite products</b> . . . . .	<b>25</b>
--	-----------

Tasks to perform before setting up PKI Services . . . . .	25
Installing and configuring the IBM HTTP Server - Powered by Apache . . . . .	25
Installing and configuring WebSphere Application Server for z/OS. . . . .	27
Installing and configuring LDAP . . . . .	27
Installing and configuring ICSF (optional) . . . . .	29
Configuring sendmail (optional) . . . . .	30
Installing and configuring DB2 . . . . .	31
Tasks to perform before configuring PKITP. . . . .	31
Installing and configuring OCSF . . . . .	31
Installing and configuring OCEP . . . . .	32

<b>Part 2. Configuring your system for PKI Services</b> . . . . .	<b>33</b>
---	-----------

<b>Chapter 4. Running IKYSETUP to perform RACF administration</b> . . . . .	<b>35</b>
---	-----------

Overview of IKYSETUP . . . . .	36
Before you begin . . . . .	36
Variables whose values must change . . . . .	37
Variables whose values might change depending on setup . . . . .	40
Variables you can optionally change . . . . .	50
Steps for performing RACF tasks using IKYSETUP . . . . .	55
Sample IKYSETUP log data set . . . . .	58

<b>Chapter 5. Configuring the UNIX runtime environment.</b> . . . . .	<b>61</b>
---	-----------

Steps for copying files. . . . .	63
Optionally updating PKI Services environment variables . . . . .	64
(Optional) Steps for updating PKI Services environment variables. . . . .	65
Optionally updating the pkiserv.conf configuration file . . . . .	66
(Optional) Steps for updating the configuration file . . . . .	68
Updating pkiserv.conf after installing a new release of z/OS . . . . .	86
Steps for setting up the var directory. . . . .	87

**Chapter 6. Tailoring the LDAP configuration for PKI Services . . . . . 89**

Steps for loading schema.user.ldif . . . . . 89  
Setting up authorization to create and access CRLs and certificates . . . . . 90  
Establishing a secure connection with LDAP (optional) . . . . . 90

**Chapter 7. Updating IBM HTTP Server - Powered by Apache configuration and starting the server. . . . . 93**

| Setting up IBM HTTP Server - Powered by Apache | httpd.conf . . . . . 93  
| Steps for updating the IBM HTTP Server - | Powered by Apache configuration files . . . . . 93  
| Starting and stopping the IBM HTTP Server - | Powered by Apache . . . . . 97

**Chapter 8. Tailoring the PKI Services configuration file for LDAP . . . . . 99**

Excerpt of LDAP section . . . . . 99  
Storing information for encrypted passwords for your LDAP servers . . . . . 99  
Steps for tailoring the LDAP section of the configuration file . . . . . 100

**Chapter 9. Creating the object store and ICL . . . . . 107**

The object store and ICL . . . . . 107  
Creating the object store and ICL using VSAM data sets. . . . . 108  
    Planning VSAM storage requirements . . . . . 108  
    (Optional) preliminary steps for establishing VSAM RLS . . . . . 109  
    Steps for creating the VSAM object store and ICL data sets and indexes . . . . . 110  
    (Optional) steps for enabling existing PKI Services VSAM data sets for VSAM RLS . . . . . 111  
    Tuning VSAM performance. . . . . 112  
    Backing up and restoring the VSAM data sets . . . . . 114  
Creating the object store and ICL using DB2 tables . . . . . 115  
    Sysplex considerations . . . . . 115  
    Planning DB2 storage requirements . . . . . 115  
    Steps for creating the object store and ICL DB2 tables . . . . . 115  
    Converting the object store and ICL from VSAM to DB2. . . . . 117  
    Columns in the ICL and object store DB2 tables . . . . . 118

**Chapter 10. Starting and stopping PKI Services . . . . . 121**

Steps for starting the PKI Services daemon . . . . . 121  
Stopping the PKI Services daemon . . . . . 123

**Part 3. Customizing PKI Services 125**

**Chapter 11. Customizing the end-user web application if you use REXX CGI execs . . . . . 127**

Contents of the pkiserv.tmpl certificates templates file . . . . . 127  
    What are substitution variables? . . . . . 128  
    What are named fields? . . . . . 129  
    INSERT sections . . . . . 130  
    The APPLICATION sections . . . . . 138  
    Templates that PKI Services provides . . . . . 140  
    TEMPLATE sections . . . . . 142  
Summary of fields in certificate templates . . . . . 151  
Examining the pkiserv.tmpl file . . . . . 156  
    Examining the APPLICATION section . . . . . 157  
    Examining the TEMPLATE section . . . . . 170  
    Examining the INSERT section . . . . . 174  
Relationship between CGIs and the pkiserv.tmpl file . . . . . 213  
Steps for performing minimal customization . . . . . 215  
Steps for additional first-time customization . . . . . 216  
Steps for retrofitting release changes into the PKI Services certificate templates . . . . . 220  
Locating code for customizing end-user web pages . . . . . 221  
Steps for adding a new certificate template . . . . . 222  
Changing the runtime user ID. . . . . 223  
    Steps for changing the runtime user ID for requesting certificates. . . . . 224  
    Steps for changing the runtime user ID for retrieving certificates . . . . . 224  
Customizing the OtherName field . . . . . 225  
    Steps for customizing the sample AltOther\_<OID> INSERTs . . . . . 226

**Chapter 12. Customizing the administration web pages if you use REXX CGI execs . . . . . 229**

CGIs for administration web pages . . . . . 229  
Customizing the administration web pages . . . . . 231  
Steps for customizing the administration web pages . . . . . 231  
Changing the runtime behavior for accessing administration pages . . . . . 232  
    Steps for changing control of access to administration pages . . . . . 232

**Chapter 13. Implementing the web application using JavaServer pages . 233**

Certificate templates files used with JSPs . . . . . 233  
    Examining the pkitmpl.xml file . . . . . 234  
Roadmap for implementing the PKI Services web application using JSPs . . . . . 238  
    Steps for preparing to implement the PKI Services web application using JSPs . . . . . 239  
    Giving WebSphere users authorization to use PKI Services functions . . . . . 240  
    Allowing WebSphere users to renew and revoke browser certificates . . . . . 244  
    Customizing the PKI Services web application . . . . . 255  
Directories for JSP files . . . . . 261

## Chapter 14. Advanced customization 267

Scaling for high volume installations . . . . .	267
Using certificate policies . . . . .	268
Steps for creating the CertificatePolicies extension on a global basis . . . . .	269
Steps for creating the CertificatePolicies extension on a template basis . . . . .	270
Updating the signature algorithm . . . . .	271
Steps for changing the signature algorithm . . . . .	272
Certificate revocation status . . . . .	273
How distribution point CRLs/ARLs work . . . . .	273
How DP CRLs are published . . . . .	273
How DP CRLs are partitioned . . . . .	274
What about CA certificates? . . . . .	274
Customizing distribution point CRLs . . . . .	274
Specifying the URI format . . . . .	275
Determining CRLDistURIIn . . . . .	276
Determining CRLDistDirPath . . . . .	277
Steps for customizing distribution point CRLs . . . . .	278
Creating a distribution point ARL . . . . .	280
Enabling support for large CRLs . . . . .	281
Steps for enabling support for large CRLs . . . . .	282
Using the OCSP responder . . . . .	283
Adding an application domain . . . . .	283
Creating application domains when you use REXX CGIs to implement the web application . . . . .	283
Creating application domains when you use JSPs to implement the web application . . . . .	285
Adding a new CA domain . . . . .	287
Task overview . . . . .	288
Task roadmap for adding CA domains . . . . .	289
Recording your progress adding CA domains . . . . .	290
Subtask 1: Steps for planning additional CA domains . . . . .	290
Subtask 2: Steps for reconfiguring your initial CA domain to allow it to coexist with other CA domains . . . . .	292
Subtask 3: Steps for running the IKYSETUP exec . . . . .	294
Subtask 4: Steps for configuring the UNIX environment . . . . .	296
Subtask 5: Steps for updating the PKI Services template file . . . . .	297
Subtask 6: Steps for updating the web server configuration . . . . .	299
Subtask 7: Creating the object store and ICL . . . . .	301
Subtask 8: Steps for starting PKI Services . . . . .	302
Enabling Simple Certificate Enrollment Protocol (SCEP) . . . . .	303
Overview of SCEP preregistration . . . . .	303
Overview of certificate request processing for preregistered SCEP clients . . . . .	304
Checking certificate fingerprints . . . . .	306
Steps for enabling Simple Certificate Enrollment Protocol (SCEP) . . . . .	307
Customizing email notifications sent to users . . . . .	309
Steps for customizing email notification forms . . . . .	314
Setting up automatic renewal of certificates . . . . .	315
Steps for setting up automatic certificate renewal . . . . .	315
Setting up PKI Services to generate keys for certificate requests . . . . .	316

Steps for setting up PKI Services to generate keys for certificate requests . . . . .	317
Adding custom extensions to certificates . . . . .	319
Steps for adding a custom extension to a certificate template if you are using REXX CGI execs . . . . .	320
Steps for adding a custom extension to a certificate template if you are using JSPs . . . . .	321
Forming the CustomExt value for CertPlist for the R_PKIServ callable service . . . . .	321

## Chapter 15. Customizing with installation exit routines. . . . . 325

Exit routine processing for automatic certificate renewal . . . . .	325
Steps for updating the exit routine code sample . . . . .	326
Using the exit routine for pre- and post-processing . . . . .	326
Scenario for using the exit routine . . . . .	328
Exit routine processing for the PKI Services CGIs . . . . .	329
Steps for updating the exit routine code sample . . . . .	329
Using the exit routine for pre- and post-processing . . . . .	329
Scenarios for using the exit routine . . . . .	340
Exit routine processing for JavaServer pages (JSPs) . . . . .	343
Class UserExit . . . . .	343
Class ExportCert . . . . .	354
Class QRecover . . . . .	354
Class RevokeCert . . . . .	355
Class UserExitException . . . . .	355
Class CertPlist . . . . .	355
Class PkiCertificate . . . . .	357
Class QrecoverResultsList . . . . .	357
Class RpkiservException . . . . .	358

## Part 4. Using PKI Services . . . . . 359

### Chapter 16. Using the end-user web pages. . . . . 361

Steps for accessing the end-user web pages . . . . .	362
Summary of fields . . . . .	365
Steps for requesting a new certificate . . . . .	369
Retrieving your certificate . . . . .	375
Steps for retrieving your certificate from the bookmarked web page . . . . .	375
Steps for retrieving your certificate from the PKI Services home page . . . . .	376
Steps for retrieving a PKI generated key certificate . . . . .	377
Steps for renewing a certificate . . . . .	378
Steps for revoking or suspending a certificate . . . . .	381
Recovering a certificate whose keys were generated by PKI Services . . . . .	382
Steps for recovering a certificate whose keys were generated by PKI Services . . . . .	382
Steps for preregistering an SCEP client . . . . .	386

**Chapter 17. Using the administration web pages . . . . . 389**

Steps for accessing the administration home page . . . . . 389  
Fields in the administration web pages . . . . . 392  
Processing certificate requests . . . . . 392  
    Status of certificate requests . . . . . 392  
    Actions on certificate requests . . . . . 393  
    Using the PKI Services administration home page . . . . . 393  
Processing certificates . . . . . 403  
    Status of certificates . . . . . 403  
    Actions for certificates . . . . . 404  
    Steps for processing a single certificate . . . . . 404  
    Steps for processing certificates by performing searches . . . . . 406  
    Relationship between certificate requests and matching certificates . . . . . 410

**Chapter 18. Using PKI Services utilities . . . . . 413**

Using the createcrs utility . . . . . 414  
Using the iclview utility . . . . . 415  
Using the pkiprereg utility . . . . . 419  
Using the postcerts utility . . . . . 423  
Using the TemplateTool utility . . . . . 425  
Using the vosview utility . . . . . 427  
    Sample record 1 . . . . . 429  
    Sample record 2 . . . . . 429  
    Sample record 3 . . . . . 429  
    Sample certificate request record . . . . . 429  
Using the vsam2db2 utility . . . . . 432

**Chapter 19. Using the certificate management protocol (CMP) with PKI Services . . . . . 435**

Support for CMP messages . . . . . 436  
    Support for the CMP certificate request message (type cr) . . . . . 437  
    Support for the CMP PKCS #10 certificate request message (type p10cr) . . . . . 439  
    Support for the CMP certificate response message (type cp) . . . . . 439  
    Support for the CMP revocation request message (type rr) . . . . . 440  
    Support for the CMP revocation response message (type rp) . . . . . 440  
    Support for the CMP error message (type error) . . . . . 441  
    Determining the CA domain to which a request is routed . . . . . 441  
    How PKI Services interprets distinguished names (DNs) on CMP requests . . . . . 443  
Setting up a client to make CMP requests to PKI Services . . . . . 444  
    Steps for setting up a certificate for a CMP requester . . . . . 444  
Setting up PKI Services to process CMP requests . . . . . 445  
    Enabling the CMP support . . . . . 445  
    Setting up PKI Services to create private keys for CMP clients . . . . . 446  
Setting up the HTTP Server for CMP . . . . . 448

Tracing the PKI CMP CGI program . . . . . 454  
Messages and codes returned from the CMP functions . . . . . 454

---

**Part 5. Administering security for PKI Services . . . . . 459**

**Chapter 20. RACF administration for PKI Services . . . . . 461**

Authorizing users for the PKI Services administration group . . . . . 461  
    Connecting members to the group . . . . . 461  
    Deleting members from groups . . . . . 461  
Authorizing users for inquiry access . . . . . 462  
    Steps for authorizing users for inquiry access . . . . . 462  
Administering HostIdMappings extensions . . . . . 462  
    Steps for administering HostIdMappings extensions . . . . . 463  
Locating your PKI Services certificates and key ring . . . . . 464  
    Steps for locating the PKI Services certificates and key ring . . . . . 464  
Establishing PKI Services as an intermediate CA . . . . . 466  
    Steps for changing PKI Services from a self-signed CA to an intermediate CA . . . . . 467  
Renewing your PKI Services CA and RA certificates . . . . . 468  
    Steps for renewing your PKI Services CA certificate . . . . . 468  
    Steps for renewing your PKI Services RA certificate . . . . . 470  
Recovering a CA certificate profile . . . . . 470  
    Steps for recovering a CA certificate profile . . . . . 471  
Retiring and replacing the PKI Services CA private key . . . . . 471  
    Steps to retire and replace the PKI Services CA private key for the PKI templates . . . . . 472  
    Steps to retire and replace the PKI Services CA private key for the SAF templates: Scenario 1 . . . . . 473  
    Steps to retire and replace the PKI Services CA private key for the SAF templates: Scenario 2 . . . . . 474  
R\_PKIServ (IRRSPX00 and IRRSPX64) callable service . . . . . 475  
    Authorizing end-user functions . . . . . 475  
    Authorizing administrative functions . . . . . 477  
Using encrypted passwords for LDAP servers . . . . . 481  
    Steps for using encrypted passwords . . . . . 482

---

**Part 6. Using the certificate validation service . . . . . 485**

**Chapter 21. PKI Services Trust Policy (PKITP) . . . . . 487**

Overview of PKITP . . . . . 487  
Certificate policies . . . . . 489  
Checking certificate status with PKITP . . . . . 489  
Certificate extensions . . . . . 490  
CRL extensions and CRL entry extensions . . . . . 491

Files for PKITP . . . . .	491	IKYCDB2. . . . .	631
Configuring and getting started with PKITP . . . . .	492	IKYCVSAM . . . . .	635
Steps for configuring PKITP . . . . .	492	IKYRVSAM . . . . .	639
Trust Policy API . . . . .	493	IKYSBIND . . . . .	643
CSSM_TP_PassThrough . . . . .	493	IKYSGRNT . . . . .	644
Building the sample application to invoke the certificate validation service . . . . .	496	IKYVBKUP . . . . .	645
		IKYVREST . . . . .	647
		PKISERVD sample procedure to start PKI Services daemon . . . . .	648
<b>Part 7. Troubleshooting . . . . .</b>	<b>509</b>		
<b>Chapter 22. Using information from SYS1.LOGREC . . . . .</b>	<b>511</b>	<b>Chapter 30. SMF recording . . . . .</b>	<b>649</b>
Sample LOGREC data . . . . .	515	PKI Services event code . . . . .	649
		Relocate section variable data . . . . .	649
<b>Chapter 23. Using information from the PKI Services logs . . . . .</b>	<b>519</b>		
Viewing SYSOUT information . . . . .	519	<b>Part 9. Appendixes . . . . .</b>	<b>651</b>
_PKISERV_MSG_LEVEL subcomponents and message levels . . . . .	523	<b>Appendix A. LDAP directory server requirements . . . . .</b>	<b>653</b>
Changing logging options . . . . .	523	<b>Appendix B. Using a gskkyman key database for your certificate store . . . . .</b>	<b>657</b>
Displaying log options settings . . . . .	524	Steps for using a gskkyman key database for your certificate store . . . . .	657
<b>Part 8. Reference information . . . . .</b>	<b>525</b>	<b>Appendix C. Configuring PKI Services as an IdenTrust certificate authority. . . . .</b>	<b>659</b>
<b>Chapter 24. Messages. . . . .</b>	<b>527</b>	Who should use this information . . . . .	659
<b>Chapter 25. File directory structure . . . . .</b>	<b>573</b>	Related information from IdenTrust . . . . .	659
Product libraries . . . . .	573	Overview of configuring z/OS PKI Services as a CA . . . . .	659
File system directory and subdirectories . . . . .	574	System prerequisites . . . . .	660
<b>Chapter 26. The pkiserv.conf configuration file . . . . .</b>	<b>577</b>	Task overview . . . . .	660
<b>Chapter 27. Environment variables . . . . .</b>	<b>585</b>	Configuring z/OS PKI Services as a CA . . . . .	661
Environment variables in the environment variables file. . . . .	585	Steps to modify pkiserv.conf for different certificate types. . . . .	662
The pkiserv.envars environment variables file . . . . .	587	Steps to modify pkiserv.conf general settings . . . . .	663
<b>Chapter 28. The IKYSETUP REXX exec . . . . .</b>	<b>589</b>	Steps to create IdenTrust specific certificate templates. . . . .	663
Actions IKYSETUP performs by issuing RACF commands . . . . .	589	Code samples . . . . .	664
Setting up the PKI Services daemon user ID . . . . .	589	Sample PKI Services configuration file directives for IdenTrust compliance . . . . .	664
Setting up access control to protect PKI Services . . . . .	589	Sample browser certificate template for IdenTrust compliance. . . . .	665
Establishing your CA and RA certificates . . . . .	592	Sample server certificate template for IdenTrust compliance . . . . .	667
Configuring the IBM HTTP Server - Powered by Apache for SSL mode . . . . .	594		
Using RACF to obtain a certificate for the web server . . . . .	594	<b>Appendix D. Using the PKI Services web application with Internet Explorer on Windows systems . . . . .</b>	<b>671</b>
Enabling the IBM HTTP Server - Powered by Apache for surrogate operation . . . . .	595	User tasks for setting up a Windows system and Internet Explorer to work with the PKI Services web application . . . . .	671
Allowing PKI Services to generate key pairs for certificate requests. . . . .	595	Installing the PKI Services ActiveX program . . . . .	671
IKYSETUP sample. . . . .	595	Configuring Internet Explorer to trust PKI Services on a Windows system . . . . .	675
<b>Chapter 29. Other code samples . . . . .</b>	<b>627</b>	Installing the PKI Services CA certificate on a Microsoft Windows system . . . . .	676
IBM HTTP Server - Powered by Apache   configuration directives . . . . .	627		

Administrator tasks for setting up a Windows system and Internet Explorer to work with the PKI Services web application . . . . .	677
Signing the PKI Services ActiveX programs . . . . .	678

**Appendix E. Accessibility . . . . . 685**

Accessibility features . . . . .	685
Consult assistive technologies . . . . .	685
Keyboard navigation of the user interface . . . . .	685
Dotted decimal syntax diagrams . . . . .	685

**Notices . . . . . 689**

Policy for unsupported hardware. . . . .	690
Minimum supported hardware . . . . .	691
Programming interface information . . . . .	691
Trademarks . . . . .	691

**Index . . . . . 693**

## Figures

1.	Component diagram of a typical PKI Services system . . . . .	6	40.	Supplying the PKCS #10 certificate request for a server or device certificate . . . . .	372
2.	Flowchart of the process of updating IKYSETUP . . . . .	56	41.	Successful request displays transaction ID	373
3.	Partial listing of the AltOther_1_2_3_4_6 sample INSERT showing the lines you are most likely to customize . . . . .	227	42.	Web page to retrieve your certificate . . . . .	374

6. Considerations before installing and configuring PKI Services . . . . .	18	43. CGI actions for administrative web pages . . . . .	229
7. Task roadmap for implementing PKI Services . . . . .	22	44. Task roadmap for implementing the PKI Services web application using the JSPs . . . . .	239
8. IBM HTTP Server - Powered by Apache information you need to record . . . . .	27	45. JSP files in the Customers directory . . . . .	262
9. LDAP information you need to record . . . . .	28	46. JSP files in the PKIServ directory . . . . .	262
10. IKYSETUP structure and divisions . . . . .	36	47. JSP files in the mod.inc directory . . . . .	263
11. IKYSETUP variables whose values must change . . . . .	38	48. Supported signature algorithms for each CA certificate key type. . . . .	272
12. Decision table for key_backup . . . . .	41	49. Task roadmap for creating multiple application domains . . . . .	283
13. Decision table for key_type . . . . .	41	50. Task roadmap for adding a new CA domain . . . . .	289
14. Decision table for restrict_surrog . . . . .	42	51. Multiple CA domains: Worksheet #1 for recording progress adding new CA domains . . . . .	290
15. Decision table for unix_sec . . . . .	43	52. Multiple CA domains: Worksheet #2 for planning your domain names . . . . .	292
16. Decision table for db2_repos and db2_subsys . . . . .	44	53. Multiple CA domains: Worksheet #3 for planning your RACF identifiers, z/OS UNIX identifiers, and VSAM data set names or DB2 package names . . . . .	292
17. Decision table for AdminGranularControl . . . . .	44	54. Information you need to enable Simple Certificate Enrollment Protocol (SCEP) . . . . .	307
18. IKYSETUP variables you might want to change depending on setup . . . . .	46	55. Descriptions of variables for forms . . . . .	312
19. IKYSETUP variables you can optionally change . . . . .	51	56. Summary of substitution variables in forms . . . . .	313
20. Deciding which files to copy and change . . . . .	61	57. Files for the pkixexit.c exit routine . . . . .	325
21. Information needed for updating the configuration file. . . . .	68	58. Values of arguments for pre- and post-processing . . . . .	327
22. LDAP information you need for tailoring LDAP configuration. . . . .	89	59. Values of arguments for pre- and post-processing . . . . .	330
23. Virtual host files . . . . .	94	60. Package and class summary for JSP exit processing . . . . .	343
24. LDAP information you need for tailoring IBM HTTP Server - Powered by Apache configuration . . . . .	94	61. Methods in class UserExit . . . . .	344
25. Information needed for updating the LDAP section of the configuration file . . . . .	100	62. Types of certificates you can request . . . . .	361
26. VSAM RLS information you need to record . . . . .	110	63. Summary of fields in end-user web pages . . . . .	365
27. Columns in the object store DB2 tables . . . . .	118	64. KeyUsage values and their intended purpose and possible PKIX bits . . . . .	368
28. Columns in the ICL DB2 tables . . . . .	119	65. Summary of fields in the administration pages . . . . .	392
29. Structure and main divisions of the certificate template file (pkiserv.tmpl) . . . . .	127	66. Statuses of certificate requests . . . . .	392
30. Substitution variables . . . . .	128	67. Summary of actions to perform on requests and required status . . . . .	393
31. INSERTs that are common HTML for web page content . . . . .	130	68. Searches to display certificate requests . . . . .	398
32. Named fields in INSERT sections . . . . .	132	69. Status of certificates . . . . .	403
33. KeyUsage values and their intended purpose and possible PKIX bits . . . . .	137	70. Summary of actions to perform and required status to do so . . . . .	404
34. Subsections of the APPLICATION sections . . . . .	138	71. Searches to display certificates . . . . .	406
35. Certificate templates PKI Services provides . . . . .	140	72. List of valid field names for use in the preregistration record as input to the pkiptereg utility . . . . .	421
36. Names, aliases, and nicknames of certificate templates. . . . .	143		
37. Summary of subsections in certificate templates . . . . .	151		

73. List of valid field names for use in the preregistration record as input to the pkiprereg utility but not intended for use with SCEP certificates. . . . .	422	93. Information you need for recovering a CA certificate profile . . . . .	471
74. Format of tcp-messages . . . . .	435	94. Summary of access authorities required for PKI Services requests . . . . .	477
75. Supported fields in the PKIMessage structure	436	95. Sequence of validation stages for PKITP certificate revocation checking . . . . .	489
76. Supported fields in the PKIHeader structure	437	96. Summary of information about important files for PKITP . . . . .	491
77. Supported values in the PKIBody structure. These are the CMP message types that PKI Services supports. . . . .	437	97. PKI Services OCSF Trust Policy (PKITP) error codes . . . . .	495
78. Supported fields in the CMP certificate request message (type cr) . . . . .	437	98. LOGREC data for PKI Services. . . . .	511
79. Supported fields in the CMP PKCS #10 certificate request message (type p10cr) . . . . .	439	99. Summary of information about important files. . . . .	525
80. Support for fields in the CMP certificate response message (type cp) . . . . .	439	100. Meaning of fourth character in message number . . . . .	527
81. Supported fields in the CMP revocation request message (type rr) . . . . .	440	101. Meaning of eighth character in message number . . . . .	527
82. Supported fields in the CMP revocation response message (type rp) . . . . .	441	102. Files contained in subdirectories . . . . .	574
83. Supported fields in the CMP error message (type error) . . . . .	441	103. Access required if you plan to have an administrator approve certificate requests . . . . .	591
84. HTTP Server environment variables used to determine the CA . . . . .	448	104. Access required if you plan to use auto-approval . . . . .	591
85. HTTP Server environment variables used to control the content of the certificate within a CA . . . . .	449	105. FACILITY class access needed for administrative functions . . . . .	591
86. HTTP Server environment variables used to configure the certificate recipients. . . . .	453	106. Access PKISRVD needs to use RACF certificates . . . . .	593
87. HTTP Server environment variables used to control tracing . . . . .	453	107. SMF event code and event code qualifier for PKI Services . . . . .	649
88. CMP error codes . . . . .	454	108. SMF data elements of the extended-length relocate section for PKI Services . . . . .	649
89. Information you need for locating your PKI Services certificates and key ring . . . . .	464	109. LDAP objectclasses and attributes that PKI Services sets . . . . .	653
90. Information you need for establishing PKI Services as an intermediate CA . . . . .	467	110. Relationship of named fields to LDAP attributes and object identifiers . . . . .	654
91. Information you need for renewing your PKI Services certificate authority certificate . . . . .	469	111. Tasks to perform to set up a Windows system and the Internet Explorer browser to work with PKI Services . . . . .	671
92. Information you need for renewing your PKI Services RA certificate. . . . .	470	112. Directory structure for a sample project named PKIXEnrollDeploy created in the C: directory . . . . .	679

---

## About this document

This document supports z/OS® (5650-ZOS). This document contains information about planning, customizing, administering, and using the PKI Services component of the z/OS Cryptographic Services.

PKI Services provides a certificate authority for the z/OS environment and enables you to issue and administer digital certificates, so that you do not have to purchase them from an external certificate authority. This document provides you with the information you need to become productive with PKI Services. It contains information about the following topics:

- Procedures for setting up PKI Services on the z/OS platform.
- Using the PKI Services administration and user web pages, you can easily issue digital certificates to trusted parties and control whether a certificate is renewed or revoked.
- Guidelines to help you plan for PKI Services, such as how to integrate PKI Services components with other products installed at your site.

---

## Who should use this document

This document should be used by those who plan, install, customize, administer, and use PKI Services. It should also be used by those who install, configure, or provide support in the following areas:

- Lightweight Directory Access Protocol (LDAP)
- Resource Access Control Facility (RACF®)
- z/OS
- z/OS UNIX System Services
- (optional) IBM® HTTP Server - Powered by Apache
- (optional) Integrated Cryptographic Service Facility (ICSF)
- (optional) Open Cryptographic Enhanced Plug-ins (OCEP)
- (optional) Open Cryptographic Services Facility (OCSF)
- (optional) z/OS Communications Server's sendmail utility
- (optional) WebSphere Application Server

This document assumes that you have experience with installing and configuring products in a network environment. You should be knowledgeable about the following concepts and protocols:

- Hardware installation and configuration
- Internet communications protocols, in particular Transmission Control Protocol/Internet Protocol (TCP/IP) and Secure Sockets Layer (SSL)
- Public key infrastructure (PKI) technology, including directory schemas, the X.509 version 3 standard, and the Lightweight Directory Access Protocol (LDAP)

---

## How to use this document

This document contains several parts:

- Part 1, "Planning," on page 1 includes the following topics:

## Preface

- Chapter 1, “Introducing PKI Services,” on page 3 introduces PKI Services, describing its basic components and related products. It also describes supported standards, certificate types, fields, and extensions.
- Chapter 2, “Planning your implementation,” on page 11 provides a planning overview for your implementation. It contains information about the components that work with PKI Services and the team members you need to implement PKI Services and the skills they need.
- Chapter 3, “Installing and configuring prerequisite products,” on page 25 describes installing and configuring related products: the IBM HTTP Server - Powered by Apache, OCSF, LDAP, and optionally ICSF.
- Part 2, “Configuring your system for PKI Services,” on page 33 describes the tasks your team members need to perform to configure PKI Services.
  - Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35 describes how the RACF administrator updates and runs IKYSETUP, a REXX exec to perform RACF administration tasks, such as setting up the daemon user ID and giving accesses.
  - Chapter 5, “Configuring the UNIX runtime environment,” on page 61 explains UNIX programmer tasks including how to copy files, update environment variables, update the PKI Services configuration file, and set up the `/var/pki serv` file system directory.
  - Chapter 6, “Tailoring the LDAP configuration for PKI Services,” on page 89 explains how the LDAP programmer updates LDAP configuration for PKI Services.
  - Chapter 7, “Updating IBM HTTP Server - Powered by Apache configuration and starting the server,” on page 93 explains how the web server programmer updates the IBM HTTP Server configuration files and starts the IBM HTTP Server.
  - Chapter 8, “Tailoring the PKI Services configuration file for LDAP,” on page 99 explains how the UNIX programmer updates the **LDAP** section of the PKI Services configuration file.
  - Chapter 9, “Creating the object store and ICL,” on page 107 explains how the MVS™ programmer creates VSAM data sets or the DB2® database administrator creates DB2 objects for the object store and issued certificate list (ICL).
  - Chapter 10, “Starting and stopping PKI Services,” on page 121 explains how the MVS programmer starts and stops the PKI Services daemon.
- Part 3, “Customizing PKI Services,” on page 125 explains how to customize end-user and administration web pages and perform advanced customization, including customization using an exit routine.
  - Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127 provides an overview of the `pki serv .tmpl` file, which contains the certificate templates, and explains how to customize the end-user web pages.
  - Chapter 12, “Customizing the administration web pages if you use REXX CGI execs,” on page 229 provides an overview of the CGI scripts and explains how to customize the administration web pages.
  - Chapter 13, “Implementing the web application using JavaServer pages,” on page 233 describes how to use Java™ server pages (JSPs) and an XML template file to create and customize the PKI Services web application.

- Chapter 14, “Advanced customization,” on page 267 explains how to use certificate policies, update the signature algorithm, enable automatic renewal of certificates, set up PKI Services to generate keys for certificates, and add custom extensions to certificates.
- Chapter 15, “Customizing with installation exit routines,” on page 325 explains how to use the PKI Services exit routine.
- Part 4, “Using PKI Services,” on page 359 explains using the end-user and administration web pages, using the PKI Services utilities, and using the certificate management protocol (CMP) with PKI Services.
  - Chapter 16, “Using the end-user web pages,” on page 361 shows the end-user web pages and explains how to request a certificate, obtain the certificate, and renew or revoke a certificate.
  - Chapter 17, “Using the administration web pages,” on page 389 shows the administration web pages and explains how to process certificate requests and certificates.
  - Chapter 18, “Using PKI Services utilities,” on page 413 explains using the PKI Services utilities.
  - Chapter 19, “Using the certificate management protocol (CMP) with PKI Services,” on page 435 describes the support for CMP that PKI Services provides.
- Part 5, “Administering security for PKI Services,” on page 459 explains how to perform many RACF administration tasks that are needed for PKI Services, such as authorizing users, administering extensions, and locating your PKI Services certificate and key ring.
- Part 6, “Using the certificate validation service,” on page 485 describes how to set up and use the PKI Services Trust Policy (PKITP) plug-in for OCSF.
- Part 7, “Troubleshooting,” on page 509 explains using logs:
  - Chapter 22, “Using information from SYS1.LOGREC,” on page 511 describes SYS1.LOGREC - which is used to record unusual runtime events, such as an exception.
  - Chapter 23, “Using information from the PKI Services logs,” on page 519 contains information about using the PKI Services logs to debug problems and explains how to change logging options and display log options settings.
- Part 8, “Reference information,” on page 525 provides reference information including messages and important code samples.
  - Chapter 24, “Messages,” on page 527 explains PKI Services messages.
  - Chapter 25, “File directory structure,” on page 573 describes product and file system directories for PKI Services and files that are contained in them.
  - Chapter 26, “The pkiserv.conf configuration file,” on page 577 provides a code sample of the pkiserv.conf configuration file.
  - Chapter 27, “Environment variables,” on page 585 explains the pkiserv.envars environment variables file and provides a code sample.
  - Chapter 28, “The IKYSETUP REXX exec,” on page 589 explains the contents of the IKYSETUP REXX exec that performs RACF administration and provides a code sample.
  - Chapter 29, “Other code samples,” on page 627 provides additional code samples.
  - Chapter 30, “SMF recording,” on page 649 describes the SMF record that PKI Services produces.
- There are several appendixes, including:

## Preface

- Appendix A, “LDAP directory server requirements,” on page 653 explains using a non-z/OS LDAP server.
- Appendix B, “Using a gskkyman key database for your certificate store,” on page 657 explains an alternative method for setting up your key database.
- Appendix C, “Configuring PKI Services as an IdenTrust certificate authority,” on page 659 explains configuring PKI Services to operate as an IdenTrust compliant certificate authority (CA).
- Appendix D, “Using the PKI Services web application with Internet Explorer on Windows systems,” on page 671 describes how you might need to set up a Windows system to work with PKI Services.

---

## Where to find more information

When possible, this information uses cross-document links that go directly to the topic in reference using shortened versions of the document title. For complete titles and order numbers of the documents for all products that are part of z/OS, see *z/OS V2R2 Information Roadmap*.

To find the complete z/OS library, including the z/OS Knowledge Center, see IBM Knowledge Center (<http://www.ibm.com/support/knowledgecenter/SSLTBW/welcome>).

## RACF courses

The following RACF classroom courses are available in the United States:

**H3917** *Basics of z/OS RACF Administration*

**H3927** *Effective RACF Administration*

**ES885** *Exploiting the Advanced Features of RACF*

**ES840** *Implementing RACF Security for CICS®*

IBM provides a variety of educational offerings for RACF. For more information about classroom courses and other offerings, either:

- See your IBM representative
- Call 1-800-IBM-TEACH (1-800-426-8322)

---

## Other sources of information

IBM provides customer-accessible discussion areas where RACF may be discussed by customer and IBM participants. Other information is also available through the Internet.

## Internet sources

The following resources are available through the Internet to provide additional information about the RACF library and other security-related topics:

- **Online library**

To view and print online versions of the z/OS publications, use this address:

<http://www.ibm.com/systems/z/os/zos/bkserv/>

- **Redbooks®**

The documents that are known as IBM Redbooks that are produced by the International Technical Support Organization (ITSO) are available at the following address:

<http://www.redbooks.ibm.com>

- **Enterprise systems security**

For more information about security on the S/390® platform, and z/OS, including the elements that comprise the Security Server, use this address:

<http://www.ibm.com/systems/z/advantages/security/>

- **RACF home page**

You can go to the RACF home page on the World Wide Web using this address:

<http://www.ibm.com/systems/z/os/zos/features/racf/>

- **RACF-L discussion list**

Customers and IBM participants may also discuss RACF on the RACF-L discussion list. RACF-L is not operated or sponsored by IBM; it is run by the University of Georgia.

To subscribe to the RACF-L discussion and receive postings, send a note to:

[listserv@listserv.uga.edu](mailto:listserv@listserv.uga.edu)

Include the following line in the body of the note, substituting your first name and last name as indicated:

```
subscribe racf-l first_name last_name
```

To post a question or response to RACF-L, send a note, including an appropriate Subject: line, to:

[racf-l@listserv.uga.edu](mailto:racf-l@listserv.uga.edu)

- **Sample code**

You can get sample code, internally developed tools, and exits to help you use RACF. This code works in our environment, at the time we make it available, but is not officially supported. Each tool or sample has a README file that describes the tool or sample and any restrictions on its use.

To access this code from a web browser, go to the RACF home page and select the “Resources” file tab, then select “Downloads” from the list, or go to <http://www-03.ibm.com/systems/z/os/zos/features/racf/goodies.html>.

The code is also available from [ftp.software.ibm.com](ftp://ftp.software.ibm.com) through anonymous FTP. To get access:

1. Log in as user **anonymous**.
2. Change the directory, as follows, to find the subdirectories that contain the sample code or tool you want to download:

```
cd eserver/zseries/zos/racf/
```

An announcement is posted on the RACF-L discussion list whenever something is added.

**Note:** Some web browsers and some FTP clients (especially those using a graphical interface) might have problems using [ftp.software.ibm.com](ftp://ftp.software.ibm.com) because of inconsistencies in the way they implement the FTP protocols. If you have problems, you can try the following:

- Try to get access by using a web browser and the links from the RACF home page.
- Use a different FTP client. If necessary, use a client that is based on command line interfaces instead of graphical interfaces.
- If your FTP client has configuration parameters for the type of remote system, configure it as UNIX instead of MVS.

## Preface

### Restrictions

Because the sample code and tools are not officially supported,

- There are no guaranteed enhancements.
- No APARs can be accepted.

---

## How to send your comments to IBM

We appreciate your input on this documentation. Please provide us with any feedback that you have, including comments on the clarity, accuracy, or completeness of the information.

Use one of the following methods to send your comments:

**Important:** If your comment regards a technical problem, see instead “If you have a technical problem.”

- Send an email to [mhvrcfs@us.ibm.com](mailto:mhvrcfs@us.ibm.com).
- Send an email from the "Contact us" web page for z/OS (<http://www.ibm.com/systems/z/os/zos/webqs.html>).

Include the following information:

- Your name and address
- Your email address
- Your phone or fax number
- The publication title and order number:
  - z/OS V2R2 Cryptographic Services PKI Services Guide and Reference
  - SA23-2286-02
- The topic and page number or URL of the specific information to which your comment relates
- The text of your comment.

When you send comments to IBM, you grant IBM a nonexclusive right to use or distribute the comments in any way appropriate without incurring any obligation to you.

IBM or any other organizations use the personal information that you supply to contact you only about the issues that you submit.

---

## If you have a technical problem

Do not use the feedback methods that are listed for sending comments. Instead, take one or more of the following actions:

- Visit the IBM Support Portal ([support.ibm.com](http://support.ibm.com)).
- Contact your IBM service representative.
- Call IBM technical support.

## Summary of changes

---

### Summary of changes for z/OS Version 2 Release 2 (V2R2) as updated March 2017

The following changes are made to z/OS Version 2 Release 2 (V2R2) as updated March 2017.

#### New

- The parameter, `CRLEnhancements` is added to Table 21 on page 68.

#### Changed

- The **Information needed** section in Table 21 on page 68 is updated for the parameter, `CRLDuration`.
- The **Information needed** section in Table 21 on page 68 is updated for the parameter, `EnableLargeCRLPosting`.
- A note is added to “Enabling support for large CRLs” on page 281.
- Chapter 26, “The `pkiserv.conf` configuration file,” on page 577 is updated to include the new parameter, `CRLEnhancements`.

---

### Summary of changes for z/OS Version 2 Release 2 (V2R2)

The following changes are made to z/OS Version 2 Release 2 (V2R2).

#### New

- “Planning considerations for installing and configuring PKI Services” on page 18 information is added.
- Variables `AdminNotifyModForm` and `PKCS12Content` are added to Table 21 on page 68.
- New Inserts `ObjectHeaderIEXP` and `ObjectHeaderIENONXP` are added to Table 31 on page 130. For more information, see “INSERT sections” on page 130, “What are substitution variables?” on page 128, and “Examining the INSERT section” on page 174.
- New template keyword `ADMINNUM`, has been added in “TEMPLATE sections” on page 142 and “Examining the `pkitmpl.xml` file” on page 234.
- “Customizing email notifications sent to users” on page 309 is updated to add the `%modreqlist%` variable.
- Signing algorithms for DSA are added to Chapter 26, “The `pkiserv.conf` configuration file,” on page 577 and “Updating the signature algorithm” on page 271.
- `FormPendingmsg2` is added to Chapter 5, “Configuring the UNIX runtime environment,” on page 61, “Steps for copying files” on page 63, “(Optional) Steps for updating the configuration file” on page 68, “Customizing email notifications sent to users” on page 309, “File system directory and subdirectories” on page 574, and Chapter 26, “The `pkiserv.conf` configuration file,” on page 577.
- Module `IRRSPX64` is added. For more information, see “Basic components of PKI Services and related products” on page 4.

- “Directories for JSP files” on page 261 and “Examining the INSERT section” on page 174 are updated because VBScript is no longer used.
- “Steps for accessing the end-user web pages” on page 362, “Steps for renewing a certificate” on page 378, “User tasks for setting up a Windows system and Internet Explorer to work with the PKI Services web application” on page 671, “Installing the PKI Services ActiveX program” on page 671, “Steps for installing the PKI Services ActiveX program when you renew a certificate” on page 674, “Administrator tasks for setting up a Windows system and Internet Explorer to work with the PKI Services web application” on page 677, and Appendix D, “Using the PKI Services web application with Internet Explorer on Windows systems,” on page 671 are updated because CAPICOM is no longer supported.

### Changed

- IBM HTTP Server 5.3 is no longer available. IBM HTTP Server - Powered by Apache is used, and updates can be found in these topics:
  - “Basic components of PKI Services and related products” on page 4
  - “IBM HTTP Server - Powered by Apache (optional)” on page 12
  - Chapter 7, “Updating IBM HTTP Server - Powered by Apache configuration and starting the server,” on page 93
  - “IBM HTTP Server - Powered by Apache configuration directives” on page 627
  - “Steps for enabling Simple Certificate Enrollment Protocol (SCEP)” on page 307
- The `pkiserv.tmp1` file is updated in the following sections:
  - “Examining the PKISERV application” on page 157
  - “Examining the CUSTOMERS application” on page 158
  - “Examining the TEMPLATE section” on page 170
  - “Examining the INSERT section” on page 174
- The Native Library Path field in “Steps for deploying the EAR file to a WebSphere Application Server” on page 257 is changed.
- The TemplateTool utility is updated support to handle multiple approvers.

---

## Summary of message changes for z/OS Version 2 Release 2 (V2R2)

The following message is new for z/OS Cryptographic Services PKI Services in z/OS V2R2. For more information, see *z/OS Cryptographic Services PKI Services Guide and Reference*.

### New

The following message is new:

IKYC090I

---

## z/OS Version 2 Release 1 summary of changes

See the following publications for all enhancements to z/OS Version 2 Release 1 (V2R1):

- *z/OS Migration*
- *z/OS Planning for Installation*
- *z/OS Summary of Message and Interface Changes*
- *z/OS Introduction and Release Guide*

---

## Part 1. Planning

The Planning part includes the following topics:

- Chapter 1, “Introducing PKI Services,” on page 3 provides an overview of PKI Services, its components, and related concepts.
- Chapter 2, “Planning your implementation,” on page 11 provides a planning overview for your implementation, including information about the components that work with PKI Services. It also contains information about the team members you need to implement PKI Services and the skills they needed.
- Chapter 3, “Installing and configuring prerequisite products,” on page 25 describes installing and configuring related products: the IBM HTTP Server - Powered by Apache, LDAP, and optionally ICSF and OCSF.

---

## Chapter 1. Introducing PKI Services

This topic provides an overview of PKI Services.

It covers the following topics:

- “What is PKI Services?”
- “What is a certificate authority?”
- “What is PKI?” on page 4
- “Basic components of PKI Services and related products” on page 4
- “Component diagram” on page 5
- “Supported standards” on page 7
- “Supported certificate types” on page 7
- “Supported certificate fields and extensions” on page 8

---

### What is PKI Services?

z/OS Cryptographic Services PKI Services allows you to use z/OS to establish a PKI infrastructure and serve as a certificate authority for your internal and external users, issuing and administering digital certificates in accordance with your own organization's policies. Your users can use a PKI Services application to request and obtain certificates through their own web browsers, while your authorized PKI administrators approve, modify, or reject these requests through their own web browsers. The web applications provided with PKI Services are highly customizable, and a programming exit is also included for advanced customization. You can allow automatic approval for certificate requests from certain users and, to provide additional authentication, add host IDs, such as RACF user IDs, to certificates you issue for certain users. You can also issue your own certificates for browsers, servers, and other purposes, such as virtual private network (VPN) devices, smart cards, and secure email.

PKI Services supports Public Key Infrastructure for X.509 version 3 (PKIX) and Common Data Security Architecture (CDSA) cryptographic standards. It also supports the following functions:

- The delivery of certificates through the Secure Sockets Layer (SSL) for use with applications that are accessed from a web browser or web server.
- The delivery of certificates that support the Internet Protocol Security standard (IPSEC) for use with secure VPN applications or IPSEC-enabled devices.
- The delivery of certificates that support Secure Multipurpose Internet Mail Extensions (S/MIME), for use with secure email applications.

z/OS is certified as IdenTrust™ compliant. This allows z/OS installations to participate in the IdenTrust infrastructure by configuring PKI Services to operate as an IdenTrust compliant certificate authority (CA). For details, see Appendix C, “Configuring PKI Services as an IdenTrust certificate authority,” on page 659.

### What is a certificate authority?

The certificate authority, commonly called a CA, acts as a trusted third party to ensure that users who engage in e-business can trust each other. A certificate authority vouches for the identity of each party through the certificates it issues. In

## Introducing PKI Services

In addition to proving the identity of the user, each certificate includes a public key that enables the user to verify and encrypt communications.

The trustworthiness of the parties depends on the trust that is placed in the CA that issued the certificates. To ensure the integrity of a certificate, the CA digitally signs the certificate as part of creating it, using its signing private key. Trying to alter a certificate invalidates the signature and renders it unusable.

Protecting the CA's signing private key is critical to the integrity of the CA. For this reason, you should consider using ICSF to securely store your PKI Services CA's private key.

As a CA using PKI Services, you can do the following tasks:

- Track certificates you issue with an issued certificate list (ICL) that contains a copy of each certificate, indexed by serial number
- Track revoked certificates using certificate revocation lists (CRLs). When a certificate is revoked, PKI Services updates the CRL during the next periodic update. Just as it signs certificates, the CA digitally signs all CRLs to vouch for their integrity.

## What is PKI?

The public key infrastructure (PKI) provides applications with a framework for performing the following types of security-related activities:

- Authenticate all parties that engage in electronic transactions
- Authorize access to sensitive systems and repositories
- Verify the author of each message through its digital signature
- Encrypt the content of all communications.

The PKIX standard evolved from PKI to support the interoperability of applications that engage in e-business. Its main advantage is that it enables organizations to conduct secure electronic transactions without regard for operating platform or application software package.

The PKIX implementation in PKI Services is based on the Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile, RFC 5280.

---

## Basic components of PKI Services and related products

*Table 1. Basic components of PKI Services and related products*

Component	Description
Administration web application	Assists authorized administrators to review requests for certificates, approve or reject requests, renew certificates, or revoke certificates through their own web browsers. The application consists of sample screens that you can easily customize to display your organization's logo. It also supports the following tasks: <ul style="list-style-type: none"><li>• Reviewing pending certificate requests</li><li>• Querying pending requests to process those that meet certain criteria</li><li>• Displaying detailed information about a certificate or request</li><li>• Monitoring certificate information, such as validity period</li><li>• Annotating the reason for an administrative action</li></ul>
DB2 (optional)	Provides an alternative to VSAM data sets as the repository for the object store (request database) and issued certificate list (ICL).

Table 1. Basic components of PKI Services and related products (continued)

Component	Description
End-user web application	Guides your users to request, obtain, and renew certificates through their web browsers. The application consists of sample screens that you can easily customize to meet your organization's needs for certificate content and standards for appearance. It offers several certificate templates that you can use to create requests for various certificate types, based on the certificate's intended purpose and validity period, and supports certificate requests that are automatically approved.
Exit	Provides advanced customization including additional authorization checking, additional validation, changes to parameters on calls to the R_PKIServ callable service (IRRSPX00 and IRRSPX64), and capture of certificates for further processing. An exit program can be called from the daemon, for automatic certificate renewal, or from the PKIServ CGIs. Exit methods can be called from JavaServer pages (JSPs). The exit program and methods support both preprocessing and post-processing functions. A code sample in C language code is included.
IBM HTTP Server (optional)	PKI Services uses the web server to encrypt messages, authenticate requests, and transfer certificates to intended recipients if you implement the PKI Services web application using REXX CGI scripts. You can use IBM HTTP Server - Powered by Apache as the web server.
ICSF (optional)	Securely stores the PKI Services certificate authority's private signing key and key pairs that PKI Services generates for certificates.
LDAP	The directory that maintains information about the valid and revoked certificates that PKI Services issues in an LDAP-compliant format. You can use an LDAP server such as the one provided by IBM Tivoli® Directory Server for z/OS.
PKI Services daemon	The server daemon that acts as your certificate authority, confirming the identities of users and servers, verifying that they are entitled to certificates with the requested attributes, and approving and rejecting requests to issue and renew certificates. It includes support for: <ul style="list-style-type: none"> <li>• An issued certificate list (ICL) to track issued certificates</li> <li>• Certificate revocation lists (CRLs) to track revoked certificates</li> </ul>
R_PKIServ callable service (IRRSPX00 and IRRSPX64)	The application programming interface (API) that allows authorized applications, such as servers, to programmatically request the functions of PKI Services to generate, retrieve and administer certificates.
RACF (or equivalent)	Controls who can use the functions of the R_PKIServ callable service and protects the components of your PKI Services system. RACF creates your certificate authority's certificate, key ring and private key. You can also use it to store the private key, if ICSF is not available.
WebSphere Application Server (optional)	Serves as the application server if you implement the PKI Services web application using JavaServer pages (JSPs).

## Component diagram

Figure 1 on page 6 shows a typical PKI Services system.

## Introducing PKI Services

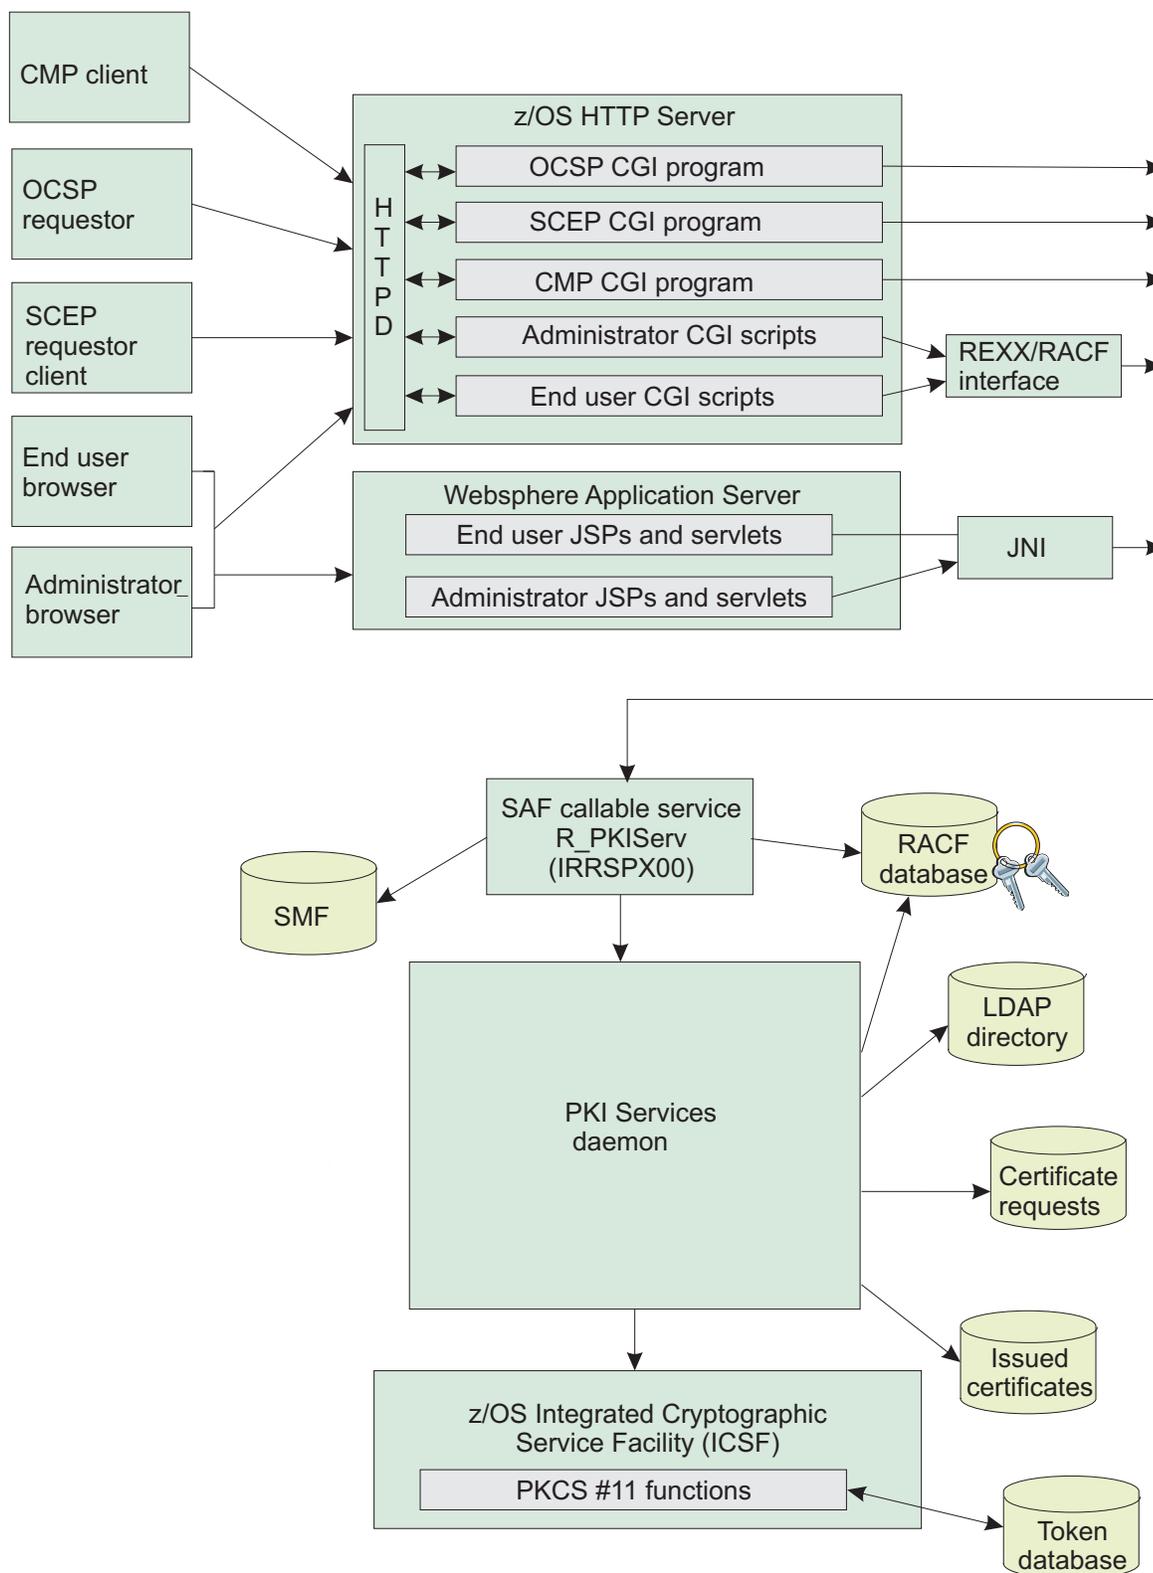

Figure 1. Component diagram of a typical PKI Services system

## Supported standards

PKI Services supports the following standards for public key cryptography:

- Secure Sockets Layer (SSL) version 2 and version 3, with client authentication
- PKCS #10 browser and server certificate format, with a base64-encoded response
- IPSEC certificate format
- S/MIME certificate format
- Browser certificates for:
  - 32-bit versions of Microsoft Internet Explorer
  - Mozilla-based browsers such as Mozilla Firefox
- Server certificates
- LDAP standard for communications with the directory
- X.509v3 certificates
- Certificate revocation lists (CRLv2)
- Key lengths up to 4096 bits for the RSA CA signing private keys and up to 1024 bits for DSA keys
- RSA algorithms for encryption and signing
- DSA algorithms for signing
- ECC algorithms for encryption and signing
- RFC 2560: *Online Certificate Status Protocol - OCSP*
- RFC 4291: *IP Version 6 Addressing Architecture*
- RFC 4210: *Internet X.509 Public Key Infrastructure Certificate Management Protocol (CMP)*
- RFC 4211 *Internet X.509 Public Key Infrastructure Certificate Request Message Format (CRMF)*
- RFC 6277 *Online Certificate Status Protocol Algorithm Agility*
- Cisco Systems' Simple Certificate Enrollment Protocol (SCEP)

The LDAP standard that PKI Services supports is LDAP Version 2. A directory using LDAP Version 3 (with RFC 1779 syntax) is acceptable if it is backwardly compatible with Version 2.

PKI Services supports the RDNs needed for an Extended Validation (EV) certificate. The criteria for issuing EV certificates are defined by the Guidelines for Extended Validation Certificates produced by the CA/Browser Forum, at [http://www.cabforum.org/Guidelines\\_v1\\_3.pdf](http://www.cabforum.org/Guidelines_v1_3.pdf). PKI Services does not enforce these criteria. If you want to issue EV certificates, it is your responsibility to enforce the criteria.

## Supported certificate types

Table 2 lists the types of certificates that you can request, based on the certificate templates that are included with PKI Services. Certificate templates are samples of the most commonly requested certificate types. You can add, modify, and remove certificate templates to customize the variety of certificate types you offer to your users.

*Table 2. Types of certificates you can request*

Type of certificate	Use
One-year PKI SSL browser certificate	End-user client authentication using SSL

## Introducing PKI Services

Table 2. Types of certificates you can request (continued)

Type of certificate	Use
One-year PKI S/MIME browser certificate	Browser-based email encryption
One-year PKI generated key certificate	Generation of public and private keys by PKI Services
Two-year EV SSL server certificate	SSL web server certification with verification of the subject's identity meeting the guidelines for extended validation (EV) certificates.
Two-year PKI browser certificate for authenticating to z/OS	End-user client authorization using SSL when logging on to z/OS
Two-year PKI Authenticode - code signing server certificate	Software signing
Two-year PKI Windows logon certificate	End-user client authentication for an Active Directory user logging in to a Windows desktop using a smart card
Five-year PKI SSL server certificate	SSL web server certification
Five-year PKI IPSEC server (firewall) certificate	Firewall server identification and key exchange
Five-year PKI intermediate CA server certificate	Subordinate (non-self-signed) certificate authority certification
Five-year SCEP certificate	Creation of a preregistration record for certificate requestors. (Certificate requestors using Simple Certificate Enrollment Protocol (SCEP) must be preregistered.)  Unlike other templates, this template is intended for administration use only.
<i>n</i> -year PKI browser certificate for extensions demonstration	Demonstration of all extensions supported by PKI Services
One-year SAF browser certificate	End-user client authentication where the security product (RACF, not PKI Services) is the certificate provider <b>Note:</b> The certificate generated by this template cannot be managed by the PKI Services administrator.
One-year SAF server certificate	Web server SSL certification where the security product (RACF, not PKI Services) is the certificate provider <b>Note:</b> The certificate generated by this template cannot be managed by the PKI Services administrator.

**Note:** You can customize certificate templates to add, modify, and remove certificate types.

---

## Supported certificate fields and extensions

PKI Services certificates support most of the fields and extensions defined in the X.509 version 3 (X.509v3) standard. This support lets you use these certificates for most cryptographic purposes, such as SSL, IPSEC, VPN, and S/MIME.

PKI Services supports Basic Latin and Latin-1 supplement characters in the Subject Distinguished Name, Issuer Distinguished Name and Othername in Subject Alternate Name.

PKI Services certificates can include the following types of extensions:

### **Standard extensions**

The standard X.509v3 certificate extensions:

- authority information access
- authority key identifier
- basic constraints
- certificate policies
- certificate revocation list (CRL) distribution points
- extended key usage
- key usage
- subject alternate name
- subject key identifier

### **Other extensions**

Extensions that are unique to PKI Services, such as host identity mapping. This extension associates the subject of a certificate with a corresponding identity on a host system, such as with a RACF user ID.

To support your organization's policies, PKI Services provides the means for you to select and customize the supported certificate extensions. For example, you can change the extensions that are specified in the default certificate templates or create templates that return certificates with different extensions. In addition, you can include your own extensions in your certificates by defining custom extensions.

---

## Chapter 2. Planning your implementation

The implementation of PKI Services requires the interaction of several software products, each with its own required skills. Therefore, it is important to understand the tasks involved and to plan your implementation.

This topic provides the information you need to understand the task of implementing PKI Services, determine which skills are required to complete your implementation team, and create your own implementation plan.

This topic covers the following topics:

- “Installing PKI Services”
- “Determining prerequisite products” on page 12
- “Identifying skill requirements” on page 13
- “Creating an implementation plan” on page 17.

---

### Installing PKI Services

Your MVS programmer uses SMP/E to install PKI Services into a file system directory. By default, PKI Services is installed in the `/usr/lpp/pkiserv` directory but the MVS programmer can determine whether to change the default for this and other directories. Before your team begins installing and configuring prerequisite products and setting up PKI Services, you need to know which file system directories were used so you can customize the installation process.

Table 3 shows each file system variable with its description and default value. Your MVS programmer should review the rightmost column of this table, crossing out any defaults that have changed and recording the correct directory names.

Table 3. File system directory variables

Variable name	Description	Default value or customized value
<i>variables-dir</i>	The file system directory where PKI Services creates working files.	<code>/var/pkiserv</code>
<i>install-dir</i>	The file system directory where PKI Services is installed.	<code>/usr/lpp/pkiserv</code>
<i>runtime-dir</i>	The file system directory where PKI Services looks for configuration files.	<code>/etc/pkiserv</code>

---

### Requirements for sysplex support

If your installation plans to use sysplex support (running multiple independent instances of PKI Services, one per image, that work in unison):

- If you are using VSAM data sets for the object store and ICL, all systems in the sysplex that run PKI Services must have the same release of z/OS installed, and all instances of PKI Services must share the same VSAM data sets. To do so, they use VSAM record-level sharing (RLS). This requires setting up a coupling facility for data sharing (lock and cache).
- If you are using DB2 tables for the object store and ICL, all systems in the sysplex that run PKI Services must be at z/OS V1R13 or later and have the same

## Planning your implementation

release of z/OS installed. DB2 Version 9 or higher must be installed and the DB2 subsystems that share data must belong to a DB2 data sharing group that runs on a sysplex cluster.

See “(Optional) preliminary steps for establishing VSAM RLS” on page 109 for information about creating VSAM data sets suitable for VSAM RLS. For information about establishing a Parallel Sysplex® environment with a coupling facility, see *z/OS MVS Programming: Sysplex Services Guide*. For more information about establishing data sharing for VSAM RLS, see *z/OS DFSMS Introduction* and *z/OS DFSMSdfp Storage Administration*.

---

## Determining prerequisite products

The installation and use of PKI Services requires the following products:

- “IBM HTTP Server - Powered by Apache (optional)”
- “WebSphere Application Server (optional)”
- “LDAP directory server” on page 13
- “OCSF (optional)” on page 13
- “ICSF (optional)” on page 13
- “sendmail (optional)” on page 13
- “OCEP (optional)” on page 13.
- “DB2 (optional)” on page 13.

The installation and use of RACF, or an equivalent security product, is required.

### IBM HTTP Server - Powered by Apache (optional)

In a PKI Services system, if you implement the web application using REXX CGI execs the HTTP server handles all requests that it receives from a web browser. The requests can include requests for new certificates and requests to renew or revoke existing certificates. If needed, it performs authentication before allowing any exchange of information to take place. The IBM HTTP Server - Powered by Apache is required if you use the REXX CGI web application or if you use one or more of the CGI programs. CGI programs provide OCSP, SCEP, and the CMP support for PKI Services.

PKI Services supports IBM HTTP Server - Powered by Apache. It is part of the IBM z/OS operating system. For more information, see <http://www.ibm.com/software/products/us/en/http-servers>. It is also included with WebSphere® Application Server.

The HTTP server must be installed on the same system on which PKI Services is installed. SSL-enablement is required. If your HTTP server is SSL-enabled, your key file can be a RACF key ring, or a key file created by another product. For more information, see “Steps for installing and configuring the IBM HTTP Server - Powered by Apache to work with PKI Services” on page 26.

### WebSphere Application Server (optional)

If you implement the PKI Services web application using JavaServer pages (JSPs), you must use WebSphere Application Server 6.1 or higher. An application server is a Java virtual machine (JVM) running user applications. WebSphere Application Server provides application servers that handle web application requests.

If you implement the PKI Services web application using REXX CGI execs, WebSphere Application Server is not required.

### **LDAP directory server**

Use of an LDAP server is required to maintain information about PKI Services certificates in a centralized location. The z/OS LDAP server provided by IBM Tivoli Directory Server for z/OS is preferred, but you can use a non-z/OS LDAP server if it can support the objectclasses and attributes that PKI Services uses. Typical PKI Services usage requires an LDAP directory server that supports the LDAP (Version 2) protocol (and the PKIX schema). If you use the z/OS LDAP server provided by IBM Tivoli Directory Server for z/OS, configure it for either the TDBM or LDBM backend.

Through the integration of the z/OS LDAP server with DB2, the directory can support millions of directory entries. It also allows client applications, such as PKI Services, to perform database storage, update, and retrieval transactions. For more information, see “Steps for installing and configuring LDAP” on page 27.

### **OCSF (optional)**

You need to install and configure OCSF if your installation plans to write an application to implement the use of PKI Trust Policy (PKITP). For more information, see “Installing and configuring OCSF” on page 31.

### **ICSF (optional)**

ICSF is preferred but not required. You can begin using PKI Services without installing ICSF and install it later without reinstalling PKI Services. ICSF is strongly suggested to store and protect your certificate authority's private key. If you plan to have PKI Services generate key pairs for certificates, you must install ICSF and set up the ICSF PKCS #11 token data set (TKDS). For more information, see “Installing and configuring ICSF (optional)” on page 29.

### **sendmail (optional)**

You need to configure sendmail if your installation plans to send email notifications to users for certificate-related events, such as certificate expiration. For more information, see “Configuring sendmail (optional)” on page 30.

### **OCEP (optional)**

You need to install and configure OCEP if your installation plans to write an application to implement the use of PKI Trust Policy (PKITP). For more information, see “Configuring and getting started with PKITP” on page 492.

### **DB2 (optional)**

You need to install and configure DB2 if your installation chooses to implement the object store and issued certificate list (ICL) using DB2 instead of VSAM. For more information, see Chapter 9, “Creating the object store and ICL,” on page 107.

---

## Identifying skill requirements

The implementation of PKI Services requires the interaction of several software products, each with its own required skills. This means that your team might consist of people from several different disciplines, particularly if you work with a large organization.

## Planning your implementation

This section provides the information that you need to determine which skills are required to complete your implementation. These skills are presented in terms of job titles for people who specialize in those skills. For example, a task requiring MVS skills is referred to as a task for an MVS programmer. Therefore, if some of your team members have multiple skills, you might require fewer individuals to complete your team.

### Team members

Your team for installing and configuring prerequisite products and setting up PKI Services should include the following members:

- DB2 database administrator (DBA) (optional)
- ICSF programmer (optional)
- LDAP programmer
- MVS programmer
- OCEP programmer (optional)
- OCSF programmer (optional)
- RACF administrator
- UNIX programmer
- Web server programmer

You might want to include a web page designer to customize your PKI Services web applications. This task is listed in the topic as a task for a web server programmer.

One or more PKI administrators are needed to manage your ongoing operation as a certificate authority when your PKI Services system is set up. The responsibilities of these administrators include approving, modifying, and rejecting certificate requests and revoking certificates. It might be advisable to appoint a PKI administrator early, and involve this person in your planning.

**Important:** PKI administrators play a powerful role in your organization. The decisions that they make when managing certificates and certificate requests determine who accesses your computer systems and what privileges they have when doing so. Assign PKI administration duties to only highly trusted individuals.

### Skills for setting up prerequisite products

The following table lists team members (alphabetically) and tasks and required skills needed for installing and configuring prerequisite products:

Table 4. Tasks and skills needed for installing prerequisite products

Role	Tasks	Required skills	Documented in:
DB2 database administrator (DBA)	(Optionally) installing and configuring DB2 (if not already done)	DB2 installation and configuration skills	<ul style="list-style-type: none"><li>• <i>Installation Guide</i> for your version of DB2.</li></ul>
ICSF programmer	(Optionally) installing and configuring ICSF (if not already done)	ICSF installation and configuration skills	<ul style="list-style-type: none"><li>• <i>z/OS Cryptographic Services ICSF Administrator's Guide</i></li><li>• <i>z/OS Cryptographic Services ICSF Application Programmer's Guide</i></li><li>• <i>z/OS Cryptographic Services ICSF System Programmer's Guide</i></li></ul>

Table 4. Tasks and skills needed for installing prerequisite products (continued)

Role	Tasks	Required skills	Documented in:
ICSF programmer	(Optionally) setting up the ICSF PKCS #11 token data set (TKDS) (if not already done)	ICSF installation and configuration skills	<ul style="list-style-type: none"> <li>• <i>z/OS Cryptographic Services ICSF Writing PKCS #11 Applications</i></li> </ul>
LDAP programmer	Installing and configuring LDAP (if not already done) and recording information	LDAP installation and configuration skills	<ul style="list-style-type: none"> <li>• <i>z/OS IBM Tivoli Directory Server Administration and Use for z/OS</i></li> </ul>
OCEP programmer	(Optionally) Installing and configuring OCEP for use with PKITP	OCEP installation and configuration skills	<ul style="list-style-type: none"> <li>• <i>Integrated Security Services Open Cryptographic Enhanced Plug-ins Application Programming</i></li> </ul>
OCSF programmer	(Optionally) Installing and configuring OCSF for use with PKITP	OCSF installation and configuration skills	<ul style="list-style-type: none"> <li>• <i>z/OS Open Cryptographic Services Facility Application Programming</i></li> </ul>
UNIX programmer	(Optionally) Configuring sendmail if your installation is planning to send email notifications to users about certificates	<ul style="list-style-type: none"> <li>• Basic UNIX commands such as the <b>cp</b> (copy) command and <b>mkdir</b> (make directory) command</li> <li>• sendmail configuration skills</li> </ul>	<ul style="list-style-type: none"> <li>• <i>z/OS Communications Server: IP Configuration Guide</i></li> </ul>
Web server programmer	If you are implementing the PKI Services web application using REXX CGI execs, or if you plan to use OCSP, SCEP, or CMP protocols: Installing and configuring the IBM HTTP Server - Powered by Apache (if not already configured for at least non-SSL pages) and recording information	IBM HTTP Server - Powered by Apache installation and configuration skills	WebSphere Application Server Library ( <a href="http://www.ibm.com/software/webservers/appserv/was/library/">http://www.ibm.com/software/webservers/appserv/was/library/</a> )
	If you are implementing the PKI Services web application using JavaServer pages (JSPs): Installing and configuring WebSphere Application Server	WebSphere Application Server installation and configuration skills	<ul style="list-style-type: none"> <li>• The information center for your release of WebSphere Application Server, at WebSphere Application Server Library (<a href="http://www.ibm.com/software/webservers/appserv/was/library/">http://www.ibm.com/software/webservers/appserv/was/library/</a>)</li> </ul>

Your team needs to install and configure prerequisite products before setting up PKI Services:

1. The web server programmer installs and configures the IBM HTTP Server - Powered by Apache (if you are implementing the PKI Services web application using REXX CGI execs or intend to use OCSP, SCEP, or CMP protocols) or WebSphere Application Server (if you are implementing the PKI Services web application using JavaServer pages).
2. The LDAP programmer installs and configures LDAP.
3. Optionally, the ICSF programmer installs and configures ICSF, and optionally sets up the token data set (TKDS).

## Planning your implementation

4. Optionally, the OCEP programmer installs and configures the OCEP.
5. Optionally, the OCSF programmer installs and configures the OCSF.
6. Optionally, the DB2 database administrator installs and configures DB2.

See Chapter 3, “Installing and configuring prerequisite products,” on page 25 for details about performing these tasks.

## Skills for setting up PKI Services

The following table lists team members (alphabetically) and the tasks and skills needed for setting up PKI Services:

Table 5. Roles, tasks, and skills for setting up PKI Services

Role	Tasks	Required skills	Documented in:
DB2 database administrator	<ul style="list-style-type: none"> <li>• Creates DB2 tables, package, and plan for the object store and issued certificate list (ICL).</li> </ul>	<ul style="list-style-type: none"> <li>• DB2 programming skills</li> <li>• DB2 administration skills</li> </ul>	<ul style="list-style-type: none"> <li>• <i>Application Programming and SQL Guide</i></li> <li>• <i>Command Reference</i></li> <li>• <i>SQL Reference</i></li> </ul> <p>for your version of DB2.</p>
LDAP programmer	<ul style="list-style-type: none"> <li>• Customizes LDAP configuration for PKI Services</li> </ul>	<ul style="list-style-type: none"> <li>• LDAP customization skills</li> </ul>	<ul style="list-style-type: none"> <li>• <i>z/OS IBM Tivoli Directory Server Administration and Use for z/OS</i></li> </ul>
MVS programmer	<ul style="list-style-type: none"> <li>• (Optionally) Creates VSAM object store and ICL data sets and indexes</li> <li>• (Optionally) sets up VSAM RLS</li> <li>• Starts the PKI Services daemon</li> </ul>	<ul style="list-style-type: none"> <li>• Basic MVS skills               <ul style="list-style-type: none"> <li>– Editing a data set</li> <li>– ISPF COPY command</li> <li>– MVS console START command</li> </ul> </li> <li>• JCL knowledge to change job card</li> <li>• Basic browser and web skills</li> </ul>	<ul style="list-style-type: none"> <li>• <i>z/OS MVS System Commands</i></li> </ul>
RACF administrator	<ul style="list-style-type: none"> <li>• Adds groups and user IDs</li> <li>• Sets up access control</li> <li>• Creates certificates</li> <li>• Sets up daemon security</li> </ul>	<ul style="list-style-type: none"> <li>• RACF administration</li> <li>• REXX skills (for working with IKYSETUP REXX exec)</li> <li>• RACF commands such as:               <ul style="list-style-type: none"> <li>– ADDGROUP</li> <li>– ADDSD</li> <li>– ADDUSER</li> <li>– RACDCERT</li> <li>– RDEFINE</li> <li>– PERMIT</li> <li>– SETROPTS</li> </ul> </li> <li>• TSO skills</li> </ul>	<ul style="list-style-type: none"> <li>• <i>z/OS TSO/E REXX Reference</i></li> <li>• <i>z/OS UNIX System Services Planning</i></li> <li>• <i>z/OS Security Server RACF Security Administrator's Guide</i></li> </ul>

Table 5. Roles, tasks, and skills for setting up PKI Services (continued)

Role	Tasks	Required skills	Documented in:
UNIX programmer	<ul style="list-style-type: none"> <li>• Copies files</li> <li>• (Optionally) customizes environment variables</li> <li>• (Optionally) customizes (non-LDAP sections of) pkiserv.conf configuration file</li> <li>• Sets up /var/pkiserv directory</li> <li>• Updates the LDAP section of the pkiserv.conf configuration file</li> </ul>	<ul style="list-style-type: none"> <li>• Basic UNIX commands, such as the <b>cp</b> (copy) command</li> <li>• Getting superuser authority</li> </ul>	<ul style="list-style-type: none"> <li>• <i>z/OS UNIX System Services Command Reference</i></li> <li>• <i>z/OS UNIX System Services Planning</i></li> </ul>
Web server programmer	<ul style="list-style-type: none"> <li>• Helps set up PKI Services               <ul style="list-style-type: none"> <li>– If you are implementing the PKI Services web application using REXX CGI execs: Updates the IBM HTTP Server - Powered by Apache configuration files and starts the IBM HTTP Server - Powered by Apache</li> <li>– If you are implementing the PKI Services web application using JavaServer pages (JSPs), updates the enterprise archive (EAR) file and deploys updated JSP files to a WebSphere Application Server.</li> </ul> </li> <li>• Customizes the PKI Services web pages</li> </ul>	<ul style="list-style-type: none"> <li>• IBM HTTP Server - Powered by Apache customization skills</li> <li>• WebSphere Application Server customization and administration skills</li> <li>• Editing configuration files</li> <li>• Customizing the web pages</li> </ul>	WebSphere Application Server Library ( <a href="http://www.ibm.com/software/webservers/appserv/was/library/">http://www.ibm.com/software/webservers/appserv/was/library/</a> )

## Creating an implementation plan

Your implementation plan should include major subtasks, responsible parties, and a realistic estimate of time and effort required. The major tasks for implementing PKI Services are provided here as a basis for you to build your own plan.

## Planning considerations for installing and configuring PKI Services

Table 6 contains information that might affect how PKI Services is installed and configured. These concerns can help you to assess the size of your administrative staff, determine what required products might be needed, and what features of PKI Services might need to be used to meet your needs.

Table 6. Considerations before installing and configuring PKI Services

Considerations	Affects on PKI Services configuration and operation	Topic
<p><b>Capability considerations:</b></p> <p>What types of certificates does this installation of PKI Services support?</p> <p>Does this installation provide customized certificate types or unique certificate types?</p>	<p>Impacts how the template files <code>pkiserv.tmp1</code> and <code>pkitmp1.xml</code> are modified when deciding what certificate types to support, and whether any customized types are supported.</p>	<p>See "Supported certificate types" on page 7 for the list of supported certificate types.</p> <p>See Chapter 11, "Customizing the end-user web application if you use REXX CGI execs," on page 127 for more information about the <code>pkiserv.tmp1</code> file.</p>
<p>Does this installation of PKI Services need to be able to generate key pairs on behalf of the certificate requester?</p>	<p>Deciding whether to configure PKI Services to generate key pairs determines whether an ICSF programmer is needed, and what tasks are needed to be performed. This also affects how the <code>IKYSETUP</code> script is customized.</p>	<p>See "Installing and configuring ICSF (optional)" on page 29.</p>
<p>How do your PKI Services administrators and clients request and manage certificates?</p> <p>Does this installation provide a web browser interface to your clients?</p>	<p>Providing a browser interface requires a choice between using JavaServer Pages (JSPs) or REXX CGI execs to implement the web pages. This choice decides whether WebSphere Application Server or the IBM HTTP Server (IHS) is used to handle the web browser traffic. A web server programmer is needed to configure either server.</p> <p>Choosing a web browser interface might require updates to the <code>pkiserv.tmp1</code> for REXX CGI execs or <code>pkitmp1.xml</code> and JSPs installed by PKI Services. This is to support the specific features that this installation wants to provide to administrator and clients. This impacts how the template files <code>pkiserv.tmp1</code> and <code>pkitmp1.xml</code> are modified.</p>	<p>For assistance on customizing the IBM HTTP Server (IHS), see Chapter 7, "Updating IBM HTTP Server - Powered by Apache configuration and starting the server," on page 93.</p> <p>Chapter 13, "Implementing the web application using JavaServer pages," on page 233 contains information about customizing the default JSPs.</p> <p>See Chapter 11, "Customizing the end-user web application if you use REXX CGI execs," on page 127 for more information about the <code>pkiserv.tmp1</code> file.</p>
<p>Does this installation allow certificate management through SCEP, OCSP, or CMP protocols?</p>	<p>Supporting SCEP, OCSP, or CMP protocols requires that the IBM HTTP Server (IHS) is enabled, regardless of the choice that is made for any web browser support. A web server programmer must configure the IBM HTTP Server.</p>	<p>For more information about using SCEP, OCSP, see Chapter 14, "Advanced customization," on page 267. For more information about CMP, see Chapter 19, "Using the certificate management protocol (CMP) with PKI Services," on page 435.</p>

Table 6. Considerations before installing and configuring PKI Services (continued)

Considerations	Affects on PKI Services configuration and operation	Topic
<p>Does this installation need to provide certificate revocation information. If so, does it provide this information through OCSP protocols or through certificate revocation lists (CRLs)?</p>	<p>To provided CRL information, modifications might be required to the PKI Services configuration file <code>pkiserv.conf</code>.</p> <p>To provided OCSP information, modifications might be required to the PKI Services template file <code>pkiserv.tpl</code> or <code>pkitmpl.xml</code>.</p> <p>A z/OS UNIX System Services programmer might be needed if CRLs are stored to a z/OS UNIX System Services directory. New PKI Services installations should use this feature. Existing PKI Services installations should enable and upgrade to this feature.</p> <p>An LDAP programmer might be needed if CRLs are to be posted to an LDAP directory server.</p> <p>If certificate revocation information is made available through OCSP or CRL using <code>http</code> protocol, a web server programmer must configure the IBM HTTP Server - Powered by Apache.</p>	<p>See “Optionally updating the <code>pkiserv.conf</code> configuration file” on page 66 for details about the options for the <code>pkiserv.conf</code> file.</p> <p>Assistance for configuring the LDAP server for PKI Services is provided in Chapter 6, “Tailoring the LDAP configuration for PKI Services,” on page 89. To store CRL information in a z/OS UNIX System Services directory, see “Enabling support for large CRLs” on page 281.</p> <p>Chapter 7, “Updating IBM HTTP Server - Powered by Apache configuration and starting the server,” on page 93 contains descriptions of the IBM HTTP Server configuration features required by PKI Services.</p>

## Planning your implementation

Table 6. Considerations before installing and configuring PKI Services (continued)

Considerations	Affects on PKI Services configuration and operation	Topic
<p><b>Scaling considerations:</b></p> <p>What volume of certificate requests is this installation expected to handle?</p> <p>How many certificates is this installation expected to manage and track?</p>	<p>The expected volume of request traffic and managed certificates affects how many PKI Services administrators are needed to provide complete coverage. The number of PKI Services administrators affects how the sample IKYSETUP script is modified for this installation.</p> <p>This consideration also impacts the choice of backend storage for PKI Services: the default VSAM storage mechanism for typical installations; the optional DB2 storage mechanism for large-scale installations.</p> <p>If DB2 is used as the backend storage, DB2 must be installed before installing and configuring PKI Services, and the services of a DB2 database administrator is required.</p> <p>Also, the more certificates that are issued by a CA, the more certificates that can be potentially revoked. New PKI Services installations should choose to use the large CRL support in PKI Services; existing PKI Services installations should consider enabling and upgrading to the large CRL support. A z/OS UNIX System Services programmer is needed to enable and configure this feature.</p> <p>Large scale PKI Services installations that can generate a large volume of certificates or CRLs also impacts the planning tasks of the LDAP programmer, who must account for the storage that these certificates and CRLs can consume in LDAP.</p>	<p>Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35 contains information about how to tailor the IKYSETUP script for the needs of your installation.</p> <p>To set up VSAM as the backing storage, see “Creating the object store and ICL using VSAM data sets” on page 108 and the IKYSETUP instructions in Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35.</p> <p>To set up DB2 as the backing storage when DB2 is installed and configured, see “Creating the object store and ICL using DB2 tables” on page 115. To correctly modify IKYSETUP to configure PKI Services for DB2, see “Deciding the value of db2_repos and db2_subsys” on page 43.</p> <p>For instructions about enabling large CRL support and storing CRLs in a z/OS UNIX System Services directory, see “Enabling support for large CRLs” on page 281.</p> <p>For information about configuring LDAP to support PKI Services, see Chapter 6, “Tailoring the LDAP configuration for PKI Services,” on page 89.</p>
<p>Do you plan to suspend and resume certificates as a regular task in your normal operation?</p>	<p>If suspension and resumption of certificates are a regular occurrence, this increases the number of revoked certificates, and also factors in to the CRL support that is chosen for this installation.</p>	<p>For instructions on storing large CRLs, see “Enabling support for large CRLs” on page 281.</p>
<p><b>Structural considerations:</b></p> <p>Is more than one CA hosted by a single z/OS image?</p>	<p>PKI Services can support multiple concurrently operating CAs within a single installation. Each CA operates within its own PKI Services CA domain.</p>	<p>Information about using and establishing multiple CA domains is in “Adding a new CA domain” on page 287.</p>
<p>Is this installation of PKI Services acting as a root certificate authority (CA) or an intermediate certificate authority?</p>	<p>By default, PKI Services is configured to be a single root certificate authority. PKI Services can be configured to be an intermediate CA using additional procedures.</p>	<p>The procedure for changing PKI Services to an intermediate CA are in “Establishing PKI Services as an intermediate CA” on page 466.</p>

Table 6. Considerations before installing and configuring PKI Services (continued)

Considerations	Affects on PKI Services configuration and operation	Topic
<p><b>Procedural considerations:</b></p> <p>Do clients of PKI Services expect around-the-clock support?</p> <p>What vetting procedures are used to determine whether certificate requests should be approved or rejected? Do any of these procedures require the approval of multiple parties?</p>	<p>Administrative coverage and vetting procedures influence how many people are designated to be PKI Services administrators. The identities of PKI Services administrators are needed to correctly update the IKYSETUP script.</p> <p>If multiple parties are involved in vetting individual requests, the templates that are used for those requests in the <code>pkiserv.tmp1</code> and <code>pkitmp1.xml</code> files should be updated to enable multiple administrative approvals.</p>	<p>Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35 contains information about how to tailor the IKYSETUP script for the needs of your installation.</p> <p>For more information about granting administrative access to users, see “Authorizing administrative functions” on page 477.</p> <p>See Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127 for more information about the <code>pkiserv.tmp1</code> file.</p> <p>Multiple party approval is described in the <code>ADMINNUM=value</code>, where <i>value</i> is a numeric subsection of the template.</p>
<p>What procedures indicate whether certificates should be suspended, revoked, or renewed?</p> <p>Do any of these procedures require the approval of multiple parties?</p>	<p>If certain requests can be automatically approved or rejected, or if certain certificates are allowed to be automatically renewed, the templates that are used for those requests in the <code>pkiserv.tmp1</code> and <code>pkitmp1.xml</code> files should be updated to enable these automated actions.</p> <p>If multiple parties are involved in vetting individual requests, the templates that are used for those requests should be updated to enable multiple administrative approvals.</p>	<p>See Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127 for more information about the <code>pkiserv.tmp1</code> file. Also, included are instructions to set templates for automated approval or rejection.</p> <p>Multiple party approval is described in the <code>ADMINNUM=value</code>, where <i>value</i> is a numeric subsection of the template.</p>
<p>Do your procedures allow anyone that is considered to be a PKI Services administrator to perform any of the available administrative actions?</p>	<p>If there is a separation of duties between different PKI Services administrators (for example, if the administrators that approve browser certificates are not given authority to approve server certificates too), need to enable PKI Services granular authorization controls. The IKYSETUP script sets the <code>pkiserv.conf</code> file to enable these granular controls. The RACF programmer must create the necessary RACF resource profiles to control PKI Services administrator authority.</p>	<p>To set up PKI Services to use granular administrative controls, see “Deciding the value of <code>AdminGranularControl</code>” on page 44. The specific control for this option is described in Table 21 on page 68.</p> <p>The RACF classes and resources necessary to implement these controls are in “Using the PKISERV class to control access to administrative functions” on page 479.</p>

## Planning your implementation

Table 6. Considerations before installing and configuring PKI Services (continued)

Considerations	Affects on PKI Services configuration and operation	Topic
<p><b>Administrative considerations:</b></p> <p>What is the best way to structure the group of PKI Services administrators?</p> <p>If multiple CAs are being hosted by a single z/OS image, are certain PKI Services administrators responsible only for specific CAs?</p> <p>Are certain PKI Services administrators authorized to perform only a subset of the administrative tasks?</p> <p>Are certain PKI Services administrators authorized to perform any administrative task?</p>	<p>Administrative coverage and vetting procedures influence how many people are designated to be PKI Services administrators. The identities of PKI Services administrators are needed to correctly update the IKYSETUP script.</p> <p>If any PKI Services administrators are being created only to monitor and audit the system, those administrators require READ access to the IRR.PKISERV.PKIADMIN and related RACF facility resource. PKI Services administrators that handle certificates and requests require UPDATE access to these RACF resources. The level of authority for each administrator affects how the IKYSETUP script is modified for this installation.</p> <p>If there is a separation of duties between different PKI Services administrators (for example, if the administrators that approve browser certificates are not given authority to approve server certificates too), need to enable PKI Services granular authorization controls. The IKYSETUP script sets the pki.serv.conf file to enable these granular controls. The RACF programmer must create the necessary RACF resource profiles to control PKI Services administrator authority.</p>	<p>Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35 contains information about how to tailor the IKYSETUP script for the needs of your installation.</p> <p>For more information about granting administrative access to users, see “Authorizing administrative functions” on page 477.</p> <p>To set up PKI Services to use granular administrative controls, see “Deciding the value of AdminGranularControl” on page 44. The specific control for this option is in Table 21 on page 68.</p> <p>The RACF classes and resources necessary to implement these controls are in “Using the PKISERV class to control access to administrative functions” on page 479.</p>

## Task roadmap for implementing PKI Services

Table 7 shows the subtasks and associated procedures for implementing PKI Services. These tasks comprise of the major part of your implementation plan.

Table 7. Task roadmap for implementing PKI Services

Subtask	Associated procedure (See ...)
Installing and configuring prerequisite products: <ul style="list-style-type: none"> <li>• “IBM HTTP Server - Powered by Apache (optional)” on page 12</li> <li>• “OCSF (optional)” on page 13</li> <li>• “LDAP directory server” on page 13</li> <li>• “ICSF (optional)” on page 13</li> </ul>	Chapter 3, “Installing and configuring prerequisite products,” on page 25 <ul style="list-style-type: none"> <li>• “Steps for installing and configuring the IBM HTTP Server - Powered by Apache to work with PKI Services” on page 26</li> <li>• “Installing and configuring OCSF” on page 31</li> <li>• “Steps for installing and configuring LDAP” on page 27</li> <li>• “Installing and configuring ICSF (optional)” on page 29</li> </ul>

Table 7. Task roadmap for implementing PKI Services (continued)

Subtask	Associated procedure (See ...)
<ul style="list-style-type: none"> <li>• “OCEP (optional)” on page 13</li> <li>• “sendmail (optional)” on page 13</li> <li>• “DB2 (optional)” on page 13</li> </ul>	<ul style="list-style-type: none"> <li>• “Configuring and getting started with PKITP” on page 492</li> <li>• “Configuring sendmail (optional)” on page 30</li> <li>• “Installing and configuring DB2” on page 31</li> </ul>
Configuring your system for PKI Services: <ul style="list-style-type: none"> <li>• RACF</li> <li>• z/OS UNIX</li> <li>• LDAP configuration</li> <li>• HTTP server</li> <li>• LDAP</li> <li>• Set up the object store and issued certificate list (ICL)</li> </ul>	Part 2, “Configuring your system for PKI Services,” on page 33 <ul style="list-style-type: none"> <li>• Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35</li> <li>• Chapter 5, “Configuring the UNIX runtime environment,” on page 61</li> <li>• Chapter 6, “Tailoring the LDAP configuration for PKI Services,” on page 89</li> <li>• Chapter 7, “Updating IBM HTTP Server - Powered by Apache configuration and starting the server,” on page 93</li> <li>• Chapter 8, “Tailoring the PKI Services configuration file for LDAP,” on page 99</li> <li>• Chapter 9, “Creating the object store and ICL,” on page 107</li> <li>• Chapter 10, “Starting and stopping PKI Services,” on page 121</li> </ul>
Customizing PKI Services: <ul style="list-style-type: none"> <li>• Customizing end-user web pages</li> <li>• Customizing administration web pages</li> <li>• Advanced customizing</li> </ul>	Part 3, “Customizing PKI Services,” on page 125 <ul style="list-style-type: none"> <li>• Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127</li> <li>• Chapter 12, “Customizing the administration web pages if you use REXX CGI execs,” on page 229</li> <li>• Chapter 14, “Advanced customization,” on page 267</li> </ul>
Testing PKI Services: <ul style="list-style-type: none"> <li>• Using end-user web pages</li> <li>• Using administration web pages</li> </ul>	Part 4, “Using PKI Services,” on page 359 <ul style="list-style-type: none"> <li>• Chapter 16, “Using the end-user web pages,” on page 361</li> <li>• Chapter 17, “Using the administration web pages,” on page 389</li> </ul>
Administering PKI Services: <ul style="list-style-type: none"> <li>• RACF</li> </ul>	Part 5, “Administering security for PKI Services,” on page 459 <ul style="list-style-type: none"> <li>• Chapter 20, “RACF administration for PKI Services,” on page 461</li> </ul>

## Planning your implementation

---

## Chapter 3. Installing and configuring prerequisite products

After the MVS programmer installs PKI Services using SMP/E (but before team members set up PKI Services, see Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35 through Chapter 9, “Creating the object store and ICL,” on page 107), your team needs to set up prerequisite products:

- An HTTP server - to handle requests through a web server
- WebSphere Application Server for z/OS (optional)- provides the web server if you implement the PKI Services web application using JavaServer pages (JSPs)
- LDAP - for posting certificates and CRLs
- ICSF (optional) - to store the CA's private key in hardware, and to generate and store key pairs for PKI Services certificate requests
- sendmail (optional) - for sending email notifications to certificate requestors and administrators
- OCSF (optional) - used by the PKI Trust Policy (PKITP)
- OCEP (optional) - used by the PKI Trust Policy (PKITP)
- DB2 (optional) - can be used to store the object store and issued certificate list (ICL) if VSAM data sets are not used

You need to install and configure the HTTP server and LDAP only if you are setting up prerequisite products for PKI Services for the first time.

---

### Tasks to perform before setting up PKI Services

Before you can set up PKI Services, your team needs to set up prerequisite software products by completing the following tasks, if not already done:

1. “Installing and configuring the IBM HTTP Server - Powered by Apache”
2. “Installing and configuring WebSphere Application Server for z/OS” on page 27
3. “Installing and configuring LDAP” on page 27
4. “Installing and configuring ICSF (optional)” on page 29
5. “Configuring sendmail (optional)” on page 30
6. “Installing and configuring DB2” on page 31

This topic explains these tasks in more detail.

### Installing and configuring the IBM HTTP Server - Powered by Apache

You need to perform this task only if you are setting up prerequisite products for PKI Services for the first time.

PKI Services requires that you have the IBM HTTP Server - Powered by Apache installed and configured for at least non-SSL page retrieval. Tasks of other team members, such as the RACF administrator and web server programmer (see Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35 and Chapter 7, “Updating IBM HTTP Server - Powered by Apache configuration and starting the server,” on page 93) assume that this is already done.

### Steps for installing and configuring the IBM HTTP Server - Powered by Apache to work with PKI Services

#### Before you begin:

1. You need web server programming skills to complete this procedure.
2. You might need to refer to the documentation for the IBM HTTP Server - Powered by Apache which available at WebSphere Application Server Library (<http://www.ibm.com/software/webservers/appserv/was/library/>).

#### Procedure

Perform the following steps to install and configure the IBM HTTP Server - Powered by Apache to work with PKI Services:

1. Use the following table to decide what you need to do:

If ...	Then ...	Notes
The IBM HTTP Server - Powered by Apache is not installed and configured ...	Install and configure IBM HTTP Server - Powered by Apache by following the instructions in the installation section of IBM HTTP Server - Powered by Apache documentation..	<b>Guideline:</b> For PKI Services, when you install the IBM HTTP Server - Powered by Apache, do not use a password file.
The IBM HTTP Server - Powered by Apache is installed but not configured for SSL ...	Fill in the missing values in the table in the next step. (The RACF programmer needs information for setting up PKI Services; see Chapter 4, "Running IKYSETUP to perform RACF administration," on page 35.)	—
The IBM HTTP Server - Powered by Apache is installed and configured for SSL using a RACF key ring ...	Fill in the missing values in the table in the next step. (The RACF programmer needs information for setting up PKI Services; see Chapter 4, "Running IKYSETUP to perform RACF administration," on page 35.)	—
The IBM HTTP Server - Powered by Apache is installed and configured for SSL using gskkyman ...	Fill in the missing values in the table in the next step. (The RACF programmer needs information for setting up PKI Services; see Chapter 4, "Running IKYSETUP to perform RACF administration," on page 35. The RACF programmer also needs to add your CA certificate to an existing keyfile; see Appendix B, "Using a gskkyman key database for your certificate store," on page 657 for information about gskkyman steps.)	—

You can now perform the steps for the decision you have made.

2. Fill in the rightmost column of the following table with information from the configuration:

Table 8. IBM HTTP Server - Powered by Apache information you need to record

IBM HTTP Server - Powered by Apache information	Explanation	Value
IBM HTTP Server - Powered by Apache fully qualified domain name	A fully qualified domain name is the name of a host system. It includes a series of subnames (each of which is a domain name). For example, ra1vm7.vnet.ibm.com is a fully qualified domain name that includes the domain names <code>ibm.com</code> and <code>vnet.ibm.com</code> . (The RACF administrator needs to know the fully qualified domain name when setting up PKI Services.)	
The full UNIX path name of your <code>httpd.conf</code> and <code>vhostport_number</code> configuration files	(The web server programmer needs to know the full UNIX path name when updating the <code>httpd.conf</code> and <code>vhost.conf</code> configuration files to support PKI Services.)	

## Installing and configuring WebSphere Application Server for z/OS

You need to perform this task only if you are setting up prerequisite products for PKI Services for the first time, or if you are implementing the PKI Services web application using JavaServer pages (JSPs) for the first time.

If you implement the PKI Services web application using JavaServer pages (JSPs), you must install WebSphere Application Server 6.1 or higher and configure an SSL configuration that uses client authentication. For more information, see Chapter 13, “Implementing the web application using JavaServer pages,” on page 233 and the online information center for your release of WebSphere Application Server at WebSphere Application Server Library (<http://www.ibm.com/software/webservers/appserv/was/library/>).

You do not need to install WebSphere Application Server if you implement the PKI Services web application using REXX CGI execs.

## Installing and configuring LDAP

The LDAP programmer installs and configures LDAP for the TDBM DB2 backend and records entries that are needed later.

### Steps for installing and configuring LDAP

You need to perform this task only if you are setting up prerequisite products for PKI Services for the first time.

Although it can be configured otherwise, typical PKI Services usage requires access to an LDAP directory server. Install the LDAP directory server separately from PKI Services. After the installation is complete, LDAP needs to be configured for PKI Services. The directory stores issued certificates and certification revocation lists. The z/OS LDAP server provided by IBM Tivoli Directory Server for z/OS is preferred but not required. The remainder of this topic assumes you are using the IBM Tivoli Directory Server for z/OS LDAP server.

**Note:** The default name of the LDAP server configuration file is `ds.conf`.

## Installing and configuring prerequisites

You can use a non-z/OS LDAP server if it can support the object classes and attributes that PKI Services uses. For information about using a non-z/OS LDAP server, see Appendix A, “LDAP directory server requirements,” on page 653.

### Before you begin

1. You need LDAP programming skills to complete this procedure.
2. For more information, see *z/OS IBM Tivoli Directory Server Administration and Use for z/OS*.

### Procedure

Perform the following steps to install and configure LDAP to work with PKI Services:

1. Use the following table to decide what you need to do:

If ...	Then...	Notes
You do not have LDAP installed and configured ...	Follow the instructions in the Administration section of <i>z/OS IBM Tivoli Directory Server Administration and Use for z/OS</i> .	
You have LDAP installed and configured but not for the TDBM or LDBM backend ...	You need to migrate to the TDBM or LDBM backend. See <i>z/OS IBM Tivoli Directory Server Administration and Use for z/OS</i> for details about how to do this.	--
You have LDAP installed and configured for the TDBM or LDBM backend ...	Go to the next step.	--

You can now perform the steps for the decision you have made.

2. Record the entries and values from the LDAP configuration step in the following table. (Your team needs this information when setting up PKI Services.)

Table 9. LDAP information you need to record

LDAP information	Explanation	Value
Distinguished name	<p>This is the distinguished name to use for LDAP binding. A distinguished name is the unique name of a data entry that identifies its position in the hierarchical structure of the directory. A distinguished name consists of the relative distinguished name (RDN) concatenated with the names of its ancestor entries. For example, an entry for Tim Jones could have an RDN of CN=Tim Jones and a DN of:</p> <p>CN=Tim Jones, O=IBM, C=US</p> <p>Any RDN type supported by the LDAP server can be used.</p> <p>The distinguished name can be a RACF-style distinguished name. For information about RACF-style distinguished names, see <i>z/OS IBM Tivoli Directory Server Administration and Use for z/OS</i>. For example, an entry for RACF user ID timjones is:</p> <p>RACFID=timjones, PROFILETYPE=user, O=racfdb, C=us</p>	

Table 9. LDAP information you need to record (continued)

LDAP information	Explanation	Value
Distinguished name password	This is the password that is defined for the distinguished name above, for use by PKI to bind to the LDAP server. RACF passwords can be case-sensitive, so make sure that the password specified for a RACF-style distinguished name in the pkiserv.conf file or in the LDAPBIND profile matches the RACF password exactly.	
LDAP fully qualified domain name and port	This is the domain name on which the LDAP server is listening. For example, for ldap.widgets.com:389, the fully qualified domain name is ldap.widgets.com and the port is 389. See Table 8 on page 27 for a definition of fully qualified domain name.	
Suffix	<p>A suffix in LDAP is the top-level name of the subtree. For example, for the following distinguished name:</p> <pre>OU=your-CA's-friendly-name,0=your-organization,   C=your-country-abbreviation</pre> <p>the suffix could be either "O=your company,C=your-country-abbreviation" or "C=your-country-abbreviation"</p> <p>The suffix value is specified after the suffix keyword in the LDAP server configuration file:</p> <pre>suffix "O=your-company,C=your-country-abbreviation"</pre> <p><b>Note:</b> If you have more than one suffix, record the suffix you intend to use as the root for storing the PKI Services CA certificate.</p>	

- 
- The topics that follow require the LDAP server to be running. Follow the instructions in the topic about running the LDAP server in *z/OS IBM Tivoli Directory Server Administration and Use for z/OS*.
- 

## Installing and configuring ICSF (optional)

You can install and configure ICSF the first time you are setting up PKI Services or later. Using ICSF is suggested, but it is not required for most PKI Services functions. However, ICSF is required for the following functions:

- RACF can use ICSF's public key data set (PKDS) to securely store the PKI Services CA signing key if directed to do so. For this to be successful, the ICSF programmer must install and configure ICSF for Public Key Algorithms (PKA), and ICSF must be running. (The RACF administrator uses the IKYSETUP REXX exec to set up any RACF profiles that are needed to control access to ICSF services and keys. For more information, see Chapter 4, "Running IKYSETUP to perform RACF administration," on page 35.)
- PKI Services uses ICSF's PKCS #11 token data set (TKDS) to store key pairs that PKI Services generates for non-CMP (certificate management protocol) certificate requests. If ICSF is not running and the TKDS is not set up, PKI Services cannot generate key pairs.
- PKI Services uses ICSF's PKCS #11 support to handle certificate requests that involve elliptic curve cryptography (ECC) keys. If ICSF is not running, PKI Services cannot process a certificate request that has an ECC public key, or for which the signing key is an ECC private key. (The TKDS is not required for these functions.)

## Installing and configuring prerequisites

- The PKI Services certificate management protocol (CMP) CGI uses ICSF's PKCS #11 support to generate key pairs. If ICSF is not running, the CMP CGI cannot generate key pairs. (The TKDS is not required, because the CMP CGI does not store keys.)

**Note:** You do not have to choose whether to install ICSF and perform the installation and configuration at this point. You can do so later in the process.

### Before you begin

- You need ICSF programming skills to complete this procedure.
- You might need to refer to the following documents:
  - *z/OS Cryptographic Services ICSF Administrator's Guide*  
This document provides information about managing cryptographic keys, setting up and maintaining the PKDS, controlling who can use cryptographic keys and services, and general information about ICSF and cryptographic keys.
  - *z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*  
This document describes the ICSF support for PKCS #11, and provides information about setting up the TKDS.

### Procedure

If ICSF is not already installed and configured for PKA, do this by following the instructions in *z/OS Cryptographic Services ICSF Administrator's Guide*. If you want PKI Services to generate key pairs for certificate requests, set up the TKDS by following the instructions in *z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*.

## Configuring sendmail (optional)

The UNIX programmer needs to configure sendmail if your installation plans to use any of the following functions:

- Sending email notifications to users whose certificate request is rejected, ready for retrieval, or about to expire
- Sending email notifications to administrators who have requests pending
- Automatic certificate renewal
- Requesting certificates for which the key pair (public key and private key) is generated by PKI Services

**Note:** Before you begin, you need the following document:

- *z/OS Communications Server: IP Configuration Guide*

Follow the instructions in *z/OS Communications Server: IP Configuration Guide* for configuring z/OS UNIX sendmail. In general, you need to perform the following steps:

1. Create an alias file to define the postmaster and MAILER-DAEMON user IDs and the nobody alias (/dev/null).
2. Create the sendmail configuration file using the m4 macro preprocessor.
3. Load this configuration file into sendmail.

### Notes:

1. Because PKI Services always provides the return email address, you do not need to configure sendmail to provide it. This simplifies your setup.

2. If you configure sendmail to run on the local system as a server, you need to change the PATH statement in the `pkiserv.envars` file to `PATH=/bin` instead of `PATH=/usr/sbin`.

Perform the following steps to test your sendmail configuration:

1. From the UNIX command line, create a mail file with some information in it. The following example is called `mail.txt`. (You need this name in the next step.)

```
To:target-email@address.com
From:source-email@address.com
Subject:This is a test
```

2. If sendmail is configured to run as a server on the local system, enter the command:

```
/bin/sendmail -t <mail.txt
```

Otherwise, enter the command:

```
/usr/sbin/sendmail -t <mail.txt
```

## Installing and configuring DB2

You need to perform this task only if you are implementing the PKI Services object store and issued certificate list (ICL) using DB2 tables for the first time.

For information about installing and configuring DB2, see the online information center for your release of DB2 at <http://publib.boulder.ibm.com/infocenter/dzichelp/v2r2/index.jsp> or the DB2 library at <http://www.ibm.com/support/docview.wss?rs=64&uid=swg27011656>.

You do not need to install DB2 if you implement the PKI Services object store and issued certificate list (ICL) using VSAM data sets.

For information about implementing the PKI Services object store and ICL, see Chapter 9, “Creating the object store and ICL,” on page 107.

---

## Tasks to perform before configuring PKITP

If you plan to use the PKI Services Trust Policy (PKITP), your team first needs to set up prerequisite software products by completing the following tasks, if not already done:

1. “Installing and configuring OCSF”
2. “Installing and configuring OCEP” on page 32

## Installing and configuring OCSF

PKI Services Trust Policy (PKITP) requires OCSF to be installed and configured. If OCSF is not already installed and configured, follow the instructions for doing so in *z/OS Open Cryptographic Services Facility Application Programming*.

### Before you begin

1. Although the base feature of z/OS includes OCSF, if you are in the United States or Canada, make sure that you ordered and installed the additional OCSF Security Level 3 feature. (There is no charge for this feature.)
2. You need OCSF programming skills to complete this procedure.

## Installing and configuring prerequisites

### Installing and configuring OCEP

To install and configure OCEP, follow the instructions in *Integrated Security Services Open Cryptographic Enhanced Plug-ins Application Programming*. Then follow the instructions in “Configuring and getting started with PKITP” on page 492.

You need to perform this task only if you are setting up prerequisite products for PKITP for the first time.

---

## Part 2. Configuring your system for PKI Services

After the MVS programmer installs PKI Services into the file system directory, your team needs to perform additional tasks to configure PKI Services, including the following tasks:

- Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35 describes how the RACF administrator updates and runs IKYSETUP, a REXX exec to perform RACF administration tasks, such as setting up the daemon user ID and giving accesses.
- Chapter 5, “Configuring the UNIX runtime environment,” on page 61 explains:
  - Copying files, such as the PKI Services configuration file
  - Updating environment variables
  - Updating the PKI Services configuration file
  - Setting up the /var/pkiserv file system directory.
- Chapter 6, “Tailoring the LDAP configuration for PKI Services,” on page 89 explains how to update your LDAP configuration (performed earlier, see “Installing and configuring LDAP” on page 27) for PKI Services.
- Chapter 7, “Updating IBM HTTP Server - Powered by Apache configuration and starting the server,” on page 93 describes updating the IBM HTTP Server configuration files and starting the IBM HTTP Server.
- Chapter 8, “Tailoring the PKI Services configuration file for LDAP,” on page 99 explains how to update the **LDAP** section of the PKI Services configuration file.
- Chapter 9, “Creating the object store and ICL,” on page 107 explains how to create the VSAM data sets or DB2 objects for the PKI Services object store and issued certificate list (ICL).
- Chapter 10, “Starting and stopping PKI Services,” on page 121 explains how to start and stop the PKI Services daemon.

---

## Chapter 4. Running IKYSETUP to perform RACF administration

You need to perform this task if you are configuring PKI Services for the first time or adding a new CA domain.

PKI Services provides SYS1.SAMPLIB(IKYSETUP), a REXX exec, to perform RACF administration tasks for setting up PKI Services. The RACF administrator updates and runs this REXX exec, which issues RACF commands to perform the following tasks:

- Adding groups and user IDs
  - Setting up the PKI Services administration group
  - Creating the PKI Services daemon user ID
  - Giving appropriate access to the RACF group
  - Creating the surrogate user ID and giving the surrogate user ID authority to generate certificates

A surrogate user ID is the identity that is assigned to client processes when they are requesting certificate services. A surrogate user ID is required for external clients. **Guideline:** For simplicity, use surrogate user IDs for internal clients also, rather than allowing them to access PKI Services under their own identities.
  - Associating the PKI Services daemon user ID with the PKI Services started procedure.
- Setting up access control to protect end-user and administrative functions of PKI Services:
  - Authorizing the PKI Services daemon user ID for CA functions
  - Authorizing the PKI Services daemon user ID to access the Resource Recovery Services access facility (RRSAF), if you use DB2 as the repository for the object store and ICL
  - Giving administrators access to VSAM data sets, if you use VSAM as the repository for the object store and ICL
  - Optionally authorizing PKI Services for ICSF resources.
  - Optionally defining granular administrative controls
- Creating certificate authority (CA), registration authority (RA), and SSL certificates:
  - Creating a CA certificate and private key
  - Backing them up to a password-protected MVS data set
  - Optionally migrating the private key to ICSF
  - Optionally creating an RA certificate and private key for Simple Certificate Enrollment Protocol (SCEP)
  - Creating a SAF key ring and associating it with the certificate
  - Exporting the CA certificate to an MVS data set and file system file
  - Generating a server certificate signed by the new CA
  - Creating a key ring for the web server
  - Associating the web server and any trusted CA certificates to the key ring.
- Setting up the IBM HTTP Server for surrogate operation.

## Running IKYSETUP

- Allowing PKI Services to generate key pairs for certificate requests

---

## Overview of IKYSETUP

IKYSETUP consists of several parts:

- A configurable section. This section assigns values to variables.
- A section that issues RACF commands to perform RACF administration tasks. (See “Actions IKYSETUP performs by issuing RACF commands” on page 589 for details about the actions that various sections of code perform.)
- A section that writes information (such as the name of the PKI Services administration group) to the log data set. The log itself consists of two parts: commands that are issued and other information. (See “Sample IKYSETUP log data set” on page 58.)

**Note:** By default, IKYSETUP creates the log. You can disable recording information to the log by changing the value of one of the variables in IKYSETUP (`log_dsn`) to null.

The configurable section contains three parts:

- Values that you must change (by making them specific to your company, such as your company's name)
- Values that you might change depending on how you want PKI Services set up (for example, whether your setup includes ICSF)
- Values that you can optionally change (these defaults are acceptable without change, but you might want to change them to make them more specific to your company, for example the name of the PKI Services administration group, which by default is PKIGRP)

The following table illustrates the structure and divisions of IKYSETUP:

*Table 10. IKYSETUP structure and divisions*

Structure and divisions of IKYSETUP
Configurable section, assigns values to variables <ul style="list-style-type: none"><li>• Values that you must change to customize (See Table 11 on page 38.)</li><li>• Values that you might change that are related to set up (See Table 18 on page 46.)</li><li>• Values that you can optionally change (See Table 19 on page 51.)</li></ul>
Issues RACF commands
Records information in the log data set

---

## Before you begin

**Important:** Update and run IKYSETUP *only* if you have not done so previously for an earlier release (or if you are changing the value of one or more variables).

You need to collect the following documents:

- *z/OS Security Server RACF Command Language Reference*
- *z/OS Security Server RACF Security Administrator's Guide*
- *z/OS TSO/E REXX Reference*

The RACF administrator needs to decide the values of variables in IKYSETUP and to record these values for future reference. Review and update as necessary the following three variables tables. There are three tables because there are three categories of variables:

- Variables whose values you are *required* to change, such as ones containing your company name
- Variables whose values you might want to change, depending based on how you are setting up PKI Services
- Variables whose values you can optionally change.

There is some overlap between the three types of variables, for example, if you are already using the RACF sample web application, PKISERV.

**Guideline:** If you are running IKYSETUP for the first time, at a minimum, you need to complete the following tasks:

- Fill in Table 11 on page 38
- Fill in Table 15 on page 43
- Fill in the rows of Table 18 on page 46 concerning z/OS UNIX level security:
  - `unix_sec`
  - `bpx_userid.` and `pgmctl_dsn.` (if z/OS level security is already set up)
- Review the default values in *all* the tables.

Several values that are described in this topic, particularly for variables in Table 11 on page 38 and Table 19 on page 51, can be qualified with a *ca\_domain* value based on whether you implement multiple CA domains. For information about implementing multiple CA domains, see “Adding a new CA domain” on page 287.

### Variables whose values must change

Fill in the blank lines in the rightmost column with your company's information (and cross out the defaults in these cells).

## Running IKYSETUP

Table 11. IKYSETUP variables whose values must change

Variable name	Description	Referenced elsewhere	Default value and your company's information
ca_dn	<p>The CA's distinguished name. (For a definition of distinguished name, see Table 9 on page 28.)</p> <p>If you already have your CA certificate and private key set up in RACF, set <code>ca_dn=""</code>, set <code>ca_label</code> (in the following row) to the value of your CA's label, and update <code>ca_expires</code> (in Table 19 on page 51) to reflect the expiration date of your CA certificate.</p> <p>If you do not already have your CA certificate and private key set up in RACF, cross out the default in the rightmost cell of this row and record the information for your company-specific information for distinguished name on the blank line.</p>	<p>The suffix of the PKI Services CA's distinguished name must match the LDAP suffix. (The LDAP suffix is in the LDAP server configuration file. See Table 9 on page 28 for a definition of suffix.)</p> <p><b>Note:</b> However, do not specify a C('value') if it is not present in your LDAP suffix.</p>	<p>When you also set <code>ca_domain</code>: <b>OU('ca_domain Human Resources Certificate Authority')</b></p> <p>When you do not set <code>ca_domain</code>: <b>OU('Human Resources Certificate Authority')</b></p> <p><b>O('Your Company')</b></p> <p><b>C('Your Country 2 Letter Abbreviation')</b></p> <hr/>
ca_label	<p>The CA certificate label. If you already have your CA certificate and private key set up in RACF (and your CA certificate's label differs from the default), you need to set <code>ca_label</code> to your CA certificate's label.</p>	No	<p>When you also set <code>ca_domain</code>: <b>ca_domain Local PKI CA</b></p> <p>When you do not set <code>ca_domain</code>: <b>Local PKI CA</b></p> <p>(Replace the default if you already have your CA certificate and private key set up in RACF.)</p> <hr/>
daemon_uid	<p>The z/OS UNIX user identifier (UID) associated with the PKI Services daemon user ID.</p>	No	<p><b>554</b></p> <hr/>
pki_gid	<p>The z/OS UNIX group identifier (GID) for the PKI Services administration group.</p>	No	<p><b>655</b></p> <hr/>

Table 11. IKYSETUP variables whose values must change (continued)

Variable name	Description	Referenced elsewhere	Default value and your company's information
pkigroup_mem.	<p>Members of the PKI administration group are responsible for administering PKI Services functions.</p> <p><b>Guideline:</b> Assign PKI administration duties to only highly trusted individuals.</p> <p>pkigroup_mem. is a list in which pkigroup_mem.0 is the number of members in the list and the rest of the entries are their user IDs. You must change the pkigroup_mem.0 to at least 1, and change pkigroup_mem.1 through pkigroup_mem.n to the member user IDs.</p>	No	<p>0 (default for <b>pkigroup_mem.0</b>, the number of member user IDs)</p> <hr/> <p><b>Note:</b> You must change the default to at least 1.</p> <p>(Record the member IDs:)</p> <hr/> <hr/> <hr/> <hr/> <hr/>
ra_dn	<p>The RA's distinguished name for use with Simple Certificate Enrollment Protocol (SCEP). (For a definition of distinguished name, see Table 9 on page 28.)</p> <p>This name should be similar but not identical to your CA's distinguished name. If you do not want to have PKI Services operate with a separate RA certificate, set ra_dn="".</p>	No	<p><b>CN('Registration Authority')</b></p> <p><b>OU('Human Resources Certificate Authority')</b></p> <p><b>O('Your Company')</b></p> <p><b>C('Your Country 2 Letter Abbreviation')</b></p> <hr/>
ra_label	<p>The certificate label of your RA certificate in RACF.</p>	No	<p>When you also set ca_domain:ca_domain<b>Local PKI RA</b></p> <p>When you do not set ca_domain: <b>Local PKI RA</b></p> <hr/>
surrog_uid	<p>The UID associated with the surrogate user ID.</p>	No	<p>555</p> <hr/>

## Running IKYSETUP

Table 11. IKYSETUP variables whose values must change (continued)

Variable name	Description	Referenced elsewhere	Default value and your company's information
web_dn	<p>Your web server's distinguished name. (For a definition of distinguished name, see Table 9 on page 28.)</p> <p><b>Notes:</b></p> <ol style="list-style-type: none"> <li>The RACF administrator copies the fully qualified domain name from an earlier table: Table 8 on page 27.</li> <li>If you already have your web server configured for SSL: <ul style="list-style-type: none"> <li>Set web_dn=""</li> <li>Update the web_ring row</li> </ul> </li> </ol> <p>(You need to connect your PKI Services CA certificate to your key ring. See the web_ring row for directions.)</p>	<p>The value of the web server's common name (CN), which is your server's symbol IP address. For example, www.YourCompany.com must match your web server's fully qualified domain name.</p>	<p>CN('www.YourCompany.com')</p> <p>O('Your Company')</p> <p>L('Your City')</p> <p>SP('Your Full State or Province Name')</p> <p>C('Your Country 2 Letter Abbreviation')</p>
web_ring	<p>The name of the web server's SAF key ring.</p> <p>If your web server is configured for SSL and you are using a RACF key ring, set web_ring to the value of the RACF key ring. If your web server is configured for SSL and you are using gskkyman, set web_ring="" and see Appendix B, "Using a gskkyman key database for your certificate store," on page 657 for additional directions.</p>	<p>vhost443.conf Host file for SSL requests with server authentication</p> <p>vhost1443.conf Host file for SSL requests with client authentication</p>	<p><b>SSLring</b></p>

### Variables whose values might change depending on setup

To help in completing the next table of variables (see Table 18 on page 46) fill out the decision tables in "Deciding the value of key\_backup," "Deciding the value of key\_type" on page 41, "Deciding the value of restrict\_surrog" on page 42, "Deciding the value of unix\_sec" on page 43, and "Deciding the value of db2\_repos and db2\_subsys" on page 43.

#### Deciding the value of key\_backup

Use the following decision table to determine the value of key\_backup in Table 18 on page 46. The key\_backup variable determines whether the PKI Services CA certificate and private key should be backed up to an encrypted data set.

Table 12. Decision table for key\_backup

If ...	Then ...	Notes
You want to back up your CA's certificate and private key to a passphrase encrypted data set ...	Do not change the default key_backup=1	When you use IKYSETUP, you need to enter a passphrase whose display is not inhibited, it appears on the screen in the clear.  You cannot back up PCICC keys (key_type=2) and hardware ECC keys (key_type=6 or key_type=7).
You do <i>not</i> want to back up your CA's certificate and private key to a passphrase encrypted data set ...	Set key_backup=0	—

### Deciding the value of key\_type

Use the following decision table to determine the value of key\_type in Table 18 on page 46. The key\_type variable determines whether you are using RSA, ICSF, PCICC, DSA, or ECC for private key protection.

By default, IKYSETUP does not use ICSF.

**Guideline:** Do not change the default the first time you run IKYSETUP but change it before going into a production environment. (For information about installing and configuring ICSF, see “Installing and configuring ICSF (optional)” on page 29.)

Table 13. Decision table for key\_type

If ...	Then	Notes
You want to use software cryptography and you want a key generated using the RSA algorithm ...	Do not change the default key_type=0	—
You want to use ICSF for private key protection but do not want the key generated by the PCI cryptographic coprocessor (PCICC) ...	Set key_type=1	Review and possibly change the following additional variables in Table 18 on page 46: <ul style="list-style-type: none"> <li>• csfkeys_profile</li> <li>• csfserv_profile</li> <li>• csfusers_grp</li> </ul>
You want to use ICSF for private key protection and you want the key generated by PCICC ...	Set key_type=2	PKI Services does not automatically back up the private key when you select the 2 value.  Review and possibly change the following additional variables in Table 18 on page 46: <ul style="list-style-type: none"> <li>• csfkeys_profile</li> <li>• csfserv_profile</li> <li>• csfusers_grp</li> </ul>
You want to use software cryptography and you want a key generated using the DSA algorithm ...	Set key_type=3	The key cannot be saved in ICSF.

## Running IKYSETUP

Table 13. Decision table for key\_type (continued)

If ...	Then	Notes
You want to use software cryptography and you want a key generated using the NIST ECC algorithm ...	Set key_type=4	The key cannot be saved in ICSF.
You want to use software cryptography and you want a key generated using the Brainpool (BP) ECC algorithm ...	Set key_type=5	The key cannot be saved in ICSF.
You want to use ICSF for private key protection and you want a key generated using the NIST ECC algorithm by the Crypto Express <sup>®</sup> 3 cryptographic coprocessor ...	Set key_type=6	Review and possibly change the following additional variables in Table 18 on page 46: <ul style="list-style-type: none"> <li>• csfkeys_profile</li> <li>• csfserv_profile</li> <li>• csfusers_grp</li> </ul> PKI Services does not automatically back up the private key.
You want to use ICSF for private key protection and you want a key generated using the Brainpool (BP) ECC algorithm by the Crypto Express 3 cryptographic coprocessor ...	Set key_type=7	Review and possibly change the following additional variables in Table 18 on page 46: <ul style="list-style-type: none"> <li>• csfkeys_profile</li> <li>• csfserv_profile</li> <li>• csfusers_grp</li> </ul> PKI Services does not automatically back up the private key.
You want PKI Services to generate a secure RSA key in the TKDS.	Set key_type=8	The key is stored in the token <i>daemon.CATOKEN</i> . For example, <i>PKISRVD.CATOKEN</i> .
You want PKI Services to generate a secure NIST ECC key in the TKDS.	Set key_type=9	The key is stored in the token <i>daemon.CATOKEN</i> . For example, <i>PKISRVD.CATOKEN</i> .
You want PKI Services to generate a secure Brainpool ECC key in the TKDS.	Set key_type=10	The key is stored in the token <i>daemon.CATOKEN</i> . For example, <i>PKISRVD.CATOKEN</i> .

### Deciding the value of restrict\_surrog

Use the following decision table to determine the value of `restrict_surrog` in Table 18 on page 46. The `restrict_surrog` variable determines if the `RESTRICTED` attribute is assigned to the surrogate user ID. The `RESTRICTED` attribute limits the resources available to this user ID.

By default, IKYSETUP does not assign the `RESTRICTED` attribute to the surrogate user ID. **Guideline:** Do not change the default the first time you run IKYSETUP but change it before going into a production environment. For more information, see the topic about defining groups and users in *z/OS Security Server RACF Security Administrator's Guide*.

Table 14. Decision table for restrict\_surrog

If ...	Then ...
You want to assign the <code>RESTRICTED</code> attribute to the surrogate user ID ...	Set <code>restrict_surrog=1</code>

Table 14. Decision table for restrict\_surrog (continued)

If ...	Then ...
You do <i>not</i> want to assign the RESTRICTED attribute to the surrogate user ID ...	Do not change the default restrict_surrog=0

### Deciding the value of unix\_sec

Use the following decision table to determine the value of `unix_sec` in Table 18 on page 46. The `unix_sec` variable determines whether you want to use z/OS UNIX security, which is a higher level of security. z/OS UNIX provides two levels of security:

#### UNIX level security

This is a less stringent level of security than z/OS UNIX level security. It is for installations where system programmers have been granted superuser authority. Programs that run with superuser authority have daemon level authority and can issue MVS identity-changing services without entering a `_passwd()` for the target user ID. With this level of security, the BPX.DAEMON profile in the FACILITY class is not defined.

#### z/OS UNIX level security

This is a higher level of security than z/OS UNIX level security. It lets your system exercise more control over superusers. With this level of security, the BPX.DAEMON profile in the FACILITY class is defined.

Table 15. Decision table for unix\_sec

If ...	Then ...	Notes
You already have z/OS UNIX security set up ...	Set <code>unix_sec=1</code>	—
You do not have z/OS UNIX security set up and you do not want to set it up ...	Do not change the default of <code>unix_sec=0</code>	—
You do not have z/OS UNIX security set up and you want to set it up for the first time ...	Set <code>unix_sec=2</code>	<ol style="list-style-type: none"> <li>1. For information about additional manual configuration, see the section about establishing z/OS UNIX security in <i>z/OS UNIX System Services Planning</i>.</li> <li>2. If you are setting <code>unix_sec=2</code>, you must update the following variables: <ul style="list-style-type: none"> <li>• <code>bpx_userid</code>.</li> <li>• <code>pgmctl1_dsn</code>.</li> </ul> </li> </ol>

### Deciding the value of db2\_repos and db2\_subsys

Use the following decision table to determine the value of `db2_repos` and `db2_subsys` in Table 18 on page 46. You have the option of using either VSAM data sets or DB2 tables as the repositories for the PKI Services object store and ICL. For information about these options, see Chapter 9, “Creating the object store and ICL,” on page 107. If you use DB2, the PKI Services daemon needs authorization to the DB2 Resource Recovery Services Access Facility (RRSAF). If you use VSAM, the PKI Services daemon and administrator need authorization to the VSAM data sets.

## Running IKYSETUP

Table 16. Decision table for db2\_repos and db2\_subsys

If ...	Then ...	Notes
You plan to use VSAM ...	Do not change the default of db2_repos=0. Do not change db2_subsys; it is ignored.	The value of db2_repos should be consistent with the value of the DBType parameter in the pkiserv.conf configuration file.
You plan to use DB2 ...	Set db2_repos=1. Set db2_subsys to the name of the local DB2 subsystem or the group attachment name for the object store and ICL.	The value of db2_repos should be consistent with the value of the DBType parameter in the pkiserv.conf configuration file. The value of db2_subsys should be the same as the value of the DBSubsystem parameter in the pkiserv.conf configuration file.

### Deciding the value of AdminGranularControl

Use the following decision table to determine the value of AdminGranularControl in Table 18 on page 46. The AdminGranularControl variable determines whether the IKYSETUP exec creates profiles to control the additional administrative function access controls described in “Using the PKISERV class to control access to administrative functions” on page 479.

**Note:** The AdminGranularControl parameter in pkiserv.conf determines whether the additional administrative function access controls described in “Using the PKISERV class to control access to administrative functions” on page 479 are enabled.

Table 17. Decision table for AdminGranularControl

If ...	Then ...	Notes
You do not want to restrict certain administrative functions to certain PKI Services administrators and the value of the AdminGranularControl variable in pkiserv.conf is F ...	Do not change the default of AdminGranularControl = 0.	

Table 17. Decision table for AdminGranularControl (continued)

If ...	Then ...	Notes
You want to restrict certain administrative functions to certain PKI Services administrators and the value of the AdminGranularControl variable in pkiserv.conf is T ...	Set AdminGranularControl = 1 .	<p>You must also modify the pkigroup1_mem and possibly pkigroup2_mem array variables to specify the number of PKI Services administrators that are to be given access to administrative functions and their user IDs. Depending on the controls that you want to set, the number of PKI Services administrators, and the templates configured for the system, you might also need to add <code>templatex</code>, <code>pkigroupx</code>, <code>pkgidx</code>, <code>pkigroupx_mem</code>, and <code>actionx</code> variables to the IKYSETUP exec.</p> <p>For more information about granular control of administrator functions, see "Using the PKISERV class to control access to administrative functions" on page 479.</p>

### Table of IKYSETUP variables that you might want to change

Update Table 18 on page 46 based on your answers in the decision tables in "Deciding the value of key\_backup" on page 40, "Deciding the value of key\_type" on page 41, "Deciding the value of restrict\_surrog" on page 42, "Deciding the value of unix\_sec" on page 43, and "Deciding the value of db2\_repos and db2\_subsys" on page 43. If you have decided to change any of the defaults in the rightmost column, cross out the defaults and enter your company's information:

## Running IKYSETUP

Table 18. IKYSETUP variables you might want to change depending on setup

Variable name	Description	Referenced elsewhere	Default value or your company's information
AdminGranularControl	<p>Specifies whether IKYSETUP is to set up profiles in the PKISERV class to control authorization to administration functions.</p> <p><b>0</b> Do not set up the profiles</p> <p><b>1</b> Set up the profiles If set to 1, other variable names must be set. See "Deciding the value of AdminGranularControl" on page 44.</p>	The AdminGranularControl keyword in pkiserv.conf	<b>0</b>
bpx_userid.	A list of user IDs with daemon and server authority. The bpx_userid.0 is the number of items in the list and the rest of the entries are the z/OS UNIX user IDs. (This is non-applicable if unix_sec =2.)	No	<b>1</b> (default for number of items) <b>OMVSKERN</b>
ca_keysize	<p>The size in bits of the certificate-authority's private key.</p> <ul style="list-style-type: none"> <li>• When key_type=0 (RSA software-generated key) or key_type=2 (RSA PCICC-generated key), the acceptable range is 512 to 4096.</li> <li>• When key_type=1 (RSA software-generated key stored in ICSF) or key_type=3 (DSA software-generated key), the acceptable range is 512 to 1024.</li> <li>• When key_type=4 (NIST ECC software-generated key) or key_type=6 (NIST ECC hardware-generated key), or key_type=9 (secure NIST ECC hardware-generated key), the acceptable values are 192, 224, 256, 384, and 521.</li> <li>• When key_type=5 (Brainpool ECC software-generated key) or key_type=7 (Brainpool ECC hardware-generated key), or key_type=10 (secure Brainpool ECC hardware-generated key), the acceptable values are 160, 192, 224, 256, 320, 384, and 512.</li> <li>• When key_type=8 (secure RSA hardware-generated key), the acceptable range is 1024 to 4096.</li> </ul>	No	<b>1024</b>

Table 18. IKYSETUP variables you might want to change depending on setup (continued)

Variable name	Description	Referenced elsewhere	Default value or your company's information
cryptoz_grp	The name of a RACF group for users authorized to use PKCS #11 tokens. Applies only if you set key_gen = 1.	No	""
csfkeys_profile	A profile to protect the PKI Services key in ICSF. (This variable is non-applicable if key_type has the value 0, 3, 4, or 5.) If you do not want IKYSETUP to create the profile, set csfkeys_profile="". <b>Note:</b> When RACF stores the private key in the PKDS, it generates the label as: 'IRR.DIGTCERT.CERTIFAUTH. unique-time-stamp'	No	IRR.DIGTCERT.CERTIFAUTH.*
csfserv_profile	A profile to protect ICSF services. (This is non-applicable if key_type=0 or key_type=3 and key_gen=0.)	No	CSF*
csfusers_grp	A group of authorized ICSF service users. (This is non-applicable if csfkeys_profile="" and csfserv_profile="" .)	No	
db2_repos	Specifies whether the repository for the PKI Services object store and ICL is DB2 or VSAM.  0 VSAM 1 DB2	pkiserv.conf – DBType parameter	0 (VSAM)
db2_subsys	Specifies the name of the local DB2 subsystem or the group attachment name for the object store and ICL repositories, if db2_repos is 1. This is a name of 1 - 4 alphanumeric characters.	pkiserv.conf – DBSubsystem parameter	DSN9
key_backup	Specifies whether the PKI Services CA certificate and private key should be backed up to an encrypted data set. The value can be: <ul style="list-style-type: none"> <li>• 1 (yes - the default)</li> <li>• 0 (no).</li> </ul> <b>Note:</b> This value is ignored when the value of key_type is 2, 6, or 7.  When you use IKYSETUP with key_backup=1, you need to enter a passphrase whose display is not inhibited - it appears on the screen in the clear.	No	1 (yes)

## Running IKYSETUP

Table 18. IKYSETUP variables you might want to change depending on setup (continued)

Variable name	Description	Referenced elsewhere	Default value or your company's information
key_gen	<p>Specifies whether you want PKI Services to generate key pairs (public key and private key) for certificate requests, if asked to do so.</p> <p>Set to 1 to allow PKI Services to generate key pairs for certificate requests.</p>	No	0
key_type	<p>Specifies whether PKI Services should use RSA, ICSF, PCICC, DSA, or ECC for private key operations. The value can be:</p> <ul style="list-style-type: none"> <li>• 0 (use software cryptography with the RSA algorithm - the default)</li> <li>• 1 (use ICSF but not PCICC)</li> <li>• 2 (use ICSF and PCICC)</li> <li>• 3 (use software cryptography with the DSA algorithm).</li> <li>• 4 (use software cryptography with the NIST ECC algorithm)</li> <li>• 5 (use software cryptography with the BP ECC algorithm)</li> <li>• 6 (use hardware cryptography with the NIST ECC algorithm)</li> <li>• 7 (use hardware cryptography with the Brainpool (BP) ECC algorithm)</li> <li>• 8 (Secure RSA in TKDS)</li> <li>• 9 (Secure NIST ECC in TKDS)</li> <li>• 10 (Secure Brainpool ECC in TKDS)</li> </ul> <p>If you are changing key_type to 1, 2, 6, or 7, see also the csfkeys_profile, csfserv_profile, and csfusers_grp rows.</p> <p><b>Guideline:</b> Do not change the default the first time you run IKYSETUP, but change it before going into a production environment.</p>	<p>If choosing option 1 or 2, ICSF must be configured for RSA (PKA) operations and running.</p> <p>If choosing option 4, 5, 8, 9, or 10, the ICSF token data set (TKDS) must be set up and ICSF must be running.</p> <p>If choosing option 6 or 7, ICSF must be set up and running, and a Crypto Express 3 cryptographic coprocessor must be available and configured with the PKDS.</p>	0

Table 18. IKYSETUP variables you might want to change depending on setup (continued)

Variable name	Description	Referenced elsewhere	Default value or your company's information
pgmctl_dsn.	<p>A list in which pgmctl_dsn.0 is the number of items in the list and the rest of the entries are a list of load libraries to be program controlled.</p> <p><b>Rule:</b> If you set unix_sec=2, you must update the list of data sets.</p>	No	<p>8 (default for number of items)</p> <ul style="list-style-type: none"> <li>• 'CEE.SCEERUN'</li> <li>• 'CBC.SCLBDLL'</li> <li>• 'SYS1.SIEALNKE'</li> <li>• 'SYS1.CSSLIB'</li> <li>• 'TCPIP.SEZALOAD'</li> <li>• 'SYS1.LINKLIB'</li> <li>• 'CSF.SCSFMOD0'</li> <li>• 'CSF.SCSFMOD1'</li> </ul>
pkigroup1_mem ppkigroup2_mem	<p>Lists of users connected to PKI Services administrative groups. pkigroup1_mem.0 is the number of members to connect to pkigroup1, and pkigroup1_mem.n specifies the users to connect. These variables are ignored if AdminGranularControl = 0.</p>	No	''''
restrict_surrog	<p>Specifies whether the surrogate user ID should be marked restricted. The value can be:</p> <ul style="list-style-type: none"> <li>• 0 (no - the default)</li> <li>• 1 (yes)</li> </ul> <p><b>Guideline:</b> Do not change the default the first time you run IKYSETUP, but change it before going into a production environment.</p>	No	0 (no)
unix_sec	<p>Specifies whether to set up z/OS UNIX level security. (See "Deciding the value of unix_sec" on page 43 for a definition of z/OS UNIX level security.) The value can be:</p> <ul style="list-style-type: none"> <li>• 0 (do not set up - the default)</li> <li>• 1 (is already set up)</li> <li>• 2 (add this level of security)</li> </ul> <p><b>Rule:</b> If you are changing unix_sec to 1 or 2, you must update the bpx_userid. and pgmctl_dsn. rows.</p> <p><b>Guideline:</b> Do not set unix_sec=2 the first time you are running IKYSETUP.</p>	For unix_sec=2, the names of the load libraries need to change.	0 (no)

### Variables you can optionally change

To help in filling out the next table of variables ( Table 19 on page 51), see “Specifying when the CA certificate and web server certificates expire.”

#### Specifying when the CA certificate and web server certificates expire

By default, IKYSETUP creates a CA certificate that expires in 20 years and a web server SSL certificate that expires in five years from the date when the IKYSETUP script is run. If these expiration times are compliant with your security guidelines, no changes are needed to the `ca_exyears`, `ca_expires`, `web_exyears`, and `web_expires` variables in Table 19 on page 51.

You can shorten or extend the lifetime of the CA certificate by altering the value of the `ca_exyears` variable. This variable specifies the lifetime of the CA certificate in years. The default value is 20. You can shorten or extend the lifetime of the web server certificate by altering the value of the `web_exyears` variable. The default value is 5. These variables are listed in IKYSETUP in “Part 3”, in the subsection titled “Method 1”. Ensure that the value for `web_exyears` is less than the value of `ca_exyears`. If it is not, the web server certificate might be added to the RACF database with the NOTRUST option.

If your security guidelines require that the CA certificate and web server certificate expire at specific dates, you can set these expiration dates in IKYSETUP. Ensure that the web server certificate expires before the date that the CA certificate expires. If you do not, the web server certificate might be added to the RACF database with the NOTRUST option.

#### Steps for setting the expiration dates for the CA certificate and web server certificate:

Perform the following steps to set the expiration dates for the CA certificate and web server certificate in IKYSETUP.

##### Procedure

1. Comment out all instructions in “Part 3, Method 1” of IKYSETUP. These are the instructions that calculate expiration dates by adding the life spans specified in the `ca_exyears` and `web_exyears` variables to the date that IKYSETUP runs. You must disable these instructions to set the expiration dates to specific dates.

---
2. Remove the comment delimiters from the sample instructions that are listed in “Part 3, Method 2” of IKYSETUP. These are the instructions that set the expiration dates to specific date values. You must enable these instructions.
3. Change the value of the `ca_expires` variable to the date when the CA certificate should expire, in the format *yyyy/mm/dd*.

---
4. Change the value of the `web_expires` variable to the date when the web server certificate should expire, in the format *yyyy/mm/dd*. Specify a date that is before the date specified by the `ca_expires` variable.

---
5. Save your changes.

---

## Results

When you are done, you have set the CA certificate expiration date and the web server certificate expiration date that takes effect the next time that you run IKYSETUP.

### Table of IKYSETUP variables you can optionally change

Review the values of the variables in Table 19 to determine if you want to change any of the defaults in the rightmost column. If you decide to change any value, cross out the default in the rightmost column and record your company's information.

Table 19. IKYSETUP variables you can optionally change

Variable name	Description	Referenced elsewhere	Default value or your company's information
backup_dsn	The data set that contains a backup copy of the PKI Services certificate and private key.	No	When you also set <i>ca_domain</i> : ' <i>daemon.ca_domain.KEY.BACKUP.P12BIN</i> '  When you do not set <i>ca_domain</i> : ' <i>daemon.KEY.BACKUP.P12BIN</i> '  <b>Note:</b> The <i>daemon</i> refers to the <i>daemon</i> variable in this table.
ca_domain	The unique name for the CA when you establish multiple PKI Services CAs.  If specified, the first eight characters must uniquely identify the CA. The characters of the <i>ca_domain</i> value are limited to the following character set: alphanumeric characters (a - z, A - Z, 0 - 9) and the hyphen (-). In addition, the first character must not be a number or hyphen.	No	""  <b>Guideline:</b> Do not change the default (null) value until you perform advanced customization. (See "Adding a new CA domain" on page 287.)
ca_expires	The date that the PKI Services CA certificate expires.  By default, IKYSETUP calculates the CA certificate expiration date based on the value of <i>ca_exyears</i> . For information about setting this variable, see "Specifying when the CA certificate and web server certificates expire" on page 50.	No	2030/01/01  The date format is <i>yyyy/mm/dd</i> .

## Running IKYSETUP

Table 19. IKYSETUP variables you can optionally change (continued)

Variable name	Description	Referenced elsewhere	Default value or your company's information
ca_exyears	<p>The life span of the PKI Services CA certificate, expressed in years.</p> <p>By default, IKYSETUP calculates the expiration date for the CA certificate by adding the number of years specified in ca_exyears to the date that IKYSETUP is run. For information about setting this variable, see "Specifying when the CA certificate and web server certificates expire" on page 50.</p>	No	20
ca_ring	The name of the PKI Services SAF key ring.	pkiserv.conf SAF KeyRing value	<p>When you also set ca_domain: <b>CAring.ca_domain</b></p> <p>When you do not set ca_domain: <b>CAring</b></p>
cacert_dsn	The data set that contains the PKI Services certificate to assist the backup process.	No	<p>When you also set ca_domain: <b>'daemon.ca_domain.CACERT.DERBIN'</b></p> <p>When you do not set ca_domain: <b>'daemon.CACERT.DERBIN'</b></p> <p><b>Note:</b> daemon refers to the daemon variable in this table.</p>
caStore	The name of the PKI Services PKCS #11 token	No	<p>When you also set ca_comain or daemon: <b>daemon.CATOKEN.ca_domain</b></p> <p>When you do not set ca_comain or daemon: <b>CATOKEN</b></p>
daemon	<p>The PKI Services daemon user ID.</p> <p>If you also set ca_domain, you can choose to assign a unique user ID to the daemon for each CA domain. <b>Example:</b> For a ca_domain called BankA, you might choose user ID PKISRVD.</p>	pkiserv.conf SAF KeyRing value	<b>PKISRVD</b>
export_dsn	The data set that contains the web server's root CA certificate for copying to file system.	No	<p>When you also set ca_domain: <b>'daemon.ca_domain.WEBROOT.DERBIN'</b></p> <p>When you do not set ca_domain: <b>'daemon.WEBROOT.DERBIN'</b></p> <p><b>Note:</b> daemon refers to the daemon variable in this table.</p>

Table 19. IKYSETUP variables you can optionally change (continued)

Variable name	Description	Referenced elsewhere	Default value or your company's information
log_dsn	The log data set name.	No	When you also set <i>ca_domain</i> : <b>'your-id.ca_domain.IKYSETUP.LOG'</b>  When you do not set <i>ca_domain</i> : <b>'your-id.IKYSETUP.LOG'</b>  <b>Notes:</b> 1. The <i>your-id</i> refers to the RACF ID of the person running IKYSETUP. (You do not need to add this; MVS adds this for you.) 2. Changing the default is not suggested.
pkigroup	The PKI Services administration group. This is a RACF group containing the list of user IDs that are authorized to use PKI Services administration functions.  If you also set <i>ca_domain</i> , you can choose to assign a unique group name to the administration group for each CA domain. <b>Example:</b> For a <i>ca_domain</i> called BankA, you might choose group name PKIGRPA.	No	<b>PKIGRP</b>
pkigroup1, pkigroup2	PKI Services administrative groups for granular control of administrative functions.	No	<b>PKIGRP1, PKIGRP2</b>
ra_backup_dsn	The data set that contains a backup copy of the PKI Services RA certificate and private key.  This name should be similar but not identical to the backup_dsn value.	No	When you also set <i>ca_domain</i> : <b>'daemon.ca_domain.RAKEY.BACKUP.P12BIN'</b>  When you do not set <i>ca_domain</i> : <b>'daemon.RAKEY.BACKUP.P12BIN'</b>  <b>Note:</b> The <i>daemon</i> refers to the daemon variable in this table.
signing_ca_label	The label of the CA certificate that is the superior (signer) of the PKI Services CA. If specified, the value must match the label of an existing CERTAUTH certificate in RACF that has a private key. Use this value to create a CA hierarchy when you establish multiple PKI Services CAs.	No	<b>''''</b>

## Running IKYSETUP

Table 19. IKYSETUP variables you can optionally change (continued)

Variable name	Description	Referenced elsewhere	Default value or your company's information
surrog	<p>The surrogate user ID for PKI Services.</p> <p>If you also set <i>ca_domain</i>, you can choose to assign a unique user ID as the surrogate user ID for each CA domain. <b>Example:</b> For a <i>ca_domain</i> called BankA, you might choose user ID PKISERVA.</p> <p><b>Note:</b> This cannot be an existing user ID (because IKYSETUP creates the user ID with the NOPASSWORD attribute).</p>	Surrogate user ID in httpd*.conf	PKISERV
vsamhlq	<p>The high-level qualifier of the VSAM data sets for PKI Services.</p> <p><b>Note:</b> The RACF administrator gets this information from the MVS programmer.</p>	<ul style="list-style-type: none"> <li>• <b>ObjectStore</b> *DSN values in pkiserv.conf</li> <li>• Data sets names in IKYCVSAM</li> </ul>	Same as the daemon variable earlier in this table.
web_expires	<p>The date that the web server certificate expires.</p> <p>By default, IKYSETUP calculates the web server certificate expiration date based on the value of web_exyears. For information about setting this variable, see “Specifying when the CA certificate and web server certificates expire” on page 50.</p>	No	<p><b>2015/01/01</b></p> <p>The date format is <i>yyyy/mm/dd</i>.</p>
web_exyears	<p>The life span of the web server certificate, expressed in years.</p> <p>By default, IKYSETUP calculates the expiration date for the web server certificate by adding the number of years specified in web_exyears to the date when IKYSETUP is run. For information about setting this variable, see “Specifying when the CA certificate and web server certificates expire” on page 50.</p>	No	5

Table 19. IKYSETUP variables you can optionally change (continued)

Variable name	Description	Referenced elsewhere	Default value or your company's information
web_label	The label for the web server's certificate.	No	SSL Cert
webserver	The web server's daemon user ID.	See web server documentation.	WEBSRV

---

## Steps for performing RACF tasks using IKYSETUP

Use the following directions to run IKYSETUP only if you have not done so for a previous release (or if you are changing values).

You can use the following directions to run IKYSETUP with minimal changes or to extensively customize it.

**Guideline:** If this is your first attempt to use IKYSETUP, change only the IKYSETUP variables in the section Things you must change. You can refine IKYSETUP later, after you are familiar with the process of updating and running it.

The following flowchart illustrates the iterative nature of the process of updating IKYSETUP:

## Running IKYSETUP

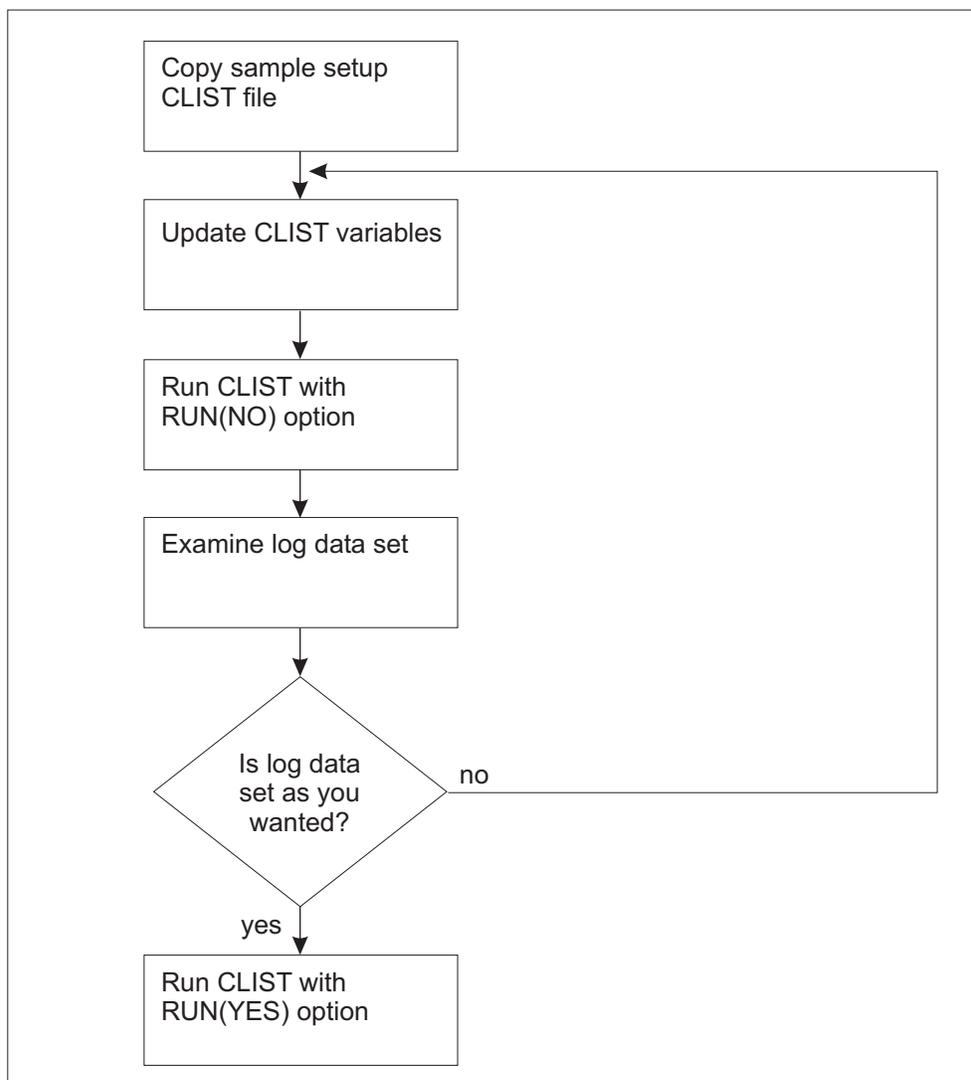

Figure 2. Flowchart of the process of updating IKYSETUP

Perform the following steps to use IKYSETUP to perform RACF administration tasks:

1. Copy SYS1.SAMPLIB(IKYSETUP) to a data set you are permitted to edit.

2. Edit the IKYSETUP code to update the values of variables you changed in Table 11 on page 38.

The following example shows how to change the pkigroup\_mem. variables. (Remember that for pkigroup\_mem., you set pkigroup\_mem.0 to the number of items in the list and pkigroup\_mem.1 through pkigroup\_mem.n to the PKI Services administration group member IDs.)

**Example:**

```
pkigroup_mem.0=3      /* Number of pkigroup members to connect */
pkigroup_mem.1="TOM"
pkigroup_mem.2="DICK"
pkigroup_mem.3="HARRY"
```

3. If necessary, update the values of variables you changed in Table 18 on page 46.

The following example shows how to change the `key_type` variable.

**Example:**

```
key_type=1
```

---

4. Optionally update any variables you changed in Table 19 on page 51. The following example shows how to change the `log_dsn` variable.

**Example:**

```
log_dsn="PRIVATE.IKYSETUP.LOG"
```

If you are changing the values of `ca_exyears`, `ca_expires`, `web_exyears`, or `web_expires`, see “Specifying when the CA certificate and web server certificates expire” on page 50 for instructions.

---

5. Run IKYSETUP by entering the following command:

```
EX 'data-set-name(IKYSETUP)' 'RUN(NO)'
```

**Notes:**

- The user ID that runs IKYSETUP must be a RACF SPECIAL user ID.
  - When IKYSETUP runs, it prompts you to enter your secret passphrase. (This is for encrypting the backup copy of your CA certificate and private key.) Be aware that asterisks do not replace the secret passphrase; it appears on the screen in the clear.  
**Important:** Make a note of this passphrase. If you forget it, your backup is useless.
  - The NO option in the command specifies displaying the commands only. (This creates a log data set listing the commands and other information. Alternative parameters are: YES, which indicates running IKYSETUP as is, and PROMPT, indicates prompting the user before running each command.)
- 

6. Review the log data set. (See “Sample IKYSETUP log data set” on page 58 for an example of the data that appears on your display when you are running IKYSETUP; this is similar to the contents of the log data set.) The top part identifies the tasks and shows the commands that run to perform those tasks. Review this to ensure that the issued commands match your expectations. (For more information about these commands, see “Actions IKYSETUP performs by issuing RACF commands” on page 589.) The bottom part provides a record of important information that you need for later steps, such the name of your daemon user ID. Review this information to ensure that the values are the ones you want.

If you want to change any of the commands or information in the log data set, you need to change additional values in IKYSETUP. Remember to record any additional changes in Table 11 on page 38, Table 18 on page 46, and Table 19 on page 51. Then go back to Step 3 on page 56.

---

7. If the log data set includes the commands and information you want, rerun the IKYSETUP code by entering the following command:

```
EX 'data-set-name(IKYSETUP)' 'RUN(YES)'
```

---

8. After running IKYSETUP with RUN(YES), examine the results recorded in the log data set. Investigate and rerun (potentially by hand) any failing commands. Investigate informational messages and make any necessary corrections.

## Running IKYSETUP

(Informational messages usually indicate a setup problem that might affect operations later. For example, any informational message from the RACDCERT commands that indicate that the certificate has been marked NO TRUST is an error.)

9. If you intend to use encrypted LDAP passwords, you need to perform additional RACF administration tasks; see “Using encrypted passwords for LDAP servers” on page 481.

## Sample IKYSETUP log data set

Here is an example of the data that appears when you run IKYSETUP.

```
Creating users and groups ...
ADDUSER PKISRV name('PKI Srvs Daemon') nopassword omvs(uid(554) assize(256000000)
threads(512))
ADDUSER PKISERV nopassword omvs(uid(555)) name('PKI Srvs Surrogate')
ADDGROUP PKIGRP OMVS(GID(655))
SETROPTS EGN GENERIC(DATASET)
ADDS 'PKISRV.**' UACC(NONE)

-----  
Information needed for PKI Services UNIX set up:  
-----

The daemon user ID is:  
PKISRVD

The VSAM high level qualifier is:  
PKISRVD  
This is needed for the [ObjectStore] section in pkiserv.conf

The PKI Services' DER encoded certificate is in data set:  
'PKISRVD.CACERT.DERBIN'

The webserver's DER encoded root  
CA certificate is in data set:  
'PKISRVD.WEBROOT.DERBIN'  
This must be OPUT to /var/pkiserv/cacert.der with the BINARY option

The fully qualified PKI Services' SAF keyring is:  
PKISRVD/CAring  
This is needed for the [SAF] section in pkiserv.conf

The label of the PKI Services' RA certificate is:  
Local PKI RA  
This is needed for the [SAF] section in pkiserv.conf

The PKI Services CA DN is:  
OU=Human Resources Certificate Authority,O=Your Company,C=Your Country 2 Letter Abbreviation  
The suffix must match the LDAP suffix in slapd.conf

The PKI Services RA DN is:  
CN=Registration Authority,OU=Human Resources Certificate Authority,O=Your Company,  
C=Your Country 2 Letter Abbreviation  
The suffix must match the LDAP suffix in slapd.conf

The recommended location for the pkiserv.conf and pkiserv.tpl is:  
/etc/pkiserv

Set the following environment variables in pkiserv.envars:  
\_PKISERV\_CONFIG\_PATH=/etc/pkiserv

Set the following environment variable in your httpd envvars files:

## Running IKYSETUP

\_PKISERV\_CONFIG\_PATH=/etc/pkiserv

The webserver's SAF keyring is:

SSLring

This is needed for the KeyFile directive in virtual host files

The Webserver's DN is:

CN=www.YourCompany.com,O=Your Company,L=Your City,ST=Your Full State or Province Name,  
C=Your Country 2 Letter Abbreviation

The left most RDN must be the webserver's fully qualified domain name

## Chapter 5. Configuring the UNIX runtime environment

You need to perform all of the tasks in this topic if you are configuring PKI Services for the first time. If you have already configured PKI Services for an earlier release, you might need to perform some of the tasks in this topic if you are adding support for a function.

After the RACF administrator performs the tasks necessary to set up PKI Services, the UNIX programmer needs to perform the following tasks:

- If necessary, copy files.
- If necessary, update the environment variables file.
- If necessary, update the configuration file.
- If configuring PKI Services for the first time or adding a new CA domain, set up the `/var/pkiserv` directory.

The following table summarizes information about copying and updating files. To view the contents of any of these files, see Chapter 29, “Other code samples,” on page 627.

Table 20. Deciding which files to copy and change

File	Purpose	Need to copy?	Need to change?
<code>expiringmsg.form</code>	The form for an email sent to a user when a certificate is going to expire.	Only if your company sends an email notification to a user about a certificate that is going to expire	<b>Guideline:</b> Make no changes to this file until later. See “Customizing email notifications sent to users” on page 309 for details about making changes.
<code>pendingmsg.form</code>	The form for an email sent to an administrator when requests are pending approval.	Only if your company sends an email notification to an administrator about requests that are pending approval.	<b>Guideline:</b> Make no changes to this file until later. See “Customizing email notifications sent to users” on page 309 for details about making changes.
<code>pendingmsg2.form</code>	The form for an email sent to an administrator when requests are approved with modifications.	Only if your company sends an email notification to an administrator about requests approved with modifications.	<b>Guideline:</b> Make no changes to this file until later. See “Customizing email notifications sent to users” on page 309 for details about making changes.

## Configuring the UNIX runtime environment

Table 20. Deciding which files to copy and change (continued)

File	Purpose	Need to copy?	Need to change?
pkiserv.conf	Configuration file. Contains various settings and values PKI Services needs.	Only if you are configuring PKI Services for the first time.	<p>The UNIX programmer might need to change the <b>LDAP</b> section of this file. <b>Guideline:</b> Do not change it now but change it later when you perform “Steps for tailoring the LDAP section of the configuration file” on page 100.</p> <p>The UNIX programmer might need to update the non-LDAP section of the pkiserv.conf configuration file when you add support for a function. For more information, see “Optionally updating the pkiserv.conf configuration file” on page 66.</p>
pkiserv.envars	The environment variables file.	Only if you are configuring PKI Services for the first time and the file needs changes.	UNIX programmer might have to update this file. See “Optionally updating PKI Services environment variables” on page 64.
pkiserv.tmp	The certificate templates file used with REXX CGI execs. It contains HTML-style code that builds the web pages underlying certificate requests.	Only if you are configuring PKI Services for the first time and using the REXX CGI execs to implement the PKI Services web application.	<b>Guideline:</b> Make no changes to this file until later. See Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127 for details about making changes.
PKIServ.xsd	The XML schema that defines the syntax of the XML certificate templates file pki tmp1.xml.	Only if you are configuring PKI Services for the first time and using the JavaServer pages (JSPs) to implement the PKI Services web application.	<b>Rule:</b> Do not make changes to this file.
pki tmp1.xml	The certificate templates file used with JavaServer pages (JSPs). It defines applications and certificates in XML.	Only if you are configuring PKI Services for the first time and using the JSPs to implement the PKI Services web application.	<b>Guideline:</b> Make no changes to this file until later. See Chapter 13, “Implementing the web application using JavaServer pages,” on page 233 for details about making changes.
readymsg.form	The form for an email sent to a user when the PKI Services administrator has approved a certificate request and the certificate is ready for retrieval.	Only if your company sends an email notification to a user after the PKI Services administrator has approved a certificate request and the certificate is ready for retrieval.	<b>Guideline:</b> Make no changes to this file until later. See “Customizing email notifications sent to users” on page 309 for details about making changes.

Table 20. Deciding which files to copy and change (continued)

File	Purpose	Need to copy?	Need to change?
rejectmsg.form	The form for an email sent to a user when the PKI Services administrator has rejected a certificate request.	Only if your company sends an email notification to a user after the PKI Services administrator has rejected a certificate request.	<b>Guideline:</b> Make no changes to this file until later. See “Customizing email notifications sent to users” on page 309 for details about making changes.
renewcertmsg.form	The form for an email sent to a user when PKI Services has automatically renewed an expiring certificate.	Only if your company enables automatic renewal of certificates.	<b>Guideline:</b> Make no changes to this file until later. See “Customizing email notifications sent to users” on page 309 for details about making changes.
recoverymsg.form	The form for an email sent to a user who has requested that PKI Services recover a certificate for which PKI Services generated the key pair.	Only if your company allows users to request that PKI Services generate key pairs for certificate requests.	<b>Guideline:</b> Make no changes to this file until later. See “Customizing email notifications sent to users” on page 309 for details about making changes.

### Steps for copying files

#### Before you begin

- You need to obtain the following document:
  - *z/OS UNIX System Services Planning*
- You need to know the file system directory where the MVS programmer installed PKI Services and the runtime directory, *install-dir* and *runtime-dir* in the commands that follow. The defaults are */usr/lpp/pkiserv/* and */etc/pkiserv*, in that order. The MVS programmer was asked to record any changes to these defaults; see Table 3 on page 11.
- The user ID you use for copying files must have superuser authority.

Perform the following steps to copy the files:

1. If you are configuring PKI Services for the first time, copy the configuration file by entering the following command from the UNIX command line:

```
cp -p /install-dir/samples/pkiserv.conf runtime-dir
```

2. If you are configuring PKI Services for the first time, copy the templates files. Do either Step 2a or Step 2b.

- a. If you are using REXX CGIs to implement the PKI Services web application, copy the text template file by entering the following command from the UNIX command line:

```
cp -p /install-dir/samples/pkiserv.tpl runtime-dir
```

- b. If you are using JavaServer pages (JSPs) to implement the PKI Services web application, copy the XML template file and the XML schema file by entering the following commands from the UNIX command line:

```
cp -p /install-dir/samples/pkitmpl.xml runtime-dir
cp -p /install-dir/samples/PKIServ.xsd runtime-dir
```

## Configuring the UNIX runtime environment

3. If your company is sending email notifications to users (when certificate requests are rejected or when certificates are ready for retrieval or expiring), copy the appropriate notification files from the samples directory to the runtime directory. For example:

```
cp -p /install-dir/samples/rejectmsg.form runtime-dir
cp -p /install-dir/samples/readymsg.form runtime-dir
cp -p /install-dir/samples/expiringmsg.form runtime-dir
```

---

4. If your company is sending email notifications to administrators when certificate requests are pending approval, copy the pendingmsg.form notification file from the samples directory to the runtime directory. For example:

```
cp -p /install-dir/samples/pendingmsg.form runtime-dir
```

---

5. If your company is sending email notifications to administrators when certificate requests are approved with modifications, copy the pendingmsg2.form notification file from the samples directory to the runtime directory. For example:

```
cp -p /install-dir/samples/pendingmsg2.form runtime-dir
```

---

6. If your company allows users to request that PKI Services create key pairs (private key and public key) for certificate requests, copy the notification file that is used when a user requests that PKI Services recover a certificate for which it created the keys. For example:

```
cp -p /install-dir/samples/recoverymsg.form runtime-dir
```

---

7. If you are configuring PKI Services for the first time, examine the values in the environment variables file (by default, pkiserv.envars). If any values need to change, copy this file by entering the following command:

```
cp -p /install-dir/samples/pkiserv.envars runtime-dir
```

---

## Optionally updating PKI Services environment variables

You need to perform this task only if any one of the following conditions is true:

- You are configuring PKI Services for the first time.
- You are adding an additional CA domain.
- You want to send email notifications (for rejected certificate requests or certificates that are ready for retrieval or expiring) and you did not use the default location for sendmail (/usr/sbin/sendmail).
- You intend to use automatic certificate renewal.
- You are implementing an **autorenew** exit.
- You intend to use JavaServer pages (JSPs) instead of REXX CGIs for the PKI Services web pages.

You need to define certain environment variables (such as LIBPATH) for the PKI Services daemon to run. There are two files related to environment variables:

- A sample environment variables file, pkiserv.envars (by default in /usr/lpp/pkiserv/samples/)
- SYS1.PROCLIB member PKISERVD (You can use the ENVAR parameter to point to the environment variables file.)

## Configuring the UNIX runtime environment

You can use `pkiserv.envars` to set environment variables for the PKI Services daemon. This file contains most of the environment variables needed to run the daemon.

You need to change the file if you did not use the default for any of these things:

- The install directory for PKI Service (`/usr/lpp/pkiserv`)
- The message level
- The location for sendmail (`/usr/sbin/sendmail`)

**Guideline:** If you need to make changes to the `pkiserv.envars` file, copy the file to another directory (such as `/etc/pkiserv`) and make changes only to the copy.

PKISERVD is the sample procedure to start PKI Services. (For sample code, see “PKISERVD sample procedure to start PKI Services daemon” on page 648.) PKISERVD sets the **TZ** (time zone) environment variable because it is very likely that the value of this variable needs to change. PKISERVD also includes parameters specifying the directory containing the environment variables file (**DIR**) and the file name of the environment variables file (**FN**). If you make a copy of `pkiserv.envars` as suggested, you also need to change the name of the directory in PKISERVD (for example, `DIR="/etc/pkiserv"`) and possibly the file name (for example, `FN="pki.env"`).

**Note:** You can change all of the following on the START command:

- Environment variables directory
- File name
- Job output class
- Region size
- Standard output
- Standard error
- Time zone

See “Steps for starting the PKI Services daemon” on page 121.

Because of the limitation of the number of characters allowed in the `PARM=operand` on the JCL EXEC card, take care to ensure that the total length of the environment variables directory and file name, **TZ** value, and `stdout` and `stderr` redirection values do not exceed the 100 character maximum.

You must specify any environment variables that PKI Services requires either in the PKISERVD procedure or in the environment variables file (`pkiserv.envars`).

**Guideline:** Make your additions and changes to the environment variables file, rather than to the PKISERVD procedure.

### (Optional) Steps for updating PKI Services environment variables

#### Before you begin

Examine the values in the environment variables file (by default, `pkiserv.envars`) and determine whether you need to update any values. (See “Environment variables in the environment variables file” on page 585 for a description of the environment variables and “The `pkiserv.envars` environment variables file” on page 587 for a code sample of the environment variables file.)

## Configuring the UNIX runtime environment

### Procedure

Perform the following steps to update PKI Services environment variables:

1. If you did not install sendmail in its default location (`/usr/sbin`), update the `PATH` environment variable to the location of sendmail. If you are running sendmail as a server, update the `PATH` environment variable to `/bin`.
2. Make any needed changes to `PKISERV.D`, such as updating the path name of the environment variables file (`FN` and `DIR` parameters). (See “PKISERV.D sample procedure to start PKI Services daemon” on page 648 for a code sample of the `PKISERV.D` procedure.)

- 
3. `_PKISERV_VARDIR` specifies the path name for a directory in which PKI Services writes persistent data. The maximum length of the path name is 256 characters, including the trailing `/`. The default value (if you do not set the environment variable) is `/var/pkiserv`. For example:

```
_PKISERV_VARDIR=/var/mypkiserv/
```

- 
4. If you do not define `_PKISERV_EXIT` or if it contains a null value, the PKI exit processing is disabled. If you have implemented an `AUTORENEW` exit, set `_PKISERV_EXIT` to the absolute path name of the exit program name. The maximum length is 256 characters including the program name. For example:

```
_PKISERV_EXIT=/mydir/renewexit
```

- 
5. Update any other values as necessary.
- 

### Optionally updating the `pkiserv.conf` configuration file

You need to update the `pkiserv.conf` configuration file if you meet any of the following conditions:

- You are configuring PKI Services for the first time
- You are adding support for:
  - Running multiple instances of PKI Services in a sysplex.
  - Running multiple CA domains on a single z/OS image. (See “Adding a new CA domain” on page 287.)
  - Sending email notifications to users if the PKI Services administrator rejects certificate requests or certificates are ready for retrieval or expiring
  - Customizing certificate revocation list (CRL) distribution point processing. (See “Customizing distribution point CRLs” on page 274 for details.)
  - Automatic renewal of expiring certificates
  - Sending email notifications to administrators if any requests are pending approval
  - A timeout value for the PKI Services exit.
  - Generation of key pairs (public and private key) for certificates
  - Setting the time that the daily maintenance task runs, or the days that it runs, or specifying that it is not to run when the PKI Services daemon starts
  - The certificate management protocol (CMP)
  - Using DB2 tables instead of VSAM files for the object store and ICL.
  - Creating CRLs without the Issuing Distribution Point extension.
  - Constraining the CA path length.

- Granular control of administrative functions.
- WTO notification.
- You installed a new release of z/OS and had configured PKI Services on the earlier release. (For more information see “Updating pkiserv.conf after installing a new release of z/OS” on page 86.

You can also optionally update the file if you want to change certain default values.

The `pkiserv.conf` configuration file for the PKI Services daemon consists of sections of name-value pairs. **Important:** Everything in the `pkiserv.conf` file, including section names, keys, and values, is case-sensitive.

Each section of the `pkiserv.conf` configuration file has a title enclosed in square brackets. The configuration file includes the following sections:

### [OIDs]

The OIDs section specifies the object identifiers for various nicknames PKI Services uses internally. The OIDs are specified in the following form:

*name=dotted-decimal*

The following excerpt is from the OIDs section:

```
[OIDs]
:
MyPolicy=1.2.3.4
```

### [ObjectStore]

The ObjectStore section specifies operational information for the object store and issued certificate list (ICL).

The following excerpt is from the ObjectStore section:

```
[ObjectStore]
ObjectDSN='pkisrzd.vsam.ost'
:
```

### [CertPolicy]

The CertPolicy section is for CA policy information.

The following excerpt is from the CertPolicy section:

```
[CertPolicy]
SigAlg1=sha-256WithRSAEncryption
:
```

### [General]

The General section is for general information.

The following excerpt is from the General section:

```
[General]
InitialThreadCount=10
:
```

**[SAF]** The SAF section is for information about the SAF (RACF) key ring that is used for CA certificate and private key storage.

The following excerpt is from the SAF section:

```
[SAF]
KeyRing=PKISRVD/CAring
```

### [LDAP]

The LDAP section contains information about the LDAP server for posting certificates and CRLs.

## Configuring the UNIX runtime environment

The following excerpt is from the LDAP section:

```
[LDAP]
NumServers=1
:
```

The UNIX programmer needs to update the **LDAP** section of this file. **Guideline:** Do not change it now but change it later when you perform “Steps for tailoring the LDAP section of the configuration file” on page 100.

### (Optional) Steps for updating the configuration file Before you begin

The following table provides information about parameters in the `pki serv.conf` configuration file. (It omits parameters for the **LDAP** section. For information about these parameters, see Table 25 on page 100.) Read the parameter descriptions, and examine the values that are provided in the sample configuration file, which is shown in the rightmost column to ensure that the values meet your company's requirements. As necessary, cross out the sample values and enter the information appropriate to your own organization's needs and policies.

Table 21. Information needed for updating the configuration file

Parameter	Information needed	Where to get this information	Sample value or your customized value
<b>OIDs section</b>			
MyPolicy	A registered Object ID identifying your organization's usage policy, for example: 1.2.3.4	If you are creating your own certificate policy, see “Using certificate policies” on page 268 for information about creating certificate policies. Otherwise, do not change this information.	<b>1.2.3.4</b>  If you need to use the CertificatePolicies extension, replace 1.2.3.4 with the value of your Object ID:
<b>ObjectStore section</b>			
DBType	Repository for the object store and issued certificate list (ICL). Valid values are: <ul style="list-style-type: none"> <li>• VSAM</li> <li>• DB2</li> </ul> The default value is VSAM.  If DBType is VSAM, specify values for the parameters ObjectDSN, ObjectTidDSN, ObjectStatusDSN, ObjectRequestorDSN, ICLDSN, ICLStatusDSN, and ICLRequestorDSN. If DBType is DB2, these parameters are ignored.  If DBType is DB2, specify values for the parameters DBPackage and DBSubsystem. If DBType is VSAM, these parameters are ignored.	UNIX programmer decides this value.	<b>VSAM</b>
DBPackage	Name of the DB2 package this instance of PKI Services uses for the object store and ICL in the DB2 subsystem that is specified by the DBSubsystem parameter. If DBType is VSAM, this parameter is ignored.	DB2 programmer decides this value.	<b>MasterCA</b>

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
DBSubsystem	Name of the DB2 subsystem or group attachment that is used by this instance of PKI Services. If DBType is VSAM, this parameter is ignored.	DB2 programmer decides this value.	DSN9
ObjectDSN	VSAM data set name for the object store base cluster. This is the request database. Each VSAM request record consists of a fixed header followed by a variable-length section.  If DBType is DB2, this parameter is ignored.  <b>Guideline:</b> If you are adding a new CA domain, insert the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the data set name. <b>Example:</b> 'pkisrvd.employee.vsam.ost'	For the high-level qualifier before the period, see the <i>vsamh1q</i> variable in Table 19 on page 51. The name of the file (after the period) can change; the MVS programmer who creates the VSAM data sets usually decides these names.	'pkisrvd.vsam.ost'  Note that this begins with the VSAM high-level qualifier.
ObjectTidDSN	VSAM data set name for the object store transaction ID (TID) alternate index.  If DBType is DB2, this parameter is ignored.  <b>Guideline:</b> If you are adding a new CA domain, insert the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the data set name. <b>Example:</b> 'pkisrvd.employee.vsam.ost.path'	For the high-level qualifier before the period, see the <i>vsamh1q</i> variable in Table 19 on page 51. The name of the file (after the period) can change; the MVS programmer who creates the VSAM data sets usually decides these names.	'pkisrvd.vsam.ost.path'  Note that this begins with the VSAM high-level qualifier.
ObjectStatusDSN	VSAM data set name for the object store status alternate index.  If DBType is DB2, this parameter is ignored.  <b>Guideline:</b> If you are adding a new CA domain, insert the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the data set name. <b>Example:</b> 'pkisrvd.employee.vsam.ost.status'	For the high-level qualifier before the period, see the <i>vsamh1q</i> variable in Table 19 on page 51. The name of the file (after the period) can change; the MVS programmer who creates the VSAM data sets usually decides these names.	'pkisrvd.vsam.ost.status'  Note that this begins with the VSAM high-level qualifier.
ObjectRequestorDSN	VSAM data set name for the object store requestor alternate index.  If DBType is DB2, this parameter is ignored.  <b>Guideline:</b> If you are adding a new CA domain, insert the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the data set name. <b>Example:</b> 'pkisrvd.employee.vsam.ost.requestr'	For the high-level qualifier before the period, see the <i>vsamh1q</i> variable in Table 19 on page 51. The name of the file (after the period) can change; the MVS programmer who creates the VSAM data sets usually decides these names.	'pkisrvd.vsam.ost.requestr'  Note that this begins with the VSAM high-level qualifier.

## Configuring the UNIX runtime environment

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
ICLDSN	<p>VSAM data set name for the ICL base cluster.</p> <p>This data set contains the certificates that have been issued. Each VSAM ICL record consists of a fixed header followed by a variable-length section containing the BER-encoded certificates.</p> <p>If DBType is DB2, this parameter is ignored.</p> <p><b>Guideline:</b> If you are adding a new CA domain, insert the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the data set name. <b>Example:</b> 'pkisrvd.employee.vsam.icl'</p>	<p>For the high-level qualifier before the period, see the <i>vsamhlq</i> variable in Table 19 on page 51. The name of the file (after the period) can change; the MVS programmer who creates the VSAM data sets usually decides these names.</p>	<p>'pkisrvd.vsam.icl'</p> <p>Note that this begins with the VSAM high-level qualifier.</p>
ICLStatusDSN	<p>VSAM data set name for ICL status alternate index.</p> <p>If DBType is DB2, this parameter is ignored.</p> <p><b>Guideline:</b> If you are adding a new CA domain, insert the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the data set name. <b>Example:</b> 'pkisrvd.employee.vsam.icl.status'</p>	<p>For the high-level qualifier before the period, see the <i>vsamhlq</i> variable in Table 19 on page 51. The name of the file (after the period) can change; the MVS programmer who creates the VSAM data sets usually decides these names.</p>	<p>'pkisrvd.vsam.icl.status'</p> <p>Note that this begins with the VSAM high-level qualifier.</p>
ICLRequestorDSN	<p>VSAM data set name for ICL requestor alternate index.</p> <p>If DBType is DB2, this parameter is ignored.</p> <p><b>Guideline:</b> If you are adding a new CA domain, insert the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the data set name. <b>Example:</b> 'pkisrvd.employee.vsam.icl.requestr'</p>	<p>For the high-level qualifier before the period, see the <i>vsamhlq</i> variable in Table 19 on page 51. The name of the file (after the period) can change; the MVS programmer who creates the VSAM data sets usually decides these names.</p>	<p>'pkisrvd.vsam.icl.requestr'</p> <p>Note that this begins with the VSAM high-level qualifier.</p>
RemoveCompletedReqs	<p>Time period that completed certificate requests remain in the object store before automatic deletion. This is a number followed by d (days) or w (weeks). If not specified, the default is 1w (1 week). The value 0d disables the deletion of completed requests (not suggested).</p>	<p>UNIX programmer decides this value.</p>	<p>1w</p>
RemoveInactiveReqs	<p>Time period that incomplete, inactive certificate requests remain in the object store before automatic deletion. This is a number followed by d (days) or w (weeks). If not specified, the default is 4w (4 weeks). The value 0d disables the deletion of inactive requests (not suggested).</p>	<p>UNIX programmer decides this value.</p>	<p>4w</p>
RemoveExpiredCertsAndKeys	<p>Time period that keys and expired certificates with keys that are generated by PKI Services remain in the ICL and TKDS before automatic deletion. This is a number followed by d (days) or w (weeks). If you do not specify this parameter, or you set the value to 0d, expired certificates are not removed.</p>	<p>UNIX programmer decides this value.</p>	<p>520w</p>

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
RemoveExpiredCerts	Time period that expired certificates with keys that were not generated by PKI Services remain in the ICL before automatic deletion. This is a number followed by d (days) or w (weeks). If you do not specify this parameter, or you set the value to 0d, expired certificates are not removed.	UNIX programmer decides this value.	0d
SharedPLEX	Indicates whether you intend to share a single copy of the PKI Services object store and the issued certificate list (ICL) among multiple images in a sysplex. This is T (True) or F (False). <b>Note:</b> This keyword has the same meaning as the SharedVSAM keyword in releases before z/OS V1R13. If the SharedVSAM parameter is present from an earlier release, it continues to work. If both SharedVSAM and SharedPLEX are present, SharedPLEX takes precedence.	UNIX programmer decides this value.	F
<b>CertPolicy section</b>			
AdminGranularControl	Enables granular authority control for administrative functions that are based on CA domain name, certificate template name, and the administrative function being performed. If enabled, appropriate RACF protection profiles must be set up. If T (True), granular authority control is enabled. If F (False), granular authority is disabled. F is the default.	UNIX programmer decides this value.	F
AdminNotifyNewn	The email address to which notification should be sent immediately when a request is created and requires approval. The notification is only sent once. There can be multiple entries, where <i>n</i> is 1 for the first entry and increases sequentially for additional entries. The mailing address is in the form <userid>@<system>.	UNIX programmer decides this value.  Do not change this information until you set up administrator notification of requests pending approval.	abigail@mycompany.com
AdminNotifyRemindern	The email address to which reminder notifications of requests pending approval should be sent when the daily maintenance task runs. There can be multiple entries, where <i>n</i> is 1 for the first entry and increases sequentially for additional entries. The mailing address is in the form <userid>@<system>.	UNIX programmer decides this value.  Do not change this information until you set up administrator notification of requests pending approval.	abigail@mycompany.com
ARLDist	Indicates whether an authority revocation list (ARL) distribution point is created. F (the default) indicates that no ARL distribution point is created. T indicates that an ARL distribution point is created if CRLDistSize is greater than zero.	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See "Creating a distribution point ARL" on page 280 for more information.	F

## Configuring the UNIX runtime environment

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
CertValidityConstraint	Specifies whether the validity period of a certificate should be constrained within the CA's certificate life time. If T (True), requests with a validity period that exceeds the CA's validity period fail. If F (False), requests are not constrained to the CA's validity period. F is the default.	UNIX programmer decides this value.	F
CPSn	The Uniform Resource Identifier (URI) for the Certification Practice Statement (CPS) that is associated with PolicyName. The value is in the form:  http://www.mycompany.com/cps.html	Do not change this information until you perform advanced customization. See "Using certificate policies" on page 268 for more information.	<a href="http://www.mycompany.com/cps.html">http://www.mycompany.com/cps.html</a>  If you changed PolicyRequired=F to PolicyRequired=T, you need to replace the sample value with a valid URI to your published Certificate Practice Statement.
CreateInterval	How often the certificate creation thread scans the database for approved requests. This is a number followed by w (weeks), d (days), h (hours), m (minutes), or s (seconds).	UNIX programmer decides this value.	3m
CRLDistDirPath	The full path for the file system directory where PKI Services is to save each DP CRL, as specified by the HTTP URI in the CRLDistributionPoints extension. This value is ignored if you do not create a CRLDistributionPoints extension or if the URI protocol is ldap. This value can be specified with or without the trailing slash.  The default value is /var/pkiserv/.	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See "Customizing distribution point CRLs" on page 274 for more information.	/var/pkiserv/
CRLDistName	Constant portion of the (leaf-node) relative distinguished name for a distribution point (DP) CRL, if DP CRL processing is being performed.  The default value is CRL.	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See "Customizing distribution point CRLs" on page 274 for more information.	CRL
CRLDistSize	An integer value that represents the maximum number of certificates that can appear on one DP CRL.  If you do not specify this parameter, or you set the value to 0, DP CRLs are not created.	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See "Customizing distribution point CRLs" on page 274 for more information.	500

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
CRLDistURIn	<i>Optional:</i> Specifies a URI format name for the DP CRL. You can specify multiple names by using parameters CRLDistURI1, CRLDistURI2, and so forth. This value is ignored if you do not create DP CRLs by specifying CRLDistSize with a value greater than zero. Specify this only if you want a URI-format name, in addition to the distinguished name format, which is built in the CRLDistributionPoints extension.	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See “Customizing distribution point CRLs” on page 274 for more information.	-
CRLDuration	The amount of time that a certificate revocation list is valid. This is a number followed by w (weeks), d (days), h (hours), m (minutes), or s (seconds). <b>Note:</b> When CRLE enhancements is set to T, the CRLDuration value is rounded up to the nearest number of days.	UNIX programmer decides this value.	<b>2d</b>
CRLEnhancements	Enables enhanced CRL processing and CRL posting logic that reduces CPU and memory usage during CRL creation processing, and posting of CRL objects to LDAP. The processing enhancements provide improvements in all configurations. However, the improvement is more noticeable when there is a large number of revoked certificates in a given CRL, and is recommended when EnableLargeCRLPosting is enabled. Set the value for this keyword to T to enable the enhanced CRL creation and posting logic. The default value, if omitted, is F. <b>Note:</b> When CRL enhancements is set to T, the CRLDuration value is rounded up to the nearest number of days.	UNIX programmer decides this value.	<b>F</b>
CRLIDPExt	Specifies whether certificate revocation lists (CRLs) should be created with a critical Issuing Distribution Point (IDP) extension. If T (True), CRLs are created with a critical IDP extension. If F (False), CRLs are created without the IDP extension. The default is T.	UNIX programmer decides this value.	<b>T</b>
CRLWTONotification	Specifies whether a console message is issued when CRL processing ends. If set to none, no console message is issued. If set to file, a console message is issued after the CRL is available in the file system. This keyword is ignored if either of the following conditions are true: <ul style="list-style-type: none"> <li>• HTTP protocol is not specified for CRL distribution.</li> <li>• Large CRL posting is not enabled.</li> </ul>	UNIX programmer decides this value.	<b>none</b>
EnableCMP	Specifies whether support for certificate management protocol (CMP) messages is enabled. If T (True), CMP messages that are supported are accepted. If F (False), all CMP messages are rejected. F is the default.	UNIX programmer decides this value.	<b>F</b>

## Configuring the UNIX runtime environment

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
EnableLargeCRLPosting	Specifies whether large CRL posting is enabled. If T, CRLs are saved in a z/OS UNIX directory before the LDAP posting thread processes them. If F, CRLs are saved in the object store (either VSAM data set or DB2 table, depending on which you are using), and are subject to a size limit of approximately 32 KB. The default is F. <b>Note:</b> It is recommended that the CRLEnhancements keyword is enabled, by setting the value to T, to reduce the CPU and memory usage that is required for building CRLs and posting CRLs to LDAP.	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See “Enabling support for large CRLs” on page 281 for more information.	F
EnablePathLenConstraint	Specifies whether certificate path length constraints are enforced by the CA. The value is T (True) or F (False). If T, the CA certificate is examined at initialization to verify that it meets path length constraint requirements. If so, the pathLenConstraint field is set in the basic constraints extension of the intermediate CA certificates that are created by this CA. If not specified, or F, certificate path length constraint is not enforced in the CA certificate that is used by the CA, and intermediate CA certificates that are created by this CA do not include a pathLenConstraint field in the basic constraints extension.	UNIX programmer decides this value.	F
EnableSCEP	Specifies whether Simple Certificate Enrollment Protocol (SCEP) is allowed. This is T (True) or F (False).	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303 for more information.	F

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
ExpireWarningTime	<p><b>Note:</b> You need a value for this parameter only if you are sending email notifications to users when certificates are expiring, or automatically renewing certificates when they are expiring and sending them to the owners.</p> <p>This parameter indicates how soon before certificate expiration to send a warning message or a renewed certificate (that is, the number of days or weeks before the day and time the certificate expires).</p> <p>If automatic certificate renewal is active, this parameter indicates how soon before certificate expiration to renew the certificate and send it to the owner.</p> <p>This name-value pair is optional. Its absence indicates that no expiration checking is performed and no automatic certificate renewal occurs. Also, if the name-value pair is present but has an incorrect value or if PKI Services is configured to operate without LDAP, no expiration checking or automatic certificate renewal is done.</p>	UNIX programmer decides this value.	<b>4w</b>
LargeCRLPostPath	The full path for the file system directory where PKI Services is to save each CRL for posting to LDAP, if support for large CRLs is enabled. This value can be specified with or without the trailing slash, and can be the same as the value of CRLDistDirPath. The default value is /var/pkiserv/.	<p>UNIX programmer decides this value.</p> <p>Do not change this information until you perform advanced customization. See “Enabling support for large CRLs” on page 281 for more information.</p>	<b>/var/pkiserv/crls</b>
MaxSuspendDuration	The length of the certificate suspension grace period in weeks or days. This is a number followed by w (weeks) or d (days). Certificates that remain suspended for longer than this period are automatically revoked. If you do not specify this parameter, or you set it to 0d, the grace period is unlimited.	UNIX programmer decides this value.	<b>120d</b>
OCSPType	<p>The type of OCSP responder support wanted:</p> <ul style="list-style-type: none"> <li>• none (the default)</li> <li>• basic</li> </ul> <p>If you do not specify this parameter, or you set the value to none, the responder is not enabled.</p>	Change to basic if you want to enable the responder.	<b>none</b>

## Configuring the UNIX runtime environment

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
PathLength	Specifies the certificate path length constraint value to be included in the basic constraints extension of intermediate CA certificates that are created by the CA. Valid values are 0 - 16. The value that is specified must be less than the pathLenConstraint value in the PKI CA certificate, if it is present. This keyword is ignored if the EnablePathLenConstraint keyword is not set to T.	UNIX programmer decides this value.	<b>1</b>
PKCS12Content	Specifies which certificates PKI Services includes in the PKCS#12 returned to the requester when the certificate is retrieved. (This only applies to certificates where PKI Services generated the public/private key pair). Acceptable values for this keyword are: <ul style="list-style-type: none"> <li>• <b>I</b> - The returned PKCS#12 contains the requested certificate and private key and contains the CA certificate that is used to sign the requested certificate. This is the default value if the keyword is omitted or if an unsupported value is specified.</li> <li>• <b>C</b> - The returned PKCS#12 contains the requested certificate and private key. It also contains the complete signing certificate chain including the root CA certificate, provided the CA certificates are connected to the key ring.</li> <li>• <b>E</b> - The returned PKCS#12 contains the requested certificate and private key. None of the CA certificates of the signing chain are included.</li> </ul>	UNIX programmer decides this value.	<b>I</b>
PolicyCritical	Indicates whether the CertificatePolicies extension should be marked critical. The value is T (True) or F (False).	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See "Using certificate policies" on page 268 for more information.	<b>F</b>
PolicyRequired	Indicates whether the CertificatePolicies extension should be included in all certificates that are created. The value is T (True) or F (False). T indicates that the CertificatePolicies extension is added to all certificates, and includes all PolicyName entries that are specified in the configuration file. Any policies that are specified in the CertPolicies input parameter or listed in the CONSTANT subsection in the template file are ignored. F indicates that the CertificatePolicies extension is added to a certificate only when a certificate policy is specified in the CertPolicies input parameter or in the CONSTANT section of the template when a certificate is requested.	UNIX programmer decides this value.  Do not change this information until you perform advanced customization. See "Using certificate policies" on page 268 for more information.	<b>F</b>

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
<code>PolicyName</code>	A list of CertificatePolicies extensions that are added to all created certificates when <code>PolicyRequired=T</code> . The policy name is the symbolic name for a certificate policy OID and must match the name of a policy that is listed in the <b>OIDs</b> section.	Do not change this information until you perform advanced customization. See “Using certificate policies” on page 268 for more information.	<i>MyPolicy</i>  If you changed <code>PolicyRequired=F</code> to <code>PolicyRequired=T</code> , replace the name <i>MyPolicy</i> with the same policy name that is used in the <b>OIDs</b> section.
<code>PolicynOrg</code>	The name of the organization that prepared the User Notice Reference information that is associated with <code>PolicyName</code> . For example: International Business Machines, Inc.	Do not change this information until you perform advanced customization. See “Using certificate policies” on page 268 for more information.	<b>My Company, Inc.</b>  If you changed <code>PolicyRequired=F</code> to <code>PolicyRequired=T</code> , you need to specify your own value for this.
<code>PolicynNoticem</code>	Specifies the number of a textual statement, which is prepared by <code>PolicynOrg</code> for the User Notice Reference that is associated with <code>PolicyName</code> . More than one textual statement can apply.	Do not change this information until you perform advanced customization. See “Using certificate policies” on page 268 for more information.	<b>1</b>  If you changed <code>PolicyRequired=F</code> to <code>PolicyRequired=T</code> , you need to specify your own value for this parameter.
<code>SigAlg1</code>	The nickname that is assigned to the Object ID for the signature algorithm in the <b>OIDs</b> section.  The supported algorithms and their nicknames are listed in Table 48 on page 272.  <b>Guideline:</b> The MD2 and MD5 hashes are found to be vulnerable to attack. Avoid specifying <code>md-5WithRSAEncryption</code> and <code>md-2WithRSAEncryption</code> if possible.	The supported algorithms and their nicknames are listed in Table 48 on page 272.  Do not change this information until you perform advanced customization. See “Updating the signature algorithm” on page 271 for more information.	<b>sha-256WithRSAEncryption</b>
<code>TimeBetweenCRLs</code>	How often a certificate revocation list (CRL) should be created. This is a number followed by w (weeks), d (days), h (hours), m (minutes), or s (seconds).  <b>Tip:</b> If you want PKI Services to create a CRL immediately, instead of waiting for the <code>TimeBetweenCRLs</code> interval to pass, use the <code>createcrls</code> utility. For more information, see “Using the <code>createcrls</code> utility” on page 414.	UNIX programmer decides this value.	<b>1d</b>
<code>UserNoticeTextn</code>	The User Notice Explicit Text information that is associated with <code>PolicyName</code> . For example: Certificate for IBM internal use only. For the CA to conform with current standards, this textual statement must not exceed 200 characters.	Do not change this information until you perform advanced customization. See “Using certificate policies” on page 268 for more information.	<i>statement</i>  If you changed <code>PolicyRequired=F</code> to <code>PolicyRequired=T</code> , you need to replace the variable <i>statement</i> with your own value.

## Configuring the UNIX runtime environment

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
<b>General section</b>			
ExitTimeout	Length of time that PKI Services waits for the <b>autorenew</b> preprocessing and postprocessing exit to return. If not specified, PKI Services waits for at most 30 seconds. PKI Services cancels the exit program if it runs longer than the specified time. The maximum value that is allowed is 1 hour. Any time specified greater is run for the maximum amount of time.	UNIX programmer decides this value.	10s
InitialThreadCount	Number of threads (at least 2 and no more than 100) the PKI Services daemon should create at program initialization.	UNIX programmer decides this value.	10
MaintRunDays	The days on which the daily maintenance task is to run. This is a list of digits 0 - 6, representing the days of the week, with 0 representing Sunday, and 6 representing Saturday. The digits that are listed represent the days on which the task is to run. No spaces or other characters can be specified, and digits cannot be repeated. The digits can be specified in any order. If not specified, the task runs every day.	UNIX programmer decides this value.	0123456
MaintRunTime	The time (local time) at which the daily maintenance task is to run, in the format <i>hh:mm</i> , where <i>hh</i> represents the hour (00 - 23) and <i>mm</i> represents the minutes (00 - 59). 00:00 represents midnight. If not specified, the task runs once per day at midnight local time.	UNIX programmer decides this value.	01:00
RunMaintAtStart	Indicates whether the daily maintenance task should run during PKI Services startup, in addition to the time and days that are specified by the <i>MaintRunTime</i> and <i>MaintRunDays</i> parameters. The value T (True) indicates that the task should run during PKI Services startup. The value F (False) indicates that the task should not run during PKI Services startup. If not specified, the daily maintenance task runs during PKI Services startup.	UNIX programmer decides this value.	T

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
ReadyMessageForm	<p>The full path name or data set name containing the “Your certificate is ready” message form.</p> <ul style="list-style-type: none"> <li>• If you are not setting up PKI Services to generate keys for certificates, this name-value pair is optional. If you do not specify this name-value pair, no message is sent.</li> <li>• If you are setting up PKI Services to generate keys for certificates, this name-value pair is required. If you do not specify this name-value pair, requests to have PKI Services generate keys for certificates fail.</li> </ul> <p><b>Guideline:</b> If you are adding a new CA domain, use the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the path name. <b>Example:</b> /etc/pkiserv/employees/readymsg.form</p>	UNIX programmer decides this value.	/etc/pkiserv/readymsg.form
RejectMessageForm	<p>The full path name or data set name containing the “Your certificate has been rejected” message form. By default, no message is issued. Using this name-value pair is optional.</p> <p><b>Guideline:</b> If you are adding a new CA domain, use the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the path name. <b>Example:</b> /etc/pkiserv/employees/rejectmsg.form</p>	UNIX programmer decides this value.	/etc/pkiserv/rejectmsg.form
ExpiringMessageForm	<p>The full path name or data set name containing the “Your certificate is about to expire” message form. By default, no message is issued. If your team specified a value for <i>ExpireWarningTime</i> (see the <i>ExpireWarningTime</i> row in this table), then <i>ExpiringMessageForm</i> is required. Otherwise, an error is logged and no expiring message processing is performed.</p> <p><b>Guideline:</b> If you are adding a new CA domain, use the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the path name. <b>Example:</b> /etc/pkiserv/employees/expiringmsg.form</p>	UNIX programmer decides this value.	/etc/pkiserv/ expiringmsg.form
AdminNotifyForm	<p>The full path name or data set name containing the 'request(s) pending for approval' message form. Defaults to no notification sent.</p> <p><b>Guideline:</b> If you are adding a new CA domain, use the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the path name. <b>Example:</b> /etc/pkiserv/employees/pendingmsg.form</p>	UNIX programmer decides this value.	/etc/pkiserv/ pendingmsg.form
AdminNotifyModForm	<p>The full path name or data set name containing the 'request(s) approved with modifications' message form. Defaults to no notification sent.</p>	UNIX programmer decides this value.	/etc/pkiserv/ pendingmsg2.form

## Configuring the UNIX runtime environment

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
RenewCertForm	The full path name or data set name containing the 'renewed certificate'. Defaults to no certificate sent.  <b>Guideline:</b> If you are adding a new CA domain, use the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the path name. <b>Example:</b> <i>/etc/pkiserv/employees/renewcertmsg.form</i>	UNIX programmer decides this value.	<i>/etc/pkiserv/renewcertmsg.form</i>
RecoverForm	The full path name or data set name containing the 'list of certificates that satisfy your search criteria for recovery' message form. Use this name-value pair if you are setting up PKI Services to generate keys for certificate requests, and want users to be able to recover those certificates.  <b>Guideline:</b> If you are adding a new CA domain, use the <i>ca_domain</i> value from Table 19 on page 51 as the second qualifier in the path name. <b>Example:</b> <i>/etc/pkiserv/employees/recoverymsg.form</i>	UNIX programmer decides this value.	<i>/etc/pkiserv/recoverymsg.form</i>
<b>SAF section</b>			
KeyRing	The fully qualified name of the SAF key ring for PKI Services to use. (This must consist of an uppercase user ID and a case-sensitive ring name that is separated by a slash (/).)	See the <i>ca_ring</i> and <i>daemon</i> values in Table 19 on page 51.	<b>PKISRVD/CARing</b>
RA_label	The label of your PKI Services registration authority (RA) certificate.	See the <i>ra_label</i> value in Table 11 on page 38.	<b>Local PKI RA</b>
SecureKey	Indicates whether keys that are generated by PKI Services are secure keys or clear keys. The value can be T (True) or F (False). T indicates that secure keys are generated in the TKDS. F or the absence of this keyword indicates that clear keys or secure keys are generated in the TKDS according to the installation configuration policy. SecureKey is ignored if TokenName is not specified.	UNIX programmer decides this value.	<b>F</b>

Table 21. Information needed for updating the configuration file (continued)

Parameter	Information needed	Where to get this information	Sample value or your customized value
TokenName	The name of a token in the ICSF PKCS #11 token data set (TKDS) that PKI Services uses to store key pairs that it generates for certificates. If this keyword is not specified, PKI Services cannot generate key pairs for certificates. If this keyword is specified, the TKDS must be set up before PKI Services starts. For information about setting up the TKDS, see <i>z/OS Cryptographic Services ICSF Writing PKCS #11 Applications</i> .	UNIX programmer decides this value. It must meet the requirements for a token name: <ul style="list-style-type: none"> <li>• Up to 32 characters in length</li> <li>• Permitted characters are: <ul style="list-style-type: none"> <li>– Alphanumeric</li> <li>– National: @ X'5B', # X'7B', or \$ X'7C'</li> <li>– Period . X'4B'</li> </ul> </li> <li>• The first character must be alphabetic or national</li> <li>• Lowercase letters can be used, but are folded to uppercase</li> <li>• The IBM1047 code page is assumed</li> </ul>	PKISRVD.PKIToken
LDAP section			
	For information about the LDAP section, see Table 25 on page 100.		

### Notes:

1. Keep in mind that everything in the `pki serv.conf` file, including section names, keys, and values, is case-sensitive.
2. For boolean values, any of the following values are accepted for True: T, t, Y, y, or 1. Any of the following values are accepted for False: F, f, N, n, or 0

### Procedure

Perform the following steps to update the `pki serv.conf` configuration file:

1. If necessary, update the **ObjectStore** section:
  - a. If you want to use DB2 tables for the object store and issued certificate list (ICL) instead of VSAM files, uncomment the following line by removing the “# ” at the beginning of the line:

```
# DBType=DB2
```

and leave the following line commented out:

```
# DBType=VSAM
```

If you want to use VSAM files, leave both lines commented out, or uncomment the following line:

```
# DBType=VSAM
```

## Configuring the UNIX runtime environment

- b. If DBType is set to DB2 (see step 1a on page 81), uncomment the following lines, and if necessary change the DB2 package name and subsystem name in the following lines to the names you chose in the DBPackage and DBSubsystem rows in Table 21 on page 68:

```
# DBPackage=MasterCA
```

```
# DBSubsystem=DSN9
```

- c. If DBType is set to VSAM, or commented out, or not present (see step 1a on page 81), if necessary change the data set names in the following lines to the names you chose in the ObjectDSN, ObjectTidDSN, ObjectStatusDSN, ObjectRequestorDSN, ICLDSN, ICLStatusDSN, and ICLRequestorDSN rows in Table 21 on page 68:

```
ObjectDSN='pkisrvd.vsam.ost'
```

```
ObjectTidDSN='pkisrvd.vsam.ost.path'
```

```
ObjectStatusDSN='pkisrvd.vsam.ost.status'
```

```
ObjectRequestorDSN='pkisrvd.vsam.ost.requestr'
```

```
ICLDSN='pkisrvd.vsam.icl'
```

```
ICLStatusDSN='pkisrvd.vsam.icl.status'
```

```
ICLRequestorDSN='pkisrvd.vsam.icl.requestr'
```

If you are configuring PKI Services for the first time, be aware that the high-level qualifier of the VSAM data set names must match the name of the RACF user ID assigned to the PKI Services daemon (by default, PKISRVD). If you change from the default to another user ID, you need to change the high-level qualifier in the pkiserv.conf configuration file too. If the MVS programmer changes the data set names (see Step 2d on page 111), you must make equivalent changes in pkiserv.conf.

- d. If necessary, change 1w in the following line to the value in the RemoveCompletedReqs row in Table 21 on page 68:
- ```
RemoveCompletedReqs=1w
```
- e. If necessary, change 4w in the following line to the value in the RemoveInactiveReqs row in Table 21 on page 68:
- ```
RemoveInactiveReqs=4w
```
- f. If necessary, uncomment the following line and, optionally, change 26w to the value in the RemoveExpiredCerts row in Table 21 on page 68:
- ```
RemoveExpiredCerts=26w
```
- g. If necessary, uncomment the following line and, optionally, change 520w to the value in the RemoveExpiredCertsAndKeys row in Table 21 on page 68:
- ```
RemoveExpiredCertsAndKeys=520w
```
- h. If necessary, update the SharedPLEX line:
- If you intend to use a sysplex and you are configuring PKI Services for the first time, change F in the following line to T:  

```
SharedPLEX=F
```
  - If you are not using a sysplex (regardless of whether you are configuring PKI Services for the first time), you do not need to do anything.

- 
2. If necessary, update the CertPolicy section.

- a. If necessary, change 3m in the following line to the value in the CreateInterval row in Table 21 on page 68:

```
CreateInterval=3m
```

- b. If necessary, update the ExpireWarningTime line or lines:

## Configuring the UNIX runtime environment

- If you are sending email notifications and you are configuring PKI Services for the first time, if necessary change the value 4w in the following line to the value in the `ExpireWarningTime` row of Table 21 on page 68.  
`ExpireWarningTime=4w`
  - If you are not using email notifications and you are configuring PKI Services for the first time, remove the `ExpireWarningTime=4w` line from the `pkiserv.conf` file.
- c. If necessary, change 1d in the following line to the value in the `TimeBetweenCRLs` row in Table 21 on page 68:  
`TimeBetweenCRLs=1d`
- d. If necessary, change 2d in the following line to the value in the `CRLDuration` row in Table 21 on page 68:  
`CRLDuration=2d`
- e. If necessary, change F in the following line to the value in the `PolicyRequired` row in Table 21 on page 68:  
`PolicyRequired=F`

For more information about this parameter, see “Using certificate policies” on page 268.

- f. If necessary, change F in the following line to the value in the `PolicyCritical` row in Table 21 on page 68:  
`PolicyCritical=F`

For more information about this parameter, see “Using certificate policies” on page 268.

- g. If necessary, change 120d in the following line to the value in the `MaxSuspendDuration` row in Table 21 on page 68:  
`MaxSuspendDuration=120d`
- h. If necessary, establish distribution point (DP) certificate revocation lists (CRLs) and a DP authority revocation list (ARL). Follow the procedure that is shown in “Steps for customizing distribution point CRLs” on page 278 to determine the values for Table 21 on page 68.
- i. If you want to enable the OCSP responder, change `OCSPType=none` to `OCSPType=basic`.
- j. If you want to allow certificate management protocol (CMP) clients to send requests to PKI Services, change `EnableCMP=F` to `EnableCMP=T`. For information about support for CMP, see Chapter 19, “Using the certificate management protocol (CMP) with PKI Services,” on page 435.
- k. If you want to enable support for CRLs larger than 32 KB, change F in the following row to T and set `LargeCRLPostPath` to the full path of the file system directory where PKI Services is to save CRLs for posting to LDAP.  
`EnableLargeCRLPosting=F`

For more information, see “Enabling support for large CRLs” on page 281.

- l. If you want certificate revocation lists (CRLs) to be created without the Issuing Distribution Point (IDP) extension, uncomment the following line by removing the “#” character and change T to F:  
`#IDPExtCRL=T`
- m. If you want to enable Simple Certificate Enrollment Protocol (SCEP), change `EnableSCEP=F` to `EnableSCEP=T`. (See “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.)

## Configuring the UNIX runtime environment

- n. If you want to enable granular authority control for administration functions, uncomment the following line by removing the “#” character and change F to T:

```
#AdminGranularControl=F
```

Before you enable granular authority control, the security administrator must set up profiles in the PKISERV class to control which functions each PKI administrator can perform. For more information, see “Using the PKISERV class to control access to administrative functions” on page 479.

- o. If you want to enable certificate path length constraint, uncomment the following line by removing the “#” character and change F to T:

```
#EnablePathLenConstraint=F
```

Then uncomment the following line by removing the “#” character and change 1 to the value that you want the pathLenConstraint field to be set to in the basic constraints extension of intermediate CA certificates that are created by the CA. The value that you specify must be in the range 0 - 16, and must be less than the value of pathLenConstraint in the PKI CA certificate if it is present.

```
#PathLength=1
```

- p. If you want to enable the CRL performance enhancements, add the following line in the **CertPolicy** section of the pki serv.conf file. If the following line exists, uncomment the line by removing the # character and change F to T.

```
CRLEnhancements=T
```

**Note:** When the CRLEnhancements keyword value is set to T, the specified CRLDuration value is rounded up to the nearest number of days.

- 
3. If you want a console message to be issued when CRL processing finishes, change the following line

```
CRLWTONotification=none
```

to

```
CRLWTONotification=file
```

- 
4. If necessary, update the **General** section:

- a. If necessary, change 10 in the following line to the value in the InitialThreadCount row in Table 21 on page 68:

```
InitialThreadCount=10
```

- b. If necessary, change 10 in the following line to the value in the ExitTimeout row in Table 21 on page 68:

```
ExitTimeout=30s
```

- c. If you choose, you can customize the time at which the daily maintenance task runs, the days on which it runs, and whether it also runs when the PKI Services daemon starts. This task is named daily\_Timer, and performs functions such as:

- Removing old and expired certificates
- Removing inactive and completed certificate requests from the object store

## Configuring the UNIX runtime environment

- Updating the low CRL distribution point that is based on expired certificates
- Processing certificate expiration notification warning messages and automatic certificate renewal messages

To specify that the daily maintenance task is to run at a time other than the default of midnight local time, remove the “#” from the following line and change 01:00 to the time that you want the task to run.

```
#MaintRunTime=01:00
```

To specify the days on which the daily maintenance task is to run, remove the “#” from the following line and change 0123456 to the list of digits representing the days on which you want the task to run. For example, specify 15 to run the task every Monday and Friday.

```
#MaintRunDays=0123456
```

To specify that the daily maintenance task is not to run when the PKI Services daemon starts, remove the “#” from the following line and change T to F.

```
#RunMaintAtStart=T
```

- d. If necessary update the ReadyMessageForm, RejectMessageForm, ExpiringMessageForm, AdminNotifyForm, RenewCertForm, and RecoverForm lines:

- If you are sending email notifications and you are configuring PKI Services for the first time, if necessary, change the values of the path name in the following lines to the corresponding values in Table 21 on page 68:

```
ReadyMessageForm=/etc/pkiserv/readymsg.form
```

```
RejectMessageForm=/etc/pkiserv/rejectmsg.form
```

```
ExpiringMessageForm=/etc/pkiserv/expiringmsg.form
```

```
AdminNotifyForm=/etc/pkiserv/pendingmsg.form
```

```
AdminNotifyModForm=/etc/pkiserv/pendingmsg2.form
```

```
RenewCertForm=/etc/pkiserv/renewcertmsg.form
```

- If you are allowing PKI Services to generate key pairs for certificates, if necessary change the value of the path name in the following lines to the corresponding value in Table 21 on page 68:

```
ReadyMessageForm=/etc/pkiserv/readymsg.form
```

```
RecoverForm=/etc/pkiserv/recoverymsg.form
```

- If you are not sending email notifications and you are configuring PKI Services for the first time, comment out the following lines in the pkiserv.conf configuration file by putting a “#” character in the first position of each line that does not already have a “#” character in it, as shown here:

```
# full pathname or data set name containing the 'your certificate request  
# has been rejected' message form. Defaults to no message issued  
# RejectMessageForm=/etc/pkiserv/rejectmsg.form
```

```
# full pathname or data set name containing the 'your certificate is about  
# to expire' message form. Defaults to no message issued  
# ExpiringMessageForm=/etc/pkiserv/expiringmsg.form
```

```
# full pathname or data set name containing the 'request(s) pending for  
# approval' message form. Defaults to no notification sent  
# AdminNotifyForm=/etc/pkiserv/pendingmsg.form
```

## Configuring the UNIX runtime environment

```
| # full pathname or data set name containing the request(s) approved  
| # with modifications message form. Defaults to no notification sent.  
| # AdminNotifyModForm=/etc/pkiserv/pendingmsg2.form
```

```
# full pathname or data set name containing the renewed certificate.  
# Defaults to no certificate sent  
# RenewCertForm=/etc/pkiserv/renewcertmsg.form
```

- If you are not sending email notifications and you are not allowing PKI Services to generate keys for certificates, and you are configuring PKI Services for the first time, comment out the following lines in the `pkiserv.conf` configuration file, as shown here:

```
# full pathname or data set name containing the 'your certificate is ready'  
# message form. Defaults to no message issued  
# ReadyMessageForm=/etc/pkiserv/readymsg.form
```

- If you are not allowing PKI Services to generate keys for certificates, and you are configuring PKI Services for the first time, comment out the following lines in the `pkiserv.conf` configuration file, as shown here:

```
# full pathname or data set name containing information on certificate(s)  
# needed to be recovered.  
# RecoverForm=/etc/pkiserv/recoverymsg.form
```

- If you are allowing PKI Services to generate keys for certificates, and you are not configuring PKI Services for the first time, and you previously deleted the following lines in the `pkiserv.conf` configuration file, restore the following lines:

```
# full pathname or data set name containing the 'your certificate is ready'  
# message form. Defaults to no message issued  
ReadyMessageForm=/etc/pkiserv/readymsg.form
```

---

### 5. If necessary, update the **SAF** section:

- a. If necessary, change `PKISRVD/CAring` in the following line to the value in the `KeyRing` row in Table 21 on page 68:

```
KeyRing=PKISRVD/CAring
```

- b. If you specified `EnableSCEP=T` in Step 2m on page 83, change `Local PKI RA` in the following line to the value in the `ra_label` row in Table 11 on page 38:

```
RALabel=Local PKI RA
```

- c. If you want PKI Services to be able to generate and store key pairs for certificate requests, and the ICSF programmer set up the ICSF PKCS #11 token data set (TKDS), uncomment the following line and change `PKISRVD.PKIToken` to the value you chose in the `TokenName` row in Table 21 on page 68:

```
TokenName=PKISRVD.PKIToken
```

- 
6. Restart PKI Services. Your changes do not take effect until you do this. For information about starting PKI Services see Chapter 10, “Starting and stopping PKI Services,” on page 121.
- 

## Updating `pkiserv.conf` after installing a new release of z/OS

After you install a new release of z/OS, you have two versions of the `pkiserv.conf` file on your system:

- The version that you used on the previous release of z/OS, which contains the changes you made to configure PKI Services.

- The sample version shipped with the new release of z/OS, which contains changes that IBM made to support the new function shipped in the release. This version does not contain any of your configuration changes.

You can continue to use the version from the previous release, but you might not be able to use the new function shipped in the new release until you merge the configuration changes you made in your version of the file with the updates that IBM made in the version shipped in the new release. One approach to merging the files is to compare your version of `pkiserv.conf` with the new sample version, located by default in the `/usr/lpp/pkiserv/samples/` directory. Update your version to match the changes made to the sample version. You should be able to cut and paste between the two versions of the file. To identify the lines that changed, you can refer to the sample of `pkiserv.conf` in Chapter 26, “The `pkiserv.conf` configuration file,” on page 577, which marks the lines that were changed with a bar in the left margin. But be aware that the sample shown might not be identical to the sample shipped with PKI Services.

---

### Steps for setting up the var directory

You need to perform this task only if you are configuring PKI Services for the first time or adding a new CA domain.

#### Before you begin

Replace the following default values (used in the command examples) with values appropriate for your configuration:

Default value	Your value
PKISRVD	Use your daemon value in Table 19 on page 51.
'pkisrvd.webroot.derbin'	Use your <code>export_dsn</code> value in Table 19 on page 51.
/var/pkiserv	<b>Guideline:</b> Use your <code>ca_domain</code> value from Table 19 on page 51 to qualify the directory location if you are adding a new CA domain. For example, <code>/var/pkiserv/employees</code> .

#### Procedure

Perform the following steps to set up a UNIX directory and copy certain files that PKI Services needs into that directory:

1. Change ownership of the directory to the user ID of the PKI Services daemon by entering the following command from the UNIX command line:

**Example:**

```
chown PKISRVD /var/pkiserv
```

2. Copy the web Server root certificate from its MVS data set to `cacert.der` in the `/var/pkiserv` directory by entering the following command from the UNIX command line:

**Example:**

```
cp "'/pkisrvd.webroot.derbin'" /var/pkiserv/cacert.der
```

3. Change the permission settings of the file by entering the following command from the UNIX command line:

**Example:**

## Configuring the UNIX runtime environment

```
chmod 644 /var/pkiserv/cacert.der
```

---

4. Change the ownership of the file by entering the following command from the UNIX command line:

**Example:**

```
chown pkisrzd /var/pkiserv/*
```

---

---

## Chapter 6. Tailoring the LDAP configuration for PKI Services

If you are configuring PKI Services for the first time, the LDAP programmer needs to load the LDAP schema file.

If you intend to use a non-z/OS LDAP product, refer to the documentation for that product. See Appendix A, “LDAP directory server requirements,” on page 653 for information about installing a non-z/OS LDAP.

If you are configuring PKI Services for the first time, the LDAP programmer needs to set up an LDAP access control list (ACL) to allow any user to read CRLs, and might also need to set up another LDAP ACL to allow the distinguished name used for LDAP binding to create certificates and CRLs. For more information, see “Setting up authorization to create and access CRLs and certificates” on page 90.

You can optionally set up a secure connection with the LDAP server. For more information, see “Establishing a secure connection with LDAP (optional)” on page 90.

---

### Steps for loading schema.user.ldif

#### Before you begin

- You need LDAP programming skills to complete this procedure.
- Make sure that the LDAP server is started before beginning these steps. If you are unsure about this, see “Steps for installing and configuring LDAP” on page 27.
- You need to know the following information from LDAP installation. Copy the information into the following table from (completed) Table 9 on page 28:

Table 22. LDAP information you need for tailoring LDAP configuration

LDAP information	Explanation	Value
Administrator's distinguished name	This is the distinguished name to use for LDAP binding. (For a definition of distinguished name, see Table 9 on page 28. The LDAP administrator defines the administrator's distinguished name with the <b>adminDN</b> keyword in the LDAP server configuration file. For example, the value is “cn=Admin” in adminDN “cn=Admin”	
Administrator password	This is the password to use for LDAP binding. The LDAP programmer can set this in several ways, for example: <ul style="list-style-type: none"><li>• By specifying the password as a TDBM entry by using the <b>userPassword</b> attribute in the <b>ldif2tdbm</b> load utility</li><li>• By using the <b>adminPW</b> keyword in the LDAP server configuration file (not suggested)</li></ul>	
LDAP fully qualified domain name and port	This is the IP address and port on which the LDAP server is listening. For example, for ldap.widgets.com:389, the fully qualified domain name is ldap.widgets.com and the port is 389. See Table 8 on page 27 for a definition of fully qualified domain name. You can specify this address with or without the preceding string “ldap://” or “ldaps://”.	

## Tailoring the LDAP configuration for PKI Services

Table 22. LDAP information you need for tailoring LDAP configuration (continued)

LDAP information	Explanation	Value
Suffix	(For a definition of suffix, see Table 9 on page 28.) The suffix value is specified after the suffix keyword in the LDAP server configuration file. suffix "o= <i>your-company</i> ,c= <i>your-country-abbreviation</i> "	

You need to load the `schema.user.ldif` file only if you are configuring PKI Services for the first time, whether you are using LDBM or TDBM. For more information, see the chapter on LDAP directory schema in *z/OS IBM Tivoli Directory Server Administration and Use for z/OS*.

### Procedure

1. If you are configuring PKI Services for the first time, issue the following command to load the schema. Replace *adminDN* and *passwd* with the `adminDN` and `adminPW` values from Table 22 on page 89.

```
ldapmodify -D adminDN -w passwd -f /usr/lpp/ldap/etc/schema.user.ldif
```

---

## Setting up authorization to create and access CRLs and certificates

Certificate revocation lists (CRLs) in an LDAP directory have an attribute of **critical**, which allows only the LDAP administrator to read them. If you are configuring PKI Services for the first time, the LDAP programmer needs to set up an LDAP access control list (ACL) to allow users other than the LDAP administrator to read CRLs. If the ACL is not set up, only the LDAP administrator can retrieve CRLs from LDAP. Other users might get access violation messages if they attempt to retrieve a CRL from LDAP, and LDAP does not return the CRL.

In addition, if the distinguished name to be used for LDAP binding is not the LDAP administrator, the LDAP programmer needs to set up another LDAP ACL to allow that distinguished name to create CRLs and certificates. You define the distinguished name to be used for LDAP binding in the `AuthName1` line of the `pkiserv.conf` file. For more information about the `AuthName1` line, see Chapter 8, "Tailoring the PKI Services configuration file for LDAP," on page 99.

For information about setting up LDAP ACLs, see the information about access control in *z/OS IBM Tivoli Directory Server Administration and Use for z/OS*.

**Tips:** When setting up an LDAP ACL for PKI Services, consider these facts:

- You can use the **entryOwner** attribute to allow an application to read and write LDAP entries without having to use the LDAP administrator bind credentials.
- You can use a propagating ACL (the **aclPropagate** attribute is set to **TRUE**) to allow the defined ACL to cover new CRLs created by PKI Services.

---

## Establishing a secure connection with LDAP (optional)

You can optionally set up a secure connection between PKI Services and the LDAP server to prevent the bind password from flowing in the clear. The secure connection uses the Secure Sockets Layer (SSL) and Transport Layer Security (TLS) protocols, provided by z/OS Cryptographic Services System SSL services, to maintain an encrypted communications path between PKI Services and the LDAP server. For information about how to configure LDAP to use a secure connection,

## Tailoring the LDAP configuration for PKI Services

see the topic on using SSL/TLS protected communications in *z/OS IBM Tivoli Directory Server Administration and Use for z/OS*.

If you are using a secure connection with LDAP, the RACF administrator needs to add a certificate to the PKI Services key ring for validating the LDAP server:

- If the LDAP server you are using is using a self-signed certificate, add that self-signed certificate to the PKI Services key ring.
- If the LDAP server is using a certificate signed by a certificate authority (CA), add the certificate for the CA to the PKI Services key ring, if it is not already there. Use whatever means the CA provides to obtain the CA's certificate.

For the name of the PKI Services key ring, see Table 19 on page 51. The RACF administrator uses the RACF RACDCERT command to add a certificate to the key ring. For information about RACDCERT, see *z/OS Security Server RACF Command Language Reference*.

---

## Chapter 7. Updating IBM HTTP Server - Powered by Apache configuration and starting the server

PKI Services uses the IBM HTTP Server - Powered by Apache for the following functions:

- The PKI Services web application, if you implement it using REXX CGI scripts.
- OCSP support
- SCEP support
- CMP support

You need to perform the tasks in this topic only if you are configuring PKI Services for the first time and use one or more of these functions. If you do not use any of these functions, you can skip the tasks in this topic.

PKI Services supports IBM HTTP Server - Powered by Apache. It is part of the IBM z/OS operating system. For more information, see <http://www.ibm.com/software/products/us/en/http-servers>. It is also included with WebSphere Application Server.

---

### Setting up IBM HTTP Server - Powered by Apache httpd.conf

Starting the web server requires having a configuration file for it. This topic describes how the web server programmer performs the following tasks for IBM HTTP Server httpd.conf:

- Updating the IBM HTTP Server - Powered by Apache configuration files by cutting and pasting directives from the PKI Services samples directory into them
- Starting the IBM HTTP Server - Powered by Apache.

#### Before you begin

- The IBM HTTP Server - Powered by Apache must already be configured.
- It would be helpful to have available the documentation for IBM HTTP Server available, WebSphere Application Server Library (<http://www.ibm.com/software/webservers/appserv/was/library/>).

### Steps for updating the IBM HTTP Server - Powered by Apache configuration files

PKI Services ships sample IBM HTTP Server - Powered by Apache configuration files

- The main configuration file (`httpd.conf`)
- Virtual host files:
  - `vhost80.conf` - Virtual Host file for non-SSL requests
  - `vhost443.conf` - Virtual Host file for SSL requests with server authentication
  - `vhost1443.conf` - Virtual Host file for SSL requests with client authentication

These files are used by the IP-based virtual hosting feature of the IBM HTTP Server - Powered by Apache. IP-based virtual hosting is a method to apply different directives that are based on the IP address and port on which a request is received. PKI Services provides sample virtual host files for non-SSL requests, SSL requests, and SSL requests with client authentication on different ports.

## Updating IBM HTTP Server - Powered by Apache configuration and starting the server

Table 23 summarizes the virtual host files that are used for normal HTTP traffic and SSL traffic with specific ports.

Table 23. Virtual host files

Virtual host configuration file	Protocol	SSL	Server authentication	Client authentication	Port number
vhost80.conf	HTTP	No	No	No	80
vhost443.conf	HTTPS	Yes	Yes	No	443
vhost1443.conf	HTTPS	Yes	Yes	Yes	1443

### Before you begin

- You must perform these steps only if you are configuring IBM HTTP Server - Powered by Apache for PKI Services for the first time. If you are using IBM HTTP Server - Powered by Apache and you are now updating the configuration for use with PKI Services, some of the following steps are not required.
- This information assumes that you used the installer program (`bin/install_ihs`) to install IBM HTTP Server - Powered by Apache. You must know the installation directory for the server instance, which is referred to as *ihs-install-dir* in the sample commands. (This directory must be different from the product directory, usually `/usr/lpp/ihsa_zos`).
- You must know the file system installation directory (the file system directory where the MVS programmer installed PKI Services), called *pki-install-dir* in the commands that follow. The default is `/usr/lpp/pki/serve/`. The MVS programmer was asked to record any changes to the defaults; see Table 3 on page 11.
- You must know the following LDAP information. Record the information in the rightmost column of Table 24.

**Note:** The default name of the LDAP server configuration file is `ds.conf` for the LDAP server that is provided by IBM Tivoli Directory Server.

Table 24. LDAP information you need for tailoring IBM HTTP Server - Powered by Apache configuration

LDAP information	Explanation	Value
Administrator's distinguished name	The distinguished name to use for LDAP binding. (For a definition of distinguished name, see Table 9 on page 28.) The LDAP administrator defines the administrator's distinguished name with the <code>adminDN</code> keyword in the LDAP server configuration file. For example, the value is <code>"cn=Admin"</code> in <code>adminDN "cn=Admin"</code>	
Administrator password	The password to use for LDAP binding. The LDAP programmer can set this password in several ways; for example: <ul style="list-style-type: none"> <li>• By specifying the password as a TDBM entry by using the <code>userPassword</code> attribute in the <code>ldif2tdbm</code> load utility</li> <li>• By using the <code>adminPW</code> keyword in the LDAP server configuration file (not suggested)</li> </ul>	
LDAP fully qualified domain name	The IP address on which the LDAP server is listening, for example, <code>ldap.widgets.com</code> . See Table 8 on page 27 for a definition of fully qualified domain name.	
LDAP port	The port for LDAP, for example, <code>389</code> in <code>ldap.widgets.com:389</code>	

### Procedure

Perform the following steps to update the IBM HTTP Server - Powered by Apache configuration files:

1. Copy the IBM HTTP Server - Powered by Apache directives from the PKI Services samples configuration file, *pki-install-dir/samples/httpd.conf* to the HTTP server configuration file, *ihp-install-dir/conf/httpd.conf*, and make the following updates.

**Note:** The file *pki-install-dir/samples/httpd.conf* is not a complete *httpd.conf* file. It contains only the directives that might not be present in your *httpd.conf* file and that might be unique to the PKI Services CGI scripts and programs.

- a. Use the load module directive to add the required modules to the list of modules, if they do not exist:
    - `rewrite_module modules/mod_rewrite.so`
    - `authnz_saf_module modules/mod_authnz_saf.so`
    - `ibm_ssl_module modules/mod_ibm_ssl.so`
    - `alias_module modules/mod_alias.so`
  - b. Add the addtype directives to your list of addtypes if they do not exist:

```
AddType application/x-x509-user-cert .cer
AddType application/x-x509-ca-cert .der
AddType application/octet-stream .msi
AddType application/pkix-crl .crl
```
  - c. Copy the Keyfile and the Include directives as is, replacing any existing values.
  - d. If your organization customized the value of `web_ring` (see Table 11 on page 38), change `SSLring` in the Keyfile directive in the following line to the customized value:

```
Keyfile /saf SSLring
```
2. If the virtual host files (*vhost80.conf*, *vhost443.conf*, *vhost1443.conf*) do not exist, create them by copying them from *pki-install-dir/samples* to *ihp-install-dir/conf/vhost80.conf*, *ihp-install-dir/conf/vhost443.conf*, and *ihp-install-dir/conf/vhost1443.conf*. For example, assuming the default *pki-install-dir* and an *ihp-install-dir* of */etc/websrv1*, the following command copies all three vhost files to the */etc/websrv1/conf* directory:

```
cp /usr/lpp/pkiserv/samples/vhost*.conf /etc/websrv1/conf
```
  3. Make the following updates to each of the virtual host files:
    - a. Change all instances of *server-domain-name* to the fully qualified domain name of your web server. For example, *www.ibm.com*. (For information about your web server's fully qualified domain name, see Table 8 on page 27.)
    - b. Change all instances of *application-root* to the value of *pki-install-dir*, which is *usr/lpp/pkiserv* by default.
    - c. If necessary, change the environment variable `_PKISERV_CONFIG_PATH` to identify the runtime directory of your CA domain. (See Table 52 on page 292.)
    - d. (Optional) If you intend to have a dedicated set of administrators for each CA domain, add an environment variable that specifies the runtime directory for each administrative domain. (See Table 52 on page 292.)

### Example:

## Updating IBM HTTP Server - Powered by Apache configuration and starting the server

```
SetEnv _PKISERV_CONFIG_PATH_PKIServ "/etc/pkiserv"
```

**Note:** In the vhost80.conf file, which defines directives for non-SSL requests, a Listen directive is not specified. It is assumed that the Listen directive is defined in the main httpd.conf file that tells the server to accept incoming requests on the specified port. If you do not have a Listen directive in the httpd.conf file, add the Listen 80 directive on the line before the VirtualHost \*:80 directive in the vhost80.conf file.

4. Perform the following step to update the vhost443.conf virtual host configuration file.
  - a. If your organization customized the value of web\_ring (see Table 11 on page 38), change SSLring in the Keyfile directive in the following line to the customized value:

```
Keyfile /saf SSLring
```
5. Perform the following steps to update the vhost1443.conf virtual host configuration file.
  - a. If your organization customized the value of web\_ring (see Table 11 on page 38), change SSLring in the Keyfile directive in the following line to the customized value:

```
Keyfile /saf SSLring
```
  - b. If you would like the IBM HTTP Server to preform revocation checking, add the following directives after the SSLClientAuth directive:
    - SSLCRLHostName
    - SSLCRLPort
    - SSLCRLUserID
    - SSLStashfile

**Note:** SSLStashfile is the fully qualified path to the file that contains the password for the user name on the LDAP server. This directive is not required for an anonymous bind. Use it when you specify a user ID. Use the **sslstash** command, which is in the bin directory of IBM HTTP Server, to create your CRL password stash file. Specify the password that you use to log in to your LDAP server as the password on the **sslstash** command. The format of the **sslstash** command is:

```
sslstash [-c] file function password
```

where:

**-c** Creates a new stash file. If not specified, an existing file is updated.

**file**

Is the fully qualified name of the file to create or update.

**function**

Indicates the function for which the password is to be used. Valid values include crl and crypto.

**password**

Is the password to stash.

## Starting and stopping the IBM HTTP Server - Powered by Apache

### Steps for starting the IBM HTTP Server - Powered by Apache

Perform the following steps to start the IBM HTTP Server - Powered by Apache.

1. Make sure that the LDAP server is started. (For more information, see “Steps for installing and configuring LDAP” on page 27.)
2. Take one of the following actions:
  - Issue the following command from the IBM HTTP Server - Powered by Apache installation directory:  

```
ihc-install-dir/bin/apachectl start
```
  - To start the IBM HTTP Server - Powered by Apache using an alternative configuration file, issue the following command:  

```
apachectl -k start -f path_to_configuration_file
```
  - If you want to use the sample JCL procedure from *hlq.SIWOJCL(IWOAPROC)*, copy the JCL to the system procedure library. If you copy the JCL to a procedure called WEBSRV1, start the server by entering the following MVS console command:  

```
S WEBSRV1
```

### Steps for stopping the IBM HTTP Server - Powered by Apache

To stop the IBM HTTP Server - Powered by Apache, perform the following step:

1. Enter the following MVS console command:  

```
S WEBSRV1, ACTION='stop'
```

## Updating IBM HTTP Server - Powered by Apache configuration and starting the server

---

## Chapter 8. Tailoring the PKI Services configuration file for LDAP

You need to tailor the **LDAP** section of the `pkiserv.conf` configuration file only if you meet one of the following conditions:

- You are configuring PKI Services for the first time
- You intend to use encrypted passwords for your LDAP servers

Chapter 5, “Configuring the UNIX runtime environment,” on page 61 describes tasks the UNIX programmer performs. The other team members perform additional tasks before the UNIX programmer updates the **LDAP** section of the `pkiserv.conf` configuration file (described in this topic) and starts the PKI Services daemon (described in Chapter 10, “Starting and stopping PKI Services,” on page 121).

---

### Excerpt of LDAP section

The following excerpt shows the **LDAP** section of the `pkiserv.conf` configuration file as it is shipped:

```
[LDAP]
NumServers=1
PostInterval=5m
Server1=myldapservice.mycompany.com:389
AuthName1=CN=root
AuthPwd1=root
CreateOUValue= Created by PKI Services
RetryMissingSuffix=T
# Name of the LDAPBIND Class profile containing the bind information for LDAP
# server 1. This key is optional. Used in place of keys Server1, AuthName1,
# and AuthPwd1
#BindProfile1=LOCALPKI.BINDINFO.LDAP1
```

You use the **LDAP** section of the `pkiserv.conf` file to provide information for one or more LDAP servers. The `NumServers` line specifies the number of servers.

---

### Storing information for encrypted passwords for your LDAP servers

You store information about passwords for binding to LDAP directories in the `pkiserv.conf` configuration file. Passwords can be in clear text or encrypted. By default, the `pkiserv.conf` configuration file contains `Server1`, `AuthName1`, and `AuthPwd1` parameters; these lines are for specifying your LDAP bind information, including passwords, in clear text: (For more than one LDAP server, you add additional lines, `Server2`, `AuthName2`, `AuthPwd2`, `Server3`, `AuthName3`, `AuthPwd3`, and so forth.) If you want to use encrypted passwords for your LDAP servers, you delete all these lines, uncomment (remove the #) from the `BindProfile1` line at the bottom of the file, and correct the profile value that is specified, if necessary. (See “Using encrypted passwords for LDAP servers” on page 481 for information about setting up this bind profile in RACF). For more than one LDAP server, you add additional lines: `BindProfile2`, `BindProfile3`, and so forth.

PKI Services performs the following processing when locating LDAP bind information:

## Tailoring the PKI Services configuration file for LDAP

1. The *Servern* line specifies the fully qualified domain and port of your LDAP server. If your file contains a *Servern* line, PKI Services looks for the matching *AuthNamen* and *AuthPwden* lines and uses these values.
2. The *BindProfilen* parameter specifies the name of the LDAPBIND class profile. If your file does not contain a *Servern* line but does contain a *BindProfilen* line, PKI Services looks for the bind information in the LDAPBIND class profile. (If *Servern* is present, PKI Services does not look for bind information in *BindProfilen*, even if the value in *Servern* is incorrect.)
3. If neither is present for a specific server, then PKI Services uses the default from IRR.PROXY.DEFAULTS in the FACILITY class.

---

## Steps for tailoring the LDAP section of the configuration file

### Before you begin

- **Important:** You need to update the **LDAP** section of the `pkiserv.conf` configuration file only if you are configuring PKI Services for the first time or your company is using encrypted passwords for your LDAP servers.
- You need UNIX programming skills to complete this procedure.
- Table 25 lists some parameters that are in the **LDAP** section of the `pkiserv.conf` configuration file. The rightmost column lists the default values. You need to change some of these values. Fill in the blank lines with your company's information (and cross out these defaults). If you decide to change any of the other defaults, cross out these values and record your company's information.

Table 25. Information needed for updating the LDAP section of the configuration file

Parameter	Information needed	Where to get this information	Default value and your company's information
NumServers=	The number of available LDAP servers. These are replicas that can post certificates and CRLs.	From LDAP programmer	1

## Tailoring the PKI Services configuration file for LDAP

Table 25. Information needed for updating the LDAP section of the configuration file (continued)

Parameter	Information needed	Where to get this information	Default value and your company's information
PostInterval=	<p>How often the posting thread scans the request database for certificates and CRLs to post to the LDAP server in weeks (w), days (d), hours (h), minutes (m), or seconds (s) if NumServers &gt; 0.</p> <p><b>Notes:</b></p> <ol style="list-style-type: none"> <li>1. If the post is unsuccessful for a certificate, the post is tried again at the next post interval. If the post continues to be unsuccessful after 3 attempts, the post frequency for this certificate is reduced to no more than once per hour. After 26 unsuccessful attempts, it is further reduced to no more than once per day. After 33 unsuccessful attempts, the post request for this certificate is deleted from the request database.</li> <li>2. Certificates created when NumServers is set to 0 are not posted to LDAP. If the value of NumServers is changed later to enable posting, the new value applies to new certificates only.</li> </ol>	<p>UNIX programmer decides this. Specify a number followed by h (hours), m (minutes), or s (seconds).</p> <p>Example: 6m</p>	5m

## Tailoring the PKI Services configuration file for LDAP

Table 25. Information needed for updating the LDAP section of the configuration file (continued)

Parameter	Information needed	Where to get this information	Default value and your company's information
Server1=	<p>You use this parameter only if you are storing LDAP passwords in the clear.</p> <p>This parameter's value is the fully qualified domain name (domain name or IP address and port) for the first LDAP server.</p> <p>If you are using a Secure Sockets Layer (SSL) session, the fully qualified domain name should be preceded by <code>ldaps://</code>.</p>	Copy this information from the earlier (completed) table, Table 9 on page 28.	<p><code>myldapserver.mycompany.com:389</code></p> <p><b>Note:</b> If the number of servers (the value in the row containing NumServers=) is greater than one, you need one value for <i>each</i> server.</p>
UseBinaryAttr1=	<p>Specifies whether the CA posts certificates and CRLs to the LDAP server with the binary attribute. Valid values are T (True) or F (False). If NumServers is greater than 1, specify a value for each server; for example, specify UseBinaryAttr2 for server 2. If a value of UseBinaryAttr<math>n</math> is not specified, it defaults to F.</p>	UNIX programmer decides this (after consulting with LDAP programmer)	<b>F</b>
AuthName1=	<p>You use this parameter only if you are storing LDAP passwords in the clear.</p> <p>This parameter's value is the distinguished name to use for LDAP binding.</p> <p>(See Table 9 on page 28 for a definition of distinguished name.)</p>	Copy this information from the earlier (completed) table, Table 9 on page 28.	<p><code>CN=root</code></p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>If the number of servers (the value in the row containing NumServers=) is greater than one, you need one value for <i>each</i> server.</li> <li>The default name of the LDAP server configuration file is <code>ds.conf</code> for the IBM Tivoli Directory Server for z/OS LDAP server.</li> </ul>

## Tailoring the PKI Services configuration file for LDAP

Table 25. Information needed for updating the LDAP section of the configuration file (continued)

Parameter	Information needed	Where to get this information	Default value and your company's information
AuthPwd1=	<p>You use this parameter only if you are storing LDAP passwords in the clear.</p> <p>This parameter's value is the password to use for LDAP binding. The LDAP programmer sets this.</p> <p><b>Note:</b> Include this parameter, Server1, and AuthName1 only if you are storing the LDAP password in the clear. Alternately, if you encrypt the password for an LDAP server, use the BindProfile1 parameter. Omitting BindProfile1 and Server1 specifies using the PROXY segment information from the IRR.PROXY.DEFAULTS profile in the FACILITY class. (For more information, see "Using encrypted passwords for LDAP servers" on page 481.)</p>	Copy this information from the earlier (completed) table, Table 9 on page 28.	<p><i>root</i></p> <p><b>Note:</b> If the number of servers (the value in the row containing NumServers=) is greater than one, you need one value for <i>each</i> server.</p>
CreateOUValue=	Value to use for the OU attribute when creating LDAP entries under the objectclass organizationalUnit. (See Table 109 on page 653.) This is used only when no OU value is specified in the relative distinguished name.	UNIX programmer decides this (after consulting with LDAP programmer)	<b>Created by PKI Services</b>
RetryMissingSuffix=	True (T) or False (F) setting that indicates whether LDAP post requests should be tried again later if the distinguished name suffix does not exist. When set to F, LDAP post requests that fail because of a missing suffix are discarded.	UNIX programmer decides this (after consulting with LDAP programmer)	<b>T</b>

## Tailoring the PKI Services configuration file for LDAP

Table 25. Information needed for updating the LDAP section of the configuration file (continued)

Parameter	Information needed	Where to get this information	Default value and your company's information
BindProfile1=	<p>You use this parameter only if you intend to use an encrypted password for your LDAP server.</p> <p>This parameter's value is the name of the LDAPBIND class profile containing the bind information for the LDAP server. (For more information, see "Using encrypted passwords for LDAP servers" on page 481.)</p>	<p>Get the profile name from the RACF administrator who creates the profile. See "Using encrypted passwords for LDAP servers" on page 481 for more information.</p>	<p>LOCALPKI.BINDINFO.LDAP1</p> <p><b>Note:</b> If the number of servers (the value in the row containing NumServers=) is greater than one, you need one value for <i>each</i> server.</p>

### Procedure

Perform the following steps to update the **LDAP** section of the `pkiserv.conf` configuration file (if you are configuring PKI Services for the first time or using encrypted passwords for your LDAP servers):

1. If necessary, change 1 (the default) in the following line to the number of available LDAP servers listed in Table 25 on page 100:

```
NumServers=1
```

2. Optionally change 5m in the following line to the posting interval in Table 25 on page 100:

```
PostInterval=5m
```

3. If necessary, update the BindProfile1 line or the Server1, AuthName1, and AuthPwd1 lines:

- If you intend to use an encrypted password for your LDAP server and you are configuring PKI Services for the first time, perform the following steps:

- a. If you are using an LDAPBIND class profile, remove the comment delimiter (#) from the start of the following line and change LOCALPKI.BINDINFO.LDAP1 to the name of the LDAPBIND class profile. (See Step 3 on page 482).

```
# BindProfile1=LOCALPKI.BINDINFO.LDAP1
```

- b. Delete the following three lines in the **LDAP** section:

```
Server1=myldapservers.mycompany.com:389
AuthName1=CN=root
AuthPwd1=root
```

- If you are not using an encrypted password for your LDAP server and are configuring PKI Services for the first time, perform the following steps:

- a. Change *your-ldap-server-address:port* to your fully qualified domain name and port as listed in Table 25 on page 100:

```
Server1=your-ldap-server-address:port
```

- b. Change *CN=root* in the following line to the value of the administrator distinguished name in Table 25 on page 100:

## Tailoring the PKI Services configuration file for LDAP

```
AuthName1=CN=root
```

- c. Change *root* in the following line to the value of the administrator password in Table 25 on page 100:

```
AuthPwd1=root
```

---

4. If the value of NumServers= is greater than 1, repeat Step 3 on page 104 for each additional server. (You need to increment the number in the parameter names for each additional server, for example Server2, AuthName2, AuthPwd2.)
- 

5. If necessary, change Created by PKI Services in the following line to the OU attribute value in Table 25 on page 100:

```
CreateOUValue=Created by PKI Services
```

---

6. If necessary, change T in the following line to the RetryMissingSuffix value in Table 25 on page 100:

```
RetryMissingSuffix=T
```

---

7. If you want certificates and CRLs posted to the LDAP server with the binary attribute, remove the comment delimiter (#) from the start of the following line and change F to T:

```
#UseBinaryAttr1=F
```

If the value of NumServers= is greater than 1, repeat this step for each server. Increment the number in the parameter name for each additional server, for example UseBinaryAttr2.

---

## Tailoring the PKI Services configuration file for LDAP

---

## Chapter 9. Creating the object store and ICL

This topic includes the following procedures:

- “Planning VSAM storage requirements” on page 108
- “(Optional) preliminary steps for establishing VSAM RLS” on page 109
- “Steps for creating the VSAM object store and ICL data sets and indexes” on page 110
- “(Optional) steps for enabling existing PKI Services VSAM data sets for VSAM RLS” on page 111
- “(Optional) steps for adding VSAM buffer space” on page 112
- “Backing up and restoring the VSAM data sets” on page 114
- “Steps for creating the object store and ICL DB2 tables” on page 115
- “Converting the object store and ICL from VSAM to DB2” on page 117

You need to perform the tasks in this topic if:

- You are configuring PKI Services for the first time or adding a new CA domain.
- Your organization is using a sysplex for PKI Services daemons.
- You want to tune VSAM performance.
- Your object store and ICL are in VSAM data sets, and you want to convert them to DB2 tables

---

### The object store and ICL

PKI Services maintains two databases containing information about certificate requests and issued certificates:

- The *object store*, or *request database*, holds records to track active certificate requests and posting objects for certificates and certificate revocation lists. Object store records are not permanent. They are deleted when they are no longer needed:
  - CRL posting requests and certificate posting requests are removed when they are successfully posted to LDAP.
  - Revocation requests are deleted at the end of revocation processing.
  - When a certificate is retrieved by the requestor, the certificate request is deleted after the time period specified by the parameter `RemovedCompletedReqs` in the configuration file (by default one week).
  - If a certificate is not retrieved by the requestor, the certificate request is deleted after the time period specified by the parameter `RemovedInactiveReqs` in the configuration file (by default four weeks).
- The *issued certificate list (ICL)* contains a permanent record for each certificate that PKI Services issues. There is one ICL record for each issued certificate.

You have two options for implementation of the object store and ICL:

- VSAM data sets.
- DB2 tables. (This option was introduced in z/OS V1R13).

Some things you should consider when choosing which option to use:

- VSAM is shipped with z/OS, but you must purchase DB2.

## Creating the object store and ICL

- VSAM supports limited query functions and does not allow users to create their own queries. DB2 allows users to create queries.

Certificate revocation lists (CRLs) created temporarily in the object store for LDAP posting are limited in size to approximately 32 KB. You can avoid this limitation by enabling support for large CRLs, which causes CRLs to be stored in the z/OS UNIX file system instead of the object store. For more information, see “Enabling support for large CRLs” on page 281.

---

## Creating the object store and ICL using VSAM data sets

The MVS programmer performs the following tasks:

- If configuring PKI Services for the first time, create the VSAM object store and ICL data sets and indexes.
- If configuring PKI Services to run in a sysplex as a single PKI instance, perform the preliminary steps for establishing VSAM record-level sharing (RLS).
- If you want, tune VSAM data set performance.

### Planning VSAM storage requirements

The MVS programmer uses the IKYCVSAM sample JCL to create two VSAM data sets (clusters):

- A data set for the request database (object store)
- A data set for the issued certificate list (ICL).

The MVS programmer also uses the same sample JCL to create five alternate index data sets (paths):

1. Transaction ID alternate index into the object store
2. Status alternate index into the object store
3. Requestor alternate index into the object store
4. Status alternate index into the ICL
5. Requestor alternate index into the ICL.

The IKYCVSAM sample JCL contains default values for the primary and secondary extent allocations for these data sets. The default allocation for base clusters is CYL(3,1). For alternate indexes, it is TRK(5,1). You need to update these values based on your anticipated future needs. Use the guidelines in “Determining storage needs for the ICL” and “Determining storage needs for the object store” on page 109 to update the space allocation parameters for the DEFINE CLUSTER and DEFINE ALTERNATEINDEX statements. (For more information about IDCAMS, see *z/OS DFSMS Access Method Services Commands*.)

### Determining storage needs for the ICL

Unless set up otherwise, the ICL grows continuously over time as more certificates are issued. The size of a certificate varies depending on many factors; for example, the public key type and size, the length of the issuer and subject names, the number and size of Subject Alternative names, and the number and size of certificate extensions. Assume an average size of 1024 bytes of storage for each ICL record. With an allocation of CYL(3,1), the data set can have a maximum of 125 cylinders on a single 3390 volume for a total size of 105 MB. This would mean that the data set should be able to hold at least 102,500 certificates. If multiple volume support is used, you can double this amount.

If your anticipated needs differ greatly from the above value, you need to adjust the space allocation parameters `CYL(3,1)` on the `DEFINE CLUSTER` statement for the ICL. (This is the second `DEFINE CLUSTER` statement in `IKYCVSAM`. See “`IKYCVSAM`” on page 635 for a code sample of this file.) You might also want to proportionally adjust the space allocation parameters `TRK(5,1)` on the `DEFINE ALTERNATEINDEX` statements for the ICL. These are defined in the `DEFALTDX` job step. (Their names contain the `icl` qualifier.)

### Determining storage needs for the object store

Object store records are not permanent. They are deleted when they are no longer needed. Unlike the ICL, the object store does not grow beyond a certain point, unless there is a sharp increase in certificate request activity. Typically, a certificate request record is less than twice the size of the ICL record. Assume that one object store record and its companion posting record occupy a total of 2560 bytes of storage. With a space allocation of `CYL(3,1)`, the data set can have a maximum of 125 cylinders on a single 3390 volume for a total size of 105 MB, which would hold at least 41,000 concurrent certificate requests. If multiple volume support is used, you can double this amount.

If your anticipated needs differ greatly from the preceding value, you need to adjust the space allocation parameters `CYL(3,1)` on the `DEFINE CLUSTER` statement for the object store. (This is the first `DEFINE CLUSTER` statement in `IKYCVSAM`. See “`IKYCVSAM`” on page 635 for a code sample of this file.) You might also want to proportionally adjust the space allocation parameters `TRK(5,1)` on the `DEFINE ALTERNATEINDEX` statements for the object store. These are defined in the `DEFALTDX` job step. (Their names contain the `ost` qualifier.)

If you set the `RemoveInactiveReqs` and `RemoveCompletedReqs` parameters in the configuration file to `0d`, certificate request records are not deleted and you should adjust the space allocation accordingly.

## (Optional) preliminary steps for establishing VSAM RLS

Your team can configure PKI Services to take advantage of a Parallel Sysplex environment. This enables you to start multiple instances of the PKI Services daemon (one per image) that work in unison. The daemons are totally independent of each other, but they all act upon a single common data store containing the ICL and object store VSAM data sets.

If you want to run multiple instances of PKI Services in a Parallel Sysplex (one per image), you must first establish the data sharing environment suitable for VSAM record-level sharing (RLS).

### Before you begin

The following steps assume that the coupling facility is already set up. If not, see *z/OS MVS Programming: Sysplex Services Guide* for information about how to set up the coupling facility. Also, see “(Optional) steps for enabling existing PKI Services VSAM data sets for VSAM RLS” on page 111 for additional information about setting up VSAM data sets to run PKI Services in a sysplex.

### Procedure

Perform the following steps to establish VSAM RLS. For specific information on how to perform these steps, see the topic about administering VSAM record level sharing in *z/OS DFSMSdfp Storage Administration*.

## Creating the object store and ICL

1. Define and activate at least two sharing control data sets (SHCDS) and one spare SHCDS for recovery purposes.

---
2. Define CF lock structure to MVS.

---
3. Define CF lock structure in the SMS base configuration.

---
4. Define at least one storage class for VSAM record-level sharing (RLS).  
You must record the name of this storage class for use in creating the VSAM data sets for PKI Services.

Table 26. VSAM RLS information you need to record

VSAM information you need to record	Your value
Name of storage class for VSAM RLS	

## Steps for creating the VSAM object store and ICL data sets and indexes

You need to perform this task only if you are configuring PKI Services for the first time.

PKI Services uses VSAM data sets to store requests in progress and issued certificates. You need to create these data sets manually.

If you expect the object store or ICL data sets to exceed 4 GB in size, consider using VSAM extended addressability. For more information, see *z/OS DFSMS Using Data Sets*.

### Before you begin

If you also want to run multiple instances of PKI Services in a Parallel Sysplex (one per image), you need to have performed the steps that are described in “(Optional) preliminary steps for establishing VSAM RLS” on page 109.

### Procedure

Perform the following steps to create the VSAM object store and ICL data sets and indexes (if you are configuring PKI Services for the first time):

1. Copy the sample JCL in SYS1.SAMPLIB(IKYCVSAM) to your JCL data set. (See “IKYCVSAM” on page 635 for a code sample of this file.)

---
2. Update your data set as directed in the instructions in the prolog of the sample JCL:
  - a. Change the JOB card.
  - b. Change the VOL statements.
    - If you are running multiple instances of PKI Services in a Parallel Sysplex, replace the VOL statements with STORCLAS statements that specify the storage class recorded in Table 26, for example:  
STORCLAS(VSAMRLS)

- If you are running without a Parallel Sysplex, replace the vvvvvv in the VOL statements with a VOL=SER suitable for your VSAM data sets.
- c. If you are running multiple instances of PKI Services in a Parallel Sysplex, remove the SPANNED and CISIZE statements in the file. Make sure that you do not delete a closing parenthesis that is still needed. For example, change:

```
DATA -
(NAME(PKISRVD.VSAM.ICL.DA) -
CISZ(4096) -
SPANNED) -
```

to

```
DATA -
(NAME(PKISRVD.VSAM.ICL.DA)) -
```

- d. You can optionally change the data set names but must remember to make equivalent changes in the `pkiserv.conf` file if you do so. (See Step 1c on page 82.)
- e. Update the primary and secondary extent allocations based on your anticipated future needs. (See “Planning VSAM storage requirements” on page 108 for guidelines on determining the space that you need.) These are the default allocations for each type of data set:

### Base cluster

```
CYL(3,1)
```

### Alternate indexes

```
TRK(5,1)
```

**Guideline:** Do not change any numeric values, other than the primary and secondary space allocation values for the base cluster and alternate index data sets.

- 
3. Submit the job when your changes are complete.
- 

## (Optional) steps for enabling existing PKI Services VSAM data sets for VSAM RLS

To run PKI Services in parallel, the UNIX programmer must specify `SharedPLEX=T` in the `pkiserv.conf` configuration file. (See the `SharedPLEX=T` row in Table 21 on page 68.) The MVS programmer enables the sysplex to access the VSAM data sets.

### Before you begin

You need to have performed the steps that are described in “(Optional) preliminary steps for establishing VSAM RLS” on page 109.

### Procedure

Perform the following steps to enable your existing PKI Services data sets for VSAM record-level sharing (RLS).

1. Copy the sample reallocation JCL in `SYS1.SAMPLIB(IKYRVSAM)` to your JCL data set.

**Attention:** Do not run `IKYCVSAM` by mistake because this JCL destroys your existing VSAM data sets.

## Creating the object store and ICL

- 
2. Update your data set, following the instructions in the prolog of the sample JCL:
    - a. Change the JOB card.
    - b. Change the STORCLAS statements.

**Note:** Before submitting this job, check your access control service (ACS) routines for naming convention definitions that are used to create the VSAM RLS data sets.

- c. Rename the source data sets to the names of your existing object store and ICL data sets.
- d. Change the destination data set names.

**Note:** Remember to give the UNIX programmer the data set names so the UNIX programmer can make equivalent changes in the `pkiserv.conf` file. See “(Optional) Steps for updating the configuration file” on page 68.

- e. Update the primary and secondary extent allocations based on your anticipated future needs. (See “Planning VSAM storage requirements” on page 108 for guidelines on determining the space that you need.) These are the default allocations for each type of data set:

**Base cluster**

CYL(3,1)

**Alternate indexes**

TRK(5,1)

**Guideline:** Do not change any numeric values, other than the primary and secondary space allocation values for the base cluster and alternate index data sets.

- 
3. Submit the job when your changes are complete.
- 

## Tuning VSAM performance

Depending on your environment, your VSAM performance might be improved by providing buffer space for the VSAM data sets as part of the IKYSPROC (alias PKISERVD) started procedure.

### (Optional) steps for adding VSAM buffer space

Perform the following steps to add buffer space for the VSAM data sets as part of the IKYSPROC (alias PKISERVD) started procedure. When completed, you need to stop and restart PKI Services before your changes take effect.

1. Make a backup copy of `SYS1.PROCLIB(PKISERVD)`. (See “PKISERVD sample procedure to start PKI Services daemon” on page 648 for a code sample of this file.)
2. Edit the JCL in `SYS1.PROCLIB(PKISERVD)` in the following ways.
  - a. Append the DD statements that are shown in the following example to the bottom of the PKISERVD procedure.

- b. Change the names of the VSAM data sets shown in the example to the names that you used when you executed the IKYCVSAM sample job to allocate the data sets. (See “Steps for creating the VSAM object store and ICL data sets and indexes” on page 110.)

**Example:**

```

/* ObjectDSN data set
//OST DD DSN=PKISRVD.VSAM.OST,DISP=SHR,
// AMP=('BUFNI=6,BUFND=4')
/* ObjectTidDSN data
//TID DD DSN=PKISRVD.VSAM.OST.PATH,DISP=SHR,
// AMP=('BUFNI=6,BUFND=4')
/* ObjectStatusDSN data set
//OSTAT DD DSN=PKISRVD.VSAM.OST.STATUS,DISP=SHR,
// AMP=('BUFNI=1,BUFND=4')
/* ObjectRequestorDSN data set
//OREQ DD DSN=PKISRVD.VSAM.OST.REQUESTR,DISP=SHR,
// AMP=('BUFNI=1,BUFND=4')
/* ICLDSN data set
//ICL DD DSN=PKISRVD.VSAM.ICL,DISP=SHR,
// AMP=('BUFNI=6,BUFND=4')
/* ICLStatusDSN data set
//ISTAT DD DSN=PKISRVD.VSAM.ICL.STATUS,DISP=SHR,
// AMP=('BUFNI=1,BUFND=4')
/* ICLRequestorDSN data set
//IREQ DD DSN=PKISRVD.VSAM.ICL.REQUESTR,DISP=SHR,
// AMP=('BUFNI=1,BUFND=4')

```

3. Edit the names in the new DD statements above to match the data sets in the **ObjectStore** section of the PKI Services configuration file (pkiserv.conf).

4. Optionally, you might need to adjust the numeric values for BUFNI and BUFND.

**Tip:** The STATUS and REQUESTR data sets are accessed sequentially only, while the others are accessed both sequentially and directly. Keep this in mind when adjusting the values. (For more information about VSAM buffer space, see *z/OS DFSMS Using Data Sets*.)

5. Edit the **ObjectStore** section of the PKI Services configuration file (pkiserv.conf) to change the existing data set names to the following DD names:

Default value	Suggested value
ObjectDSN='pkisrvd.vsam.ost'	ObjectDSN=DD:OST
ObjectTidDSN='pkisrvd.vsam.ost.path'	ObjectTidDSN=DD:TID
ObjectStatusDSN='pkisrvd.vsam.ost.status'	ObjectStatusDSN=DD:OSTAT
ObjectRequestorDSN='pkisrvd.vsam.ost.requestr'	ObjectRequestorDSN=DD:OREQ
ICLDSN='pkisrvd.vsam.icl'	ICLDSN=DD:ICL
ICLStatusDSN='pkisrvd.vsam.icl.status'	ICLStatusDSN=DD:ISTAT
ICLRequestorDSN='pkisrvd.vsam.icl.requestr'	ICLRequestorDSN=DD:IREQ

6. Save your changes.
7. Stop and restart PKI Services.

### Backing up and restoring the VSAM data sets

You can use the DFSMSdss DUMP and RESTORE commands to back up and restore the VSAM data sets. For information about these commands, see *z/OS DFSMSdss Storage Administration*.

#### Steps for backing up the VSAM data sets

Perform the following steps to back up the VSAM data sets using the DFSMSdss DUMP command.

##### Procedure

1. Copy the sample JCL in SYS1.SAMPLIB(IKYVBKUP) to your JCL data set. (See "IKYVBKUP" on page 645 for a code sample of this file.)
2. Update the JCL as directed in the instructions in the prolog of the sample JCL:
  - a. Change the job card.
  - b. If you are not using the default data set qualifiers, change all occurrences of "PKISRVD.VSAM" to the qualifiers you are using.
  - c. Change all occurrences of *vvvvvv* to a VOLSER value that contains sufficient free space to contain a complete backup of both of the PKI Services VSAM data set clusters.
  - d. Change the primary and secondary allocation values for the backup data set to values that ensure a complete backup of both VSAM data set clusters. Change the *xxx* value for the primary allocation, and the *yyy* value for the secondary allocation.
  - e. You can optionally change the data set name for the BACKUPDS DD, but if you do be sure to make the same change to the restore JCL in IKYVREST.
3. Stop the PKI Services address space. For information about how to do this, see Chapter 10, "Starting and stopping PKI Services," on page 121.
4. Submit the job.
5. When the job has completed, restart the PKI Services address space. For information about how to do this, see Chapter 10, "Starting and stopping PKI Services," on page 121.

##### Results

When you are done, you have created a backup data set containing the PKI Services VSAM files.

#### Steps for restoring the VSAM data sets

Perform the following steps to restore the VSAM data sets using the DFSMSdss RESTORE command.

##### Procedure

1. Copy the sample JCL in SYS1.SAMPLIB(IKYVREST) to your JCL data set. (See "IKYVREST" on page 647 for a code sample of this file.)
2. Update the JCL as directed in the instructions in the prolog of the sample JCL:
  - a. Change the job card.
  - b. If you are not using the default data set qualifiers, change all occurrences of "PKISRVD.VSAM" to the qualifiers you are using.

- c. If you changed the default data set name for the BACKUPDS DD in the IKYVBKUP JCL, change the data set name (DSN) value in the BACKUPDS DD statement to match.
3. Stop the PKI Services address space. For information about how to do this, see Chapter 10, “Starting and stopping PKI Services,” on page 121.
4. Submit the job.
5. When the job has completed, restart the PKI Services address space. For information about how to do this, see Chapter 10, “Starting and stopping PKI Services,” on page 121.

### Results

When you are done, you have restored the PKI Services VSAM files from a backup data set.

---

## Creating the object store and ICL using DB2 tables

PKI Services can use DB2 tables to store requests in progress and issued certificates. You need to create these tables (see “Steps for creating the object store and ICL DB2 tables”).

### Sysplex considerations

**Requirements:** These requirements apply when you share the DB2 tables in a sysplex environment:

- If PKI Services is set up to run in a sysplex environment and share the DB2 tables for the object store and ICL, all systems in the sysplex must be running the same release of z/OS, which must be z/OS Version 1 Release 13 or later.
- DB2 Version 9 must be installed and the DB2 subsystems that share data must belong to a DB2 data sharing group that runs on a sysplex cluster.
- The SharedPLEX parameter in the configuration file `pkiserv.conf` must be set to T (true). (See the SharedPLEX=T row in Table 21 on page 68.)

### Planning DB2 storage requirements

The space allocation for DB2 is specified in the CREATE TABLESPACE SQL statements in the IKYCDB2 sample. The PRIQTY value is 144400 in kilobytes, which holds 144,400 ICL records that are 1024 bytes in length. Assuming that an object store certificate request record is approximately twice the size of an ICL record, 144,400 kilobytes holds 72,200 object store records. No SECQTY keyword is specified, because DB2 calculates a secondary quantity value.

If your anticipated needs differ greatly from the amount of storage provided by the PRIQTY keyword in the IKYCDB2 sample, adjust the PRIQTY value.

If you set the `RemoveInactiveReqs` and `RemoveCompletedReqs` parameters in the configuration file to 0d, certificate request records are not deleted and you should adjust the space allocation accordingly.

### Steps for creating the object store and ICL DB2 tables

Perform the following steps to implement the object store and ICL using DB2 tables.

#### Before you begin

- DB2 must be installed and running.

## Creating the object store and ICL

- You need to know the name of the DB2 subsystem or the group attachment name for the object store and ICL.
- You need to know the name you are using for the DB2 package. The default package name is MASTERCA.
- You need to know the name of the PKI Services daemon.

### About this task

You need to perform this task only if you are configuring PKI Services for the first time. If you have been using VSAM files for the object store and ICL and want to use DB2 tables instead, follow the steps in “Converting the object store and ICL from VSAM to DB2” on page 117.

### Procedure

1. Update the IKYCDB2 sample and run it to create the DB2 objects. This sample contains SQL statements that define the database, table space, tables, and indexes for the ICL and object store.
  - a. Copy the sample from SYS1.SAMPLIB(IKYCDB2). (For a code sample of this file, see “IKYCDB2” on page 631.)
  - b. As directed in the sample, if you have run the sample before, uncomment the statements in the first section so that the existing indexes, tables, table spaces, and database are dropped and committed.
  - c. If you are using a package name other than the default name MASTERCA, change every occurrence of MASTERCA in the sample to the package name you have chosen.
  - d. Run your updated copy of IKYCDB2. You can use the DB2 SPUFI facility to run it.

---
2. Update the sample job IKYSBIND and run it to build the PKI Services package.
  - a. Copy the sample job from SYS1.SAMPLIB(IKYSBIND). (For a code sample of this file, see “IKYSBIND” on page 643.)
  - b. If you are using a package name other than the default name MASTERCA, change every occurrence of MASTERCA in the sample job to the package name you have chosen.
  - c. Run your updated copy of IKYSBIND.

---
3. Update the sample job IKYSGRNT and run it to grant execute privilege on the DB2 package for PKI Services to the PKI Services daemon user ID.
  - a. If the PKI Services daemon has a name other than the default name of PKISRVD, change PKISRVD to the name of your PKI Services daemon. (The daemon name is determined by the daemon variable in IKYSETUP. For more information, see Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35.)
  - b. Change MASTERCA to the package name that was used in the IKYSBIND job.
  - c. Run your updated copy of IKYSGRNT.

---
4. Update the IKYSETUP REXX exec to indicate that you are using DB2 tables, so that IKYSETUP gives the PKI Services daemon the access it needs to the DB2 Resource Recovery Services Access Facility (RRSAF). Find the section “Question 6 - Use DB2 as the repository for the Issued Certificate List (ICL) and Object Store”. Change the line:

```
db2_repos = 0
```

to:

```
db2_repos = 1
```

Update the line:

```
db2_subsys = 'DSN9'
```

and change 'DSN9' to the name of the DB2 subsystem or the group attachment name that provides the repository. Run the updated copy of IKYSETUP.

- 
5. Update the configuration file, `pkiserv.conf`, to indicate that you are using DB2 tables.
    - In the **ObjectStore** section, uncomment the following line:

```
# DBType=DB2
```

and make sure that the following line is commented out or omitted:

```
# DBType=VSAM
```
    - In the **ObjectStore** section, uncomment the following line:

```
# DBPackage=MasterCA
```

If you used a package name other than `MasterCA` in the `IKYCDB2` and `IKYSBIND` samples, change `MasterCA` in this line to the package name you used.
    - In the **ObjectStore** section, uncomment the following line:

```
# DBSubsystem=DSN9
```

If you are using a DB2 subsystem or a group attachment with a name other than `DSN9`, change `DSN9` in this line to the name of your DB2 subsystem or group attachment.
    - If the object store and ICL are shared in a sysplex with other instances of PKI Services, change the line:

```
SharedPLEX=F
```

to

```
SharedPLEX=T
```
    - Restart PKI Services so that your changes take effect.
- 

## Results

When you are done, you have created DB2 objects for the object store and ICL.

## Converting the object store and ICL from VSAM to DB2

If you have previously set up PKI Services to use VSAM data sets for the object store and ICL, you can convert it to use DB2 tables instead. To do this you must copy the data in your existing VSAM data sets to DB2 tables.

### Steps for converting the object store and ICL from VSAM to DB2

Perform the following steps to convert the object store and ICL from VSAM data sets to DB2 tables.

## Creating the object store and ICL

### Before you begin

- DB2 must be installed and running.
- You need to know the name of the DB2 subsystem or the group attachment name.
- You need to know the name that you are using for the DB2 package. The default package name is MASTERCA.
- You need to know the name of the PKI Services daemon.

### Procedure

1. Stop the instance of PKI Services for which you want to do the conversion. For information about how to do this, see Chapter 10, “Starting and stopping PKI Services,” on page 121.

---
2. Update the IKYCDB2 sample and run it to create the DB2 objects. See step 1 on page 116.

---
3. Update the sample job IKYSBIND and run it to create the DB2 package. See step 2 on page 116.

---
4. Update the sample job IKYSGRNT and run it to grant execute privilege on the DB2 package for PKI Services to the PKI Services daemon user ID. See step 3 on page 116.

---
5. Use the utility program vsam2db2 to copy the data from your VSAM data sets to the corresponding DB2 tables. See “Using the vsam2db2 utility” on page 432.

---
6. Update the configuration file, `pkiserv.conf`, to indicate that you are using DB2 tables. See step 5 on page 117.

---
7. Restart PKI Services. For information about how to do this, see Chapter 10, “Starting and stopping PKI Services,” on page 121.

---

### Results

When you are done, you have copied your object store and ICL VSAM data sets to DB2 tables, and set up PKI Services to use the DB2 tables.

## Columns in the ICL and object store DB2 tables

### NOT Programming Interface Information

The information in Table 27 and Table 28 on page 119 is intended for your use when creating DB2 queries and reports. It is not a programming interface.

*Table 27. Columns in the object store DB2 tables*

Column name	Format	Contents
<b>Header:</b>		
RECORD_KEY	BINARY(4)	
RECORD_STATE	BINARY(4)	

Table 27. Columns in the object store DB2 tables (continued)

Column name	Format	Contents
REQDATA_LEN	INTEGER	
REQUESTOR_NAME	VARCHAR(32)	Requestor name
TRANS_ID	CHAR(24)	Transaction ID
COMMENT	VARCHAR(64)	Comment
ISSUED_TIME	TIMESTAMP	Issued time
LAST_CHANGE_TIME	TIMESTAMP	Last changed time
TEMPLATE_NICKNAME	VARCHAR(8)	Template nickname
SERIAL_NUM	BINARY(4)	Serial number
<b>Body:</b>		
REQDATA	VARBINARY(32512)	Request object in ASN1 format

Table 28. Columns in the ICL DB2 tables

Column name	Format	Contents
<b>Header:</b>		
SERIAL_NUM	BINARY(4)	Serial number
CERT_STATE	BINARY(4)	
CERT_LEN	INTEGER	
REQUESTOR_NAME	VARCHAR(32)	Requestor name
REVOKE_DATE	TIMESTAMP	Revocation date
INVALID_DATE	TIMESTAMP	Expiration date
REVOKE_REASON	INTEGER	Revoke reason
COMMENT	VARCHAR(64)	Comment
ISSUED_TIME	TIMESTAMP	Issued time
LAST_CHANGE_TIME	TIMESTAMP	Last changed time
TEMPLATE_NICKNAME	VARCHAR(8)	Template nickname
OBFUS_PW	VARBINARY(33)	Obfuscated passphrase
PROCESS_FLAGS	BINARY(4)	Flags
KEYID	BINARY (20)	SHA1 hash of public key
CRLDP_NUM	INTEGER	CRL DP number
EXPIRE_EPOCH_DAYS	INTEGER	Expiration date, expressed as "days since the epoch " (January 1, 1970)
EXPIRE_DATE	TIMESTAMP	Expiration date, expressed in DB2 TIMESTAMP format
KU_DIGTSIG	BINARY(1)	digitalSignature keyusage
KU_NONRPU	BINARY(1)	nonRepudiation keyusage
KU_KEYENC	BINARY(1)	keyEncipherment keyusage
KU_DATAENC	BINARY(1)	dataEncipherment keyusage
KU_KEYAGR	BINARY(1)	keyAgreement keyusage
KU_CRTSGN	BINARY(1)	keyCertSign keyusage

## Creating the object store and ICL

Table 28. Columns in the ICL DB2 tables (continued)

Column name	Format	Contents
KU_CRLSGN	BINARY(1)	CRLSign keyusage
KU_ENCONLY	BINARY(1)	encipherOnly keyusage
KU_DECONLY	BINARY(1)	decipherOnly keyusage
EKU_SEVAUTH	BINARY(1)	serverAuth extended keyusage
EKU_CLIAUTH	BINARY(1)	clientAuth extended keyusage
EKU_CODESGN	BINARY(1)	codeSigning extended keyusage
EKU_EMLPROT	BINARY(1)	emailProtection extended keyusage
EKU_TMESTMP	BINARY(1)	timeStamping extended keyusage
EKU_OCSPSGN	BINARY(1)	OCSPSigning extended keyusage
EKU_MSSCLNON	BINARY(1)	Microsoft smart card logon extended keyusage
PREV_SERIAL_NUM	BINARY(4)	Previous serial number if the certificate has been renewed
SUBJ_DN	VARCHAR(1024)	Subject distinguished name
<b>Body:</b>		
X509CERT	VARBINARY(10240)	Certificate in ASN1 format

End NOT Programming Interface Information

---

## Chapter 10. Starting and stopping PKI Services

You start the PKI Services daemon or daemons the first time you are configuring PKI Services or if you are adding sysplex support to run multiple independent instances of PKI Services (one per image) on a sysplex. The MVS programmer performs these tasks.

---

### Steps for starting the PKI Services daemon

You need to start the PKI Services daemon if:

- You are configuring PKI Services for the first time.
- You want to enable Simple Certificate Enrollment Protocol (SCEP).
- You renewed your CA or RA certificate.
- You want to use Parallel Sysplex support and need to run another instance of the PKI Services on a different image in the sysplex.
- You stopped PKI Services and need to restart it.
- You created a new (additional) CA domain and want to start it.
- The PKI Services CA certificate private key is managed by ICSF and ICSF became unavailable. After you fix the problem with ICSF, you need to stop and restart PKI Services.
- You use DB2 tables for the object store and ICL, and you need to stop DB2. You must stop PKI Services first. After DB2 restarts, restart PKI Services.

#### Before you begin

- Your HTTP server should be SSL-enabled (see Chapter 7, “Updating IBM HTTP Server - Powered by Apache configuration and starting the server,” on page 93) and the uncustomized PKISERV application should be ready for use.
- If you are starting PKI Services for the first time, you need to know the runtime directory, called *runtime-dir* in the command examples. The default is `/etc/pkiserv/`. The MVS programmer was asked to record any changes to the default; see Table 3 on page 11.
- If you are starting PKI Services for a new CA domain, you need to know the job name that contains the instance of the daemon you need to start. Do not use these steps. Instead, see “Adding a new CA domain” on page 287 for steps to add a new domain and start the new daemon.

#### Procedure

Perform the following steps to start the PKI Services daemon and view your web pages:

1. If you have not done so already, start the web server and the LDAP server.
2. If you want to test the configuration to this point before customizing PKI Services (preferred), you need to temporarily prevent PKI Services from posting issued certificates to LDAP because posting to LDAP is not successful. Have the UNIX programmer perform the following steps to prevent PKI Services from posting issued certificates to LDAP:
  - a. Edit the PKI Services configuration file (by default, this is: `/etc/pkiserv/pkiserv.conf`).

## Starting and stopping PKI Services

---

b. Set NumServers=0 in the **LDAP** section of the file.

---

c. Exit to save your changes.

**Note:** After testing the configuration, you need to stop PKI Services and undo the change in this step (see Step 5) and then restart PKI Services.

- 
3. Start the PKI Services daemon from the MVS console by entering the following command:

```
S PKISERVD
```

**Notes:**

- a. You must start the PKI Services daemon only from a started procedure. PKI Services rejects all other methods of starting the daemon (including INETD, /etc/rc, UNIX shell, or submitted JCL job).
- b. Depending on the amount of customization you did, there are various versions of the preceding command to start the PKI Services daemon. For example, if you changed the pki serv.envars file (see Step 7 on page 64), you need to specify its new location as a parameter in the START command:

```
S PKISERVD,DIR='runtime-dir'
```

(Single quotation marks are required to maintain the character case of the values being assigned to the substitution parameters.)

The command in the following example specifies the runtime directory and the file name of the environment variables file:

**Example:**

```
S PKISERVD,DIR='/etc/pkiserv',FN='pkiserv.envars'
```

The default time zone is EST5EDT. If you need to change this, you can supply the new value as a parameter, as in the following examples:

**Examples:**

```
S PKISERVD,TZ=PST8PDT
```

```
S PKISERVD,JOBNAME=jobname,DIR='/etc/pkiserv',FN='pkiserv.envars',TZ=PST8PDT
```

- 
4. Go to your web pages by entering the following URL from your browser:

```
http://webserver-fully-qualified-domain-name/PKIServ/public-cgi/camain.rexx
```

The *webserver-fully-qualified-domain-name* is the common name (CN) portion of the web server's distinguished name; see Table 11 on page 38.

You should be able to go through your web pages to request, retrieve, and revoke a certificate of type "PKI browser certificate for authenticating to z/OS". Ensure you can do this before trying to customize the application.

- 
5. If you elected to test the configuration, you need to stop PKI Services (see "Stopping the PKI Services daemon" on page 123), undo the change in Step 2 on page 121, and then restart PKI Services. To undo the change in Step 2 on page 121:

- a. Edit the PKI Services configuration file (by default /etc/pkiserv/pkiserv.conf).
- b. Set NumServers=*n* in the **LDAP** section of the file, where *n* is the same number of LDAP servers indicated in Table 25 on page 100.

- c. Exit to save your changes.
- 

### Stopping the PKI Services daemon

To stop the PKI Services daemon, you can use either the MODIFY (or **F**) console command, or the STOP (or **P**) command. Enter one of the following two commands:

```
F PKISERVD,STOP
```

or

```
P PKISERVD
```

## Starting and stopping PKI Services

---

## Part 3. Customizing PKI Services

PKI Services provides two ways to implement and customize the PKI Services web interface:

- Using REXX CGI scripts. This method uses a text template file.
- Using JavaServer pages (JSPs). This method uses an XML template file.

Both methods produce identical web pages with the default files shipped with PKI Services.

This part includes the following topics:

- Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127 provides an overview of the `pki serv. tmpl` file, which contains the certificate templates, and explains customizing the end-user web pages when you are implementing them using the REXX CGI execs.
- Chapter 12, “Customizing the administration web pages if you use REXX CGI execs,” on page 229 provides an overview of the REXX CGI execs and explains how to customize the administration web pages when you are implementing them using the REXX CGI execs.
- Chapter 13, “Implementing the web application using JavaServer pages,” on page 233 provides an overview of customizing the PKI Services web pages when you implement them using the JavaServer pages.
- Chapter 14, “Advanced customization,” on page 267 explains:
  - “Scaling for high volume installations” on page 267
  - “Using certificate policies” on page 268
  - “Updating the signature algorithm” on page 271
  - “Customizing distribution point CRLs” on page 274
  - “Using the OCSP responder” on page 283
  - “Creating a distribution point ARL” on page 280
  - “Adding an application domain” on page 283
  - “Adding a new CA domain” on page 287
  - “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303
  - “Customizing email notifications sent to users” on page 309
  - “Setting up automatic renewal of certificates” on page 315
  - “Setting up PKI Services to generate keys for certificate requests” on page 316
  - “Adding custom extensions to certificates” on page 319
  - “Enabling support for large CRLs” on page 281
- Chapter 15, “Customizing with installation exit routines,” on page 325 explains how to use installation exits with PKI Services.

---

## Chapter 11. Customizing the end-user web application if you use REXX CGI execs

This information applies if you are using REXX CGI execs for your PKI Services web pages. If you are using JavaServer pages (JSPs), see Chapter 13, “Implementing the web application using JavaServer pages,” on page 233.

For certificate processing to work, you need to customize the end-user web pages at least to some degree. Before you begin to customize web pages, you need to understand the `pkiserv.tmpl` certificate templates file. This file contains certificate templates, which define the fields that comprise a specific certificate request. This topic describes the `pkiserv.tmpl` certificate templates file and explains how to use it to customize the end-user web pages. This topic also explains the relationship between CGIs and the certificate templates file. Finally, this topic also contains information about customizing email notifications. (Sending email notifications is an optional feature.)

---

### Contents of the `pkiserv.tmpl` certificates templates file

The `pkiserv.tmpl` certificate templates file contains certificate templates that define the fields that comprise a specific certificate request. The file contains a mixture of true HTML and HTML-like tags. The HTML can contain JavaScript for input field verification.

The main sections of the `pkiserv.tmpl` certificate templates file are listed in Table 29:

*Table 29. Structure and main divisions of the certificate template file (`pkiserv.tmpl`)*

<b>Structure and main divisions of the certificate template file (<code>pkiserv.tmpl</code>)</b>
A prolog section of comments explaining main sections, subsections, named fields, and substitution variables.
A DEBUG flag appears right after the prolog section. (You can change <code>DEBUG=0</code> to <code>DEBUG=1</code> to get CGI debugging information.)
<b>APPLICATION sections</b> The APPLICATION sections contain subsections, which produce certain web pages, such as the PKI Services home page shown in Figure 37 on page 363. For details, see “The APPLICATION sections” on page 138.
<b>TEMPLATE sections</b> These are the certificate templates (models) that contain the HTML to produce certificate request forms. They also define the fields that are permissible in the certificate. For details, see “TEMPLATE sections” on page 142.
<b>INSERT sections</b> These contain HTML for certain web pages, such as the “Request submitted successfully” web page, and certificate field dialogs, such as text entry boxes (the common name INSERT produces a text box where the user enters this information) and drop-downs. For details, see Figure 41 on page 373.

## Customizing the end-user web pages using REXX CGIs

The `pki serv.tmpl` file begins with a prolog. This is a section of comments that explains the main sections and subsections of the file. Any line with a `#` in column 1 is a comment.

Only the APPLICATION sections and TEMPLATE sections can contain subsections, but all three can contain named fields and substitution variables.

### What are substitution variables?

A substitution variable holds a value that HTML code can reference. At run time, the actual value replaces a substitution variable.

You use square brackets to delineate a substitution variable.

#### Example:

```
[base64cert]
```

#### Notes:

1. Substitution variables are case-sensitive.
2. Depending on the section where a substitution variable is present, it might not have a valid meaning. For example, the `[base64cert]` substitution variable is meaningless before the certificate is retrieved. Therefore, in this case, the value of `[base64cert]` would be the null string (an empty string).

Table 30 summarizes valid substitution variables:

Table 30. Substitution variables

Substitution variable	Description
<code>altrawvalue</code>	The concatenated value of the AltOther fields.
<code>base64cert</code>	The requested certificate, base64-encoded.
<code>browsertype</code>	<p>A special substitution variable to qualify named fields only. It enables Mozilla-based browsers and Internet Explorer to perform browser-specific operations, such as generating a public and private key pair. To generate a key pair, a Mozilla-based browser uses a KEYGEN HTML tag, while Internet Explorer uses ActiveX controls.</p> <p>An example is if <code>%%PublicKey[browsertype]%%</code> is specified in a TEMPLATE CONTENT section. If the user referencing this section uses the Mozilla Firefox browser, INSERT PublicKeyNS is included. If the browser that is used is Microsoft Internet Explorer, INSERT PublicKeyIE is included.</p>
<code>cadomain</code>	The CA domain name that is used to examine the preregistration record in the Simple Certificate Enrollment Protocol (SCEP).
<code>errorinfo</code>	Information such as the return code and reason code related to a failing SAF call.
<code>iecert</code>	The requested certificate in a form that Microsoft Internet Explorer accepts.
<code>keyid</code>	The SHA1 hash of the generated public key.
<code>optfield</code>	A special substitution variable that should be placed in any certificate field name INSERT where the end user can supply the value. It makes the input field optional.

Table 30. Substitution variables (continued)

Substitution variable	Description
p12cert	A PKCS #12 package in DER encoded format, containing a certificate and the private key that PKI Services generated for the certificate.
printablecert	This variable contains the certificate details so that the end user can confirm that the certificate is the correct one to renew or revoke. The displayed data is extracted from the ICL entry.
readonly	This substitution variable is converted to a null string when the INSERT is used for input purposes, such as when requesting a certificate. It is substituted with the string readonly when the INSERT is used for output purposes, such as when displaying request or certificate information.
requestor	The email address of the requestor, when the keys for the certificate were generated by PKI Services.
serialno	The serial number of a certificate.
tmplname	A certificate template name. This is primed from the HTML tag <SELECT NAME="Template"> in the <APPLICATION NAME=PKISERV> section. The end user selects it on the first web page.
transactionid	A unique value that is returned from a certificate request.
osversion	A special substitution variable to allow for the dynamic creation of operating system specific INSERTS.  An example is if %%ObjectHeaderIE[osversion]%% is specified in a TEMPLATE CONTENT section and the operating system that is used is Windows Vista and above, INSERT ObjectHeaderIENONXP is included.

### What are named fields?

Named fields insert common HTML code, such as a common input field or a page header or footer, in a web page. (Each named field refers to a corresponding INSERT section.) A named field is delineated with %%.

#### Examples:

```
%%Country%%
%%-pagefooter%%
```

**Note:** Named fields are case-sensitive.

A named field can include or not include a dash. A named field without a dash, such as %%Label%% might have a special meaning as a certificate field. Its special meaning depends on the section in which it appears. (See “Relationship between CGIs and the pkiserv.tmpl file” on page 213 for more information.)

A named field with a dash, such as %%-pagefooter%%, has no special meaning. PKISERV treats it simply as HTML code to insert. Any special meaning the named field might have, based on the section in which it is contained, is ignored. For example, in a TEMPLATE CONTENT section (see “TEMPLATE sections” on page 142) if you specify %%-pagefooter%%, -pagefooter is not considered a certificate field name. However, the INSERT section with the name -pagefooter is included in the HTML page displayed to the end user.

### INSERT sections

Although the INSERT sections are at the end of the pkiserv.tmpl certificate templates file, they are explained first because of their relationship to named fields. Any named field that is used in the pkiserv.tmpl file must be defined in a corresponding INSERT section.

Unlike the APPLICATION sections and TEMPLATE sections, INSERT sections can have no subsections. The format of an INSERT section is:

```
<INSERT NAME=insert-name>...</INSERT>
```

An INSERT contains HTML that either:

- Defines a certificate field
- Defines other common HTML that can be referenced in other sections.

The following example of an INSERT defines a certificate field.

#### Example:

```
<INSERT NAME=Country>
<p> <LABEL for="countryfield">Country [optfield]</LABEL> <BR>
<INPUT NAME="Country" TYPE="text" SIZE=2 maxlength="2" id="countryfield">
<SCRIPT LANGUAGE="JavaScript">
<!--
function ValidCountry(frm){
  if ("[optfield]" == "" && frm.Country.value == "") {
    alert("Enter required field."); frm.Country.focus();
    return false;
  }
  return true;
}
//-->
</SCRIPT>
</INSERT>
```

The next example defines other common HTML:

#### Example:

```
<INSERT NAME=-pagefooter>
<p>email: webmaster@your_company.com
</INSERT>
```

To reference an INSERT, you use a named field of the form `%%insert-name%%`, for example `%%Country%%` or `%%-pagefooter%%`.

The pkiserv.tmpl certificate templates file contains INSERT sections of several main types:

- INSERTs that are for internal processing. (This is common HTML for web page content as listed in Table 31.)
- INSERTs that are related to the certificate content. (See Table 32 on page 132.) These include:
  - X.509 fields (for example, OrgUnit)
  - Non-X.509 fields (for example UserId).

Table 31. INSERTs that are common HTML for web page content

INSERT NAME	Contents
-AdditionalHeadIE	ActiveX controls to enable Internet Explorer to generate a key pair.

## Customizing the end-user web pages using REXX CGIs

Table 31. INSERTs that are common HTML for web page content (continued)

INSERT NAME	Contents
-ChallengePassphrase, -ChallengePassPhrase2	HTML for a web page that requests the passphrase that was specified when a certificate request was submitted.
-ObjectHeaderIEXP	ActiveX controls to enable Internet Explorer to generate a key pair if the application is running on Windows XP operating system.
-ObjectHeaderIENONXP	ActiveX controls to enable Internet Explorer to generate a key pair if the application is running on Windows Vista and above operating system.
-RecoverEmail, -RecoverEmail2	HTML for the web page that requests the email address that was used when a certificate was requested, after a user requests to recover the certificate.
-requestok	HTML for the web page "Request submitted successfully" after a successful certificate request (for both original requests and renewals). (For a sample of this web page, see Figure 41 on page 373.)
-requestbad	HTML for the web page "Request was not successful".
-requestor	HTML for a web page that requests the name of a certificate requestor.
-requestor2	HTML for a web page that requests the email address of a certificate requestor.
-renewkeysetIE	ActiveX controls to create a renewal certificate request using the original certificates key pair.
-renewkeysetNS	Mozilla-based browser script for renewal certificate requests.
-renewrevokeok	HTML for the web page "Request submitted successfully" after a successful attempt to revoke a certificate. (See Figure 50 on page 380 for a sample of the web page to renew or revoke a certificate.)
-renewrevokebad	HTML for the web page "Request was not successful" after an unsuccessful attempt to renew or revoke a certificate. (See Figure 50 on page 380 for a sample of the web page to renew or revoke a certificate.)
-returnp12cert	HTML for a web page that displays a PKCS #12 package.
-preregok	HTML for the web page "Preregistration successful" after a successful attempt to preregister a client for a certificate.
-returnpkcs10	This returns the server certificate in B64 format.
returnbrowsercertNS	This contains [base64cert], which is the base64 substitution variable.
returnbrowsercertIE	This contains a script for producing a popup window installing your certificate (if you are using the Microsoft Internet Explorer browser). See Figure 44 on page 375 for a sample of this web page.

### Named fields in INSERT sections

Most of the following fields are X.509 fields. Table 32 on page 132 summarizes the named fields in INSERT sections. (See **Restrictions** at the end of the table.)

## Customizing the end-user web pages using REXX CGIs

Table 32. Named fields in INSERT sections

Field	Description
AltDomain	The host name of the machine where a certificate is installed. This is a text field of up to 100 characters. The field can be repeated. <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.
AltEmail	The user's email address, including the @ character and any periods (.). This is a text field of up to 100 characters. The field can be repeated. <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.
AltIPAddr	The unique IP address that specifies the location of the server or device on the Internet. The field can be repeated. PKI Services supports both IP version 4 and IP version 6 addresses. The IP address is a text field of up to 45 characters. <ul style="list-style-type: none"> <li>For IP version 4, the IP address is in dotted decimal format; for example, 9.67.97.103.</li> <li>For IP version 6, the IP address is divided into eight 16-bit hexadecimal blocks separated by colons. Leading zeros in each 16-bit field are optional, and successive fields of zeros can be represented by double colons, but only once; for example 1:2::3:4 is equivalent to 0001:0002:0000:0000:0000:0000:0003:0004.</li> <li>In a mixed IP version 4 and IP version 6 environment, the IP address can be expressed in the format <i>x:x:x:x:d.d.d.d</i>, where the <i>x</i> values are the hexadecimal values of the six high-order 16-bit pieces of the address, and the <i>d</i> values are the decimal values of the four low-order 8-bit pieces of the address in standard IP version 4 representation; for example, 0:0:0:0:0:ABCD:1.2.3.4, or the equivalent value ::ABCD:1.2.3.4</li> </ul> <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.
AltOther <sup>1</sup>	A free form value for the other name of the subject's alternate name. Unlike the other INSERTs, you must customize it before you use it. The name of this INSERT consists of the string AltOther, concatenated with an underscore (_), then followed by the OID, specified in the following format: AltOther_1_2_3_4_5. (See "Customizing the OtherName field" on page 225.)  You can have more than one input field but the total length of these fields together with the length of the OID and the comma cannot exceed 255 bytes. The resulting AltOther field is built by concatenating the dotted decimal OID that matches the INSERT name, a comma, and the value of the input field. This is a text field of up to 255 characters. <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.
AltURI	A name or address referring to an Internet resource; a URL is one type of uniform resource identifier. This is a text field of up to 100 characters. The field can be repeated. <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.
BusinessCat	The business category. This is a text field of up to 64 characters. <b>Note:</b> This field is intended for use in certificates that follow the criteria for Extended Validation (EV) certificates. For more information about the criteria, see the Guidelines for Extended Validation Certificates produced by the CA/Browser Forum, at <a href="http://www.cabforum.org/Guidelines_v1_3.pdf">http://www.cabforum.org/Guidelines_v1_3.pdf</a> .
ChallengePassPhrase <sup>1</sup>	The passphrase the user entered when requesting a certificate. The user types the same passphrase, exactly as entered on the request form. This is a case-sensitive text field of up to 32 characters.

Table 32. Named fields in INSERT sections (continued)

Field	Description
ClientName <sup>1</sup>	<p>Name of the person or device being preregistered. This is a text field of up to 64 characters.</p> <p><b>Restriction:</b> The first 32 characters of the name must be unique, irrespective of case, for each preregistered user.</p>
CommonName	<p>For browser certificates, this is your name, such as John Smith. (You can use your first and last name, in that order.) For server certificates, this is name by which the server's administrator wants it to be known. For SSL servers, the SSL protocol requires the CommonName to be the fully qualified domain name of the server, for example, www.ibm.com. CommonName is a text field of up to 64 characters.</p> <p>Although CommonName is a constant, no value is assigned to it. This indicates that RACF must determine the value. The user authenticates by specifying a user ID and password. (If UserId is listed in the APPL section, this means the application provides the user ID and password.) Providing the user ID and password enables RACF to look up the CommonName value in the user's profile.</p> <p><b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.</p>
Country	<p>The country where your organization is located. This is a 2-character text field.</p> <p><b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.</p>
CustomExt	<p>A custom certificate extension. Use this field to support extensions that PKI Services does not otherwise support. This is a repeatable field. For more information, see "Adding custom extensions to certificates" on page 319.</p>
DNQualifier <sup>1</sup>	<p>The subject's distinguished name qualifier. This is a text field of up to 64 characters.</p>
DomainName <sup>1</sup>	<p>The subject's domain name. It contains all the domain name components in the form &lt;domain component1&gt;.&lt;domain component2&gt;. ... .&lt;domain component<i>n</i>&gt;. This is a text field of up to 64 characters.</p>
Email <sup>1</sup>	<p>This is a deprecated insert for the email address for the distinguished name; use the Mail insert instead. This is a text field of up to 64 characters.</p> <p><b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.</p>
EmailAddr <sup>1</sup>	<p>The email address for the distinguished name. This is a text field of up to 64 characters.</p> <p><b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.</p>

## Customizing the end-user web pages using REXX CGIs

Table 32. Named fields in INSERT sections (continued)

Field	Description
ExtKeyUsage <sup>1</sup>	<p>The intended purpose of the certificate. Possible values are:</p> <p><b>clientauth</b> Client side authentication</p> <p><b>codesigning</b> Code signing</p> <p><b>emailprotection</b> Email protection</p> <p><b>mssmartcardlogon</b> Microsoft Smartcard logon</p> <p><b>ocspsigning</b> OCSP response signing</p> <p><b>serverauth</b> Server side authentication</p> <p><b>timestamping</b> Digital timestamping.</p>
HostIdMap <sup>1</sup>	<p>This is the user ID for authorization purposes, in an email type of format: <i>subject-id@host-name</i></p> <p>For example, this could be <i>dsmith@ibm.com</i>. This is a text field of up to 100 characters.</p> <p>There are three ways to use %%HostIdMap%:</p> <ul style="list-style-type: none"> <li>• If you place it in the CONTENT section, the end user can specify the value (or values, because it can be repeated).</li> <li>• You can also place it in the APPL section that the application provides. If you do so, it should have the following form: %%HostIdMap=@host-name%% The host-name is the hardcoded system name for the current system. The application provides the user ID as the user entered it when prompted for user ID and password. Note that, for this to function properly, the IBM HTTP Server protection scheme for the request must force a prompt for user ID and password. Thus, only one HostIdMap is provided using this method.</li> <li>• A third way to specify HostIdMap is to place %%HostIdMap%% in the ADMINAPPROVE section. This allows the administrator to fill in the value when approving the certificate request. See “Administering HostIdMappings extensions” on page 462 for more information.</li> </ul>
InstallCert	(This field is for the Internet Explorer browser only.) This field contains script for producing a window that installs an automatically-renewed certificate copied from an email notification.
JurCountry	<p>The jurisdiction of incorporation country name. This is a two-character text field.</p> <p><b>Note:</b> This field is intended for use in certificates that follow the criteria for Extended Validation (EV) certificates. For more information about the criteria, see the Guidelines for Extended Validation Certificates produced by the CA/Browser Forum, at <a href="http://www.cabforum.org/Guidelines_v1_3.pdf">http://www.cabforum.org/Guidelines_v1_3.pdf</a>.</p>
JurLocality	<p>The jurisdiction of incorporation locality name. This is a text field of up to 64 characters.</p> <p><b>Note:</b> This field is intended for use in certificates that follow the criteria for Extended Validation (EV) certificates. For more information about the criteria, see the Guidelines for Extended Validation Certificates produced by the CA/Browser Forum, at <a href="http://www.cabforum.org/Guidelines_v1_3.pdf">http://www.cabforum.org/Guidelines_v1_3.pdf</a>.</p>

Table 32. Named fields in INSERT sections (continued)

Field	Description
JurStateProv	The jurisdiction of incorporation state or province name. This is a text field of up to 64 characters. <b>Note:</b> This field is intended for use in certificates that follow the criteria for Extended Validation (EV) certificates. For more information about the criteria, see the Guidelines for Extended Validation Certificates produced by the CA/Browser Forum, at <a href="http://www.cabforum.org/Guidelines_v1_3.pdf">http://www.cabforum.org/Guidelines_v1_3.pdf</a> .
KeyProt <sup>1</sup>	(This field is for the Internet Explorer browser only.) This field asks if the user wants to enable strong private key protection. The drop-down choices are Yes and No.
KeySize	The size of the keys (public key and private key) in bits, if they are to be generated by PKI Services. Valid values for each key type are: <b>RSA</b> 512, 1024, 2048, 4096 <b>NISTECC</b> 192, 224, 256, 384, 521 <b>BPECC</b> 160, 192, 224, 256, 320, 384, 512
KeyUsage	The intended purpose of the certificate. Each possible value is shown in Table 33 on page 137 with its intended purpose and possible PKIX bits.
Label <sup>2</sup>	The label assigned to the requested certificate. This is a text field of up to 32 characters.
Locality	The city or municipality where your organization is located, such as Pittsburgh or Paris. This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.
Mail <sup>1</sup>	The email address for the distinguished name. This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.
NotBefore	Number of days (0 - 30) before the certificate becomes valid.
NotAfter	Number of days (1 - 9999) that the certificate is current. For example, 365 for a one-year certificate.
NotifyEmail <sup>1</sup>	The email address for notification purposes. If automatic certificate renewal is in effect, this is the email address to which PKI Services sends the certificate when it is automatically renewed. This is a text field of up to 64 characters. <b>Notes:</b> 1. When a certificate is created and posted to LDAP, the NotifyEmail value, if specified, is posted as the MAIL attribute. If the MAIL attribute already exists in that directory entry, its value is replaced by the new value. If both NotifyEmail and Email appear on one request, they must have the same value. 2. If a certificate for which PKI Services generated the keys is renewed, the NotifyEmail field is ignored, and the renewed certificate is sent to the requestor's email address.
Org	Organization. The legally registered name (or trademark name, for example, IBM) of your organization. This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.
OrgUnit	The name of your division or department. This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.

## Customizing the end-user web pages using REXX CGIs

Table 32. Named fields in INSERT sections (continued)

Field	Description
OrgUnit2	The name of your division or department. (There can be more than one organizational unit field on a request form. For example, one could be for your department and another for your division.) This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.
PassPhrase <sup>1</sup>	The user decides this and enters and then reenters it when requesting a certificate (and must later supply this value when retrieving the certificate). This is a case-sensitive text field of up to 32 characters. There is no minimum number of characters, and the user can use any characters, but alphanumeric characters (A - Z, a - z, and 0 - 9) are suggested.
PostalCode <sup>1</sup>	The zip code or postal code. This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.
PublicKey	The base64-encoded #10 certificate request. (This is for server or device enrollment only.) You create a certificate request on behalf of another server (which could be a z/OS server or other type of server) or device for which you are requesting a certificate. You use software specific to that server to generate the #10 request before going to the PKI Services website. Save the request in a file. Then open the file in a text editor such as Windows Notepad and copy and paste the contents into the text box on the enrollment form. A text area of 70 columns and 12 rows is allocated for this certificate request. Here is an example of the certificate request:  -----BEGIN NEW CERTIFICATE REQUEST----- MIIBiDCB8gIBADAZMRCwFQYDVQQDEw5Kb2huIFEuIFB1YmXpYzCBnzANBgkqhkiG 9w0BAQEFAAOBjQAwYkCgYEASt1cJHAGPqi60jAyl+xNbt8z5ngmvq02V003oYu /mEnQtRM96e+2jbmDCRo5tWVklG40Yf9ZVB5biURMJFLztfa4AVdEVtun8DH2pwc wiNIZZcC1Zym5adurUmyDk64Pgi iIPMQS/t0ttG4c5U8uWSK0b1J4V4f7ps+t1aG t+cAwEAAaAwMC4GCSqGSIb3DQEJJDjEhMB8wHQYDVR00BBYEFA1KTovBBvnFqDAO 1oIhtRinwRC9MA0GCSqGSIb3DQEJBBQUAA4GBAIBcVpwYvppIX3HHmpKZPNY8Snsz AJrDsgAEH51W0IRGywhqKcLLxa9htoQai6cdc8RpFVTwk6UfdCOGxMn4aFb34Tk3 5WYdz0iHXg8MhHiB3EruwdWs+S7Fv3JhU3FLWU61FLfAjvbi+35iEWQymOR6mE5W CathprmGfKRDE5E -----END NEW CERTIFICATE REQUEST-----
PublicKeyIE <sup>1</sup>	(This field is for the Internet Explorer browser only.) This is the cryptographic service provider. The user selects a value from a drop-down list (Microsoft Base Cryptographic Provider or Microsoft Enhanced Cryptographic Provider).
PublicKeyNS <sup>1</sup>	(This field is for Mozilla-based browsers only.) This is the key size for your public/private key pair. The user selects a value from the drop-down list. Larger keys are more secure, but they also increase the time needed for connecting to a secure session.
PublicKey2IE	(This field is for the Internet Explorer browser only.) This field is the smart card cryptographic service provider. The user selects a smart card provider from a list.
PublicKey2NS	(This field is for Mozilla-based browsers only.) This field is the keygen HTML tag. It displays a menu of key sizes from which the user must choose one. When the user clicks <b>submit</b> , a key pair of the selected size is generated.
RecoverEmail, RecoverEmail2	This field is used to recover a certificate whose keys were generated by PKI Services. It contains the email address of the requestor.
Requestor <sup>1</sup>	The user's name, which is used for tracking the request. This can be in any format, for example, John Smith or John. J. Smith. (This can differ from the common name, especially if the request is for a server certificate.) The value is saved with the request and issued certificate, but it is not a field in the created certificate. The default value is taken from the leftmost RDN in the subject's distinguished name, truncated to 32 characters.
Requestor2	The email address of the requestor. This field is used to request a certificate with a key pair generated by PKI Services, and to retrieve such a certificate.

Table 32. Named fields in INSERT sections (continued)

Field	Description
Security1, Security 2, ... Security <i>n</i>	Security questions used to assist recovering a certificate whose keys were generated by PKI Services. These fields can be used by the GENCERT, REQCERT and QRECOVER exits. You can have as many of these fields as you want, but the number you have must match the number that your exits handle. The fields should be numbered in order, beginning with Security1.
SerialNumber <sup>1</sup>	Serial number of the subject device. This is a text field of up to 64 characters.
SignWith	For PKI the component and for SAF the component and key-label used to sign this certificate, indicating the provider for certificate generation. This is a text field of up to 45 characters. It can be SAF or PKI Services, as shown in the following examples.  Examples: "SAF:CERTAUTH/Local CA Cert" "PKI:"  For SAF, the label of the signing certificate must be included. The first example shows the SignWith field in a SAF template. It includes the signing certificate, a CERTAUTH certificate labeled 'Local CA Cert'.  For PKI, it is an error to include the signing certificate. The second example shows the SignWith field in a PKI template. Notice that this contains no signing certificate.
StateProv	The state or province where your organization is located. Your registration policies determine whether you spell out the full name of the state or province or use an abbreviation. This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.
Street <sup>1</sup>	The street address. This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.
Title	Job title. This is a text field of up to 64 characters. <b>Note:</b> The value is one of the relative distinguished names that is saved in the subject's distinguished name in the certificate.
TransactionId	PKISERV web pages assign this after the user requests a certificate. When it is displayed, the user needs to record this number. This is a text field of up to 56 characters.
Uid <sup>1</sup>	The subject's login ID. This is a text field of up to 64 characters.
UnstructAddr <sup>1</sup>	Unstructured address of the subject device. This is a text field of up to 64 characters.
UnstructName <sup>1</sup>	Unstructured device name. This is a text field of up to 64 characters.
UserId	The owning SAF user ID. This is a text field of up to 8 characters.

**Restrictions:**

1. This field is applicable for only PKI certificates (certificates using the PKI: value in the SignWith field).
2. This field is applicable for only SAF certificates (certificates using the SAF: value in the SignWith field).

Table 33. KeyUsage values and their intended purpose and possible PKIX bits

KeyUsage value	Intended purpose	PKIX bits
certsign	Certificate and CRL signing	KeyCertSign and cRLSign
crlsign	CRL signing	cRLSign

## Customizing the end-user web pages using REXX CGIs

Table 33. KeyUsage values and their intended purpose and possible PKIX bits (continued)

KeyUsage value	Intended purpose	PKIX bits
dataencrypt, dataencipherment, or dataenciph	Data encryption	dataEncipherment
digitalsig or digitalsignature	Authentication	digitalSignature
docsign or nonrepudiation	Document signing	nonRepudiation
handshake	Protocol handshaking (for example, SSL)	digitalSignature and keyEncipherment
keyagree or keyagreement	Key agreement	keyAgreement
keycertsign	Certificate signing	keyCertSign
keyencrypt, keyencipherment, or keyenciph	Key transport	keyEncipherment

**Note:** If **certsign**, **crisign**, or **keycertsign** is specified, the certificate is created with the basic constraints extension to indicate that it is a certificate authority certificate, in addition to the key usage extension.

## The APPLICATION sections

The APPLICATION sections identify the application domains supported by PKI Services. The default certificate templates file (`pkiserv.tmpl`) ships with two applications sections, **PKISERV** (for PKI administrators) and **CUSTOMERS** (for general users).

The format of the APPLICATION sections is:

```
<APPLICATION NAME=appl-name>...</APPLICATION>
```

Each application section begins with an application name definition.

**Examples:**

```
<APPLICATION NAME="PKISERV">
```

This application contains support for all templates and functions.

```
<APPLICATION NAME="CUSTOMERS">
```

This application contains support for all templates and functions but does not include the button on the bottom of the PKI Services home page that directs users to the administration page.

Each APPLICATION section can contain the subsections that are shown in Table 34.

Table 34. Subsections of the APPLICATION sections

Section or subsection	Contents
CONTENT	HTML for the "PKI Services Certificate Generation Application" web page. (For a sample of this web page, see Figure 37 on page 363.) This subsection should contain one or more named fields (see "What are named fields?" on page 129) identifying certificate templates to use for requesting or managing certificates through this application. These template names should match the HTML selection value that is associated with them.

## Customizing the end-user web pages using REXX CGIs

Table 34. Subsections of the APPLICATION sections (continued)

Section or subsection	Contents
FAILURECONTENT	This subsection contains the HTML for the web page that is displayed when the certificate request submit failed. Any named fields in this subsection are interpreted as content inserts defined by INSERT sections. For PKISERV, the INSERT sections are included as part of the HTML presented to the end user.
FINDRECOVERCONTENT	This subsection contains the information for recovering a certificate in the case where the user has forgotten the passphrase. <b>Note:</b> Only certificates whose keys were generated by PKI Services are recoverable.
RECONTENT	HTML for the web page “Renew or revoke a browser certificate”. The web page displays information about a certificate so that the end user can confirm that this is the correct certificate to renew or revoke. (For a sample of this web page, see Figure 50 on page 380.) This subsection uses the substitution variable [printablecert], which contains the data that is extracted from the ICL entry. (See “What are substitution variables?” on page 128.)
RECONTENT2	This subsection is similar to the RECONTENT section except that it applies to a certificate whose key was generated by PKI Services and is to be revoked.
RECOVERCONTENT	This subsection contains HTML and JavaScript functions to recover a previously issued certificate whose key was generated by PKI Services.
RENEWEDCERT	This subsection contains HTML and JavaScript functions to install an automatically renewed certificate that is copied from an email notification if using the Internet Explorer browser.
RESUCCESSCONTENT	Contains only the named field %%-renewrevokeok% (whose associated INSERT contains HTML for the web page “Request submitted successfully”).
REFAILURECONTENT	Contains only the named field %%-renewrevokebad% (whose associated INSERT contains HTML for the web page “Request was not successful”). The web page is displayed to the end user when a renewal or revocation request is unsuccessful.
RETRIEVECONTENT2	This subsection contains the HTML to allow the end user to retrieve a recovered certificate.
RETURNCERT	This subsection contains the HTML for the web page that is displayed upon successful retrieval of a recovered certificate. This section contains the named field %returnp12cert%, which indicates a PKCS #12 format.
ADMINSCOPE	This subsection is for an administration page. It contains only the named field %selectCADomain% to prompt the administrator to choose a domain. (For more information, see “Adding a new CA domain” on page 287.)
ADMINHEADER	This subsection contains the general installation-specific HTML content for the header of all administration web pages. See “Steps for customizing the administration web pages” on page 231 for more information.

## Customizing the end-user web pages using REXX CGIs

Table 34. Subsections of the APPLICATION sections (continued)

Section or subsection	Contents
ADMINFOOTER	This subsection contains the general installation-specific HTML content for the footer of all administration web pages. See "Steps for customizing the administration web pages" on page 231 for more information.

## Templates that PKI Services provides

PKI Services provides the templates to request the following certificates:

- One-year SAF server certificate
- One-year SAF browser certificate
- One-year PKI SSL browser certificate (See Figure 39 on page 370 to see a sample of this web page.)
- One-year PKI SSL S/MIME browser certificate
- One-year PKI generated key certificate
- Two-year EV SSL server certificate
- Two-year PKI browser certificate for authenticating to z/OS
- Two-year PKI Authenticode - code signing server certificate
- Two-year PKI Windows logon certificate
- Five-year PKI SSL server certificate
- *n*-year PKI browser certificate for extensions demonstration
- Five-year SCEP certificate - Preregistration
- Five-year PKI IPSEC server (firewall) certificate
- Five-year PKI intermediate CA server certificate
- 

The following table describes the certificate templates that PKI Services provides:

Table 35. Certificate templates PKI Services provides

Certificate template	Description
One-year SAF server certificate	This template allows end users to request a server certificate using native SAF certificate generation facilities (rather than PKI Services certificate generation facilities). The certificate is used for handshaking only (for example, SSL). This certificate is auto-approved.
One-year SAF browser certificate	This template allows end users to request a browser certificate. SAF certificate generation facilities (rather than PKI Services certificate generation facilities) create the certificate. The requestor must input a label (see Table 32 on page 132 for descriptions of fields) because the certificate is stored in a RACF database. This certificate is auto-approved.
One-year PKI SSL browser certificate	This template allows end users to request a browser certificate that PKI Services generates. The end user enters the common name. (See Table 32 on page 132 for descriptions of fields.) This template contains an ADMINAPPROVE section. Therefore, certificates requested using this template require administrator approval before being issued. The user ID and password are not required but the passphrase is required.
One-year PKI S/MIME browser certificate	This template allows end users to request a browser certificate that PKI Services generates. This is similar to the one-year PKI SSL browser certificate except the end user selects AltEmail.

## Customizing the end-user web pages using REXX CGIs

Table 35. Certificate templates PKI Services provides (continued)

Certificate template	Description
One-year PKI generated key certificate	<p>This template allows end users to request a certificate that PKI Services generates, with a public key and private key that PKI Services generates. The user must supply a name, email address, passphrase, and key size. This template requires administrator approval.</p> <p>You need to assess the risk of using this template. The requestor provides the transaction ID and passphrase to retrieve the private key and the certificate. The transaction ID and the passphrase entered by the requestor can be shown on the administrator pages. A malicious administrator could retrieve the certificate and the private key and use them. You should implement measures to minimize the risk of this happening; for example, check the log record on the number of retrievals or create an exit to limit the number of retrievals.</p>
Two-year EV SSL server certificate	<p>This template allows end users to request a two-year extended validation server certificate.</p>
Two-year PKI browser certificate for authenticating to z/OS	<p>This template allows end users to request a browser certificate that PKI Services generates. This certificate is similar to the one-year PKI SSL browser certificate except that it includes the %%HostIdMap%% INSERT and this certificate is auto-approved.</p> <p>%%HostIdMap%% is intended as a replacement for adding (and mapping) the certificate to a RACF user ID.</p> <p>This template specifies %%HostIdMap=@ host-name%% and %%UserId%% in the APPL section. This template does not require administrator approval but has protection through the user ID and password. (For more information about %%HostIdMap%%, see the HostIdMap field in Table 32 on page 132.)</p>
Two-year PKI Authenticode - code signing server certificate	<p>This template allows end users to request that a server certificate be used to sign software that is downloaded across an untrusted medium. It also demonstrates how to define extensions for template specific certificate policies and third party-provided OCSP.</p>
Two-year PKI Windows logon certificate	<p>This template allows end users to request a certificate to use when logging in with a smart card to a Windows desktop as an Active Directory user. This template supports requests from both Internet Explorer and Mozilla-based browsers, and supports the following cryptographic services providers (CSPs).</p> <ul style="list-style-type: none"> <li>• Datakey</li> <li>• Gemplus</li> <li>• Infineon SICRYPT</li> <li>• Schlumberger</li> </ul> <p>Support for additional CSPs can be added when you customize the template.</p>
Five-year PKI SSL server certificate	<p>This template allows end users to request a server certificate that PKI Services generates. This is similar to the SAF server template except that this template contains an ADMINAPPROVE section. Therefore, certificates requested using this template require administrator approval before being issued. The user ID and password are not required but the passphrase is required.</p>
Five-year PKI IPSEC server (firewall) certificate	<p>This template allows end users to request a server certificate that PKI Services generates. This is similar to the five-year PKI SSL server certificate except that KeyUsage constants handshake and dataencrypt are hardcoded. Also, the end user selects AltEmail, AltIPAddr, AltURI, and AltDomain.</p>

## Customizing the end-user web pages using REXX CGIs

Table 35. Certificate templates PKI Services provides (continued)

Certificate template	Description
Five-year PKI intermediate CA server certificate	This template allows end users to request a server certificate that PKI Services generates. This is similar to the PKI SSL server template except that KeyUsage is hardcoded as certsign. Also, this certificate is auto-approved (because it runs under the user ID of the requestor, that is the person requesting this must be highly authorized). The user ID and password are required, and the units of work should run under the client's ID. In other words, the end user must be someone who can do this using RADCERT alone, that is, must have CONTROL authority to IRR.DIGTCERT.GENCERT, and so forth. Given this requirement, the administrator need not approve this. The PassPhrase is required.
Five-year SCEP certificate - Preregistration	This template supports certificate preregistration for Simple Certificate Enrollment Protocol (SCEP) clients. The PassPhrase is required.
<i>n</i> -year PKI browser certificate for extensions demonstration	This template creates a browser certificate that has most of its information provided by the user rather than controlled by the administrator. The certificate contains all the supported extensions.

### TEMPLATE sections

TEMPLATE sections define the fields that comprise a specific certificate request. They define the certificate templates that are referenced in the APPLICATION section. The `pkiserv.tmp1` certificate templates file contains a TEMPLATE section for each of the certificates that are described in Table 35 on page 140.

Each template section begins with one or more template names.

`<TEMPLATE NAME=tmpl-name>...</TEMPLATE NAME>`

The `pkiserv.tmp1` certificate templates file that ships with PKI Services includes lines like the following example:

**Example:**

```
<TEMPLATE NAME=1-Year PKI SSL Browser Certificate>
<TEMPLATE NAME=PKI Browser Certificate>
<NICKNAME=1YBSSL>
```

The true name of a certificate template is its actual complete name. This is the name in the first line, 1-Year PKI SSL Browser Certificate. However, you can refer to a single template by more than one name by using an alias. The template name in the second line, PKI Browser Certificate, is an alias. An alias differentiates browser from server certificates. Finally, renewing a certificate requires recalling the template name, so the template name must be stored with the certificate. The NICKNAME (or short name) serves this purpose.

**Notes:**

1. You can have more than one alias. (Use an additional `<TEMPLATE NAME=alias>` line for each one.)
2. The value of a NICKNAME is an 8-character string.
3. SAF certificate templates do not include nicknames.

Table 36 on page 143 shows the true name, alias, and nickname for each certificate template:

## Customizing the end-user web pages using REXX CGIs

Table 36. Names, aliases, and nicknames of certificate templates.

True name	Alias	Nickname
1-Year PKI SSL Browser Certificate	PKI Browser Certificate	1YBSSL
1-Year PKI S/MIME Browser Certificate	PKI Browser Certificate	1YBSM
1-Year PKI Generated Key Certificate	PKI Key Certificate	1YKRC
2-Year EV SSL Server Certificate	PKI Server Certificate	2YEVSSL
2-Year PKI Browser Certificate For Authenticating To z/OS	PKI Browser Certificate	2YBZOS
2-Year PKI Authenticode - Code Signing Certificate	PKI Server Certificate	2YIACS
2-Year PKI Windows Logon Certificate	PKI Browser Certificate	2YBWL
5-Year PKI SSL Server Certificate	PKI Server Certificate	5YSSSL
5-Year PKI IPSEC Server (Firewall) Certificate	PKI Server Certificate	5YSIPS
5-Year PKI Intermediate CA Certificate	PKI Server Certificate	5YSCA
5-Year SCEP Certificate - Preregistration	—	5YSCEPP
<i>n</i> -Year PKI Certificate for Extensions Demonstration	PKI Browser Certificate	SAMPLB
1-Year SAF Browser Certificate	SAF Browser Certificate	-
1-Year SAF Server Certificate	SAF Server Certificate	-

The AUTORENEW tag is optional. It determines whether the certificate is to be automatically renewed when it approaches expiration. This tag has the form <AUTORENEW=*value*>, where *value* can have the value Y, y, N, or n. If the AUTORENEW tag has any other value, or does not immediately follow the NICKNAME tag, PKI Services operates as if the tag is not present. The tag has the following meanings:

- AUTORENEW tag not present means that the certificate is not set up for automatic renewal.
- AUTORENEW=Y means that the certificate is enabled for automatic renewal.
- AUTORENEW=N means that the certificate is eligible for automatic renewal, but automatic renewal is disabled.

**Note:** Adding the AutoRenew=Y does not enable all certificates to be AutoRenewed. It enables only the newly issued certificates after the template is updated. For more information about how AutoRenew processing should be added, see Chapter 17, “Using the administration web pages,” on page 389.

See “Setting up automatic renewal of certificates” on page 315 for more information.

### Example:

```
<TEMPLATE NAME=1-Year PKI SSL Browser Certificate>
<TEMPLATE NAME=PKI Browser Certificate>
<NICKNAME=1YBSSL>
<AUTORENEW=Y>
```

TEMPLATE sections can have the following subsections:

- CONTENT

## Customizing the end-user web pages using REXX CGIs

- APPL
- CONSTANT
- ADMINAPPROVE
- SUCCESSCONTENT
- FAILURECONTENT
- RETRIEVECONTENT
- RETURNCERT
- PREREGISTER

### <CONTENT>...</CONTENT>

This subsection contains the HTML to display a web page to the end user requesting a certificate of a specific type. (See Figure 39 on page 370 for a sample web page.) Field names on the certificate request (such as a text box where the user enters a value for Common Name) match the names of INSERT sections. The following examples show the INSERT sections corresponding to the field names `%%CommonName%%` and `%%Requestor (optional)%%`.

#### Examples:

```
<INSERT NAME=CommonName>
<p><LABEL for="commonnamefield">Common Name [optfield]</LABEL><BR>
<INPUT NAME="CommonName" TYPE="text" SIZE=64 maxlength="64" id="commonnamefield">

<INSERT NAME=Requestor>
<p><LABEL for="requestorfield">Your name for tracking this request [optfield]</LABEL><BR>
<INPUT NAME="Requestor" TYPE="text" SIZE=32 maxlength="32" id="requestorfield">
```

Named fields in this subsection are optional if the named field contains more than one word within the `%%` delimiters (as in `%%Requestor (optional)%%`). The user need not supply a value for Requestor.

### <APPL>...</APPL>

This subsection identifies certificate fields for which the application itself should provide values. This subsection should contain only named fields, one per line. The only supported named fields that are allowed in this section are:

- UserId
- HostIdMap

#### Example:

```
<APPL>
%%UserId%%
%%HostIdMap=@www.ibm.com%%
</APPL>
```

### <CONSTANT>...</CONSTANT>

This subsection identifies certificate fields that have a constant (hardcoded) value for everyone. This subsection should contain only named fields, one per line. The syntax for specifying the values is `%%field-name=field-value%%`:

#### Example:

```
%%KeyUsage=handshake%%
```

In addition to the named fields listed in Table 32 on page 132, you can also include the following named fields in this subsection only.

#### Critical

Identifies a certificate extension that is to be marked critical

## Customizing the end-user web pages using REXX CGIs

in the issued certificates. This name-value pair can be repeated for each extension to be marked critical. Here is the list of acceptable values for **Critical**:

- BasicConstraints (ignored as this extension is always marked critical)
- KeyUsage (ignored as this extension is always marked critical)
- ExtKeyUsage
- SubjectAltName, AltEmail, AltIPAddr, AltDomain, AltURI
- HostIdMappings, HostIdMap
- CertificatePolicies, CertPolicies

### Example:

```
%%Critical=ExtKeyUsage%%
```

### Rules:

1. If you have specified configuration file setting PolicyRequired=T, then specifying %%Critical=CertPolicies%% is ignored. The configuration file setting PolicyCritical determines if the CertificatePolicies extension is marked critical. See “Using certificate policies” on page 268 for more information.
2. When ExtKeyUsage is extracted from an input PKCS #10 certificate request, the critical flag in the request is ignored. Therefore, setting %%Critical=ExtKeyUsage%% is the only way to get the ExtKeyUsage extension marked critical.

### CertPolicies

Identifies the certificate policies that are to be included in the issued certificates. The value is a vector of numbers each representing one of the PolicyName*n* values that are specified in the **CertPolicy** section of the configuration file.

### Example:

```
%%CertPolicies=3 6 10%%
```

**Rule:** If you specified configuration file setting PolicyRequired=T, then specifying %%CertPolicies=*any-value*%% is ignored. All issued certificates have the same certificate policies as defined in the configuration file. See “Using certificate policies” on page 268 for more information.

### AuthInfoAcc

Indicates the information necessary for the AuthorityInfoAccess extension. The value specifies a two-part, comma-separated string identifying the access method (OCSP or IdentrusOCSP) and the access URL. The URL must be specified in HTTP-protocol format only. (LDAP protocol is not supported.) The name-value pair can be repeated for each value that is required in the extension.

### Examples:

## Customizing the end-user web pages using REXX CGIs

```
%%OCSP,URL=https://ocsp.vendor.com%%  
%%IdentrusOCSP,URI=https://identrus200.identrus.com%%  
%%OCSP,URI=http://www.mycompany.com/PKIServ/public-cgi/caocsp%%
```

### <ADMINAPPROVE>...</ADMINAPPROVE>

This optional subsection contains the named fields that the administrator can modify when approving certificate requests. (The named fields refer to INSERT sections.) When an end user requests a certificate, the certificate request might contain fields that the end user cannot see. When approving a request, the administrator can modify:

- Fields that are present and visible to the end user in the certificate request, for example Common Name
- Fields that are not visible to the end user but are hardcoded (in the CONSTANT subsection) in the template, for example Organizational unit
- Fields that are not visible to the end user and that the PKI Services administrator can add, for example, HostIdMappings extension or an empty Organizational Unit field (these are listed in the <ADMINAPPROVE> section, and either the end user did not fill them in or they are not present on the template request form).

The presence of this section (even if empty) indicates that an administrator must approve this request. The absence of this section indicates using auto-approval.

**Note:** In the `pkiserv.tmpl` certificate templates file, the only certificate templates that are auto-approved are:

- One-year SAF server certificate
- One-year SAF browser certificate
- Two-year PKI browser certificate for authenticating to z/OS
- Five-year PKI intermediate CA server certificate

The following tags are allowed in the ADMINAPPROVE section:

- ADMINNUM
- AltDomain
- AltEmail
- AltIPAddr
- AltOther\_OID
- AltURI
- AuthInfoAcc
- CertPolicies
- CommonName
- Country
- Critical
- CustomExt
- DNQualifier
- DomainName
- EmailAddr
- EndDate
- ExtKeyUsage

## Customizing the end-user web pages using REXX CGIs

- HostIdMap (can repeat)
- JurCountry
- JurLocality
- JurStateProv
- KeyUsage
- Locality
- Mail
- Org
- OrgUnit (can repeat)
- PostalCode
- SerialNumber
- StartDate
- StateProv
- Street
- Title
- Uid
- UnstructName
- UnstructAddr

**Note:** The following fields are not modifiable and are ignored in the ADMINAPPROVE section:

- Label
- PublicKey
- Requestor
- SignWith
- UserId

(For information about fields, see Table 32 on page 132.)

### Example:

```
<ADMINAPPROVE>
%%KeyUsage%%
%%CommonName%%
%%OrgUnit%%
%%Org%%
%%Country%%
%%HostIdMap%%
%%HostIdMap%%
%%HostIdMap%%
%%HostIdMap%%
<ADMINAPPROVE>
```

The ADMINNUM tag is optional. It indicates the number of PKI Services administrators that must approve certificate requests that are using this template before certificates are issued for them. This tag has the form <ADMINNUM=*value*>, where *value* is a numeric value from 1 to 32. The tag has the following meanings:

- By default, all certificate requests require approval by one PKI Services administrator. If the ADMINNUM tag is not present, all certificate requests that use this template require approval by one PKI Services administrator before issuing a certificate.

## Customizing the end-user web pages using REXX CGIs

- If the ADMINNUM tag does not occur within the ADMINAPPROVE subsection, PKI Services operates as if the tag is not present.
- If the ADMINNUM value is greater than 32, a value of 32 is used.
- If the ADMINNUM value is less than one or is a non-numeric value, a value of 1 is used.

**Note:** A request remains in Pending Approval state until the required number of individual administrative approvals is made for the request, at which time the request changes to Approved state. If an administrator issues an Approve with Modifications on a request that is in Pending Approval state, any previously made approvals are nullified, and the number of approvals that are made for the request is reset to 1.

### Example:

```
<ADMINAPPROVE>
<ADMINNUM=4>
%%KeyUsage%%
%%CommonName%%
%%OrgUnit%%
%%Org%%
%%Country%%
%%HostIdMap%%
%%HostIdMap%%
%%HostIdMap%%
%%HostIdMap%%
</ADMINAPPROVE>
```

### <SUCCESSCONTENT>...</SUCCESSCONTENT>

This subsection contains the HTML to display to the end user a web page indicating that the certificate request was submitted successfully. Any named fields in this subsection are interpreted as content inserts defined by INSERT sections. For PKISERV, the INSERT sections are included as part of the HTML to display a web page to the end user.

In all of the templates included with PKI Services, <SUCCESSCONTENT> contains only the named field %%-requestok%%. (See “What are named fields?” on page 129 for an explanation of named fields.) This contains HTML for the web page “Request submitted successfully”. (For a sample of this web page, see Figure 41 on page 373.)

### <FAILURECONTENT>...</FAILURECONTENT>

This subsection contains the HTML to display to the end user a web page indicating the certificate request was not submitted successfully. Any named fields in this subsection are interpreted as content inserts defined by INSERT sections. For PKISERV, the INSERT sections are included as part of the HTML to display a web page to the end user.

In all of the templates included with PKI Services, <FAILURECONTENT> contains only the named field %%-requestbad%%. (See “What are named fields?” on page 129 for an explanation of named fields.) This contains HTML for the web page that says, “Request was not successful”.

### <RETRIEVECONTENT>...</RETRIEVECONTENT>

This subsection contains the HTML to display to the end user a web page to enable certificate retrieval. Any named fields in this subsection are interpreted as content inserts that the INSERT sections define. For PKISERV, the INSERT sections are included as part of the HTML presented to the end user.

For a sample of a web page this section generates, see Figure 42 on page 374. You might want to look at this web page while reading the following explanation:

In all of the templates included with PKI Services, <RETRIEVECONTENT> contains:

- The named field `%%-copyright%%`, which displays any copyright information. (See “What are named fields?” on page 129 for an explanation about named fields.)
- The title of the web page (This appears in the banner of your browser. Figure 42 on page 374 does not include the banner header but shows only the frame containing the content and not the browser window displaying the content.)
- A JavaScript script for processing the fields that the user enters on the web page.
- A heading that says “Retrieve Your (name of certificate)”. This uses the substitution variable [tmp]name]. (See “What are substitution variables?” on page 128 for an explanation of substitution variables.)
- Text: a heading and paragraph about bookmarking this web page.
- The named field `%%TransactionId%%` - A field where you enter your transaction ID if it is not already displayed.
- A field where you enter the passphrase you entered on the certificate request form.

### <RETURNCERT>...</RETURNCERT>

This subsection contains the HTML to display a web page upon successful certificate retrieval. The formats are:

- A browser certificate that can be installed into the browser.
- A server certificate that is displayed in B64 format.
- A PKCS #12 package, which contains the private key. For a browser or server certificate, this can be a single certificate or a certificate chain, depending on the authority of the user ID that does the retrieval. For a certificate with a key pair generated by PKI Services, the PKCS #12 package contains the requested certificate and its issuer certificate.

### <PREREGISTER>...</PREREGISTER>

This optional subsection indicates the creation of a preregistration record and contains the Simple Certificate Enrollment Protocol (SCEP) rules for approval of a SCEP request. (For details, see “Overview of certificate request processing for preregistered SCEP clients” on page 304.)

#### **Example:**

```
<PREREGISTER>
AuthenticatedClient=AutoApprove
SemiauthenticatedClient=AdminApprove
```

## Customizing the end-user web pages using REXX CGIs

```
UnauthenticatedClient=Reject  
SubsequentRequest=AutoApprove  
RenewalRequest=AutoApprove  
</PREREGISTER>
```

The ADMINNUM tag is optional. It indicates the number of PKI Services administrators that must approve certificate requests for clients that are marked as AdminApprove before certificates are issued for those clients. This tag has the form <ADMINNUM=*value*>, where *value* can be a numeric value from 1 to 32. The tag has the following meanings:

- By default, all requests for clients that are marked as AdminApprove require the approval of one PKI Services administrator. If the ADMINNUM tag is not present, all certificate requests for clients that are marked as AdminApprove require approval by one PKI Services administrator before issuing a certificate.
- If the ADMINNUM tag does not occur within the PREREGISTER subsection, PKI Services operates as if the tag is not present.
- If the ADMINNUM value is greater than 32, a value of 32 is used.
- If the ADMINNUM value is less than one or is a non-numeric value, a value of 1 is used.

**Note:** A request remains in Pending Approval state until the required number of individual administrative approvals is made for the request, at which time the request changes to Approved state. If an administrator issues an Approve with Modifications on a request that is in Pending Approval state, any previously made approvals are nullified, and the number of approvals that are made for the request is reset to 1.

### Example:

```
<PREREGISTER>  
<ADMINNUM=4>  
AuthenticatedClient=AutoApprove  
SemiauthenticatedClient=AdminApprove  
UnauthenticatedClient=Reject  
SubsequentRequest=AutoApprove  
RenewalRequest=AutoApprove  
</PREREGISTER>
```

In this example:

- SCEP requests originating from authenticated clients are automatically approved, and do not require an explicit approval from a PKI Services administrator.
- SCEP requests originating from a semi-authenticated client require approvals from four PKI Services administrators before a certificate is issued.
- SCEP requests originating from any unauthenticated clients are automatically rejected without an explicit action from a PKI Services administrator.
- Requests for more certificates from previously authenticated SCEP clients, including SCEP requests to renew certificates, are automatically approved, and do not require an explicit approval from a PKI Services administrator.

### Summary of subsections contained in certificate templates

Table 37 summarizes the subsections that are present in the various certificate templates in the `pkiserv.tpl` file (as it is shipped):

Table 37. Summary of subsections in certificate templates

Subsection (in TEMPLATE section)	1-year PKI SSL browser	1-year PKI SSL S/MIME browser	1-year SAF browser	1-year SAF server	1-year PKI key	2-year EV SSL server	2-year PKI browser for z/OS	2-year PKI Auth-code signing server	2-year PKI Windows logon browser	5-year PKI SSL server	5-year PKI IPSEC server (fire-wall)	5-year PKI intermediate CA server	5-year SCEP pre-reg-istration	n-year PKI browser extensions demo

### Summary of fields in certificate templates

The tables in this topic summarize the fields contained in each certificate template that PKI Services provides.

Certificate templates	Fields
Fields in the PKI browser certificate templates	Table 38
Fields in the PKI server certificate templates	Table 39 on page 153
Fields in the SAF (browser and server), SCEP, and PKI generated key certificate templates	Table 40 on page 155

Table 38, Table 39 on page 153, and Table 40 on page 155 identify each template field as one of the following:

- Required
- Optional
- Provided by the application
- Constant (supplied value is shown)
- Blank (field is not present in either the CONTENT or CONSTANT section)

Table 38. Summary of fields for PKI browser certificate templates

Field name	One-year PKI SSL browser	One-year PKI S/MIME browser	Two-year PKI browser for z/OS	Two-year PKI Windows logon certificate	n-year PKI browser extensions demonstration
AltDomain					Optional
AltEmail		Required		Optional	
AltIPAddr					Optional
AltOther_OID				Constant <sup>1</sup>	Optional
AltURI					Optional
AuthInfoAcc					Constant <sup>2</sup>
BusinessCat					

## Customizing the end-user web pages using REXX CGIs

Table 38. Summary of fields for PKI browser certificate templates (continued)

Field name	One-year PKI SSL browser	One-year PKI S/MIME browser	Two-year PKI browser for z/OS	Two-year PKI Windows logon certificate	n-year PKI browser extensions demon- stration
CertPolicies					Constant: 1
ClientName					
CommonName	Required		Constant <sup>3</sup>	Optional	
Country					Optional
Critical					
CustomExt					Optional
DomainName					Optional
DNQualifier					Optional
EmailAddr					Optional
ExtKeyUsage	Constant: clientauth		Constant: clientauth	Constants: clientauth and mssmartlogon	Optional
HostIdMap <sup>4</sup>			Application provides		Optional
JurCountry					
JurLocality					
JurStateProv					
KeySize					
KeyUsage	Constant: handshake			Constant: digitalSig	Required
Label					Optional
Locality					Optional
Mail (previously called Email)					Optional
NotAfter	Constant: 365		Constant: 730		Optional
NotBefore	Constant: 0				Optional
NotifyEmail	Optional				
Org	Constant: The Firm				Optional
OrgUnit	Constant: Class 1 Internet Certificate CA				Required
OrgUnit2					Optional
PassPhrase	Required				
PostalCode					Optional
PublicKey	Browser provided <sup>5</sup>				
PublicKey2				Browser provided <sup>5</sup>	
Requestor	Optional				
SerialNumber					Optional

## Customizing the end-user web pages using REXX CGIs

Table 38. Summary of fields for PKI browser certificate templates (continued)

Field name	One-year PKI SSL browser	One-year PKI S/MIME browser	Two-year PKI browser for z/OS	Two-year PKI Windows logon certificate	<i>n</i> -year PKI browser extensions demonstration
SignWith	Constant: PKI :				
StateProv					Optional
Street					Optional
Title					Optional
Uid					Optional
UnstructAddr					Optional
UnstructName					Optional
UserId			Application provides		

**Notes:**

1. The constant value is `_1_3_6_1_4_1_311_20_2_3`.
2. The constant value is `OCSP,URL=https://IV.OCSP.BankXYZ.com`.
3. Although `CommonName` is a constant, no value is assigned to it. This indicates that RACF must determine the value. The user authenticates by specifying a user ID and password. (If `UserId` is listed in the APPL section, this means the application provides the user ID and password.) Providing the user ID and password enables RACF to look up the `CommonName` value in the user's profile.
4. The `HostIdMap` value is formed by concatenating `UserId` with `@host-name`.
5. The `PublicKey` and `PublicKey2` fields are coded with the *browsertype* substitution variable.

Table 39. Summary of fields for PKI server certificate templates

Field name	Two-year EV SSL server	Two-year PKI Authenticode code signing server	Five-year PKI SSL server	Five-year PKI IPSEC server (firewall)	Five-year PKI intermediate CA server
AltDomain	Optional		Optional		
AltEmail	Optional	Required	Optional

BusinessCat	Optional				
CertPolicies		Constant: 1			
ClientName					
CommonName	Required	Constant: My Company Code Signing Certificate	Optional		
Country	Required		Optional		

## Customizing the end-user web pages using REXX CGIs

Table 39. Summary of fields for PKI server certificate templates (continued)

Field name	Two-year EV SSL server	Two-year PKI Authenticode code signing server	Five-year PKI SSL server	Five-year PKI IPSEC server (firewall)	Five-year PKI intermediate CA server
Critical		Constant: ExtKeyUsage			
CustomExt					
DNQualifier					
DomainName					
EmailAddr					
ExtKeyUsage		Constant: codesigning	Constant: serverauth		
HostIdMap <sup>2</sup>					
JurCountry	Required				
JurLocality	Optional				
JurStateProv	Optional				
KeySize					
KeyUsage		Constants: digitalsig and docsign	Constant: handshake	Constants: handshake and dataencrypt	Constant: certsign
Label					
Locality	Required		Optional		
Mail (previously called Email)	Optional				
NotAfter		Constant: 730	Constant: 1825		
NotBefore		Constant: 0			
NotifyEmail	Optional	Required		Optional	
Org	Required	Constant: The Firm	Optional		
OrgUnit	Required	Optional			
OrgUnit2			Optional		
PassPhrase	Required				
PostalCode	Optional		Optional		
PublicKey	Required				
PublicKey2					
Requestor	Optional				
SerialNumber	Required				
SignWith		Constant: PKI :			
StateProv	Required		Optional		
Street	Optional		Optional		
Title					
Uid					
UnstructAddr					
UnstructName					

## Customizing the end-user web pages using REXX CGIs

Table 39. Summary of fields for PKI server certificate templates (continued)

Field name	Two-year EV SSL server	Two-year PKI Authenticode code signing server	Five-year PKI SSL server	Five-year PKI IPSEC server (firewall)	Five-year PKI intermediate CA server
UserId					Application provides

**Notes:**

1. The constant value is OCSP,URL=https://ocsp.vendor.com.
2. The HostIdMap value is formed by concatenating UserId with @host-name.

Table 40. Summary of fields for SAF, SCEP, and PKI generated key certificate templates

Field name	One-year SAF server	One-year SAF browser	Five-year SCEP preregistration	One-year PKI generated key
AltDomain	Optional			
AltEmail	Optional			
AltIPAddr	Optional			
AltOther_OID				
AltURI	Optional		Optional	
AuthInfoAcc				
BusinessCat				
CertPolicies				
ClientName			Required	
CommonName	Optional	Constant <sup>1</sup>	Optional	Required
Country	Required	Constant: US	Optional	
Critical				
CustomExt				
EmailAddr			Optional	
ExtKeyUsage			Optional	
HostIdMap <sup>2</sup>			Optional	
JurCountry				
JurLocality				
JurStateProv				
KeySize				Required
KeyUsage			Optional	Constant: handshake
Label	Required		Optional	
Locality	Optional		Optional	
Mail (previously called Email)			Optional	
NotAfter	Constant: 365		Constant: 1825	Constant: 365
NotBefore	Constant: 0			
NotifyEmail			Optional	
Org	Required	Constant: The Firm	Optional	Constant: The Firm

## Customizing the end-user web pages using REXX CGIs

Table 40. Summary of fields for SAF, SCEP, and PKI generated key certificate templates (continued)

Field name	One-year SAF server	One-year SAF browser	Five-year SCEP preregistration	One-year PKI generated key
OrgUnit	Required	Constants: OrgUnit=SAF template certificate and OrgUnit=Nuts and Bolts Division	Optional	Constant: Class 1 Internet Certificate CA
OrgUnit2	Optional		Optional	
PassPhrase			Required	Required
PostalCode			Optional	
PublicKey	Required <sup>3</sup>	Browser provided <sup>4</sup>	Optional	
PublicKey2				
Requestor			Optional	Required
SerialNumber			Optional	
SignWith	Constant: SAF:CERAUTH/taca		Constant: PKI:	Constant: PKI:
StateProv	Optional		Optional	
Street			Optional	
Title			Optional	
UnstructAddr			Optional	
UnstructName			Optional	
UserId	Application provides			

### Notes:

1. Although CommonName is a constant, no value is assigned to it. This indicates that RACF must determine the value. The user authenticates by specifying a user ID and password. (If UserId is listed in the APPL section, this means the application provides the user ID and password.) Providing the user ID and password enables RACF to look up the CommonName value in the user's profile.
2. The HostIdMap value is formed by concatenating UserId with *@host-name*.
3. The PublicKey is the PKCS #10 request.
4. The PublicKey field is coded with the *browsertype* substitution variable.

## Examining the pkiserv.tmpl file

This topic contains excerpts from the following sections of the `pkiserv.tmpl` file. Each excerpt contains numbered pointers that describe the important tags in each section.

- “Examining the APPLICATION section” on page 157
- “Examining the TEMPLATE section” on page 170
- “Examining the INSERT section” on page 174

The `pkiserv.tmpl` file begins with a prolog section of comments explaining main sections, subsections, named fields, and substitution variables. The prolog section

is followed by a DEBUG tag that you can change from the default (DEBUG=0) to DEBUG=1 to get CGI debugging information.

### Examining the APPLICATION section

The APPLICATION section of the pkiserv.tmpl file contains two sample applications named PKISERV and CUSTOMERS.

- “Examining the PKISERV application”
- “Examining the CUSTOMERS application” on page 158

### Examining the PKISERV application

The following example is an excerpt of the PKISERV application in the APPLICATION section of the pkiserv.tmpl file. (The vertical ellipses indicate omitted sections.)

```
| # =====
| #
| # Application - PKISERV
| #
| # The installation should customize the CONTENT, ADMINHEADER
| # ADMINFOOTER, and ADMINSCOPE subsections as appropriate
| #
| # =====
| #
| <APPLICATION NAME=PKISERV> 1
| <CONTENT> 2
| <!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN" "http://www.w3.org/TR/html4/loose.dtd">

## Customizing the end-user web pages using REXX CGIs

```
| <HTML lang="en"><HEAD>
| %%-copyright%%
| <TITLE>Web Based Certificate Generation Administration</TITLE>
| </HEAD>
| <BODY>
| </ADMINHEADER>
| <ADMINFOOTER>
| <p> %%-pagefooter%% 7
| </BODY>
| </HTML>
| </ADMINFOOTER>
| <ADMINSCOPE> 8
| # Uncomment the following line to enable multiple CA domains
| %%SelectCADomain%%
| </ADMINSCOPE>
| </APPLICATION>
```

The numbers in the following list refer to the highlighted tags in the preceding excerpt of the PKISERV application.

1. This is the beginning of the APPLICATION section. The name of the application is PKISERV.
2. This is the beginning of the CONTENT subsection. The CONTENT subsection contains HTML to display the web page where the administrator begins. The TITLE indicates the main heading of that web page, "PKI Administrators Start Page." (See Figure 60 on page 390 for a sample of that web page.)
3. The HREF tag is the link to install the CA certificate in the browser.
4. The ACTION tag indicates where to go when the user clicks the **Administration Page** button. (See Figure 63 on page 394 for a sample of that web page.)
5. The ACTION tag indicates where to go when the user clicks the **Customers' Home Page** button. (See Figure 37 on page 363 for a sample of that web page.)
6. The ADMINHEADER subsection references the %%-copyright%% named field, which is defined in the INSERT section. This should contain the copyright statement for your company.
7. The ADMINFOOTER subsection references the %%-pagefooter%% named field, which is defined in the INSERT section. This named field should specify the email address of your PKI Services administrator.
8. The ADMINSCOPE subsection references the %%SelectCADomain%% named field, which is defined in the INSERT section. When you have multiple CA domains, you can use this variable to allow PKI administrators to select a CA domain on the administrator's home page. (See "Adding a new CA domain" on page 287 for details about implementing multiple CA domains.)

### Examining the CUSTOMERS application

The following example is an excerpt of the CUSTOMERS application in the APPLICATION section of the pkiserv.tmp1 file. (The vertical ellipses indicate omitted sections.)

```
| # =====
| #
| # Application - CUSTOMERS
| #
| # The installation should customize the CONTENT subsection as appropriate.
| #
| # =====
| #
| <APPLICATION NAME=CUSTOMERS> 1
| <CONTENT> 2
| <!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN" "http://www.w3.org/TR/html4/loose.dtd">

The numbers in the following list refer to the highlighted tags in the preceding excerpt of the CUSTOMERS application.

1. This is the beginning of the APPLICATION section. The name of the application is CUSTOMERS.
2. This is the beginning of the CONTENT subsection. The CONTENT subsection contains HTML to display the web page where the end user requests or retrieves a certificate. The <H1> indicates the main heading of that web page, "PKI Certificate Generation Application." (See Figure 37 on page 363 for a sample of that web page.)
3. The HREF tag is the link to install the CA certificate in the browser.
4. The HREF tag is the link to install the PKI Services ActiveX control.
5. The ACTION tag indicates where to go when the user clicks **Request certificate**.
6. The SELECT tag produces a drop-down that lists the certificate templates the user can request. (The named fields, which are bracketed with %% symbols, are the names of the certificate templates.)
7. The RECONTENT section contains the HTML to display the web page where the end user renews or revokes a certificate. The main heading on this web page is "Renew or Revoke a Browser Certificate". It includes a JavaScript function that determines which PKI Services ActiveX programs should be loaded. (See Figure 50 on page 380 for a sample of that web page.)
8. The RECONTENT2 subsection is similar to the RECONTENT section except that it applies to a certificate whose key was generated by PKI Services and is to be revoked.
9. The RESUCCESSCONTENT subsection references the %%-renewrevokeok%% named field, which is defined in the INSERT section. This contains HTML for the web page displayed when the user's attempt to revoke a certificate is successful. The main heading on this web page is "Request submitted successfully". (See Figure 41 on page 373 for a sample of that web page.)
10. The REFAILURECONTENT subsection references the %%-renewrevokebad%% named field, which is defined in the INSERT section. This contains HTML for the web page displayed when the user's attempt to renew or revoke a certificate fails. The main heading on this web page is "Request was not successful".
11. The RECOVERCONTENT subsection contains the HTML and JavaScript to input parameters required to recover a previously issued certificate whose key was generated by PKI Services.
12. The FINDRECOVERCONTENT subsection displays security questions for users to answer when they want to recover a certificate and have forgotten the passphrase.
13. The RETRIEVECONTENT2 subsection contains the HTML to allow the end user to retrieve a recovered certificate.

## Customizing the end-user web pages using REXX CGIs

14. The RETURNCERT subsection contains the HTML for the web page that is displayed upon successful retrieval of a recovered certificate. This section contains the named field %%returnp12cert%%, which indicates a PKCS #12 format.
15. The FAILURECONTENT subsection contains the HTML for the web page that is displayed when the certificate request submit failed. Any named fields in this subsection are interpreted as content inserts defined by INSERT sections. For PKISERV, the INSERT sections are included as part of the HTML presented to the end user.
16. The RENEWEDCERT subsection references the %%RenewKeySetIE%% named field, which is defined in the INSERT section. This field contains the HTML and JavaScript functions for the web page displayed when a user clicks a link in an email notification to install an automatically renewed certificate.

## Examining the TEMPLATE section

The TEMPLATE section follows the APPLICATION section and contains several sample templates. The following example is an excerpt from the TEMPLATE section of the pkiserv.tpl file. (The vertical ellipses indicate omitted sections.)

```
| # =====  
| #  
| # Template Name - 2-Year PKI Browser Certificate For Authenticating  
| #                 to z/OS 1  
| # Function - Creates a 2-year certificate good for authenticating to  
| #             z/OS. If approved, the certificate becomes valid after  
| #             it's requested.  
| #             (You may delay the valid date by specifying a non zero  
| #             number for the value of 'NotBefore',  
| #             eg. NotBefore=5. That means if the request is approved,  
| #             the certificate will become valid 5 days after it's  
| #             requested.)  
| #             HostidMap is formed by putting %%Userid%% and  
| #             %%HostidMap=@host-name in the APPL section.  
| #  
| # 2@DHD  
| #  
| # Other than the user input fields, all other information is hard coded.  
| #  
| # User input fields:  
| # Requestor - optional  
| # PassPhrase - required  
| # PublicKey - required (Provided by the browser itself)  
| # NotifyEmail - optional  
| #  
| # The presence of CommonName without a value tells SAF to determine  
| # the CN value from the PGMNAME field of the user's USER profile.  
| # See the RACF Callable Services Guide for more information  
| #  
| # RACF userid/password authentication : required  
| # Administrator approval             : not required  
| #  
| #

| </BODY>
| </HTML>
| </RETRIEVECONTENT>
| <RETURNCERT> 18
| %%returnbrowsercert[browsertype]%%
| </RETURNCERT>
| </TEMPLATE>

```

The numbers in the following list refer to the highlighted tags in the preceding excerpt of the TEMPLATE section.

1. The template begins with a block comment identifying the template and explaining its use and fields.
2. There are three names for each certificate (except for SAF templates, which do not include nicknames). The first TEMPLATE NAME line defines the true (actual, complete) name of the certificate. The next TEMPLATE NAME line defines an alias. (This simply differentiates browser from server certificates.) The NICKNAME defines an 8-character string. In each template for which you want certificates to be automatically renewed, insert the AUTORENEW tag immediately following the NICKNAME tag, if it is not already there, and set it to Y.
3. The CONTENT subsection contains the HTML to display a web page to the end user requesting this type of certificate. (The CGI script catmpl.rexx displays this content.)

## Customizing the end-user web pages using REXX CGIs

4. The `%%-copyright%%` named field displays the copyright statement.
5. The title contains the heading that appears at the top of the browser when the web page is displayed.
6. The heading is the main heading on the web page for requesting the selected certificate.
7. The ACTION tag indicates that the CGI script that gets control when the user clicks the **Submit certificate request** button is `careq.rexx`.
8. Fields for which the user can supply input include `%%Requestor%%`, `%%PassPhrase%%`, `%%NotifyEmail%%`, and `%%PublicKey2%%`. (These fields are named fields that are defined in the INSERT section, which is shown later.) All fields not marked optional are required. `%%PublicKey2%%` contains the substitution variable, `[browsertype]`. This is replaced at run time with IE or NS, depending on the browser the user has. This is necessary because the browsers behave differently for key generation and certificates.
9. This JavaScript script provides the underlying logic for the text entry that the user must perform.
10. The `%%-pagefooter%%` named field is defined in the INSERT section (shown later). This contains the email address of the PKI Services administrator.
11. The APPL subsection indicates the fields that `careq.rexx` itself provides, in this case, `%%UserId%%` and `%%HostIdMap%%`. (These are set from the IBM HTTP Server environment variable `REMOTE_USER`.)
12. The CONSTANT subsection has hardcoded values to use, for example (for the non-SAF certificates), the signing certificate is `PKI:`.
13. The SUCCESSCONTENT subsection contains the HTML to display upon successfully requesting the certificate. It includes the `%%-requestok%%` named field. (This is defined in the INSERT section, shown in “Examining the INSERT section”. See list item 1 on page 213.)
14. The FAILURECONTENT subsection contains the HTML to display when the certificate request is unsuccessful. This subsection contains the `%%-requestbad%%` named field. (This named field is defined in the INSERT section, shown in “Examining the INSERT section.”)
15. The `-requestok` INSERT (mentioned in list item 13) includes an ACTION that calls `caretrieve.rexx`, which displays the HTML in the RETRIEVECONTENT subsection. The first time the web page is displayed, it includes the transaction ID associated with the certificate request. If the user leaves the web page and then returns, the transaction ID field must be filled in. Entering the transaction ID and clicking the **Continue** button calls `cagetcrt.rexx`.
16. The main heading on the web page is “Retrieve Your (Name of Certificate)”.
17. The ACTION is to call `cagetcrt.rexx` as list item 15 indicates.
18. The RETURNCERT subsection contains the `%%return10cert%%` named field, which is defined in an INSERT. (See list item 4 on page 213.)

## Examining the INSERT section

The final section of the `pkiserv.tmpl` file contains several sample INSERTS. The following example is an excerpt from the INSERT section of the `pkiserv.tmpl` file. (The vertical ellipses indicate omitted sections.)

```
| # =====  
| #  
| # Sample INSERTS  
| #  
| # =====  
| # @LTC  
| <INSERT NAME=-AdditionalHeadIE>
```

## Customizing the end-user web pages using REXX CGIs

| </INSERT>
|
| # =====
| #
| # X.509 fields (INSERTs) that require customization before being used
| #
| # =====
| # =====
| # INSERT NAME=AltOther_<OID>
| # Here it shows two 'AltOther' INSERTs. You may add as many as you need.
| # The name of this INSERT is built with the string 'AltOther_',
| # concatenated with an underscore(_) separated OID that you need.
| # You may have more than one input fields. But the total length of the
| # fields together with the length of the OID and the comma can not exceed
| # 255.
| # The result AltOther field is built by concatenating the dot(.) separated
| # OID, which matches this INSERT name, a comma, and the value(s) of the
| # input field(s).
| # Eg., in AltOther_1_2_3_4_5, the AltOther field is:
| # 1.2.3.4.5,<value of Other1a>
| # Eg., in AltOther_1_2_3_4_6, the AltOther field is:
| # 1.2.3.4.6,<value of Other2a><value of Other2b>
| #
| # Structure:
| # 1) INSERT NAME - 'AltOther_' + <n1_n2_n3_n4_n5>
| # 2) a hidden INPUT field with the same name as the INSERT NAME. It
| #    is used to hold the AltOther field value to be included in the
| #    certificate.
| # 3) input field(s), with substitution variables [optfield] and [readonly].
| #    [optfield] is used to control whether the field is an optional field.
| #    [readonly] is used to control the display mode of the field: if the
| #    field is on a web page requesting input, it will be assigned with
| #    NULL, if it is on a web page for displaying request/certificate AltOther
| #    information, it will be assigned with the HTML attribute 'READONLY'.
| # 4) a hidden INPUT field with name 'altrawstring_' + <n1_n2_n3_n4_n5>.
| #    Its value is a substitution variable [altrawvalue] which
| #    is used to hold the result of the returned value of the AltOther,
| #    excluding the OID and the comma. This is used for displaying the
| #    AltOther information in a request or a certificate after it is
| #    generated.
| # 5) a JavaScript which will be called at load time. It contains the
| #    parsing logic to parse the result obtained in 4) back into
| #    individual input field(s) when the AltOther information
| #    is displayed. Make sure the parsing logic matches the input
| #    field(s) format.
| # 6) a JavaScript function with the name built with a string
| #    'ValidAltOther_' + <n1_n2_n3_n4_n5>. The name must be of this format.
```

## Customizing the end-user web pages using REXX CGIs

```

| # Unlike the other validate functions in the other INSERTs which validate
| # user input(s) only, it also sets the variable specified in 2) above.
| # It concatenates the OID(n1.n2.n3.n4.n5) and value(s) of all the input
| # field(s).
| # You may customize different validation logic needed to validate
| # the input field(s).
| # The validation logic shown in the samples include:
| # - validate the required field(s) is/are filled
| # - validate the length of the input(s)
| # - pad the optional field(s) with preset value(s), if there is more
| # than one input field

The numbers in the following list refer to the highlighted tags in the preceding excerpt of the INSERT section.

## Customizing the end-user web pages using REXX CGIs

1. The `-requestok INSERT` has the logic to generate the certificate. If the certificate is successfully generated, a web page (whose main heading is “Request submitted successfully”) is displayed. This web page includes the transaction ID.
2. The `-requestok INSERT` includes an `ACTION` that calls `caretrieve.rexx`, which allows the user to retrieve the certificate.
3. Alternately, if the request is not successful, the `-requestbad INSERT` gains control.
4. (The `caretrieve.rexx` CGI displays the `RETRIEVECONTENT` subsection (see list item 15 on page 174) HTML, which displays a web page that prompts the user for the transaction ID associated with the certificate request. The user enters the transaction ID (and any password) and clicks the **Continue** button, which calls `cagetcrt.rexx`.) The `cagetcrt.rexx` CGI calls `R_PKIServ` for `EXPORT` of the certificate. If the export is successful, `cagetcrt.rexx` displays the HTML under the `RETURNCERT` subsection. (See list item 18 on page 174.)
5. The base64-encoded certificate is displayed on the web page by using the `[base64crt]` substitution variable.
6. This is a browser-qualified `PublicKey INSERT` for Internet Explorer.
7. Additional `INSERTs` are certificate field name `INSERTs`. These describe the fields using the HTML dialogs that are displayed on the web pages if the user is allowed to input these fields. For example, `PassPhrase` is a text field with a maximum length of 32 characters. The two-year PKI browser certificate for authenticating to z/OS allows the user to fill in this field. (`%PassPhrase%` is listed in the input fields; see list item 8 on page 174.)

---

### Relationship between CGIs and the `pkiserv.tmpl` file

CGIs for the end-user web pages are execs that gain control when the end user clicks an action button - for example, the **Request certificate** button on the PKI Services home page. The CGIs read the `pkiserv.tmpl` file to determine the action to perform. They resolve substitution variables in the `pkiserv.tmpl` file.

The CGIs for the end-user web pages (including their directories) are:

- `/usr/lpp/pkiserv/PKIServ/public-cgi/camain.rexx`
- `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/catmpl.rexx`
- `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/auth/careq.rexx`
- `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/carecover.rexx`
- `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/caretrieve.rexx`
- `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/auth/cagetcrt.rexx`
- `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/auth/cagetcrt2.rexx`
- `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/cagorcvr.rexx`
- `/usr/lpp/pkiserv/PKIServ/clientauth-cgi-bin/cadisplay.rexx`
- `/usr/lpp/pkiserv/PKIServ/clientauth-cgi-bin/camodify.rexx`
- `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/installcert.rexx`

**Note:** `installcert.rexx` is invoked from a link in the certificate renewal email notification, not from a web page.

The following table summarizes the actions the CGIs perform:

## Customizing the end-user web pages using REXX CGIs

Table 41. CGI actions for end-user web pages

CGI exec	Action	Sample web page
camain.rexx	<ul style="list-style-type: none"> <li>When the user clicks <b>Request certificate</b>, this CGI calls catmpl.rexx, passing it a parameter identifying the selected template.</li> <li>The user can click <b>Pick up certificate</b> to go directly to caretrieve.rexx (if the certificate is already requested).</li> <li>The user can click <b>Renew or revoke certificate</b> to go to cadisplay.rexx.</li> </ul>	See Figure 37 on page 363.
catmpl.rexx	<ul style="list-style-type: none"> <li>Displays web page coded in the HTML under the CONTENT subsection (of a TEMPLATE section).</li> <li>When the user clicks <b>Submit certificate request</b>, this CGI passes template and field name parameters to careq.rexx.</li> <li>When the user clicks <b>Retrieve your certificate</b>, this CGI passes control to caretrieve.rexx.</li> </ul>	See Figure 39 on page 370.
carecover.rexx	<ul style="list-style-type: none"> <li>Displays web page coded in the HTML under the RECOVERCONTENT subsection (of a TEMPLATE section).</li> <li>This HTML prompts the user to enter the requestor name and passphrase if the user entered one when requesting the certificate.</li> <li>When the user clicks <b>Recover Certificate</b>, this CGI passes the requestor name and passphrase to cagryrcvr.rexx.</li> </ul>	See Figure 51 on page 382
careq.rexx	<ul style="list-style-type: none"> <li>Processes field names under the APPL subsection (of a TEMPLATE section). <b>Note:</b> Depending on the template, the field names can be: <ul style="list-style-type: none"> <li>– UserId only</li> <li>– UserId and HostIdMap.</li> </ul> </li> <li>Processes hardcoded field names under the CONSTANT subsection (of a TEMPLATE section).</li> <li>Depending on the results, displays web page coded in the HTML under the SUCCESSCONTENT or FAILURECONTENT subsection (of a TEMPLATE section): <ul style="list-style-type: none"> <li>– The SUCCESSCONTENT subsection includes a <b>Continue</b> button the user can click to continue to caretrieve.rexx.</li> </ul> </li> </ul>	See Figure 41 on page 373.
caretrieve.rexx	<ul style="list-style-type: none"> <li>Displays web page coded in the HTML under the RETRIEVECONTENT subsection (of a TEMPLATE section). This HTML prompts the user to enter the transaction ID and a password if the user entered one when requesting the certificate.</li> <li>When the user clicks <b>Retrieve and install certificate</b>, this CGI passes the transaction ID parameter to cagetcert.rexx.</li> </ul>	See Figure 42 on page 374.
cagetcert.rexx	<ul style="list-style-type: none"> <li>Displays web page coded in the HTML under RETURNCERT subsection (of a TEMPLATE section). This HTML determines which of the following forms to use when returning the certificate: <ul style="list-style-type: none"> <li>– as a base64-encoded certificate (for server certificates)</li> <li>– as an ActiveX object (for Microsoft Internet Explorer browser certificates)</li> <li>– as an application/x-x509-user-certificate MIME type (for Mozilla-based browser certificates).</li> </ul> </li> </ul>	See Figure 44 on page 375.
cagetcert2.rexx	<ul style="list-style-type: none"> <li>Displays web page coded in the HTML under RETURNCERT subsection (of a TEMPLATE section). This HTML returns the certificate and private key in PKCS #12 format.</li> </ul>	

Table 41. CGI actions for end-user web pages (continued)

CGI exec	Action	Sample web page
cagorcvr.rexx	<ul style="list-style-type: none"> <li>Displays web page coded in HTML under the FINDRECOVERCONTENT subsection of the APPLICATION section. This subsection displays security questions for users to answer. The answers to these questions can be used to recover a passphrase, which is used to recover a certificate.</li> </ul>	
cadisplay.rexx	<ul style="list-style-type: none"> <li>Displays web page coded in the HTML under the RECONTENT subsection (of the APPLICATION section).</li> <li>For renewing a certificate, the user fills in the passphrase and clicks <b>Renew</b>. For revoking a certificate, the user clicks <b>Revoke</b>. Both actions call camodify.rexx.</li> </ul>	See Figure 50 on page 380.
camodify.rexx	<ul style="list-style-type: none"> <li>Displays web page coded in the HTML under the SUCCESSCONTENT subsection (of a TEMPLATE section) for a successful renewal. The SUCCESSCONTENT subsection includes a <b>Continue</b> button the user can click to call caretrieve.rexx.</li> <li>Displays the web page coded in HTML under the RESUCCESSCONTENT subsection (of the APPLICATION section) for a successful revocation.</li> </ul>	See Figure 41 on page 373.
installcert.rexx	<ul style="list-style-type: none"> <li>When a user who is using the Internet Explorer browser clicks a link in a notification email for a renewed certificate, this CGI displays a web page where the user can paste the renewed certificate sent in the email and install it in the browser.</li> </ul>	

## Steps for performing minimal customization

You need to perform these steps only if you are customizing certificate templates for the first time. If your company used an earlier release of PKI Services, you do *not* need to do so again.

### Before you begin

Review the certificate templates and decide if there are any that you want to remove from the `pkiserv.tmp1` certificates template file. If so, do this first. (To remove a certificate template, you can simply remove its name from the appropriate APPLICATION sections.)

#### Notes:

- Fields such as `%%Org%%` and `%%Country%%` are used to form the subject's distinguished name. Therefore, make sure that the name formed has a suffix that matches a suffix that the LDAP directory supports (that is, that it matches one of the suffix values in the LDAP server configuration file).
- The default name of the LDAP server configuration file is `ds.conf` for the IBM Tivoli Directory Server for z/OS LDAP server.

Perform the following steps to do the minimal updates on the remaining certificate templates:

- For the SAF templates, update the following fields as needed:
  - If present, replace the OrgUnit values in the following lines with values more appropriate to your organization:

```
%%OrgUnit=Nuts and Bolts Division%%
%%OrgUnit=SAF template certificate%%
```

## Customizing the end-user web pages using REXX CGIs

- b. Replace `taca` in the following line with the correct label of the CERTAUTH signing certificate:

```
%%SignWith=SAF:CERTAUTH/taca%%
```

---

2. For the PKI templates, replace the `OrgUnit` value in the following line with a value more appropriate for your organization:

```
%%OrgUnit=Class 1 Internet Certificate CA%%
```

---

3. If present, replace `The Firm` with the name of your company in the following `%%Org` line:

```
%%Org=The Firm%%
```

---

4. If your company location is not the United States, update the following line by specifying the correct two-letter country abbreviation:

```
%%Country=US%%
```

---

5. If present, replace `host-name` with the domain name of this system in the following `%%HostIdMap` line:

```
%%HostIdMap=@host-name%%
```

You also need to follow the instructions in “Administering HostIdMappings extensions” on page 462.

---

6. For non-SAF certificates, you can notify users when certificate requests are rejected or when certificates are ready for retrieval or are expiring.
  - a. If you do not want to have `NotifyEmail` appear as an input field for any non-SAF certificates, delete the `NotifyEmail` lines in the following locations in the `TEMPLATE` section for this certificate:

- In the header:

```
# NotifyEmail - optional
```

- In the list of fields:

```
%%NotifyEmail (optional)%%
```

- b. If you do not want to have `NotifyEmail` appear as an input field for renewal of any non-SAF certificates, delete the following `NotifyEmail` line in the `APPLICATION` section and in the list of fields:

```
%%NotifyEmail (optional)%%
```

---

7. Insert the copyright statement for your company in the `-copyright` named field in the `INSERT` section.
- 

8. Insert the email address of your company's PKI Services administrator in the `-pagefooter` named field in the `INSERT` section.
- 

## Steps for additional first-time customization

You need to perform these steps only if you are customizing certificate templates for the first time. If your company used an earlier release of PKI Services, you do *not* need to perform these steps.

## Customizing the end-user web pages using REXX CGIs

Perform the following steps if you want to perform additional customization of the end-user web pages:

1. Review the templates and decide which you need to update.

2. If necessary, change the true name, alias, or nickname, as in the following lines.

```
<TEMPLATE NAME=true_name>
<TEMPLATE NAME=alias>
<NICKNAME=nickname>
```

***true\_name***

Is the whole and complete name of the certificate template.

***alias***

Differentiates browser from server certificates. An alias is not required. You can have more than one alias.

***nickname***

Is an 8-character name. SAF certificates do not have nicknames. If a nickname is not present, the certificate is not automatically renewable.

**Example:**

```
<TEMPLATE NAME=1-Year PKI SSL Browser Certificate>
<TEMPLATE NAME=PKI Browser Certificate>
<NICKNAME=1YBSSL>
```

3. If necessary, in the CONTENT subsection, change the certificate fields listed. The following example is from the one-year PKI SSL browser certificate template.

**Example:**

```
<p> Enter values for the following field(s)
%%CommonName%%
%%Requestor (optional)%%
%%PassPhrase%%
%%PublicKey2[browsertype]%%
```

4. If you add required fields in the preceding step, update the JavaScript code that is part of the embedded HTML to check for required fields that are missing.

**Example:**

```
ValidCommonName(frm) &&
ValidPassPhrase(frm) &&
ValidPublicKey2(frm) &&
```

5. If necessary, in the APPL subsection, change the list of certificate fields that the application provides. (Currently, the only supported fields are UserId and HostIdMap.) The following example is from the two-year PKI browser certificate for authenticating to z/OS:

**Example:**

```
<APPL>
%%UserId%%
%%HostIdMap=@host-name%%
</APPL>
```

## Customizing the end-user web pages using REXX CGIs

6. If necessary, in the CONSTANT subsection, update the list of certificate fields whose values are hardcoded. The following example is from the one-year PKI SSL browser certificate template:

**Example:**

```
<CONSTANT>
%%NotBefore=0%%
%%NotAfter=365%%
%%KeyUsage=handshake%%
%%OrgUnit=Class 1 Internet Certificate CA%%
%%Org=The Firm%%
%%SignWith=PKI:%%
</CONSTANT>
```

**Note:** If you update the CONSTANT subsection to create subject distinguished names, make sure that the names match the LDAP suffix that are defined for your LDAP server. Otherwise, the certificates are not posted to LDAP. PKI Services constructs the subject distinguished name from the fields that are specified in the following order:

- CommonName
- Title
- OrgUnit (if repeating, in the order that they appear in the template file)
- Org
- Locality
- StateProv
- Country

- 
7. If necessary, edit the ADMINAPPROVE subsection. (Certificates requiring an administrator's approval have an ADMINAPPROVE subsection. The absence of the ADMINAPPROVE subsection indicates auto-approval for requests.) Make sure the ADMINAPPROVE subsection, if present, correctly lists the minimum set of certificate fields that the administrator can change.

**Note:**

- a. There might be more fields in the ADMINAPPROVE subsection than fields that the user can complete in the certificate request (because the users do not necessarily see all fields).
- b. Do not include the Requestor, Label, UserId, PublicKey, or SignWith fields in the ADMINAPPROVE subsection. These fields cannot be changed and are ignored if present. (For a list of tags that are allowed in the ADMINAPPROVE subsection, see the subsection ADMINAPPROVE, in the topic about “TEMPLATE sections” on page 142.)
- c. If a request is examined and approved by more than one PKI Services administrator, include the ADMINNUM=*value* tag in the ADMINAPPROVE subsection.

The following example of the ADMINAPPROVE subsection is from the one-year PKI SSL browser certificate template:

**Example:**

```
<ADMINAPPROVE>
%%CommonName (Optional)%%
%%OrgUnit (Optional)%%
%%OrgUnit (Optional)%%
%%Org (Optional)%%
%%NotBefore (optional)%%
%%NotAfter (Optional)%%
```

```

%%KeyUsage (Optional)%%
%%HostIdMap (Optional)%%
%%HostIdMap (Optional)%%
%%HostIdMap (Optional)%%
%%HostIdMap (Optional)%%
</ADMINAPPROVE>

```

**Note:** The four %%HostIdMap%% lines in the example indicate that the approver can provide up to four HostIdMap entries.

### 8. If necessary, update the following subsections:

- The SUCCESSCONTENT subsection contains only the %%-requestok%% named field, which contains the HTML for the web page whose main heading is “Request submitted successfully”. To make changes to this web page, update the -requestok INSERT (in the INSERT section of pkiserv.tmp1):

```

<INSERT NAME=-requestok>
<!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN" "http://www.w3.org/TR/html4/loose.dtd">
<HTML lang="en"><HEAD>
<TITLE> Web Based Certificate Generation Success</TITLE>
</HEAD>
<BODY>
<H1> Request submitted Successfully</H1>
[errorinfo]
<p> Here's your transaction ID. You will need it to retrieve your
certificate. Press 'Continue' to retrieve the certificate.
<p> <TABLE BORDER=<TR><TD>[transactionid]</TD></TR></TABLE>
<FORM METHOD=GET ACTION="/PKIServ/ssl/cgi/caretrieve.rexx">
<INPUT NAME="Template" TYPE="hidden" VALUE="[tmplname]">
<INPUT NAME="TransactionId" TYPE="hidden" VALUE="[transactionid]">
<INPUT TYPE="submit" VALUE="Continue">
</FORM>
<p>%%-pagefooter%%
</BODY>
</HTML>
</INSERT>

```

- The FAILURECONTENT subsection contains only the %%-requestbad%% named field, which contains the HTML for the web page whose main heading is “Request was not successful”. To make changes to this web page, update the requestbad INSERT:

```

<INSERT NAME=-requestbad>
<!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN" "http://www.w3.org/TR/html4/loose.dtd">
<HTML lang="en"><HEAD>
<TITLE> Web Based Certificate Generation Failure</TITLE>
</HEAD>
<BODY>
<H1> Request was not successful</H1>
<p> Please correct the problem or report the error to your Web admin
person<br>
<PRE>
[errorinfo]
</PRE>
<p>%%-pagefooter%%
</BODY>
</HTML>
</INSERT>

```

### 9. If necessary, update the RETRIEVECONTENT subsection.

**Note:** See “Steps for changing the runtime user ID for retrieving certificates” on page 224 for directions for changing the runtime user ID for retrieving a certificate.

- a. The RETRIEVECONTENT subsection includes the %%-copyright%% named field. If you want to make any changes in the copyright statement, update the copyright INSERT. (The following sample is the copyright INSERT as it is originally provided in the pkiserv.tmp1 file. You should have previously updated this INSERT by providing information tailored to your company, as described in “Steps for performing minimal customization” on page 215.)

## Customizing the end-user web pages using REXX CGIs

```
<INSERT NAME=-copyright>
<!--
/*****
/*
/* LICENSED MATERIALS - PROPERTY OF IBM
/* THIS SCRIPT IS "RESTRICTED MATERIALS OF IBM"
/* 5650-ZOS (C) COPYRIGHT IBM CORP. 2000,2015
/*
/*
/*****
--> </INSERT>
```

- b. If necessary, update any web page content (such as headers, footers, titles, background colors, frames, links, and so on) for the web page whose main heading is "Retrieve Your (certificate template name)".

- 
10. If you are updating the template for a server certificate, you can update the HTML in the RETURNCERT subsection to customize the returned web page. (For a browser template, you cannot change the RETURNCERT subsection. It must contain the %%returnbrowsercert%% named field, which contains the [browserstype] substitution variable. The INSERT section contains browser-specific returnbrowsercert INSERTs.)
- 

## Steps for retrofitting release changes into the PKI Services certificate templates

If you used an earlier release of PKI Services, you might need to retrofit changes into the `pkiserv.tpl` certificate templates file. (You would not want to replace the file if you customized it in the previous release.)

You can use a file comparison tool to compare the new PKI Services certificates template file (`/usr/lpp/pkiserv/samples/pkiserv.tpl`) and your existing PKI Services certificates template file (`/etc/pkiserv/pkiserv.tpl`).

Perform the following steps to retrofit changes into the `pkiserv.tpl` certificate templates file so you do not lose any customization that you made in a previous release.

1. Make a backup copy of your current certificate templates file. For example, enter from the UNIX command line:  

```
cp /etc/pkiserv/pkiserv.tpl /etc/pkiserv/pkiserv.backup
```
  2. Copy the new sample templates file to the runtime location. (This is the copy you edit.)  

```
cp /usr/lpp/pkiserv/samples/pkiserv.tpl /etc/pkiserv/pkiserv.tpl
```
  3. Using a compare program of your choice, compare the two template files:
    - `/etc/pkiserv/pkiserv.tpl`
    - `/etc/pkiserv/pkiserv.backup`
  4. Edit the runtime copy of the templates file (`/etc/pkiserv/pkiserv.tpl`). Using the compare output that is generated in Step 3, merge the changes that you made to the original template file into the runtime copy of the templates file.
  5. Exit the file to save your changes.
-

## Locating code for customizing end-user web pages

For ongoing customization of end-user web pages, you must know the code locations for those web pages. The following table summarizes this information:

Table 42. Location of code for various web pages

Main header (and sample web page if any)	Location of code in pkiserv.tmpl certificate templates file
"1-Year PKI S/MIME Browser Certificate"	TEMPLATE section, CONTENT subsection
"1-Year PKI SSL Browser Certificate" (See Figure 39 on page 370.)	TEMPLATE section, CONTENT subsection
"2-Year EV SSL server certificate"	TEMPLATE section, CONTENT subsection
"2-Year PKI Browser Certificate For Authenticating To z/OS"	TEMPLATE section, CONTENT subsection
"2-Year PKI Authenticode - Code Signing Certificate"	TEMPLATE section, CONTENT subsection
"5-Year PKI Intermediate CA Certificate"	TEMPLATE section, CONTENT subsection
"5-Year PKI IPSEC Server (Firewall) Certificate"	TEMPLATE section, CONTENT subsection
"5-Year PKI SSL Server Certificate"	TEMPLATE section, CONTENT subsection
"5-Year SCEP certificate - Preregistration"	TEMPLATE section, CONTENT subsection
"n-Year PKI Certificate for Extensions Demonstration"	TEMPLATE section, CONTENT subsection
"Here's Your Certificate. Cut and Paste it to a File"	INSERT section, -return10cert INSERT. (This is referenced in the RETURNCERT subsection of the TEMPLATE section of each certificate template.)
"Internet Explorer Certificate Install" (See Figure 44 on page 375.)	INSERT section, returnbrowsercertIE INSERT
"Preregistration successful"	INSERT section, -preregok INSERT. (This is referenced in the SUCCESSCONTENT subsection of the TEMPLATE section of each certificate template.)
"PKI Services Certificate Generation Application" (See Figure 37 on page 363.)	APPLICATION section, CONTENT subsection
"Renew or Revoke a Browser Certificate" (See Figure 50 on page 380.)	APPLICATION section, RECONTENT subsection
"Internet Explorer Auto Renewed Certificate Install"	APPLICATION section, RENEWEDCERT subsection
"Request submitted successfully" (For submitting a successful certificate request or renewal, see Figure 41 on page 373.)	<ul style="list-style-type: none"> <li>For a successful certificate request or renewal: INSERT section, -requestok INSERT. (This is referenced in the SUCCESSCONTENT subsection of the TEMPLATE section of the appropriate certificate template.)</li> <li>For a successful certificate revocation: INSERT section, -renewrevokeok INSERT. (This is referenced in the RESUCCESSCONTENT subsection of the APPLICATION section.)</li> </ul>

## Customizing the end-user web pages using REXX CGIs

Table 42. Location of code for various web pages (continued)

Main header (and sample web page if any)	Location of code in pkiserv.tpl certificate templates file
"Request was not successful"	<ul style="list-style-type: none"> <li>For an unsuccessful certificate request: INSERT section, -requestbad INSERT. (This is referenced in the FAILURECONTENT subsection of the TEMPLATE section of each certificate template.)</li> <li>For an unsuccessful certificate revocation request: INSERT section, -renewrevokebad INSERT. (This is referenced in the REFAILURECONTENT subsection of the APPLICATION section.)</li> </ul>
"Retrieve Your 1-Year PKI S/MIME Browser Certificate"	TEMPLATE section, RETRIEVECONTENT subsection
"Retrieve Your 1-Year PKI SSL Browser Certificate" (See Figure 42 on page 374.)	TEMPLATE section, RETRIEVECONTENT subsection
"Retrieve Your 2-Year PKI Browser Certificate For Authenticating To z/OS"	TEMPLATE section, RETRIEVECONTENT subsection
"Retrieve Your 2-Year PKI Authenticode - Code Signing Certificate"	TEMPLATE section, RETRIEVECONTENT subsection
"Retrieve Your 5-Year PKI Intermediate CA Certificate"	TEMPLATE section RETRIEVECONTENT subsection
"Retrieve Your 5-Year PKI IPSEC Server (Firewall) Certificate"	TEMPLATE section, RETRIEVECONTENT subsection
"Retrieve Your 5-Year PKI SSL Server Certificate"	TEMPLATE section, RETRIEVECONTENT subsection
"Retrieve Your [tmp]name]"	TEMPLATE section, RETRIEVECONTENT subsection
"Retrieve Your SAF Browser Certificate 1-Year"	TEMPLATE section, RETRIEVECONTENT subsection
"Retrieve Your SAF Server Certificate 1-Year"	TEMPLATE section, RETRIEVECONTENT subsection
"SAF Browser Certificate 1-Year (Auto Approved)"	TEMPLATE section, CONTENT subsection
"SAF Server Certificate 1-Year (Auto Approved)"	TEMPLATE section, CONTENT subsection

**Note:** Fields (such as the Key Usage (KeyUsage) drop down or the Organizational Unit (OrgUnit) text field) are defined in the pkiserv.tpl certificate templates file, in the INSERT section. (See Table 32 on page 132 for descriptions of the fields.)

## Steps for adding a new certificate template

Perform the following steps to add a new certificate template:

1. Review the contents of the certificate templates provided with PKI Services to determine the one that most closely approximates the certificate template you want to add.

2. After you determine the certificate template to use as a model, copy the section defining the model template in the certificate templates file.

---
3. Provide a new name, alias, and, if present, nickname for the certificate template.

---
4. Follow the steps for customizing certificate templates, starting at Step 3 on page 217.

---

---

### Changing the runtime user ID

When the PKI Services CGIs are called, they are assigned a runtime user ID. This is the identity that is associated with the unit of work (task). This identity must be authorized to call the function being requested. (See Chapter 20, “RACF administration for PKI Services,” on page 461 for more information.) Most of the templates run under the surrogate user ID (PKISERV) for requesting a certificate and for then retrieving it.

There are two exceptions:

- The two SAF templates run under PKISERV for requesting a certificate but run under the client's user ID for certificate retrieval.
- The five-year PKI intermediate CA template runs under the client's user ID for requesting a certificate and for certificate retrieval.

The advantage of having PKISERV as the runtime user ID is that this is the only user ID that needs to be authorized for requesting certificates. The advantage of using the client's user ID is that you have greater control over who can request and retrieve certificates. For example, you can require the user to authenticate by entering user ID and password before requesting or retrieving a certificate.

You can control the user ID under which a certificate request or retrieval runs by selectively commenting and uncommenting FORM statements in the `pkiserv.tmpl` file. (For requesting a certificate, the FORM statements are in the appropriate TEMPLATE section, in the CONTENT subsection. For retrieving a certificate, the FORM statements are in the appropriate TEMPLATE section, in the RETRIEVECONTENT subsection.)

There are three levels of access control for requesting and retrieving certificates:

- Under the client's ID with user ID and password authentication
- Under the surrogate user ID with user ID and password authentication
- Under the surrogate user ID without user ID and password authentication.

The IBM HTTP Server configuration file enforces these three levels of access control. The default configuration for PKI Services maps the three levels of access control to the following CGI directories:

- `/PKIServ/ssl-cgi-bin/auth`
- `/PKIServ/ssl-cgi-bin/surrogateauth`
- `/PKIServ/ssl-cgi-bin`

Each of the request and retrieve CGIs is in all three directories. Thus, when you run a CGI you get the protection established for the directory from which it is called.

## Customizing the end-user web pages using REXX CGIs

Each certificate template contains several FORM statements (two commented out and one uncommented, which is active) that determines which of these apply. You can change the access control by uncommenting one of the FORM statements that is commented out and commenting out the one that is active.

### Steps for changing the runtime user ID for requesting certificates

Perform the following steps to change the runtime user ID for requesting a certificate.

1. In the `pkiserv.tmpl` file, find the `CONTENT` subsection of the `TEMPLATE` section for the template whose user ID you want to change. Locate the lines containing the FORM statements, such as those in the following example:

**Example:**

```
<h3><li>Request a New Certificate
# This ACTION forces userid/pw authentication and runs the task under
# the client's ID
#<FORM NAME="CertReq" METHOD=POST ACTION=
#          "/PKIServ/ssl-cgi-bin/auth/careq.rexx" onSubmit=

# This ACTION forces userid/pw authentication but runs the task under
# the surrogate ID
#<FORM NAME="CertReq" METHOD=POST ACTION=
#          "/PKIServ/ssl-cgi-bin/surrogateauth/careq.rexx" onSubmit=

# This ACTION is for non z/OS clients. The task runs under the
# surrogate ID
<FORM NAME="CertReq" METHOD=POST ACTION=
          "/PKIServ/ssl-cgi-bin/careq.rexx" onSubmit=
```

Notice that the preceding lines contain three FORM statements. The first two FORM statements are commented out, so they are not active. They are for:

- Requesting the certificate under the client's ID and using user ID and password authentication
- Requesting the certificate under the surrogate ID and using user ID and password authentication

The third FORM statement is for requesting the certificate under the surrogate user ID without user ID and password authentication. This is active (it is not commented out).

- 
2. To change the runtime user ID, remove the comment delimiter (`#`) from in front of the lines for the commented-out FORM statement you want to use and insert the comment delimiter in front of the lines for the bottom FORM statement.
- 

### Steps for changing the runtime user ID for retrieving certificates

Perform the following steps to change the runtime user ID for retrieving a certificate.

1. In the `pkiserv.tmpl` file, find the `RETRIEVECONTENT` subsection of the `TEMPLATE` section for the template whose user ID you want to change. Locate the lines containing the FORM statements, such as those in the following example:

**Example:**

## Customizing the end-user web pages using REXX CGIs

```
<H1> Retrieve Your [tplname]
<H3>Please bookmark this page
<p>Since your certificate may not have been issued yet, we recommend
that you create a bookmark to this location so that when you return to
this bookmark, the browser will display your transaction ID.
This is the easiest way to check your status.
```

```
# This ACTION forces userid/pw authentication and runs the task
# under the client's ID
#<FORM NAME=retrieveform METHOD=POST ACTION=
#   "/PKIServ/ssl-cgi-bin/auth/cagetcert.rexx" onSubmit=
#
# This ACTION forces userid/pw authentication but runs the task
# under the surrogate ID
#<FORM NAME=retrieveform METHOD=POST ACTION=
#   "/PKIServ/ssl-cgi-bin/surrogateauth/cagetcert.rexx" onSubmit=
#
# This ACTION is for non z/OS clients. The task runs under surrogate ID
<FORM NAME=retrieveform METHOD=POST ACTION=
  "/PKIServ/ssl-cgi-bin/cagetcert.rexx" onSubmit=
```

Notice that the preceding lines contain three FORM statements. The first two FORM statements are commented out (they are not active). These are for:

- Retrieving the certificate under the client's ID
- Retrieving it under the surrogate ID, but requiring user ID and password authentication.

The third FORM statement is for retrieving the certificate under the surrogate user ID without user ID and password authentication. This is active (it is not commented out).

- 
2. To change the runtime user ID, remove the comment delimiter (#) from in front of the lines for the commented-out FORM statement you want to use and insert the comment delimiter in front of the lines for the bottom FORM statement.
- 

## Customizing the OtherName field

When you use the OtherName field, you are able to bind additional identities or owner information to the subject of the certificate using the subject alternate name extension. These identities might take different forms, such as employee numbers, customer account numbers, and other identities that you choose to use.

The OtherName value is a concatenated string that consists of one or more pairs of OIDs and their associated values. The string is saved in the subject alternate name extension in the certificate.

PKI Services implements the OtherName field as a customizable INSERT called AltOther\_<OID>. The following certificate template in `pkiserv.tpl` is supplied to illustrate the use of the INSERT fields.

Template Name - n-Year PKI Certificate for Extensions Demonstration

The *n*-year PKI certificate template builds a certificate using information provided primarily by users, rather than information that you control. For demonstration purposes, the template builds a certificate that contains all extensions that are supported by PKI Services. The template contains two sample OtherName fields:

```
%%AltOther_1_2_3_4_5%%
    Builds one input field.
```

## Customizing the end-user web pages using REXX CGIs

`%%AltOther_1_2_3_4_6%%`

Builds two input fields.

The `AltOther_1_2_3_4_5` string represents an `OtherName` field with OID 1.2.3.4.5, an 11-character string that stores a customer account number. The `AltOther_1_2_3_4_6` string represents an `OtherName` field with OID 1.2.3.4.6, a 17-character string that stores a 9-digit license number and an expiration date in the `yyymmdd` format.

When you choose to use the `OtherName` field to build the subject alternate name extension, you might also want to customize the end-user web pages to allow end-users to enter the required information using customized input screens that are easier for them to use. For example, rather than asking a user to enter a string like the one shown below, you can prompt the user to enter a 9-digit license number and its expiration date.

**Example of an `OtherName` field value:**

1.2.3.4.6,12345678920050215

## Steps for customizing the sample `AltOther_<OID> INSERTs` Before you begin

- Decide what identifiers you want to add to the Subject Name Alternate extension.
- Select the registered OID value to use to represent your data string. Check the appropriate standards organization (ISO or ITU). If not already registered, register your own OID.
- Select which certificate templates you want to update to add the Subject Name Alternate extension.
- Decide whether to use a sample INSERT for your `AltOther_<OID> INSERT` or create your own INSERT. The sample INSERT called `AltOther_1_2_3_4_5` demonstrates using one input field. The sample insert that is called `AltOther_1_2_3_4_6` demonstrates using two input fields.
- Determine the following values that you want to use to customize your INSERT.
  - The OID value for your `OtherName` field
  - The name and length for each input field.
- Review Figure 3 on page 227. It contains a listing of the sample INSERT called `AltOther_1_2_3_4_6` which demonstrates using two input fields. The lines you are most likely to customize are marked in Figure 3 on page 227. The following steps refer to the marked lines.

## Procedure

Perform the following steps to customize the `AltOther_<OID> INSERT` using Figure 3 on page 227 as a reference.

## Customizing the end-user web pages using REXX CGIs

```
=====
# Sample AltOther INSERT with two input fields
# =====
<INSERT NAME=AltOther_1_2_3_4_6> 1
<INPUT NAME="AltOther_1_2_3_4_6" TYPE="hidden" maxLength="255">

<p> Other Name for alternate name: <BR>
<p> <LABEL for="other2afield">Customer's driver license number (9 digits) [optfield]</LABEL> <BR> 2
<INPUT NAME="Other2a" TYPE="text" SIZE=9 maxLength="9" [readonly] id="other2afield"> 3
<p> <LABEL for="other2bfield">Customer's driver license expiration date (yyyymmdd) [optfield]</LABEL> <BR> 4
<INPUT NAME="Other2b" TYPE="text" SIZE=8 maxLength="8" [readonly] id="other2bfield"> 5

<INPUT NAME="altrawstring_1_2_3_4_6" TYPE="hidden" VALUE="[altrawvalue]">

<SCRIPT LANGUAGE="JavaScript">
<!--
//This is the script that will be called at load time.
var form=document.forms[0]
if (form.altrawstring_1_2_3_4_6.value.length > 0) {
  //The name 'Otherx' needs to match with the above INPUT NAME.
  //Substr(start position, length)
  form.Other2a.value=form.altrawstring_1_2_3_4_6.value.substr(0,9) 6
  form.Other2b.value=form.altrawstring_1_2_3_4_6.value.substr(9,8) 7
}
//-->
</SCRIPT>
<SCRIPT LANGUAGE="JavaScript"> 8
<!--
//This is the validation script
function ValidAltOther_1_2_3_4_6(frm){
  if ((" [optfield]" == "" && frm.Other2a.value.length != 9) ||
      (" [optfield]" != "" && frm.Other2a.value != "" && frm.Other2a.value.length != 9)) {
    alert("Enter 9 digit license number.");
    frm.Other2a.focus();
    return false;
  }
  :
  //Build the entire AltOther field.
  if (frm.Other2a.value != "" && frm.Other2b.value != "")
    frm.AltOther_1_2_3_4_6.value = "1.2.3.4.6," + frm.Other2a.value + 9
    frm.Other2b.value;
  else
    frm.AltOther_1_2_3_4_6.value = "";
  return true;
}
//-->
</SCRIPT>
</INSERT>
```

Figure 3. Partial listing of the AltOther\_1\_2\_3\_4\_6 sample INSERT showing the lines you are most likely to customize

1. Change the OID value `_1_2_3_4_6` to the OID value you need in the line marked **1** and in all other lines in the sample INSERT. For example, if you chose OID `2.16.76.1.3.1` for your OtherName field, change all occurrences of `AltOther_1_2_3_4_6` to `AltOther_2_16_76_1_3_1`.
2. Customize the first input field description in the line marked **2** to prompt users of your web page. For example, change Customer's driver license number (9 digits) to Enter your member card number.
3. Customize the first INPUT field name "Other2a" to your value in the line marked **3** and in all other lines in the sample INSERT. For example, change all occurrences of "Other2a" to "MemNum". Also, customize SIZE and maxLength as needed.
4. Customize the next input field description in the line marked **4** to prompt users of your web page. For example, change Customer's driver license expiration date (yyyymmdd) to Enter your date of birth (yyyymmdd).

## Customizing the end-user web pages using REXX CGIs

5. Customize the next INPUT field name "Other2b" to your value in the line marked **5** and in all other lines in the sample INSERT. For example, change all occurrences of "Other2b" to "Birthdate". Also, customize SIZE and maxlength as needed.

---
6. Customize the starting positions and lengths for each input field value in the lines marked **6** and **7**. For example, if the member card number is an 11-digit number, change  
form.Other2a.value=form.altrawstring\_1\_2\_3\_4\_6.value.substr(0,9) to  
form.MemNum.value=form.altrawstring\_2\_16\_76\_1\_3\_1.value.substr(0,11).

---
7. Customize the validation script that begins with the line marked **8**.

---
8. Change the OID value 1.2.3.4.6 to the OID value you need in the line marked **9**. For example, if you chose OID 2.16.76.1.3.1 for your OtherName field, change 1.2.3.4.6 to 2.16.76.1.3.1.

---
9. Repeat steps 2 on page 227 through 8 for each additional input field you need.

---

## Chapter 12. Customizing the administration web pages if you use REXX CGI execs

This information applies if you are using REXX CGI execs for your PKI Services web pages. If you are using JavaServer pages (JSPs), see Chapter 13, “Implementing the web application using JavaServer pages,” on page 233.

### CGIs for administration web pages

CGIs for administration web pages are execs that gain control when the user clicks an action button and render the web pages dynamically. All of the administration CGIs are contained in the `/usr/lpp/pkiserv/PKIServ/ssl-cgi-bin/auth` directory.

Table 43 (which lists the CGI execs in logical order) summarizes the actions that they perform:

Table 43. CGI actions for administrative web pages

CGI exec	Action	Sample web page
<code>admmain.rexx</code>	This displays the administration home page. The main heading is “PKI Services Administration”. This web page lets the administrator work with a single certificate request or certificate or search for certificate requests or certificates.	See Figure 63 on page 394.
<code>admpend.rexx</code>	On the administration home page, the administrator can search for certificate requests. The result of this search is one of the following web pages: <ul style="list-style-type: none"> <li>• “Certificate Requests” web page. This web page lists certificate requests matching the criteria and allows the administrator to process certificate requests.</li> <li>• “Processing was not successful” web page.</li> </ul>	For an example of the “Certificate Requests” web page, see Figure 68 on page 400.
<code>admpendtid.rexx</code>	On the administration home page, the administrator can enter a transaction ID to work with a single certificate request. This displays a web page whose main heading is one of the following: <ul style="list-style-type: none"> <li>• “Single Request” - This lists the certificate request that matches the transaction ID and allows the administrator to process that certificate request.</li> <li>• “Processing was not successful”</li> </ul>	For an example of the “Single Request” web page, see Figure 64 on page 395.
<code>admodtid.rexx</code>	This displays the “Modify and Approve Request” web page that appears when the administrator decides to modify a request before approving it (on the “Single Request” web page).	See Figure 67 on page 397.
<code>admicl.rexx</code>	On the administration home page, the administrator can search for certificates. This displays a web page whose main heading is one of the following: <ul style="list-style-type: none"> <li>• “Issued Certificates” - This lists the certificate or certificates that match the search criteria. It also allows the administrator to revoke or delete selected certificates.</li> <li>• “Processing was not successful”</li> </ul>	For a sample of the “Issued Certificates” web page, see Figure 68 on page 400.

## Customizing the administration web pages using REXX CGIs

Table 43. CGI actions for administrative web pages (continued)

CGI exec	Action	Sample web page
admiclcert.rexx	<p>On the administration home page, the administrator can enter a serial number to work with a single certificate. This displays a web page whose main heading is one of the following:</p> <ul style="list-style-type: none"> <li>• “Single Issued Certificate” - This lists the certificate that matches the serial number ID and allows the administrator to revoke or delete that certificate.</li> <li>• “Processing was not successful”</li> </ul>	<p>For a sample of the “Single Issued Certificate” web page, see Figure 72 on page 405.</p>
admacttid.rexx	<p>Displays a web page after the administrator processes a single certificate request (approving it with or without modifications, rejecting, or deleting it). This web page has one of the following as its main heading:</p> <ul style="list-style-type: none"> <li>• “Processing successful”</li> <li>• “Processing was not successful”</li> </ul>	<p>For a sample of the web page whose main heading is “Processing successful”, see Figure 65 on page 396.</p>
admacttid2.rexx	<p>This displays a web page after the administrator approves a certificate request with modifications. The web page has one of the following main headings:</p> <ul style="list-style-type: none"> <li>• “Processing successful”</li> <li>• “Processing was not successful”</li> </ul>	<p>For a sample of the web page whose main heading is “Processing successful”, see Figure 65 on page 396.</p>
admpendall.rexx	<p>After the administrator searches for certificate requests and admpend.rexx displays the results, the administrator clicks a button to approve, reject, or delete selected certificate requests. This calls <code>admpendall.rexx</code>, whose main heading is one of the following:</p> <ul style="list-style-type: none"> <li>• “Processing successful” if the action was successful</li> <li>• “Processing was not successful” if the action failed (for example, if the administrator tried to delete certificate requests that were already deleted)</li> <li>• “Processing partially successful” if not all of the selected requests are processed successfully</li> </ul>	<ul style="list-style-type: none"> <li>• For an example of the “Processing successful” web page, see Figure 69 on page 402.</li> <li>• For an example of the “Processing was not successful” web page, see Figure 70 on page 402.</li> <li>• For an example of the “Processing partially successful” web page, see Figure 71 on page 403.</li> </ul>
admactcert.rexx	<p>Displays a web page after the administrator tries to revoke or delete one or more selected certificates. The web page has one of the following main headings:</p> <ul style="list-style-type: none"> <li>• “Processing successful”</li> <li>• “Processing was not successful”</li> </ul>	

Table 43. CGI actions for administrative web pages (continued)

CGI exec	Action	Sample web page
admiclall.rexx	<p>After the administrator searches for certificates and admicl.rexx displays the results, the administrator clicks a button to revoke or delete selected certificates. This calls admiclall.rexx, which displays a web page whose main heading is one of the following:</p> <ul style="list-style-type: none"> <li>• “Processing successful” if the action was successful</li> <li>• “Processing was not successful” if the action failed</li> <li>• “Processing partially successful” if not all of the selected certificates are processed successfully</li> </ul>	-

---

## Customizing the administration web pages

The administration web pages are not as customizable as the end-user web pages. You can customize page headers, footers, frames, links, colors, and so forth, but you cannot change internal web page content. Except for identifying the fields that an administrator can change when approving certificate requests, the administration web page logic is fixed.

However, you can make changes in the following subsections in the PKISERV APPLICATION section of the pkiserv.tmp certificate template file. (These subsections appear in the application section of PKISERV only.)

### ADMINHEADER

Contains the general installation-specific HTML content for the header of all the administration web pages.

### ADMINFOOTER

Contains the general installation-specific HTML content for the footer of all the administration pages.

### ADMINSCOPE

This optional subsection allows the administrator to choose a different CA domain. For more information, see “Adding a new CA domain” on page 287.

---

## Steps for customizing the administration web pages

Perform the following steps to customize the administration web pages:

1. Add any web page header for the administration pages to the ADMINHEADER subsection of the PKISERV APPLICATION section. (The ADMINHEADER subsection is near the end of the APPLICATION section.)

#### Example:

```
<ADMINHEADER>
<!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN" "http://www.w3.org/TR/html4/loose.dtd">
<HTML lang="en"><HEAD>
<TITLE>Web-Based Certificate Generation Administration</TITLE></HEAD>
<BODY>
</ADMINHEADER>
```

2. Add any web page footer for the administration pages to the ADMINFOOTER subsection of the APPLICATION section. (The ADMINFOOTER subsection is near the end of the APPLICATION section.)

#### Example:

## Customizing the administration web pages using REXX CGIs

```
<ADMINFOOTER>
<p> email: webmaster@company.com
</BODY>
</HTML>
</ADMINFOOTER>
```

---

## Changing the runtime behavior for accessing administration pages

When the administrator tries to access the administration pages (by clicking the **Go to administration page** button on the PKI Services home page), access to the administration pages is controlled in one of the following ways:

- A popup window appears, requiring the administrator to enter a user name and password. (See Figure 62 on page 391 for a sample of the authentication popup window.)
- Alternately, the administrator might have to authenticate by using a previously issued browser certificate. In other words, the administrator would need to have a certificate before going to the administration web pages.

By default, the first method is used. However, you can change the runtime behavior so that the second method is used instead. If you decide to use the second method, anyone intending to become a PKI Services administrator needs to request and retrieve a one-year PKI browser certificate for authenticating to z/OS before trying to access the administration pages.

**Note:** The one-year PKI browser certificate for authenticating to z/OS contains a HostIdMappings extension. (For more information, see Chapter 20, “RACF administration for PKI Services,” on page 461.)

## Steps for changing control of access to administration pages

Perform the following steps to change the access control of the administration pages to require authenticating by using a certificate:

1. Edit the `pkiserv.tmp1` certificate templates file and find the following lines in the PKISERV APPLICATION section:

```
# The following action will force userid/pw authentication for administrators
<FORM name=admform METHOD=GET ACTION="/PKIServ/ssl-cgi/auth/admain.rexx">
# The following action will force client certificate authentication
# for administrators
#<FORM name=admform METHOD=GET
# ACTION="/PKIServ/clientauth-cgi/auth/admain.rexx">
<p>
<INPUT TYPE="submit" VALUE="Go to Admin Pages">
</FORM>
```

The first FORM statement in these lines is active. (It is not commented out with # characters in front of the lines.) This requires authentication by entering the user name and password in a popup window. The second FORM statement is commented out (using # characters). This requires authentication by using a previously issued browser certificate.

2. Comment out the first FORM statement (add # characters in front of the FORM and ACTION lines) and uncomment the second FORM statement (removing the # characters in front of the FORM and ACTION lines).
-

---

## Chapter 13. Implementing the web application using JavaServer pages

As an alternative to the REXX CGI execs and text template file described in Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127 and Chapter 12, “Customizing the administration web pages if you use REXX CGI execs,” on page 229, you can use JavaServer pages (JSPs) and an XML template file to create and customize the PKI Services web application. This approach has several advantages over the REXX CGI approach:

- It uses Java, a popular and flexible web application programming language.
- It uses XML, which is likely to be more familiar and intuitive to web application programmers than the text template file format used by the REXX CGI approach.
- You can validate the syntax of your XML template file using the TemplateTool utility (see “Using the TemplateTool utility” on page 425) or web application tools that include XML validation, such as IBM Rational® Software Development Platform.
- The XML template with modifiable JSP files is a simpler structure than the single text template file used by the REXX CGI approach.

JavaServer pages control the content or appearance of web pages through the use of Java code that runs on an application server to modify a web page before it is sent to the user who requested it. JavaServer pages can contain a mixture of HTML and Java code. For the PKI Services web application, the XML template file defines the applications and the certificates that the applications provide. The JavaServer pages define and process the web pages. The application server is assumed to be WebSphere Application Server.

---

### Certificate templates files used with JSPs

When you implement the web application using JSPs, there are two versions of the certificate templates file:

- An XML templates file, `pkitmpl.xml`, used to customize the web application
- A text CGI templates file, `pkixgen.tmp1`, used by the PKI Services daemon

Whenever you update `pkitmpl.xml`, you must use the TemplateTool utility to create an equivalent copy of `pkixgen.tmp1`. For more information, see “Using the TemplateTool utility” on page 425. If you do not create an updated `pkixgen.tmp1` file, the daemon writes the following message to the daemon log file when it determines that `pkixgen.tmp1` is not current:

```
IKYC068I The templates file used may not be current
```

The default location of the two versions of the template file is `/etc/pkiserv/`. Alternatively, if the environment variable `PKISERV_CONFIG_PATH` is defined, PKI JSP processing uses the value of `PKISERV_CONFIG_PATH` as the location of `pkitmpl.xml` and `pkixgen.tmp1`. The XML schema is defined in the file `PKIServ.xsd` in the same directory as `pkitmpl.xml`.

## Examining the pkimpl.xml file

The PKI Services XML template, `pkimpl.xml`, defines:

- A root CA URL.  
The root CA URL is the URL of the PKI Services CA certificate.
- The PKI Services ActiveX install URL for Windows XP and earlier versions of Windows.  
This URL is the URL of the Windows installer program that installs the PKI Services ActiveX control on Microsoft Windows XP and earlier versions of Windows.
- The PKI Services ActiveX install URL for Windows Vista and later versions of Windows.  
This URL is the URL of the Windows installer program that installs the PKI Services ActiveX control on Microsoft Windows Vista and later versions of Windows.
- One or more applications.  
An application is a grouping of certificate request templates. This grouping might be done because the templates are shared among a set of end users or because the templates have a common administrator. A PKI Services installation can have one or more applications defined.
- One or more certificate request templates.  
A certificate request template is a predefined set of characteristics for certificate requests and the resulting certificates. Each certificate request template defines:
  - The type of certificate request (for example, browser or server, SCEP preregistration request, SAF or PKI certificate)
  - A name for the certificate request template, which is displayed to both the end user and the administrator
  - A nickname (maximum of 8 characters) that uniquely identifies each template, which PKI Services uses to retrieve information about the template
  - The values that you want a user to input and whether those values are optional or required
  - The values that you want to supply for the user
  - The values an administrator is allowed to supply
  - Whether the certificate is automatically approved
  - Whether the certificate is automatically renewed
  - A set of preregistration rules (applicable only to SCEP preregistration requests), which define whether approval is needed based on the level of authentication provided

The XML template file, `pkimpl.xml`, begins by defining the URL of the PKI Services CA certificate.

```
<tns:CA_cert_URL>/PKIServ/cacerts/cacert.der</tns:CA_cert_URL>
```

The `CA_cert_URL` is the URL of the PKI Services CA certificate. The URL can be relative to the PKIServ web root context or absolute. This URL is displayed as a link with the text “Install the CA certificate to enable SSL sessions for PKI Services” on the home page for both end users and administrators. Users need to install the PKI Services CA certificate to use a secure connection and retrieve certificates.

Next `pkimpl.xml` defines the PKI Services ActiveX install URLs.

```
<tns:XEnroll_install_URL>http://hostname:port/PKIServ/PKIXEnroll/PKIXEnrollDeploy.msi</tns:XEnroll_install_URL>
<tns:CEnroll_install_URL>http://hostname:port/PKIServ/PKICEnroll/PKICEnrollDeploy.msi</tns:CEnroll_install_URL>
```

The tag for `XEnroll_install_URL` specifies the URL of the PKI Services ActiveX control installer program for Windows XP and earlier versions of Windows. The tag for `CEnroll_install_URL` specifies the URL of the PKI Services ActiveX control installer program for Windows Vista and later versions of Windows. Each URL can be relative to the PKI Services web root context or absolute. The text “Install the PKI ActiveX Control to renew certificates” on the PKI Services home page for end users (see Figure 37 on page 363) links to the URL specified for the version of Microsoft Windows running on the system. Users need to install the PKI Services ActiveX control to install renewed certificates using the Internet Explorer browser.

The application tag (`<tns:application>`) defines a particular set of end users. The application tag consists of an application name (in this case Customers) and one or more application templates (`<tns:apptemplate>`).

```
<tns:applname>Customers</tns:applname>
<tns:apptemplate>1-Year PKI SSL Browser Certificate</tns:apptemplate>
```

The contents of the `apptemplate` tag (“1-Year PKI SSL Browser Certificate”, for example) corresponds to the `certname` element of a `certreq_template` tag.

A certificate request template is defined by a `certreq_template` tag, shown in Figure 4.

```
<tns:certreq_template>
  <tns:certname>1-Year PKI SSL Browser Certificate </tns:certname>
  <tns:certtype>PKI Browser Certificate</tns:certtype>
  <tns:certtype_description>PKI Browser Certificate for Secured Connections</tns:certtype_description>
  :
  :
```

Figure 4. A `certreq_template` tag

The certificate type tag (`<tns:certtype>`) can have one of the following values:

- PKI Preregistration (for SCEP preregistration requests)
- PKI Browser Certificate
- PKI Server Certificate
- PKI Key Certificate (for a certificate for which PKI Services generated the key pair)
- SAF Browser Certificate
- SAF Server Certificate

The certificate type description (`<tns:certtype_description>`) is an optional tag. Its contents are used on the web pages wherever the certificate type is to be displayed. This tag allows administrators to use words that they feel might be more understandable to their end users than the pre-defined values for the certificate types. A common use of this tag might be to translate the certificate types to another language. If this tag is omitted the contents of the certificate type tag (`<tns:certtype>`) is used as the certificate type description.

The request authentication type tag (`<tns:request_authtype>`) and retrieve authentication type tag (`<tns:retrieve_authtype>`) define the type of authentication that must be used to request or retrieve a certificate. The acceptable values for these tags are:

**noAuthRunAsSurrogate**

No authentication should be used. The task runs as a surrogate user.

**zAuthRunAsSurrogate**

The user is prompted to authenticate (log in) to z/OS using a RACF user ID and password. The task runs as a surrogate user.

**zAuthRunAsClient**

The user is prompted to authenticate (log in) to z/OS using a RACF user ID and password. The task runs as the client.

The next element of a certificate request template is the Auto-Approve indicator (<tns:AutoApprove>). A value of Y or y indicates that any certificate requests made with this template should be automatically approved (no administrator approval is required and the administrator does not have an opportunity to modify or reject certificate requests). A value of N or n indicates that certificate requests made with this template are not automatically approved and must be approved by an administrator.

The next element of a certificate request template is the Admin-Num indicator (<tns:AdminNum>). The value is to set the number of administrators that are required to approve a certificate request. If both <tns:AdminNum> and <tns:AutoApprove> Y exist, then <tns:AdminNum> takes precedence. Any improper values are handled the same way as the ADMINNUM entry in the CGI templates file.

**Note:** A request created from this template remains in Pending Approval state until the required number of individual administrative approvals is made for the request, at which time the request changes to Approved state. If an administrator issues an Approve with Modifications on a request that is in Pending Approval state, any previously made approvals are nullified, and the number of approvals that are made for the request is reset to 1.

The next element of a certificate request template is the Auto-Renew indicator (<tns:AutoRenew>). A value of Y or y indicates that any certificate created using this template is automatically renewed. A value of N or n indicates that certificates created using this template are not automatically renewed.

The following form fields are defined with tags in the certificate request template:

- AltDomain
- AltEmail
- AltIPAddr
- AltOther
- AltURI
- BusinessCat
- ClientName
- CommonName
- Country
- CustomExt
- DomainName
- DNQualifier
- EmailAddr
- ExtKeyUsage
- HostIdMap
- JurCountry
- JurLocality
- JurStateProv

- KeySize
- KeyUsage
- Label
- Locality
- Mail
- NotAfter
- NotBefore
- NotifyEmail
- Org
- OrgUnit
- PassPhrase
- PostalCode
- PublicKey
- Requestor
- Security
- SerialNumber
- SignWith
- StateProv
- Street
- Title
- Uid
- UnstructAddr
- UnstructName
- UserId

A form field tag has the form:

```
<tns:Name formtype="InstallationSpecified | AdminSpecified | UserSpecified"
          initvalue="xxxxx"
          optional="true | false"
          JSPfilename="xxx.jsp"/>
```

where

*Name* is the name of the form field, for example AltOther or Security.

#### **formtype**

can have one of the following values:

##### **UserSpecified**

The form field appears on the certificate request web page where the user can enter data.

##### **InstallationSpecified**

The value is provided by the XML template and is not displayed on the certificate request web page. Instead, there is a hidden form field on the certificate request web page that specifies the value.

##### **AdminSpecified**

The administration Approve with Modification web page should always display this form field and allow an administrator to specify a value for it.

The default for formtype is UserSpecified.

#### **initvalue**

The initial value of the form field. If formtype is AdminSpecified or UserSpecified, the form field is displayed with this initial value set but modifiable. If formtype is Installation Specified, this initial value is given to the hidden form field and it cannot be changed for the certificate request.

### optional

Indicates whether this form field is optional. For `UserSpecified` form fields, `optional` indicates whether a value must be provided on the Certificate Request web page. For `AdminSpecified` form fields, `optional` indicates whether a value must be provided on the administrator's Approve with Modifications web page. For `InstallationSpecified` form fields, the `optional` attribute is ignored. The default value for `optional` is `false`, and the form field is required.

### JSPfilename

The file name of a JSP file that is included to display and validate the form field. The file that is included is a modifiable include file in the `mod_inc` directory with your web application's EAR file. If `formtype` is `InstallationSpecified`, `JSPfilename` is ignored.

The default value for `JSPfilename` is the name of the form field, in lowercase, combined with the `.jsp` extension. For example, the default value for `JSPfilename` for the form field tag for `PassPhrase` would be `passphrase.jsp`.

**Rules:** You can write your own JSP files to process form fields, but they must conform to the following rules:

- The HTML form field, whether it is a select field, an input field, a text area field, or a hidden form field, must have the same name as the form field tag, but in lowercase. For example, for the tag

```
<tns:CommonName formtype="AdminSpecified" optional="true" JSPfilename="cn.jsp"/>
```

the form field must have the name `commonname` in the file `cn.jsp`.

- The HTML form field must contain a JavaScript function with the name `Valid` concatenated with the lowercase form field name. For example, for the tag

```
<tns:CommonName formtype="AdminSpecified" optional="true" JSPfilename="cn.jsp"/>
```

`cn.jsp` must contain a JavaScript method named `Validcommonname`. This JavaScript method should verify the form field and return `true` if it is valid and `false` if not. If there is no verification to be done, the `Validformfieldname` method can return `true` in all cases.

Each of the attributes (`formtype`, `initvalue`, `optional` and `JSPfilename`) can be omitted and defaulted.

Examples of form field tags:

```
<tns:CommonName formtype="AdminSpecified" optional="true" JSPfilename="cn.jsp"/>  
<tns:PassPhrase />
```

---

## Roadmap for implementing the PKI Services web application using JSPs

### About this task

To implement the PKI Services web application using JSPs, perform the tasks in Table 44 on page 239.

Table 44. Task roadmap for implementing the PKI Services web application using the JSPs

Subtask	Associated instructions (see . . . )
Preparation	“Steps for preparing to implement the PKI Services web application using JSPs”
Give WebSphere users authorization to use PKI Services functions	“Giving WebSphere users authorization to use PKI Services functions” on page 240
Set up a WebSphere SSL configuration that uses client authentication, to allow WebSphere users to renew and revoke browser certificates	“Allowing WebSphere users to renew and revoke browser certificates” on page 244
Customize the web application	“Customizing the PKI Services web application” on page 255
<ul style="list-style-type: none"> <li>• Update the template file.</li> <li>• (Optional) Modify the JSP files and update the EAR file with the modified JSP files.</li> <li>• Deploy the EAR file to a WebSphere Application Server.</li> </ul>	<ul style="list-style-type: none"> <li>• “Updating the template file” on page 255</li> <li>• “(Optional) Modifying the JSP files and the EAR file” on page 255</li> <li>• “Deploying the EAR file to a WebSphere Application Server” on page 257</li> </ul>

## Steps for preparing to implement the PKI Services web application using JSPs

### About this task

Perform the following steps to prepare to implement the PKI Services web application using JSPs.

### Procedure

1. Set the `_PKISERV_ENABLE_JSP` environment variable to indicate that you are using the JSPs instead of the REXX CGIs. To do this, uncomment the following line in the environment variables file `pkiserv.envars`:

```
_PKISERV_ENABLE_JSP=TRUE
```

(If the line is not in your copy of the environment variables file, add it.)

2. If you have not previously done so, copy the XML template file and the XML schema file from the directory in which the MVS programmer installed PKI Services to the runtime directory by entering the following commands from the UNIX command line. The default directories are `/usr/lpp/pkiserv/` and `/etc/pkiserv` respectively. The user ID you use for copying files must have superuser authority.

```
cp -p /install-dir/samples/pkitmpl.xml runtime-dir
cp -p /install-dir/samples/PKIServ.xsd runtime-dir
```

### Results

**Note:** You do not copy the file `pkixgen.tmpl`. PKI Services does not ship a copy of this file in the `samples` directory. You generate `pkixgen.tmpl` from `pkitmpl.xml` after you customize `pkitmpl.xml`.

When you are done, you are ready to customize the PKI Services web application.

# Giving WebSphere users authorization to use PKI Services functions

You need to give each WebSphere user that uses the PKI Services web application authorization to use PKI Services functions.

## Steps for giving WebSphere users authorization to use PKI Services functions

### Before you begin

You need RACF administration skills and you must have the RACF SPECIAL attribute. You need WebSphere administration skills.

### About this task

Perform the following steps to give WebSphere users authorization to use PKI Services functions

### Procedure

1. Log on to the WebSphere administrative console.
2. Configure WebSphere for application security using SAF authorization.
  - a. In the left pane, under Security, click **Global security**, and verify that the **Enable application security** check box is selected, as shown in Figure 5. If it is not, select it and click **Apply**.

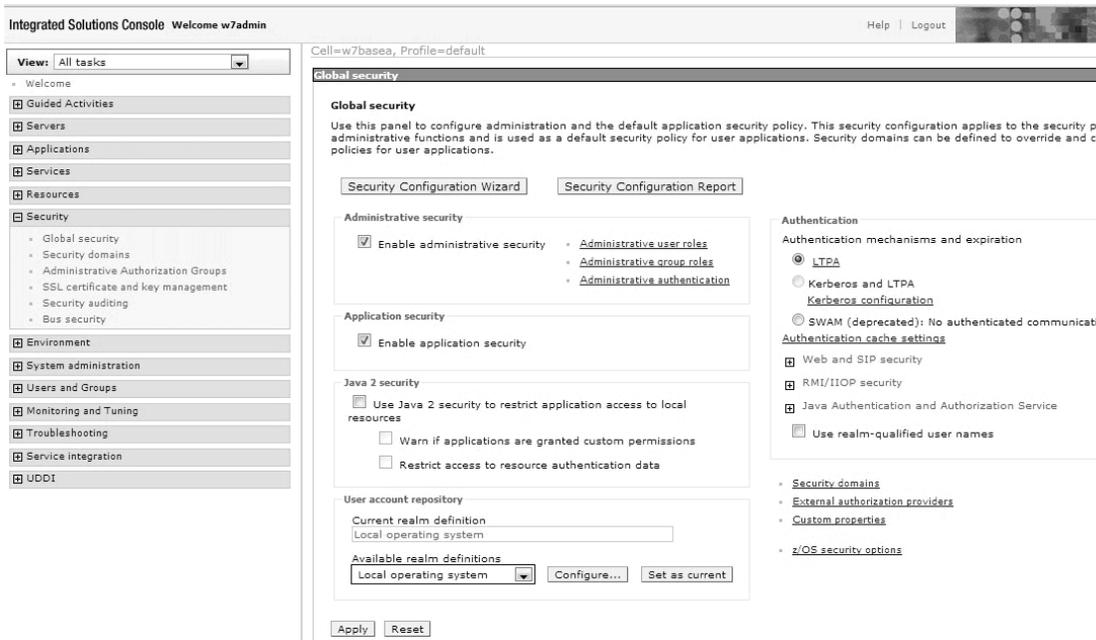

Figure 5. Configuring WebSphere for application security

- b. Click **External authorization providers**, and verify that **System Authorization Facility (SAF) authorization** is selected, as shown in Figure 6. If it is not, click **System Authorization Facility (SAF) authorization**, and then click **Configure**. Fill in the **PKI Surrogate User ID** in the **Unauthenticated user ID** field as shown in Figure 7 on page 242.

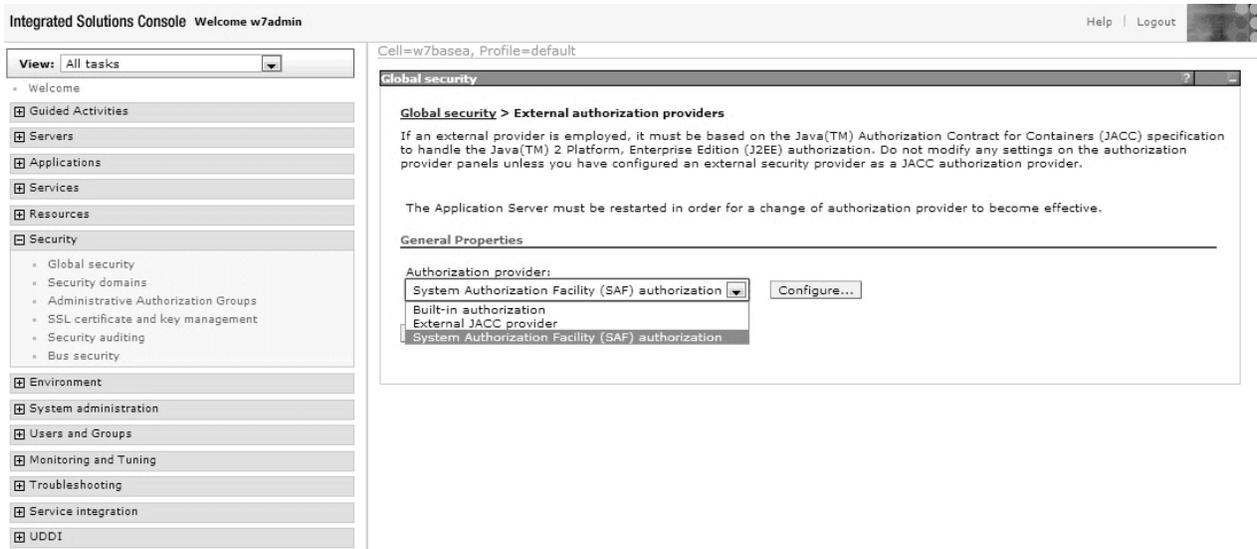

Figure 6. Configuring Websphere for application security using SAF authorization

Click **Apply** and then **Save** to go back to the page as displayed in Figure 6. Click **Apply** and then **Save** to save the changes to the master configuration.

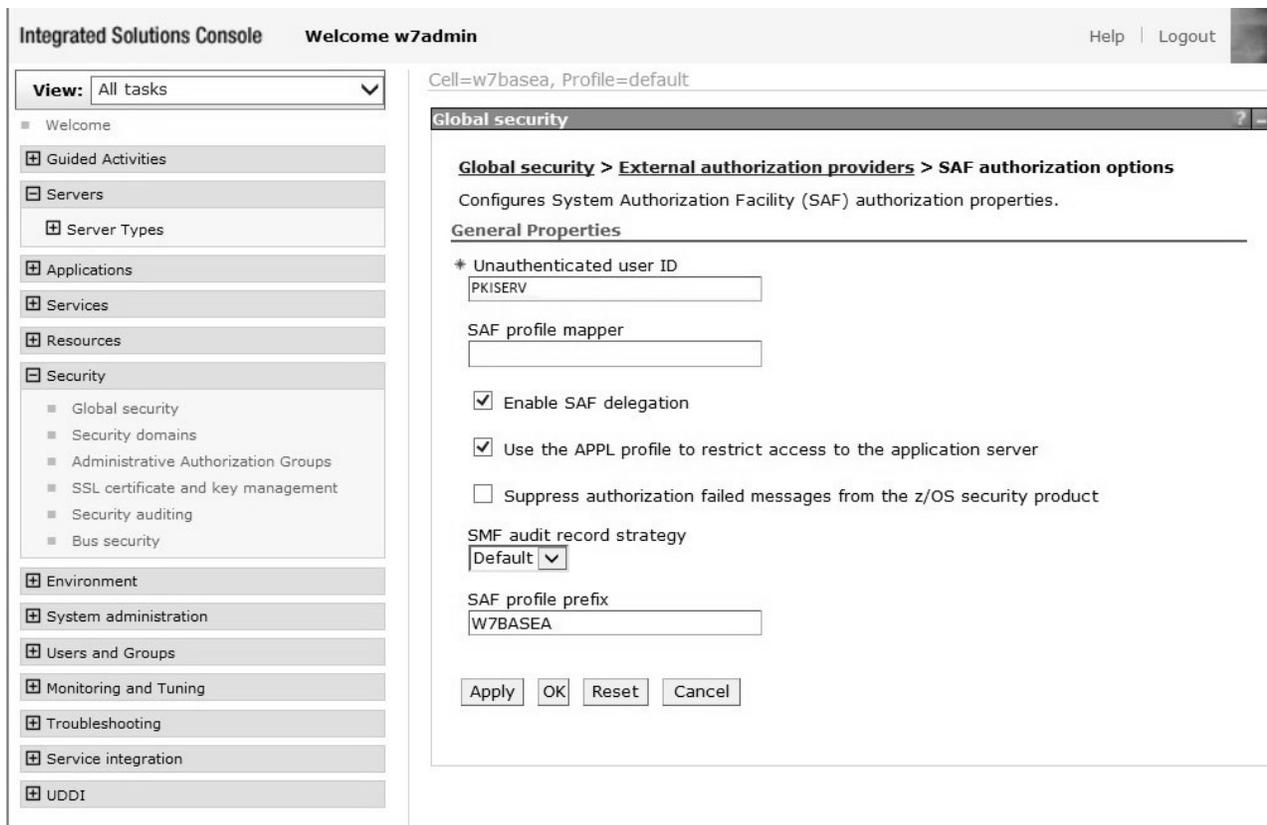

Figure 7. SAF authorization options

- c. From the web page shown in Figure 5 on page 240, click **z/OS security options** and select the **Enable application server and z/OS thread identity synchronization** check box, then click **OK**.
  - d. If you changed any settings, you see the message shown in Figure 24 on page 258 indicating that changes are made to your local configuration. Click **Save** to save the changes to the master configuration.
3. The web.xml file for PKIServ\_Web defines two roles, SAFuser and PKIAdmin. You need the SAFuser role only if you want to specify z/OS authentication (either zAuthRunAsSurrogate or zAuthRunAsClient) for certificate request or retrieval authentication. In the sample pki tmp1.xml file, z/OS authentication is used for these certificate templates: 1-Year SAF Browser Certificate, 1-Year SAF Server Certificate, 2-Year PKI Browser Certificate For Authenticating To z/OS, 5-Year SCEP Certificate - Preregistration, and 5-Year PKI Intermediate CA Certificate. The PKIAdmin role allows users assigned it to use the PKI Services administration web pages.

Enter the following TSO commands to create the SAFuser and PKIAdmin roles. The first RDEFINE command creates the SAFuser role and gives it to all users who are authenticated. The second RDEFINE command creates the PKIAdmin role.

```
RDEFINE EJBROLE SAFuser UACC(READ)
RDEFINE EJBROLE PKIAdmin UACC(NONE)
```

Then enter *one* of the following commands. The first PERMIT command must be entered for *each* user who should have authorization to use the PKI Services administration web pages.

```
PERMIT PKIAdmin CLASS(EJBROLE) ID(userid) ACCESS(READ)
```

or

```
PERMIT PKIAdmin CLASS(EJBROLE) ID(pkigrp) ACCESS(READ)
```

where *pkigrp* is the value of the variable *pkigroup* in the IKYSETUP exec (default value PKIGRP). For a description of the *pkigroup* variable, see Table 19 on page 51.

**Note:** If your installation uses security domains the role name is qualified by the security domain, for example:

```
RDEFINE EJBROLE securitydomain.SAFuser UACC(READ)
RDEFINE EJBROLE securitydomain.PKIAdmin UACC(NONE)
PERMIT securitydomain.PKIAdmin CLASS(EJBROLE) ID(PKIGRP) ACCESS(READ)
```

4. Issue TSO commands to give WebSphere users authorization to use PKI Services.

- a. Give the user ID for the WebSphere servant region address space READ access to the FACILITY class profile IRR.RPKISERV.*function.ca-domain*. ASSR1 is the user ID for the WebSphere servant region address space. For unnamed domains issue the command:

```
PERMIT IRR.RPKISERV.* CLASS(FACILITY) ID(ASSR1) ACCESS(READ)
```

For named domains issue the command:

```
PERMIT IRR.RPKISERV.*.DomainName CLASS(FACILITY) ID(ASSR1) ACCESS(READ)
```

- b. Authorize the PKI Services surrogate user to use the R\_PKIServ functions REQCERT, GENCERT, ADD, VERIFY, REVOKE, RESPOND, SCEPREQ, REQRENEW, GENRENEW, EXPORT, and QRECOVER. Enter the following TSO commands. Change the value PKISERV to the user ID you specified for the surrogate user in the IKYSETUP exec, if you specified a different user ID. (See Table 19 on page 51.)

```
RDEFINE FACILITY IRR.DIGTCERT.REQCERT UACC(NONE)
PERMIT IRR.DIGTCERT.REQCERT CLASS(FACILITY) ID(PKISERV) ACCESS(READ)
```

```
RDEFINE FACILITY IRR.DIGTCERT.GENCERT UACC(NONE)
PERMIT IRR.DIGTCERT.GENCERT CLASS(FACILITY) ID(PKISERV) ACCESS(CONTROL)
```

```
RDEFINE FACILITY IRR.DIGTCERT.ADD UACC(NONE)
PERMIT IRR.DIGTCERT.ADD CLASS(FACILITY) ID(PKISERV) ACCESS(UPDATE)
```

```
RDEFINE FACILITY IRR.DIGTCERT.VERIFY UACC(NONE)
PERMIT IRR.DIGTCERT.VERIFY CLASS(FACILITY) ID(PKISERV) ACCESS(READ)
```

```
RDEFINE FACILITY IRR.DIGTCERT.REVOKE UACC(NONE)
PERMIT IRR.DIGTCERT.REVOKE CLASS(FACILITY) ID(PKISERV) ACCESS(READ)
```

```
RDEFINE FACILITY IRR.DIGTCERT.RESPOND UACC(NONE)
PERMIT IRR.DIGTCERT.RESPOND CLASS(FACILITY) ID(PKISERV) ACCESS(READ)
```

```
RDEFINE FACILITY IRR.DIGTCERT.SCEPREQ UACC(NONE)
PERMIT IRR.DIGTCERT.SCEPREQ CLASS(FACILITY) ID(PKISERV) ACCESS(READ)
```

```
RDEFINE FACILITY IRR.DIGTCERT.REQRENEW UACC(NONE)
PERMIT IRR.DIGTCERT.REQRENEW CLASS(FACILITY) ID(PKISERV) ACCESS(READ)
```

```
RDEFINE FACILITY IRR.DIGTCERT.GENRENEW UACC(NONE)
PERMIT IRR.DIGTCERT.GENRENEW CLASS(FACILITY) ID(PKISERV) ACCESS(READ)
```

```
RDEFINE FACILITY IRR.DIGTCERT.EXPORT UACC(NONE)
PERMIT IRR.DIGTCERT.EXPORT CLASS(FACILITY) ID(PKISERV) ACCESS(CONTROL)
```

```
RDEFINE FACILITY IRR.DIGTCERT.QRECOVER UACC(NONE)
PERMIT IRR.DIGTCERT.QRECOVER CLASS(FACILITY) ID(PKISERV) ACCESS(READ)
```

- c. Allow the unauthenticated user to run a task that is associated with the PKI Services surrogate user ID. Change the value PKISERV to the user ID you specified for the surrogate user in the IKYSETUP exec, if you specified a different user ID. (See Table 19 on page 51.)

```
RDEFINE EJBROLE PKISurrogate UACC(READ) APPLDATA('PKISERV')
SETROPTS RACLIST(EJBROLE) REFRESH
```

- d. If you modified `pkitmpl.xml` and use the `zAuthRunAsClient` retrieve authentication type:

```
<tns:retrieve_authtype>zAuthRunAsClient</tns:retrieve_authtype>
```

you must give any user ID that requests this kind of certificate authorization to the `R_PKIServ EXPORT` function:

```
PERMIT IRR.DIGTCERT.EXPORT CLASS(FACILITY) ID(userid) ACCESS(CONTROL)
```

- e. Allow the WebSphere user ID to run as an authenticated RACF user. To do this, the user ID for the WebSphere control region must have CONTROL access to the resource `BBO.SYNC.cell_short_name.cluster_short_name`. Enter commands similar to the following example:

```
RDEFINE FACILITY BBO.SYNC.DCEIMGLX.BBOC001 UACC(NONE)
PERMIT BBO.SYNC.DCEIMGLX.BBOC001 CLASS(FACILITY) ID(ASCR1) ACCESS(CONTROL)
```

- f. Refresh the in-storage profiles so that the changes you made to the FACILITY class take effect:

```
SETR RACLIST(FACILITY) REFRESH
```

## Results

When you are done, you authorized WebSphere users to use PKI Services functions.

## Allowing WebSphere users to renew and revoke browser certificates

To allow WebSphere users to renew and revoke browser certificates (see Figure 8 on page 245), you need to set up a WebSphere SSL configuration that uses client authentication.

## PKI Services Certificate Generation Application

[Install the CA certificate to enable SSL sessions for PKI Services](#)

### Choose one of the following:

- Request a new certificate using a model

Select the certificate template to use as a model

- Pick up a previously requested certificate

Enter the assigned transaction ID

Select the certificate return type

- Renew or revoke a previously issued browser certificate

- Recover a previously issued certificate whose key was generated by PKI Services

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 8. Renewing or revoking a browser certificate

### Steps for allowing WebSphere users to renew and revoke browser certificates

Perform the following steps to set up a WebSphere SSL configuration that uses client authentication, so that users can renew and revoke browser certificates.

#### Before you begin

You need RACF administration skills. You must have the RACF SPECIAL attribute or sufficient authority to IRR.DIGTCERT resources in the FACILITY class to issue the RACDCERT commands shown.

#### Procedure

1. Create a RACF key ring that contains the PKI Services CA certificate for the WebSphere Control address space user ID (ASCR1 in this example):  

```
RACDCERT ADDRING(WASKeyring.PKI) ID(ASCR1)
```
2. Add the PKI CA certificate to this key ring. The CA certificate label ("Master PKI CA") is defined in the IKYSETUP exec.  

```
RACDCERT ID(ASCR1) CONNECT(CERTAUTH LABEL('Master PKI CA') RING(WASKeyring.PKI))
```
3. Create a client certificate that is signed by the PKI CA certificate, and add this client certificate to the key ring.  

```
RACDCERT GENCERT  
ID(ASCR1)  
SUBJECTSDN(CN('DCEIMGLX CLIENT CERT') OU('IBM'))
```

```

WITHLABEL('pki ssl cert')
SIGNWITH(CERTAUTH LABEL(Master PKI CA')) TRUST
RACDCERT ID(ASCR1)
CONNECT(ID(ASCR1) LABEL('pki ssl cert') RING(WASKeyring.PKI) USAGE(PERSONAL))

```

**Tip:** The value of SUBJECTDSN does not matter here. The labels in the two commands must be the same, but otherwise do not matter.

4. Define the RACF keystore to WebSphere. On the WebSphere administrator console, on the left side of the page expand **Security** and click **SSL certificate and key management**. You should see a web page that looks like Figure 9.

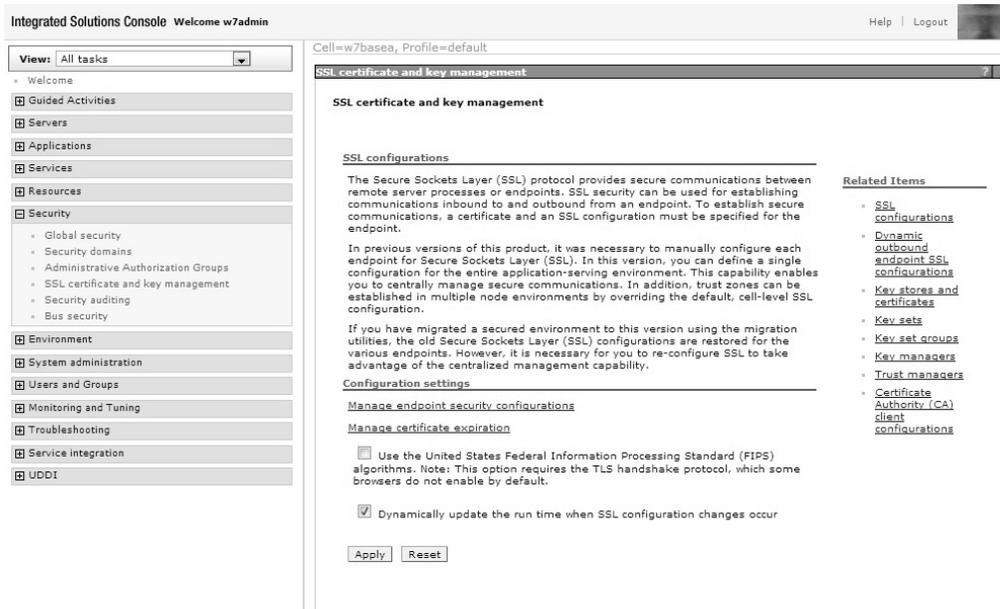

Figure 9. WebSphere SSL certificate and key management page

Click **Key stores and certificates** on the right side of the page. On the next page click **New** to create a new keystore. On the next page, enter a name for your keystore in the **Name** field. In the **Path** field enter:

```
safkeyring:///WASKeyring.PKI
```

In the **Password** and **Confirm password** fields enter a password value of password. Select the **Read only** check box. See Figure 10 on page 247

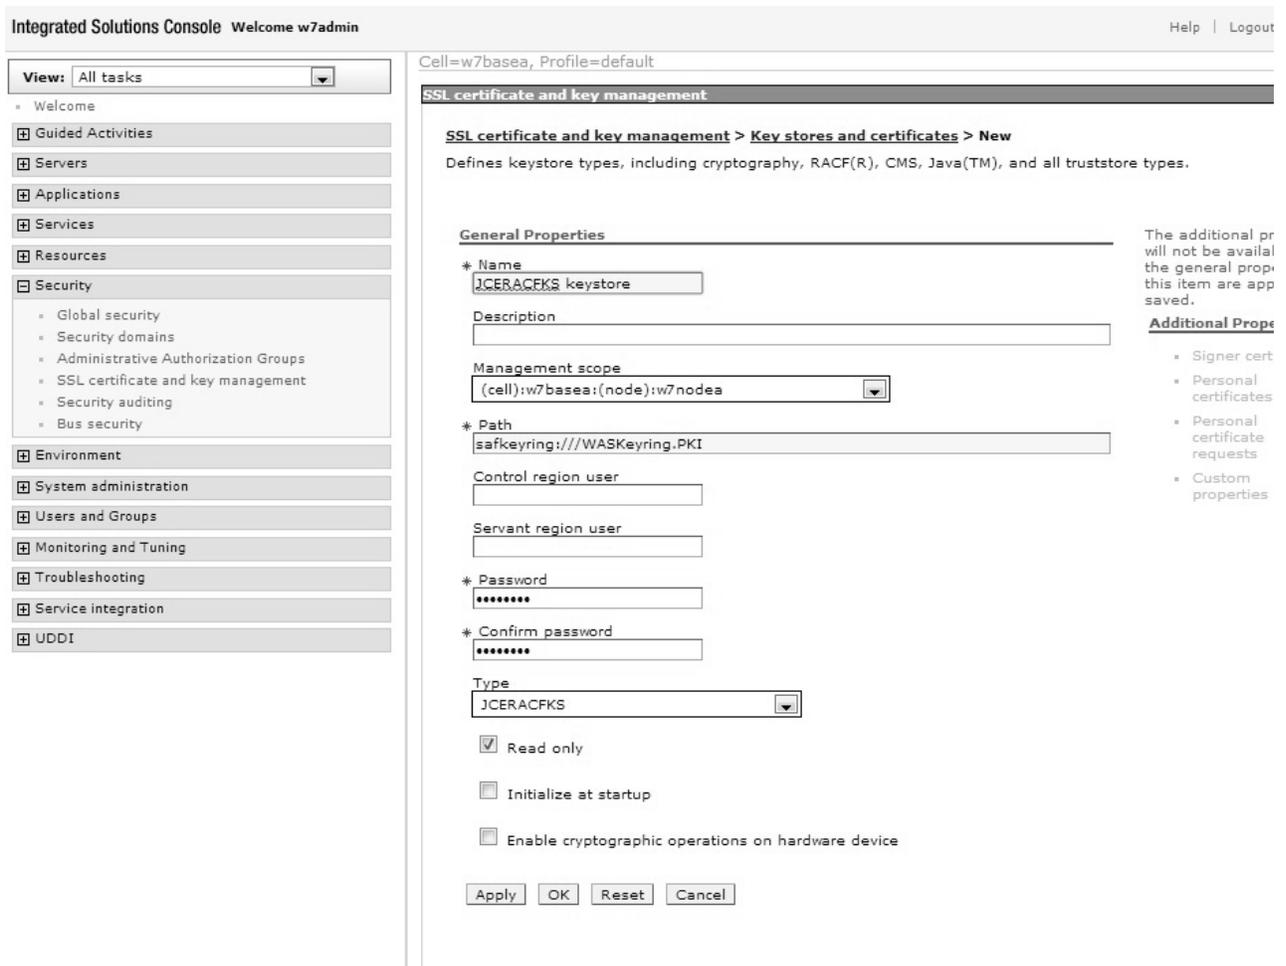

Figure 10. WebSphere page for creating a new keystore

Click **OK** and then **Save**. You should now be able to click the name of the keystore you created and view the signer certificate. See Figure 11 on page 248.

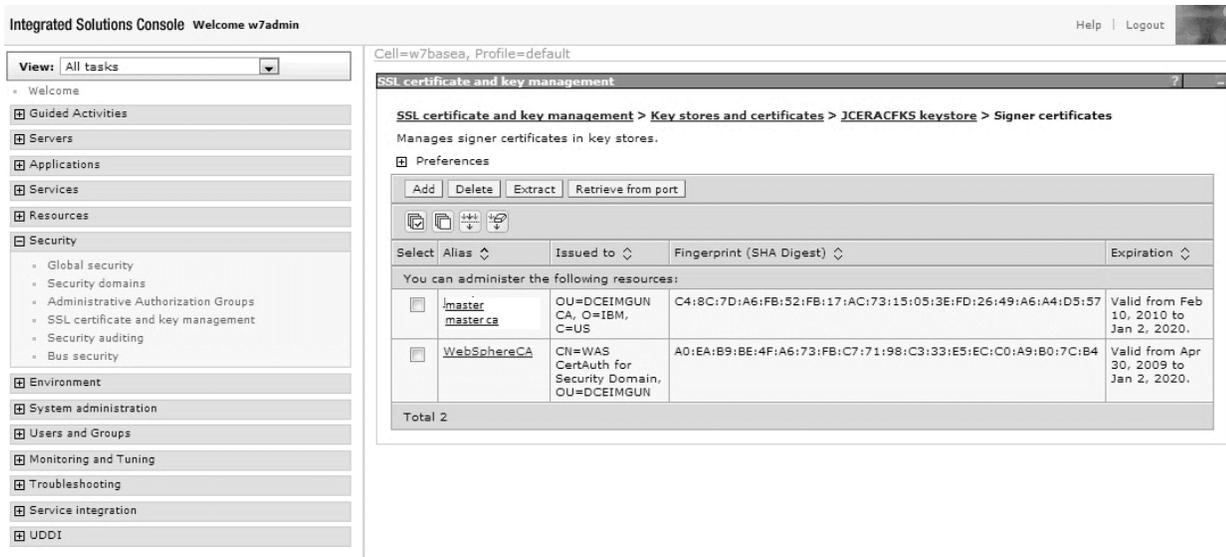

Figure 11. Viewing the signer certificate

5. Create a new JSSE type SSL configuration. On the left side of the page expand **Security** and click **SSL certificate and key management**. On the right side of the page click **SSL configurations**. (See Figure 9 on page 246.) The page shown in Figure 12 is displayed.

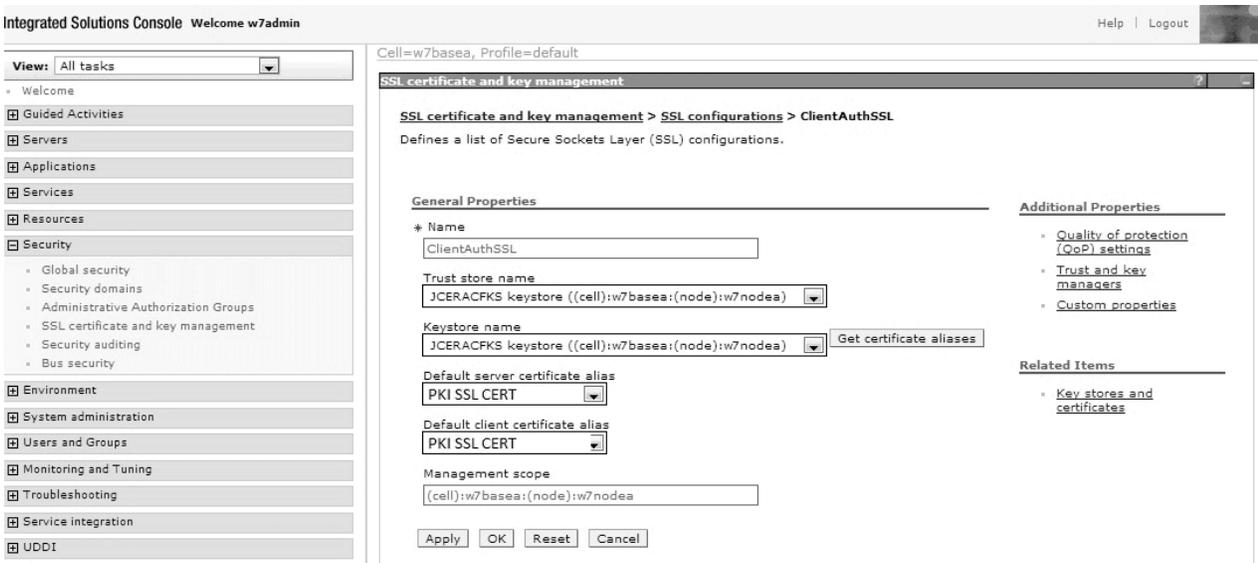

Figure 12. WebSphere new SSL configuration page

In the **Name** field enter ClientAuthSSL. In the **Trust store name** and **Keystore name** fields, enter the name of the keystore that you just defined. Click **Get certificate aliases** to get the alias (label) of the default certificate in your key ring. This is the value for Default server certificate alias and Default client

certificate alias. Click **OK**. The page shown in Figure 13 is displayed.

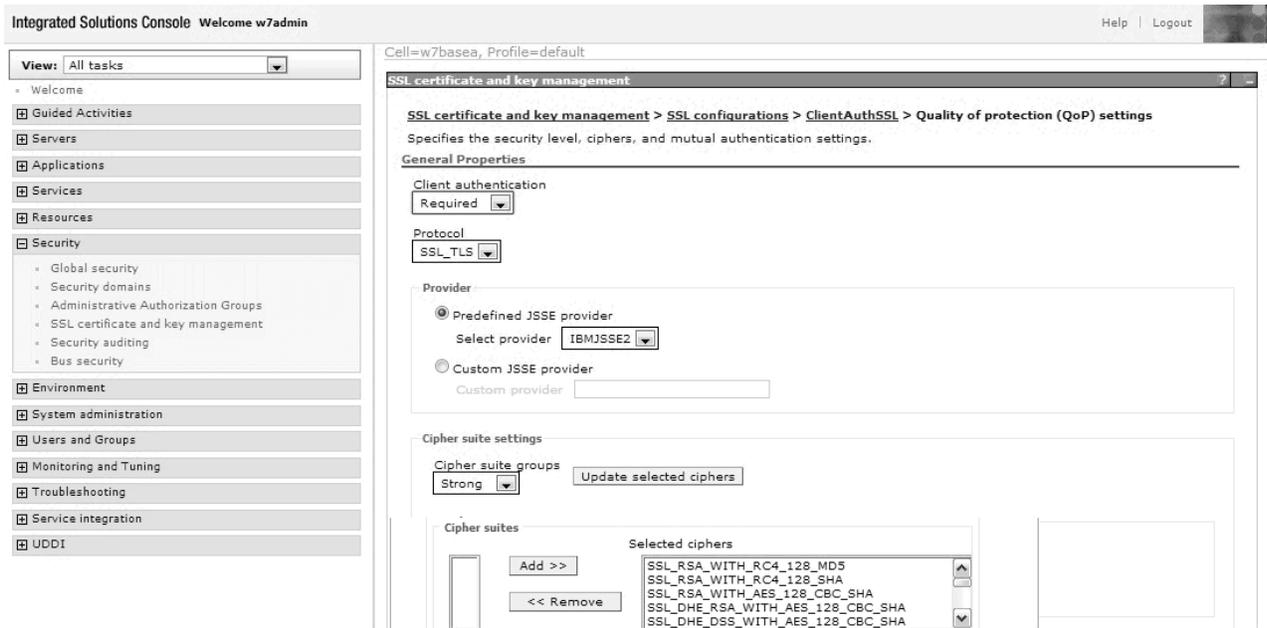

Figure 13. WebSphere quality of protection settings page

In the **Client authentication** list, select **Required**, then click **OK**.

6. Define a new port for your default host. On the left side of the page, expand **Environment** and click **Virtual Hosts**. Then click **default host**, then click **Host Aliases**, then click **New**. On the page that results, the value 9444 in the **Port** field should match your client authorization port address in the `web.xml` file. See Figure 14 on page 250.

If you must change the authorization port address in the `web.xml` file, follow the instructions in “Steps for creating application domains other than Application2” on page 286, except in steps 3 on page 286 and 4 on page 286 you must find the section that looks like:

```
<env-entry>
  <env-entry-name>_PKISERV_CLIENTAUTH_PORT</env-entry-name>
  <env-entry-type>java.lang.String,</env-entry-type>
  <env-entry-value>9444</env-entry-value>
</env-entry>
```

and change the 9444 to the value that you want to use.

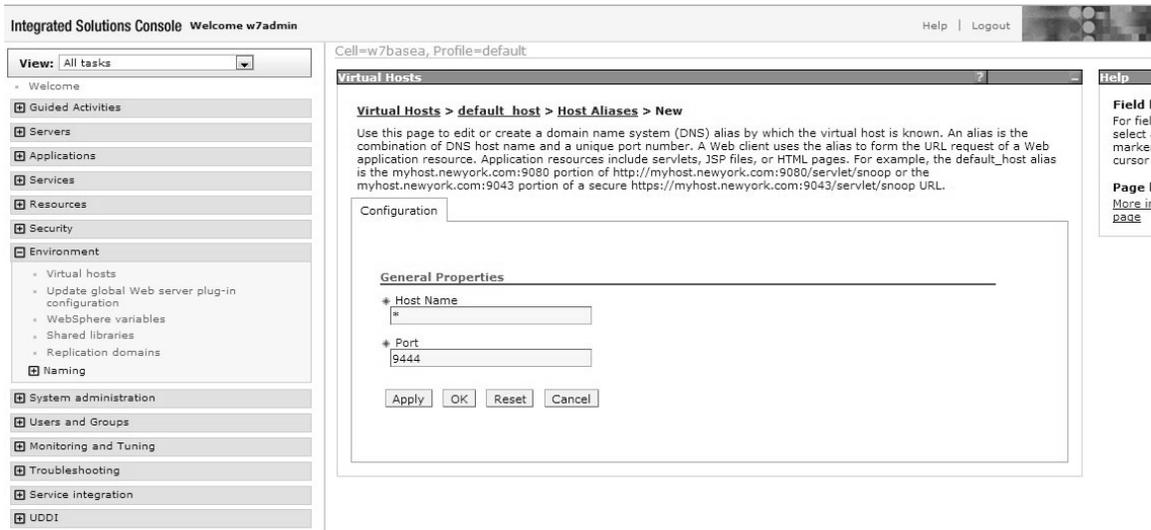

Figure 14. Defining a new port

Click **OK** and then **Save** to save this new port number.

7. Assign the new port number to your application server. On the left side of the page, expand **Servers** and click **Websphere application servers**. Click the name of your application server. See Figure 15 on page 251.

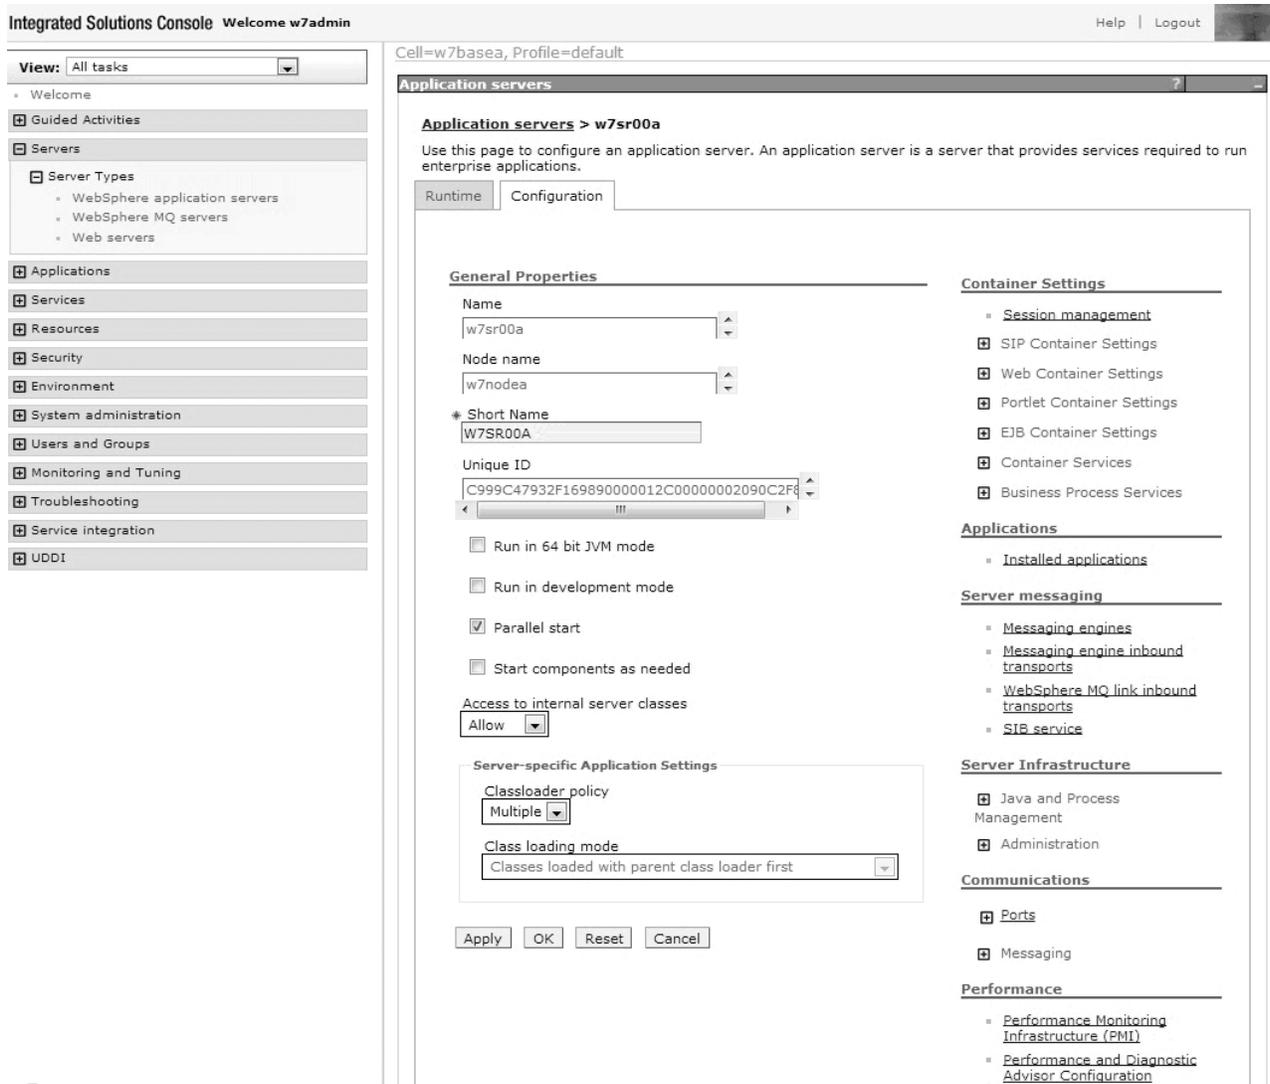

Figure 15. Assigning a port to the application server

Under Communications expand **Ports** and click **New**. Click **User-defined Port**, and in the **Specify Port name** field enter client-authenticated SSL. In the **Host** field enter \*. In the **Port** field enter 9444. See Figure 16 on page 252.

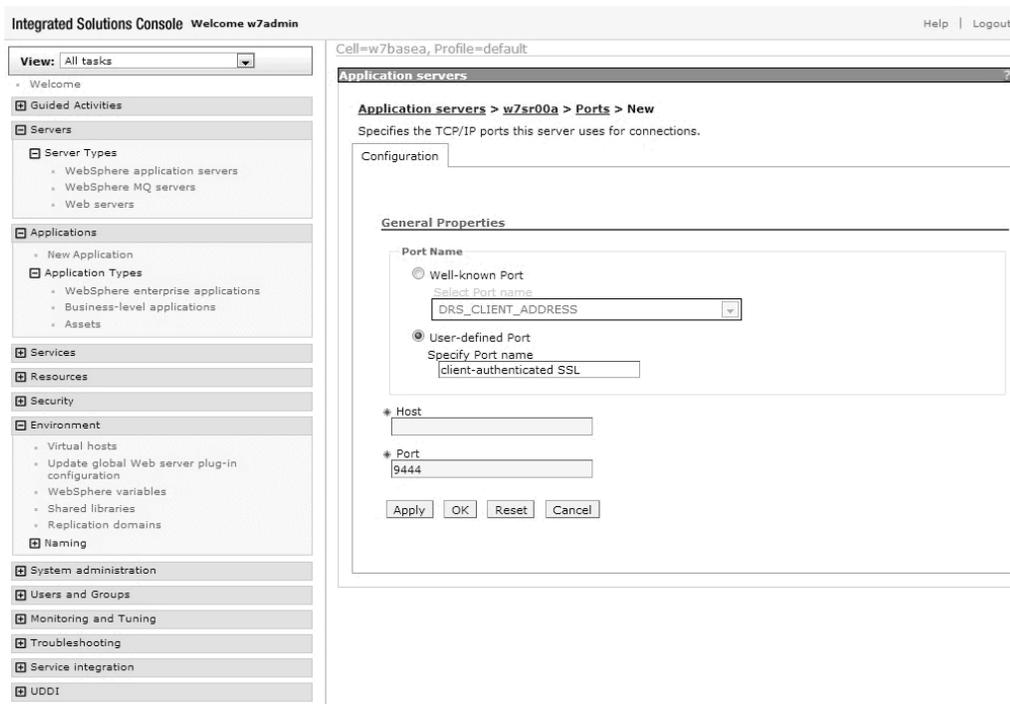

Figure 16. Assigning your new port to the application server

Click **OK** and **Save**.

8. Define transport chains associated with the new port.
  - a. On the left side of the page expand **Servers** and click **WebSphere application servers**. Click the name of your application server. Expand **web container settings**. See Figure 17 on page 253.

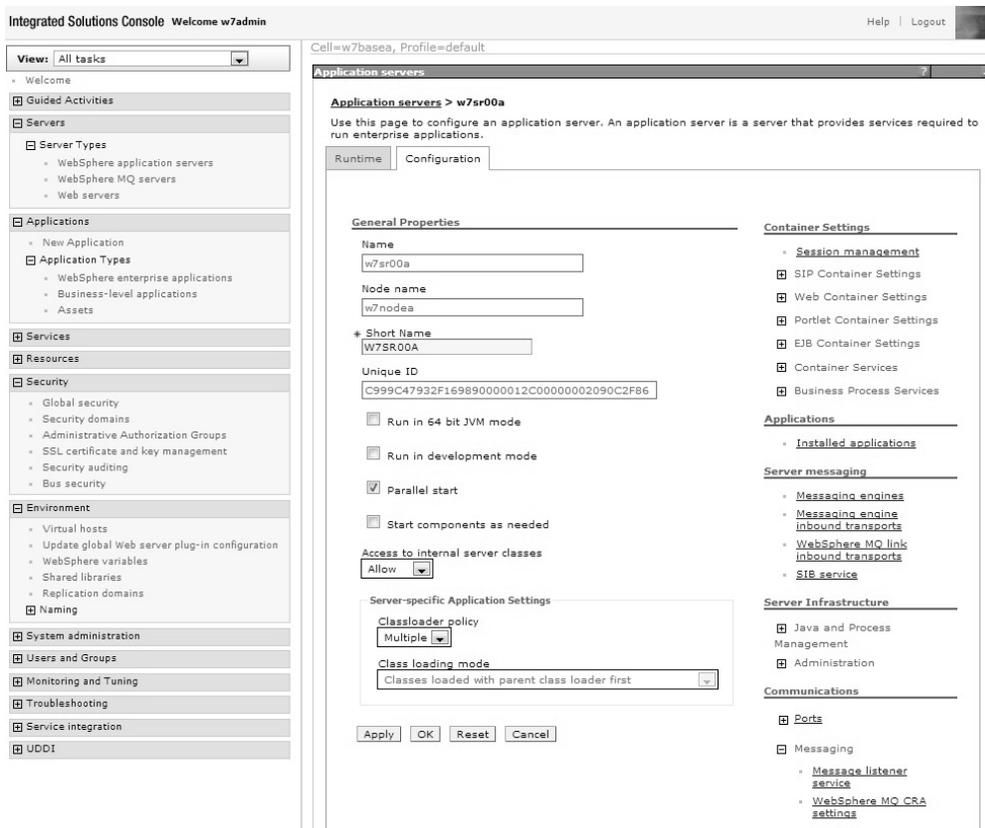

Figure 17. Selecting web container transport chains

- b. Click **web container transport chains**, and then click **New**. You should see a page like Figure 18.

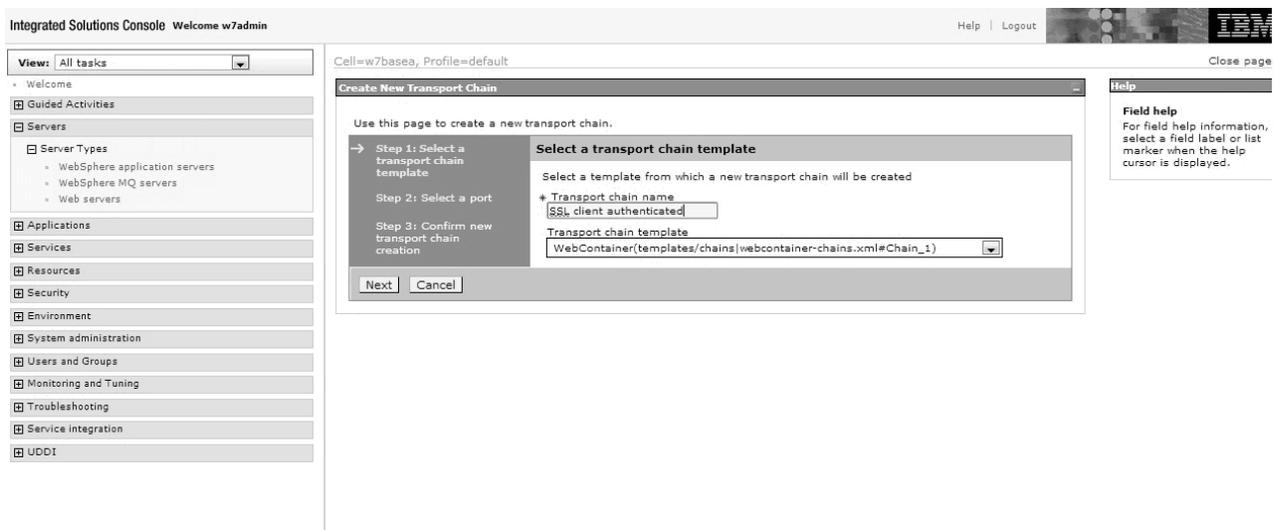

Figure 18. Selecting a transport chain template

- c. Choose a secure transport chain template and click **Next**. On the next page select **Use an existing port**, then click **Confirm** and then **Save**. A page

opens that displays all existing transport chains. See Figure 19.

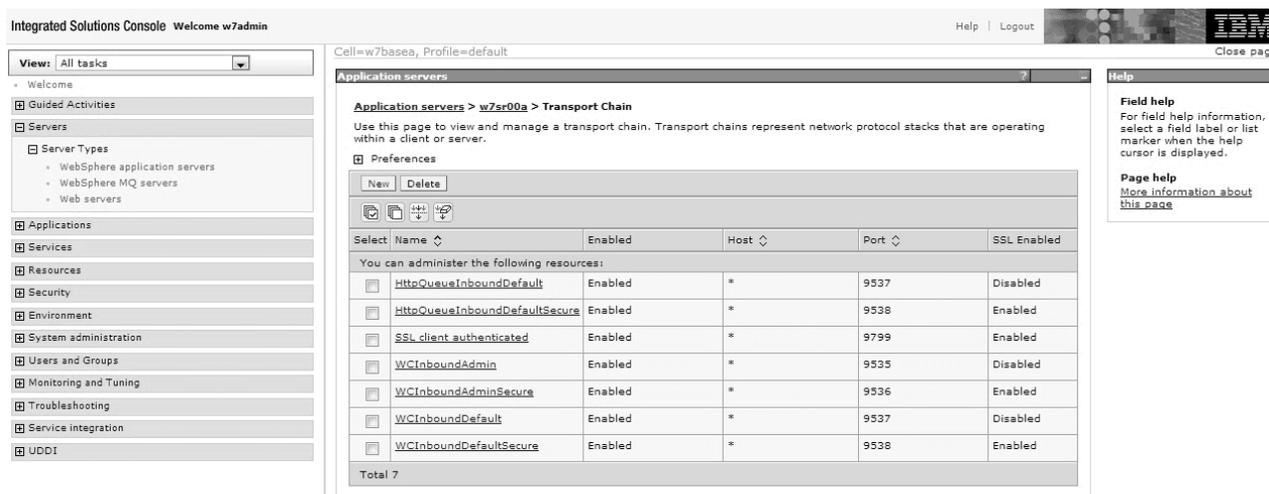

Figure 19. All existing transport chains

- d. Click the name of the chain you defined, then click **SSL inbound channel**. Set the SSL inbound channel properties to use the SSL configuration you defined (which requires client authentication). See Figure 20.

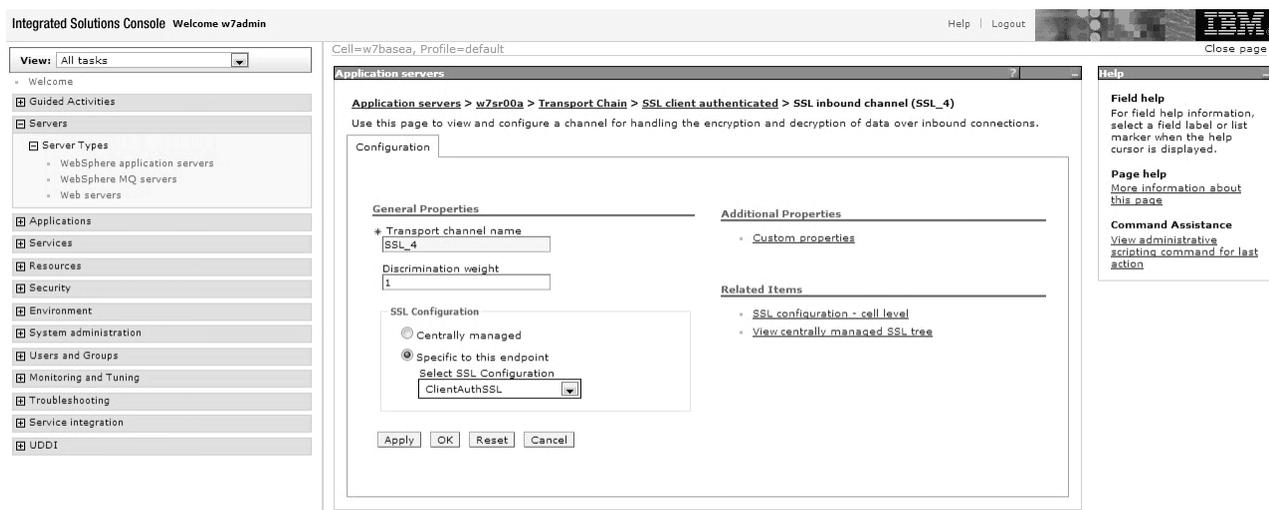

Figure 20. Setting the SSL inbound channel properties

9. Stop and restart the WebSphere server so that your changes take effect.

## Results

When you are done, you set up a WebSphere SSL configuration that uses client authentication so that users can renew and revoke browser certificates.

## Customizing the PKI Services web application

To customize the PKI Services web application, you need to perform the following tasks:

1. Update the template file.
2. (Optional) Modify the JSP files and update the EAR file with the modified JSP files.
3. Deploy the EAR file to a WebSphere Application Server

### Updating the template file

You can customize the PKI Services web application by modifying the default copies of the template file, `pkitempl.xml`. Any time that you update `pkitempl.xml`, you need to create an equivalent copy of `pkixgen.tmp`. You do this using the TemplateTool utility. For more information, see “Using the TemplateTool utility” on page 425.

### (Optional) Modifying the JSP files and the EAR file

After you update the template file, you can optionally perform additional customization on the PKI Services web application by modifying the JSP files. You might want to modify the JSP files in the directory `mod_inc`. You can modify any line that is not marked with a comment saying that it cannot be modified. You also might want to modify JSP files in the directories `Customers` and `PKIServ`. You cannot modify JSP files in the directory `not_mod_inc`. For information about what files are contained in each directory, see “Directories for JSP files” on page 261.

**Example:** This example shows how you could customize a JSP file. `notbefore.jsp` is a JSP file in `mod_inc`. The portion of this file that displays the prompt and the options is shown in Figure 21, without customization.

```
⋮
Number of days after today before the certificate becomes current<<%=optional_str %>

<SELECT NAME="notbefore">
<OPTION VALUE="0"
<% if (initvalue_str.equalsIgnoreCase("0")) out.print(" SELECTED "); %>
>0
<OPTION VALUE="30"
<% if (initvalue_str.equalsIgnoreCase("30")) out.print(" SELECTED "); %>
>30
</SELECT>
```

Figure 21. A portion of the JSP file `notbefore.jsp`, without customization

You could customize this code to reword the prompt and add an option of 7 days, as shown in Figure 22 on page 256.

```

:
Number of days after today before the certificate is valid<%=optional_str %>

<SELECT NAME="notbefore">
<OPTION VALUE="0"
<% if (initvalue_str.equalsIgnoreCase("0")) out.print(" SELECTED "); %>
>0

<OPTION VALUE="7"
<% if (initvalue_str.equalsIgnoreCase("7")) out.print(" SELECTED "); %>
>7

<OPTION VALUE="30"
<% if (initvalue_str.equalsIgnoreCase("30")) out.print(" SELECTED "); %>
>30
</SELECT>

```

Figure 22. A portion of the JSP file `notbefore.jsp`, with customization

An enterprise archive (EAR) file is a specialized Java archive (JAR) file, used to deploy Java EE applications to Java EE application servers. PKI Services ships a default EAR file in the directory `/usr/lpp/pkiserv/pkijsp`. If you make changes to the JSP files for the PKI Services web application, you need to update the EAR file to include your changes.

### Steps for updating the EAR file:

Perform the following steps to update the EAR file

#### Before you begin

You must have the `jar` command in your path. If you do not, define the `JAVA_HOME` variable (you can find its value on the WebSphere administration console) and add the `$JAVA_HOME/bin` directory to your path. For example:

```

export JAVA_HOME=/WebSphere/V6R1/AppServer/java
export PATH=$JAVA_HOME/bin:$PATH

```

#### Procedure

1. (Optional) Set up a directory to use just for updating the EAR file and make this your working directory. For example:

```

cd $HOME
mkdir pki_ear
cd pki_ear

```

2. Copy the EAR file that you are using to the working directory. The default version shipped with PKI Services is in the file `PKIServ.ear` in the directory `/usr/lpp/pkiserv/pkijsp`. For example:

```

cp /usr/lpp/pkiserv/pkijsp/PKIServ.ear .

```

3. Expand the EAR file using the `jar` command. For example:

```

jar -xvf /usr/lpp/pkiserv/pkijsp/PKIServ.ear

```

4. Expand the file `PKIServ_Web_war`:

```

jar -xvf PKIServ_Web.war

```

5. Change to the modifiable include directory:

```
cd mod_inc
```

---

6. The JSP files are in ASCII (ISO8859-1 code page). To edit them on z/OS, you must convert them to EBCDIC. Use **iconv** to convert a file to EBCDIC. For example, to convert the file `footer.jsp` to EBCDIC, enter:

```
iconv -f iso8859-1 -t ibm-1047 footer.jsp > $HOME/footer.jsp.edit
```

---

7. Use **oedit** to edit the edit file that you created:

```
oedit $HOME/footer.jsp.edit
```

---

8. Use **iconv** to convert the edited file back to ASCII. For example:

```
iconv -t iso8859-1 -f ibm-1047 $HOME/footer.jsp.edit > footer.jsp
```

---

9. Go back to the directory containing the WAR and EAR files, and update the WAR file with the edited and reconverted JSP file:

```
cd ..  
jar -uvf PKIServ_Web.war mod_inc/footer.jsp
```

---

10. Update the EAR file with the updated WAR file:

```
jar -uvf PKIServ.ear PKIServ_Web.war
```

---

11. Make sure the `PKIServ.ear` file is publicly readable by issuing the **chmod** command.

```
chmod 755 PKIServ.ear
```

---

## Results

When you are done, you updated the JSP files, and updated the EAR file to include the updated JSP files. You can now deploy your updated EAR file to a WebSphere Application Server.

## Deploying the EAR file to a WebSphere Application Server

To use the JSP files for the PKI Services web application, a WebSphere administrator must deploy them to a WebSphere Application Server.

### Steps for deploying the EAR file to a WebSphere Application Server:

Perform the following steps to deploy the EAR file to a WebSphere Application Server.

#### Before you begin

You need to have WebSphere administration skills. You might need to refer to information in the WebSphere information center at WebSphere Application Server Library (<http://www.ibm.com/software/webservers/appserv/was/library/>)

#### Procedure

1. Log on to the WebSphere administrative console.

---

2. Create a new shared library.

- a. In the left pane, click **Environment > Shared Libraries**.
- b. Click **New** to add a shared library. The window shown in Figure 23 opens.

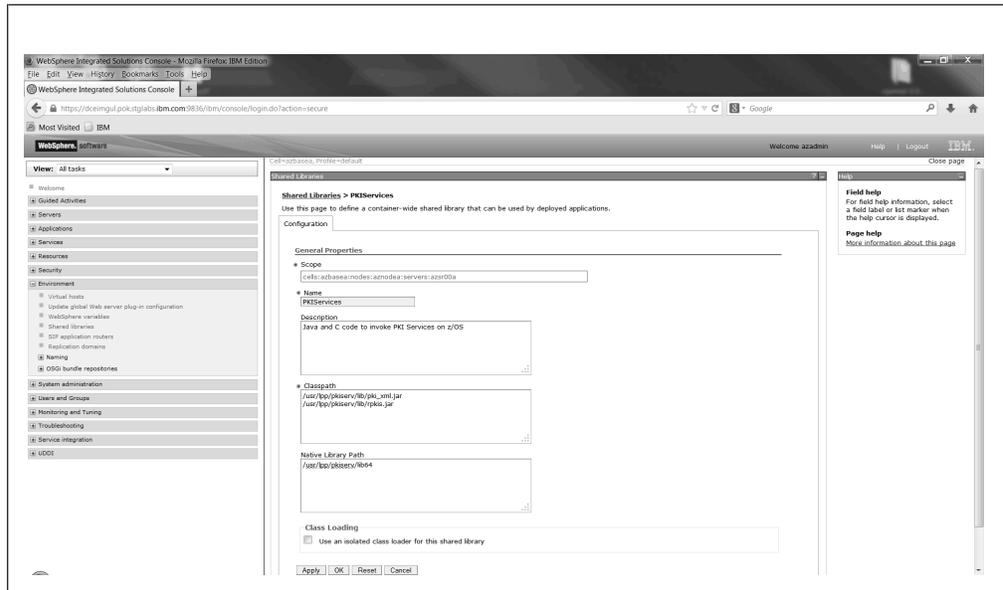

Figure 23. The WebSphere Shared Libraries window

- c. In the **Scope** field, select a scope that includes the server where you deploy the PKI Services JSPs (PKIServ\_EAR).
- d. In the **Name** field enter PKIServices.
- e. Optionally enter a description in the **Description** field; for example, Java and C code to invoke PKI Services on z/OS.
- f. In the **Classpath** field, enter the following two lines:
 

```
/usr/lpp/pkiserv/lib/pki_xml.jar
/usr/lpp/pkiserv/lib/rpkis.jar
```
- g. In the **Native Library Path** field, enter:
 

```
/usr/lpp/pkiserv/lib64
```

**Note:**

If running WebSphere Application Server in 31-bit mode, enter:  

```
/usr/lpp/pkiserv/lib
```

- h. Click **OK**. A message is displayed indicating that changes have been made to your local configuration. See Figure 24.

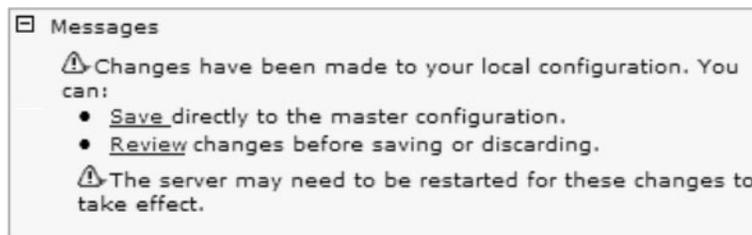

Figure 24. Message indicating that changes have been made to your local configuration.

- i. Click **Save** to save the changes to the master configuration.
- 
3. Deploy the enterprise archive (EAR) file.
    - a. In the left pane, click **Applications > Enterprise Applications**.
    - b. Click **Install**. The window shown in Figure 25 opens.

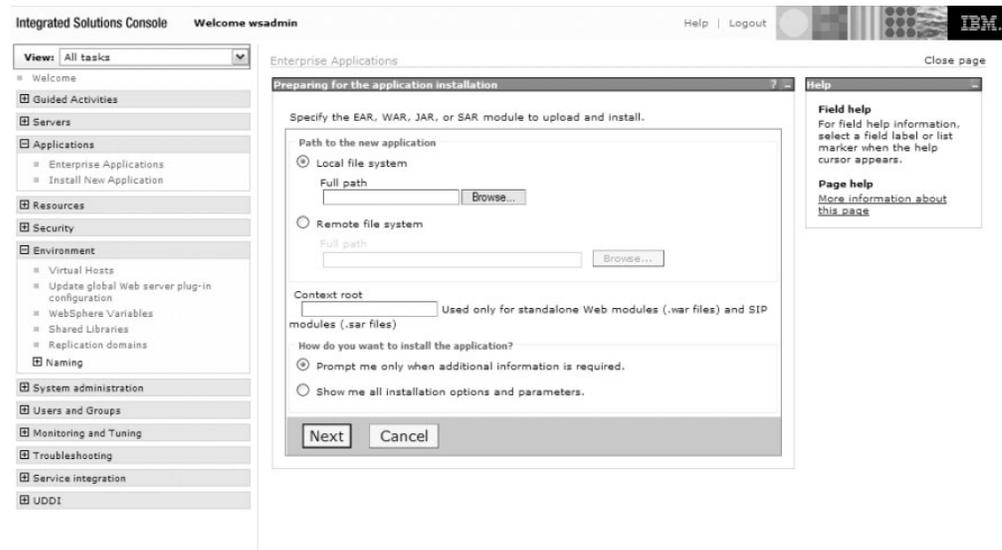

Figure 25. Window for specifying the EAR file

- c. Click **Remote file system**, and click **Browse**.
  - d. Click the icon for the z/OS system. The root directory is displayed. Continue selecting until you reach:  

```
/usr/lpp/pkiserv/pkijsp/PKIServ.ear
```
  - e. Click **OK** and **Next**. Continue clicking **OK** and **Next** or **Finish** until you see a message saying that the EAR was installed and the message shown in Figure 24 on page 258 indicating that changes have been made to your local configuration. (If you have more than one application installed into WebSphere Application Server, you might see a window where you must select a server to which you want to map modules before you click **Next**.)
  - f. Click **Save** to save the changes to the master configuration.
- 
4. Associate the PKI Services shared library with the PKI Services application.
    - a. In the left pane, click **Applications > Enterprise Applications**. Click **PKIServ\_EAR**. The window shown in Figure 26 on page 260 opens.

Figure 26. Application properties page

b. Click **Shared Library References**. The window shown in Figure 27 opens.

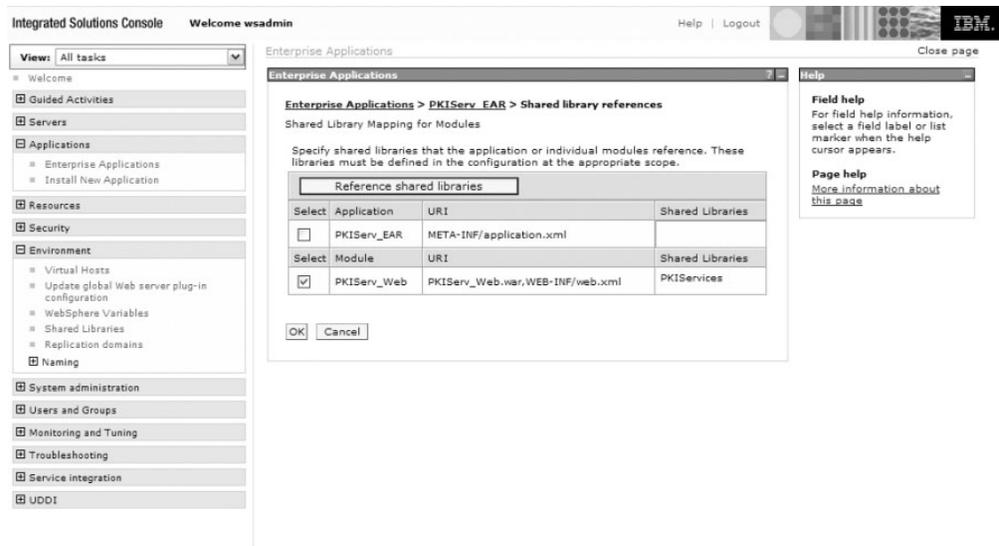

Figure 27. Shared library mapping for modules page

- c. Select the **PKIServ\_Web** check box and click **Reference Shared Library**.
- d. Add the PKI Services shared library to the Selected list and click OK.
- e. Select the **PKIServ\_EAR** check box and click **Reference Shared Library**.
- f. Add the PKI Services shared library to the Selected list and click OK.
- g. Again you see the message shown in Figure 24 on page 258 indicating that changes have been made to your local configuration. Click **Save** to save the changes to the master configuration.

## Results

When you are done, you have deployed the PKI Services JSP files to a WebSphere Application Server. You can now begin using the customized PKI Services web application.

---

## Directories for JSP files

The JSP files are shipped in PKIServ\_Web.war in PKIServ.ear and are in the following directories:

- Customers

JSPs used by end users. Each JSP file in this directory defines all HTML and script for an entire end-user web page. Each file starts with an `<HTML>` tag and ends with a `</HTML>` tag. JSP files in this directory can be modified, but contain lines of Java processing that cannot be modified. Lines that cannot be modified are identified with comments. Table 45 on page 262 lists the JSP files in this directory.

- PKIServ

JSPs used by administrators. Each JSP file in this directory defines all HTML and script for an entire administrator web page. Each file starts with an `<HTML>` tag and ends with a `</HTML>` tag. JSP files in this directory can be modified, but contain lines of Java processing that cannot be modified. Lines that cannot be modified are identified with comments. Table 46 on page 262 lists the JSP files in this directory.

- mod\_inc

Modifiable include files. Each JSP file in this directory defines HTML and script (JavaScript) that might be used on multiple web pages, such as running headers or footers for a page, or a form field element (including JavaScript to verify the input). (If you are familiar with the text template file, `pkiserv.tmp1`, used with the REXX CGIs, these modifiable include files generally correspond to an INSERT section.) Installations are likely to want to customize the code in these files. Some parts of these files cannot be modified and these parts are identified by comments in the file. Table 47 on page 263 lists the JSP files in this directory. “Customizing the PKI Services web application” on page 255 shows an example of customizing a JSP file in this directory.

- not\_mod\_inc

Non-modifiable include files. Each JSP file in this directory defines HTML and script that might be used on more than one web page, and should not be modified.

- domain\_specific

Contains `selectCAdomain.jsp`, which an installation would modify if it had multiple domains with a single administrator.

- WEB-INF

Contains supporting Java classes, including servlets, that an installation is not expected to modify, and `web.xml`, which an installation needs to modify to add additional applications or domains. (See “Creating application domains when you use JSPs to implement the web application” on page 285.)

Table 45. JSP files in the Customers directory

File name	Description
pkimain.jsp	Starting point for all tasks available to the end user, such as requesting a new certificate, picking up a previously requested certificate, renewing or revoking a previously issued browser certificate, or recovering a certificate whose key was generated by PKI Services
certrequest.jsp	Web page to request a certificate.
certretrieve.jsp	Web page to retrieve a certificate.
genericbad.jsp	Displays error information when processing fails.
genericok.jsp	Notifies the user of successful processing when no additional information (such as a transaction ID) needs to be returned to the user.
installcert.jsp	Contains HTML and JavaScript, functions to install an automatically renewed certificate that is copied from an email notification if using the Internet Explorer browser.
keygenrequestok.jsp	Notifies the user of a successful certificate request with PKI-generated keys, and includes the email address where notification has been sent.
pkcs10retrieved.jsp	Returns a retrieved PKCS #10 certificate.
qrecover.jsp	Implements the web page to recover a certificate.
recoverbad.jsp	Displays information for an unsuccessful attempt to find certificates for which the private key is to be recovered.
recoverok.jsp	Displays results of a successful attempt to find certificates for which the private key is to be recovered.
renew_revoke.jsp	Displays a client-authenticated browser certificate for the user to renew, revoke, or suspend.
requestok.jsp	Returns results (such as the transaction ID) of a successful certificate request.
requestbad.jsp	Returns error information for an unsuccessful certificate request.
retrievebad.jsp	Returns error information for an unsuccessful attempt to retrieve a certificate.

Table 46. JSP files in the PKIServ directory

File name	Description
actcertok.jsp	Returns results of a successful certificate action, such as deleting, revoking, suspending, or resuming a certificate.

Table 46. JSP files in the PKIServ directory (continued)

File name	Description
actcertbad.jsp	Returns error information for an unsuccessful certificate action, such as deleting, revoking, suspending, or resuming a certificate.
actrequestok.jsp	Returns results of a successful action on a certificate request, such as approving, rejecting, or deleting.
acttrequestbad.jsp	Returns error information for an unsuccessful action on a certificate request, such as approving, rejecting, or deleting.
adminmain.jsp	The main PKI Services administration page, from which the administrator can search certificates or certificate requests, or enter a specific transaction ID or serial number to act upon.
admhome.jsp	The PKI Services administration home page, which contains links to the end-user home page for each application and to the main PKI Services administration web page (admain.jsp)
approvewithmods.jsp	Displays the form for an administrator to approve a certificate request with modifications.
certdetailsbad.jsp	Displays error information for a failed attempt to display the details of a certificate.
certdetailsok.jsp	Displays details of a single certificate.
genericfailure.jsp	Displays error information when the requested administration processing fails.
modifybad.jsp	Displays error information when an approve with modifications action fails.
modifyok.jsp	Displays results of successful approve with modification action.
querycertok.jsp	Displays search results when administrator queries certificates.
queryreqok.jsp	Displays search results when administrator queries certificate requests.
reqdetailsok.jsp	Displays details of a single certificate request.

Table 47. JSP files in the mod.inc directory

File name	Description
adminbottomnav.jsp	Bottom of page navigation appearing on administrator's web pages
adminfooter.jsp	Bottom footer (the last element) on administrator's web pages
altdomain.jsp	Form field for altdomain
altemail.jsp	Form field for altemail
altipaddr.jsp	Form field for altipaddr

Table 47. JSP files in the mod.inc directory (continued)

File name	Description
altother_1_2_3_4_5.jsp	altother form field sample for OID 1.2.3.4.5
altother_1_2_3_4_6.jsp	altother form field sample for OID 1.2.3.4.6
altother_1_3_6_1_4_1_311_20_2_3.jsp	altother form field sample for OID 1.3.6.1.4.1.311.20.2.3
alturi.jsp	Form field for alturl
autorenew.jsp	Form field for autorenew
bottomnav.jsp	Bottom of page navigation on end user web pages
businesscat.jsp	Form field for BusinessCat
certrow.jsp	Displays a row in a table about certificates, format tied to PKIServ/certdetail sok.jsp
challengepassphrase.jsp	Displays passphrase form field when user is prompted to match the passphrase previously entered
clientname.jsp	Form field for clientname
commonfunctions.jsp	Contains JavaScript functions that are commonly used, such as trim()
commonname.jsp	Form field for commonname
country.jsp	Form field for country
CustomExt.jsp	The HTML and JavaScript for defining custom certificate extensions.
date.jsp	Displays validity period form fields as two dates, the date the certificate becomes valid, and the date the certificate expires, used on approve with modification processing
dnqualifier.jsp	Form field for distinguished name qualifier
domainname.jsp	Form field for domain name
emailaddr.jsp	Form field for emailaddr
extkeyusage.jsp	Form field for extended key usage
footer.jsp	Footer (last element) on end users pages
hostidmap.jsp	Form field for host id mapping
jurcountry.jsp	Form field for JurCountry
jurlocality.jsp	Form field for JurLocality
jurstateprov.jsp	Form field for JurStateProv
keysize.jsp	Form field for keysize
keyusage.jsp	Form field for key usage
label.jsp	Form field for label
locality.jsp	Form field for locality
mail.jsp	Form field for mail
notafter.jsp	Form field for the number of days the certificate should be valid (from the time of request)
notbefore.jsp	Form field for the number of days before the certificate should be valid

Table 47. JSP files in the *mod.inc* directory (continued)

File name	Description
notifyemail.jsp	Form field for notifyemail
org.jsp	Form field for org
orgunit.jsp	Form field for orgunit
passphrase.jsp	Form field for user to enter passphrase
postalcode.jsp	Form field for postal code
publickey.jsp	“Public key” form field, text box for entering base64-encoded PKCS #10 certificate request
publickey_smartcard.jsp	The HTML and JavaScript for the public key form field, when the browser provides the public key after the user selects from a list of available cryptographic providers.
recoveremail.jsp	recoveremail form field
requestor.jsp	Requestor form field (with prompt for name for tracking this request)
requestor2.jsp	Requestor form field (with prompt for email address of requestor)
security.jsp	Displays a form field for entering a response to a security question
security2.jsp	Displays a form field for entering a response to a second security question
serialnumber.jsp	Form field for entering a certificate’s serial number
signwith.jsp	Form field for selecting the signer of the requested certificate
stateprov.jsp	Form field for stateprov
street.jsp	Form field for street
title.jsp	Form field for title
transactionid.jsp	Form field for entering a certificate request’s transaction ID
uid.jsp	Form field for uid
unstructaddr.jsp	Form field for unstructaddr
unstructname.jsp	Form field for unstructname
userid.jsp	Form field for userid

---

## Chapter 14. Advanced customization

This topic describes the advanced customization procedures available for PKI Services. All are optional.

- “Scaling for high volume installations”
- “Using certificate policies” on page 268
- “Updating the signature algorithm” on page 271
- “Customizing distribution point CRLs” on page 274
- “Enabling support for large CRLs” on page 281
- “Using the OCSP responder” on page 283
- “Creating a distribution point ARL” on page 280
- “Adding an application domain” on page 283
- “Adding a new CA domain” on page 287
- “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303
- “Customizing email notifications sent to users” on page 309
- “Setting up automatic renewal of certificates” on page 315
- “Setting up PKI Services to generate keys for certificate requests” on page 316
- “Adding custom extensions to certificates” on page 319

---

### Scaling for high volume installations

Some PKI Services installations manage many certificates and certificates requests. The following guidelines can help you scale your system to maintain high performance in a high volume environment.

#### Guidelines:

1. Use distribution point CRLs if you average more than 500 revoked non-expired certificates at any given time. For more information, see “Customizing distribution point CRLs” on page 274.
2. If you anticipate having many certificate requests pending approval at any given time, implement a PKI exit to automate the approval process. (For more information, see Chapter 15, “Customizing with installation exit routines,” on page 325.) This need arises from the human limitation rather than a technical one because it becomes nearly impossible to manually approve the requests when the volume grows too high.
3. To prevent name collisions in the LDAP directory, ensure that the subject distinguished names are unique. This can either be done by implementing a PKI exit to supply a unique name, or by enforcing the use of the MAIL= distinguished name attribute where you require the email address to be unique.
4. Queries against the request or ICL database can time out if the database contains many records. The performance of the query can be vastly improved by supplying the requester's name as additional search criteria if the saved requester data is meaningful to your organization and it is recallable. In this case, a PKI exit can be used to supply a meaningful value, such as a Lotus® Notes® short name or customer account number.

## Advanced customization

5. Keep the size of the request and ICL databases small by quickly removing records that are no longer needed. This can be done by setting low values for the following fields in the **ObjectStore** section of the PKI Services configuration file (`pkiserv.conf`):
  - `RemoveCompletedReqs`
  - `RemoveInactiveReqs`
  - `RemoveExpiredCerts`

---

## Using certificate policies

Certificates can contain a CertificatePolicies extension. This extension contains policy information, such as how your CA operates and the intended purpose of the issued certificates. (For more information about this extension, see *RFC 5280: Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile* at <http://www.ietf.org/rfc/rfc5280.txt>.)

The CertificatePolicies extension contains one or more PolicyInformation sequences. (Typical usage has just one of these.) The PolicyInformation sequence has the following format:

- Your Policy OID as registered with the appropriate standards organization (ISO or ITU)
- Zero or more PolicyQualifiers sequences, each having the following information:
  - Either a Certificate Practices Statement (CPS) URI
  - Or a UserNotice sequence, which consists of one or both of the following text strings:
    - A notice that is intended to be viewed by customers using the certificate such as copyright or other legal information
    - Your organization's legal name with one or more notice numbers defined elsewhere, perhaps in your CPS.

By default, PKI Services does not include this extension in the certificates it creates. However, you can define your own CertificatePolicies extension by modifying fields in the **CertPolicy** section of the `pkiserv.conf` configuration file. You can also specify the `PolicyRequired` value to indicate whether a CertificatePolicies extension should be created for all certificate templates on a global basis or whether one is individually created based on the specifications of each certificate template.

### **PolicyRequired=T**

Indicates that the CertificatePolicies extension is added to all certificates, and includes all `PolicyName` values specified in the `pkiserv.conf` file. Policies that are specified in the `CertPolicies` input parameter or listed in the `CONSTANT` section of the template used to generate the certificate are ignored.

See “Steps for creating the CertificatePolicies extension on a global basis” on page 269.

### **PolicyRequired=F (default)**

Indicates that the CertificatePolicies extension is added to certificates only when a certificate policy is specified in the `CertPolicies` input parameter or in the template when a certificate is requested. If you are implementing the web application using REXX CGI execs, the specification is done in the `CONSTANT` section of `pkiserv.tmpl`. If you are using JavaServer pages (JSPs), the specification is done with the `CertPolicies` tag in `pkitmpl.xml`.

See “Steps for creating the CertificatePolicies extension on a template basis” on page 270.

**Note:** PolicyCritical is ignored unless PolicyRequired=T. When PolicyRequired=F, setting %%Critical=CertPolicies%% in the CONSTANT section of the template marks the extension critical.

**Restriction:** When policies are specified within an individual template, the policy data is saved with the request at the time the request is submitted or modified. Therefore, if PKI Services is stopped and restarted to make changes in the policy data before the certificate is issued, the changes are not reflected in the issued certificate. However, the PolicyRequired=F setting is checked at the time the certificate is issued. Therefore, if PKI Services is stopped and restarted to make changes to the PolicyRequired setting before the certificate is issued, the new setting is used to determine which policy information is used (the global policy data or the data saved with the request.)

## Steps for creating the CertificatePolicies extension on a global basis

Perform the following steps to create your own CertificatePolicies extension on a global basis:

1. Edit the pkiserv.conf configuration file and find the **CertPolicy** section.

- 
2. Change the value of PolicyRequired to T (True) as in the following line:  
PolicyRequired=T

- 
3. If you want to have the extension marked critical (this is not suggested), set the PolicyCritical equal to T (True) as in the following line:  
PolicyCritical=T

- 
4. Go to the **OIDs** section of the pkiserv.conf configuration file. By default (as shown in the following example), the name is MyPolicy=1.2.3.4 and value is 1.2.3.4. The value of MyPolicy should be an installation-specific (registered) Object ID identifying your organization's certificate. Replace the value of MyPolicy in the following line with your Object ID.

**Example:**

```
[OIDs]
MyPolicy=1.2.3.4
```

Optionally, change the parameter name MyPolicy to your own installation-specific name. If you change the parameter name in this step, make a note of it. You need it for the next step. You can repeat the MyPolicy parameter using unique names and values if you need to define multiple policies.

**Example:**

```
MyPolicy=1.2.3.4
MyOtherPolicy=2.3.4.5
```

- 
5. If you changed the parameter name MyPolicy in the previous step, go back to the **CertPolicy** section and update the PolicyName1 line to change the MyPolicy parameter to the policy name you specified in the **OIDs** section:

## Advanced customization

```
[CertPolicy]
PolicyName1=MyPolicy
```

---

6. If you want to add qualifiers, perform the following steps:
  - a. Uncomment the following lines by removing the “#” characters and update the Policy1Org and Policy1Notice*n* fields:

```
#Policy1Org=MyOrganization
#Policy1Notice1=3
#Policy1Notice2=17
```

### **Policy1Org**

Your organization's name, for example, International Business Machines, Inc.

### **Policy1Notice1 through Policy1Notice*n***

Your notice numbers. (You might need more than one Policy1Notice*n* line, depending on how many notice numbers you have. Repeat the line as needed, by incrementing the suffix number on the keyword, for example Policy1Notice1, Policy1Notice2, and so forth.)

- b. Change the value of the UserNoticeText1 line shown in the following sample. The *statement* should be your notice text string, for example, Certificate for IBM internal use only. It cannot be longer than 200 characters, and must not contain embedded control characters (such as tab, carriage return, and line feed).

```
UserNoticeText1=statement
```

**Note:** Starting in z/OS V2R1, PKI Services encodes the UserNoticeText1 data as a UTF8String. In earlier releases it was encoded as a VisibleString, which is not allowed by RFC 5280.

- c. Change the value of the CPS1 line shown in the following sample. The value should be your CPS URI, for example, <http://www.ibm.com/cps.html>.

```
CPS1=http://www.mycompany.com/cps.html
```

If you do not want to add qualifiers, delete or comment out (by inserting a # character at the start of the line) the preceding lines.

---

7. If you need multiple qualifiers, repeat the following fields as needed, incrementing the suffix numbers, for example:

```
PolicyName2=MyOtherPolicy
Policy2Org=International Business Machines, Inc.
Policy2Notice1=5
Policy2Notice2=9
UserNoticeText2=Certificate is intended for testing only
CPS2=http://www.ibm.com/cps2.html
```

---

8. If you made any changes to the PKI Services configuration, stop, and restart PKI Services to activate the changes.
- 

## Steps for creating the CertificatePolicies extension on a template basis

Perform the following steps to create your own CertificatePolicies extension on an individual template basis:

1. Edit the pki serv.conf configuration file and find the **CertPolicy** section.

- 
2. Change the value of `PolicyRequired` to F (False) as in the following line:

```
PolicyRequired=F
```

---

3. Follow steps 4 on page 269 through 7 on page 270 in “Steps for creating the CertificatePolicies extension on a global basis” on page 269 to create the individual policies you need.
- 

4. Update the certificate template to specify the CertificatePolicies extensions that are to be created for it.

- **If you are implementing the web application using REXX CGI execs:** Edit `pkiserv.tmpl` and customize the CONSTANT subsection under the certificate template for which you need CertificatePolicies extensions.

For example, if you have specified values for `PolicyName1`, `PolicyName3`, and `PolicyName6` in `pkiserv.conf`, then you can specify the certificate policies in `pkiserv.tmpl` in the following ways:

```
%%CertPolicies=3%%
or
%%CertPolicies=3 6%%
or
%%CertPolicies=1 3 6%%
```

If you want to make the `CertPolicies` extension critical, specify the following in the CONSTANT section:

```
%%Critical=CertPolicies%%
```

- **If you are implementing the web application using JavaServer pages (JSPs):** Edit `pkitmpl.xml` and customize the section for the certificate template for which you need CertificatePolicies extensions.

For example, if you have specified values for `PolicyName1`, `PolicyName3`, and `Place-name` in `pkiserv.conf`, then you can specify the certificate policies in `pkitmpl.xml` in the following ways:

```
<tns:CertPolicies>3</tns:CertPolicies>
or
<tns:CertPolicies>3 6</tns:CertPolicies>
or
<tns:CertPolicies>1 3 6</tns:CertPolicies>
```

If you want to make the `CertPolicies` extension critical, specify the following tag in the certificate template section:

```
<tns:Critical>CertPolicies</tns:Critical>
```

**Rule:** The policy numbers in the template file must exist in the `pkiserv.conf` file. For each template, you can choose a different subset of these numbers.

---

5. If you made any changes to the PKI Services configuration, stop and restart PKI Services to activate the changes.
- 

## Updating the signature algorithm

The signature algorithm that PKI Services uses to sign certificates must be based on the key type of the CA certificate. If it is not, PKI Services is unable to start. By default, IKYSETUP creates the CA certificate with an RSA key pair. The default value of the signature algorithm in the `pkiserv.conf` file is `sha-256WithRSAEncryption`. You can change the signature algorithm by changing

## Advanced customization

the `SigAlg1` value in the **CertPolicy** section of the `pkiserv.conf` configuration file. Set `SigAlg1` to one of the algorithm identifiers shown in Table 48 for the key type of the CA certificate.

Table 48. Supported signature algorithms for each CA certificate key type

CA certificate key type	Algorithm nickname	Algorithm OID
RSA	sha-1WithRSAEncryption	1.2.840.113549.1.1.5
	sha-224WithRSAEncryption	1.2.840.113549.1.1.14
	sha-256WithRSAEncryption	1.2.840.113549.1.1.11
	sha-384WithRSAEncryption	1.2.840.113549.1.1.12
	sha-512WithRSAEncryption	1.2.840.113549.1.1.13
DSA	id-dsa-with-sha1	1.2.840.10040.4.3
	id-dsa-with-sha224	2.16.840.1.101.3.4.3.1
	id-dsa-with-sha256	2.16.840.1.101.3.4.3.2
ECC	ecdsa-with-sha1	1.2.840.10045.4.1
	ecdsa-with-sha224	1.2.840.10045.4.3.1
	ecdsa-with-sha256	1.2.840.10045.4.3.2
	ecdsa-with-sha384	1.2.840.10045.4.3.3
	ecdsa-with-sha512	1.2.840.10045.4.3.4

**Tips:** Consider these points when choosing the signature algorithm:

- In general, an SHA1 hash is more secure than an MD2 or MD5 hash. MD2 and MD5 have been found to be vulnerable to attack and should not be used.
- `sha-256WithRSAEncryption` is more secure than `sha-1WithRSAEncryption`, but some browsers cannot install certificates that use `sha-256WithRSAEncryption`.
- The National Institute of Standards and Technology (NIST) recommends that SHA1 not be used after the year 2010.

## Steps for changing the signature algorithm

### Before you begin

Change the signing algorithm *before* you create any certificate requests. If changing the signing algorithm *after* some certificates requests have been created, you must wait until all requests are approved and the certificates created, or else you must add a `SigAlg2=old-signing-algorithm` line to the **CertPolicy** section. If you take this second option, `SigAlg1` becomes the signature algorithm for new requests.

### Procedure

Perform the following steps to change the signature algorithm:

1. Edit the `pkiserv.conf` configuration file and find the **OIDs** section.
2. Ensure that the OID for the signature algorithm that you want to use is listed. (If you are using a version of `pkiserv.conf` from a previous release, OIDs added in later releases are missing if you have not added them.) If the OID is missing, add it by adding a line with the following format:

```
algorithm_nickname=algorithm_OID
```

where the values of *algorithm\_nickname* and the corresponding *algorithm\_OID* are from Table 48 on page 272. For example, if you want to use SHA512, `sha-512WithRSAEncryption=1.2.840.113549.1.1.13`

- Find the **CertPolicy** section. If you want to use a signature algorithm other than SHA256, change `sha-256WithRSAEncryption` in the following line to the value for the signature algorithm that you want to use. The supported values for each CA certificate key type are shown in Table 48 on page 272.

```
SigAlg1=sha-256WithRSAEncryption
```

**Note:** If your configuration file is from a release before z/OS V1R12 and contains the default value, the line for the signature algorithm is:

```
SigAlg1=sha-1WithRSAEncryption
```

---

## Certificate revocation status

PKI Services provides the following for certificate revocation status checking:

- Certificate revocation lists.

Forms of revocation lists supported are:

- The global certificate revocation list (global CRL) which represents all of the non-CA certificates that are created by an instance of PKI Services.
- The global authority revocation list (global ARL) which represents all of the subordinate CA certificates that are created by an instance of PKI Services.
- The distribution point certificate revocation lists (DP CRLs) which represent a subset of the non-CA certificates that are created by an instance of PKI Services based on the serial number of the issued certificate.
- The distribution point authority revocation list (DP ARL) which represents all the subordinate CA certificates that are created by an instance of PKI Services.
- Online Certificate Status Protocol (OCSP).

---

## How distribution point CRLs/ARLs work

PKI Services always creates a *global* CRL regardless of whether you choose to use DP CRLs. The global CRL contains revocation information for certificates that have no `CRLDistributionPoints` extension (in other words, certificates defined with `CRLDistSize=0`). When a certificate contains a `CRLDistributionPoints` extension, PKI Services publishes its revocation status to the appropriate DP CRL, not in the global CRL.

The following topics help you understand more about how DP CRLs work. This information is useful if you write applications that process CRLs.

### How DP CRLs are published

DP CRLs are published to LDAP at leaf nodes directly below the CA's entry. For example, if the CA's name is:

```
OU=My Company Certificate Authority,O=My Company,C=US
```

Then, the DP CRLs would be published to:

```
CN=DP-name,OU=My Company Certificate Authority,O=My Company,C=US
```

### How DP CRLs are partitioned

The partitioning of the overall CRL into partial CRLs is based on certificate serial number and the value of `CRLDistSize` in `pkiserv.conf`. For example, if `CRLDistSize` is 100 and `CRLDistName` is ABC, then certificates with serial numbers 1–100 appear on DP ABC1; 101–200 on DP ABC2, and so on. PKI Services dynamically creates DP CRLs as needed as a part of certificate issuance. Existing DP CRLs are refreshed along with the global CRL during CRL interval processing.

As certificates expire, they are no longer eligible for revocation and do not appear on any CRL. Therefore, over time, each distribution point becomes inactive. PKI Services automatically retires DP CRLs that become inactive by no longer publishing their CRLs. However, retired DP CRLs previously published to LDAP remain in LDAP. PKI Services makes no attempt to delete these.

Even when using distribution point CRLs, the single non-DP CRL (global CRL) is still created. Revoked certificates containing the `CRLDistributionPoints` extension appears only on the appropriate DP CRL, not the global CRL.

### What about CA certificates?

PKI Services can be used to create other subordinate certificate authority certificates. Since revocation activity against these CA certificates is normally low, PKI Services, by default, does not partition authority revocation lists (ARLs). You can choose to create a distribution point ARL in a single partition for checking the revocation status of CA certificates. (See “Creating a distribution point ARL” on page 280.) When you choose to create a DP ARL, your CA certificates contain a `CRLDistributionPoints` extension.

When you do not choose to create a DP ARL (`ARLDist=F`), applications wanting to check the revocation status of a CA certificate must check the global ARL. In addition, when `ARLDist=F`, CA certificates do not contain a `CRLDistributionPoints` extension, although they are treated as if they had the extension when determining the partitioning of the global CRL. For instance, with `ARLDist=F` and `CRLDistSize=10`, if you issue 10 CA certificates plus one non-CA certificate, the non-CA certificate information would be published to the second distribution point CRL. (The first DP CRL would remain empty.)

---

## Customizing distribution point CRLs

If your PKI Services installation is very active, many certificates can be in the revoked state at any one time. Therefore, the certificate revocation list (CRL) can become quite large, causing considerable network traffic and overhead to an application wanting to process it. Publishing partial CRLs to multiple distribution point (DP) CRLs is a way of keeping your CRLs small.

**Guideline:** Consider using distribution point CRLs if you anticipate averaging more than 500 revoked non-expired certificates at any given time.

You begin using distribution point CRLs when you accept the defaults settings contained in PKI Services configuration file (`pkiserv.conf`). You can customize those settings by specifying the number of certificates per DP CRL and by specifying the name of the DP CRL using the following two parameters in the `CertPolicy` section of the `pkiserv.conf`:

**CRLDistSize**

Specifies the maximum number of certificates to be managed by a single DP. This represents the number of entries in each DP CRL if all active certificates are revoked at once.

**CRLDistName**

Specifies the file name, or the constant portion of the leaf-node RDN, for the CRL distribution point.

You can choose to further customize your DP CRL processing to build the URI format name for the distribution point in the CRLDistributionPoints extension of each certificate. This allows your certificate validation programs to dynamically retrieve a CRL without being preconfigured with LDAP bind information. However, because bind credentials cannot be added to DP CRLs with URI format names, anonymous access is used to retrieve the CRL.

The URI format name is built in *addition* to the LDAP distinguished name of the DP CRL that is always added when CRLDistSize is greater than zero. You can add the URI format name by customizing the following two parameters in the **CertPolicy** section of the `pki serv.conf`:

**CRLDistURI**

Specifies the name for the DP CRL in the form of a URI that adds the protocol type and the server domain name.

**CRLDistDirPath**

Specifies the full path for the file system directory where PKI Services saves each DP CRL.

You can also choose to have PKI Services create a CRLDistributionPoints extension for each CA certificate in addition to non-CA certificates. You choose this by customizing the ARLDist parameter in the **CertPolicy** section of the `pki serv.conf`. This creates a distribution-point authority-revocation list (DP ARL) for your CA certificates. See “Creating a distribution point ARL” on page 280 for details.

## Specifying the URI format

When you choose to use distribution points for CRL and ARL processing, PKI Services updates the CRLDistributionPoints extension with the distinguished name for the LDAP entry where the distribution point is posted. You can choose to add another name to the extension in the URI format which contains the protocol type and the server domain name in addition to the distinguished name. With the URI format, the location of the distribution point is self-contained in the CRLDistributionPoints extension.

The URI format contains the following information:

- The protocol type (LDAP or HTTP).
- The server domain name.
- If the protocol is LDAP:
  - The distinguished name of the distribution point.
  - For non-CA certificates, the attribute string `?certificateRevocationList`.
  - For CA certificates, the attribute string `?authorityRevocationList`.
- If the protocol is HTTP, the virtual or real path name, ending with the file name - formed from the common name portion of the distinguished name of the distribution point with the `.crl` extension - where the distribution point CRL is stored.

## Advanced customization

### Examples:

```
ldap://ldap.bankxyz.com:389/CN=CRLlist1,OU=Bank XYZ  
Authority,0=Bank XYZ,C=US?certificateRevocationList
```

```
http://www.bankxyz.com/PKIServ/cacerts/CRLlist1.crl
```

**Note:** This is an example of an HTTP protocol URI using a virtual path name. When using virtual path names in an HTTP URI, a `Pass` statement is required in the HTTP configuration file to map the virtual path name to a real path name. See “Determining `CRLDistDirPath`” on page 277 for additional information.

**Restriction:** Special characters, such as spaces, quotation marks, and square brackets are not considered *safe* to use in URLs and should be encoded using the appropriate *escape* sequence. For details, see RFC 1738: *Uniform Resource Locators (URL)*.

## Determining `CRLDistURI $n$`

If you are using DP CRLs (you specified a `CRLDistSize` value greater than 1 in the `CertPolicy` section of `pkiserv.conf`), you can choose to further customize your DP CRL processing to build the URI format name for the DP CRL in the `CRLDistributionPoints` extension of each certificate. The URI format name is built in *addition* to the LDAP distinguished name of the DP CRL, as described in “Specifying the URI format” on page 275.

This is an optional parameter. If you do not specify a `CRLDistURI $n$`  value, the URI format name is not created. You can specify multiple entries for the `CRLDistURI $n$`  parameter, using the parameters `CRLDistURI1`, `CRLDistURI2`, and so forth. This value is ignored if you did not specify `CRLDistSize` with a value greater than zero. The URI format is not created if you specify `CRLDistURI $n$`  with an  $n$  value of 0.

There are different ways to specify the value of `CRLDistURI $n$`  for different protocols. **Valid values** include *one* of the following strings:

- A string that begins with the characters `http://` or `ldap://`
- A string that consists of `LdapServer $n$` , where  $n$  is greater than zero.

**Restriction:** PKI Services provides syntax checking based only on valid values for the `CRLDistURI $n$`  value. You must ensure that the URIs you choose can be accessed.

### Specifying an HTTP URI

For HTTP, specify the complete URL but do not specify the name of a file where the CRL DP is stored. The value for `CRLDistURI $n$`  can be specified with or without a trailing slash.

#### Example:

```
CRLDistURI1=http://www.bankxyz.com/PKIServ/cacerts/
```

**Note:** This is an example of an HTTP protocol URI using a virtual path name. When using virtual path names in an HTTP URI, an `AliasMatch` HTTP directive is required in the `vhost80.conf` (host file for non-SSL requests) configuration file to map the virtual path name to a real path name. See “Determining `CRLDistDirPath`” on page 277 for more information.

### Specifying an LDAP URI

For LDAP, there are two ways to indicate the `CRLDistURI $n$`  value. Choose either of the following two methods:

- Specify the protocol and the domain name (and the port, if needed). The value for `CRLDistURI $n$`  can be specified with or without a trailing slash.

**Example:**

```
CRLDistURI1=ldap://ldap.bankxyz.com:389/
```

- Specify the keyword `LdapServern` to have PKI Services build the `CRLDistURI $n$`  value for you based on a server identified by the `Servern` or `BindProfile $n$`  directives in the **LDAP** section of `pkiserv.conf`.

**Example:**

```
CRLDistURI3=LdapServer1
```

This example assumes that the first server specified in the **LDAP** section was similarly defined as one of the following examples:

**Examples:**

```
Server1=ldap.bankxyz.com:389
```

*or*

```
BindProfile1=LOCALPKI.BINDINFO.LDAP1
```

**Rules for using the `LdapServern` keyword:**

1. You must have specified a value greater than zero for `NumServers` in the **LDAP** section of `pkiserv.conf`.
2. Each server represented by the  $n$  value in the `LdapServern` keyword must be identified in *one* of the following ways:
  - The corresponding LDAP server must be identified by a `Servern` or `BindProfile $n$`  value in the **LDAP** section of `pkiserv.conf`, *or*
  - The corresponding LDAP server must be identified in the default FACILITY class profile `IRR.PROXY.DEFAULTS` and must follow the same identification requirements for PKI Services LDAP processing. See “Using encrypted passwords for LDAP servers” on page 481.

## Determining `CRLDistDirPath`

If the protocol for the URI you specified with `CRLDistURI $n$`  is HTTP protocol, you need to also determine your value for the `CRLDistDirPath` parameter. The `CRLDistDirPath` parameter specifies the full path of the `var` directory where PKI Services saves each DP CRL. The value can be specified with or without the trailing slash. The default value is `/var/pkiserv/`. If you are customizing this value for a CA Domain, you should specify a directory name that contains the CA Domain name, for example `/var/pkiserv/employees/`. In a case such as this, it is also necessary to add an additional `Pass` statement to the HTTP configuration file that maps the virtual path name in the URI to the real path specified by this `CRLDistDirPath` statement.

Statements in the `pkiserv.conf` file:

```
CRLDistURI1 = http://www.bankxyz.com/Employees/cacerts/  
CRLDistDirPath = /var/pkiserv/employees/
```

Matching `AliasMatch` HTTP directive in the `vhost80.conf` (host file for non-SSL request) configuration file.

Uncomment the `AliasMatch` HTTP directive in the `vhost80.conf` (host file for non-SSL request) configuration file.

```
#AliasMatch /Employees/cacerts/(.*) /var/pkiserv/employees/$1
```

The default value is `/var/pkiserv/`. See “Specifying the URI format” on page 275. This value is ignored if you do not create a `CRLDistributionPoints` extension or if the URI protocol is LDAP.

## Steps for customizing distribution point CRLs

### Before you begin

Be aware of the following **restrictions**:

- If running PKI Services in a sysplex, all instances of PKI Services must specify the same values for the parameters `CRLDistURIn` (for all values of *n*), `CRLDistDirPath`, `CRLDistSize`, and `CRLDistName`.
- Once a value for `CRLDistName` has been set, it must not be changed or removed from the configuration file.
- Once a nonzero value has been set for `CRLDistSize`, it must not be changed back to zero or removed from the configuration file. Adjusting the value is acceptable.

### Procedure

Perform the following steps to customize distribution point CRLs:

1. Determine your value for the `CRLDistSize` parameter based on the following algorithm. The default value specified in `pkiserv.conf` is 500. Your value should be based on your wanted average number of CRL entries per distribution point and your estimated revoked-certificate percentage as expressed by the following formula:

$$\text{CRLDistSize} = E / P$$

where:

**E** is the wanted average number of CRL entries per distribution point.

**P** is the estimated revoked-certificate percentage.

**Example:** If you estimate that 10% of the non-expired certificates are in the revoked state at any time and you want the CRLs to average about 100 entries each, then:

$$\text{CRLDistSize} = 100 / 0.10 = 1000$$

The `CRLDistSize` in bytes can be roughly estimated to be  $500 + (25 \times \text{number of CRL entries})$ . Using the example above, the average CRL size in bytes would be  $500 + (25 \times 100) = 3000$  bytes.

**Note:** The longer the CRL, the longer it takes to process it.

**Restriction:** When CRLs are posted to LDAP, a single CRL cannot exceed approximately 32 K bytes in length, unless you have enabled support for large CRLs. For more information, see “Enabling support for large CRLs” on page 281. Therefore, if a CRL is posted to LDAP and you have not enabled support for large CRLs, you must limit the length of the CRL.

#### Rules:

- a. The value of `CRLDistSize` is a numeric value from 0 - 2147483647.
- b. A nonzero value indicates that distribution point (DP) CRLs are created.
- c. A value of zero (the default) indicates that DP CRL processing is not performed.

**Guideline:** If you anticipate a low revocation rate for active certificates, use a value of **0**. Your installation might not need to use distribution point CRLs and the global CRL might be sufficient.

- 
2. If necessary, update the value of `CRLDistSize` in the **CertPolicy** section of `pkiserv.conf` to the customized value you determined in Step 1.

If you selected the 0 value for `CRLDistSize`, complete this step and then continue with Step 12 on page 280.

- 
3. Determine your value for the `CRLDistName` parameter. The default value is `CRL`. The common name portion of the distinguished name of each DP CRL is formed by appending the DP number to this value. The CA's name is also appended. (See "How DP CRLs are published" on page 273.)

**Example:**

`CN=CRL3,OU=My Company Certificate Authority,O=My Company,C=US`

**Restrictions:**

- a. The value of `CRLDistName` must contain only alphanumeric characters.
- b. The length of the entire DP distinguished name should not exceed 255 bytes. (DP distinguished names that are longer appear truncated in the `PKIDPUBR` audit record.)

- 
4. If necessary, update the value of `CRLDistName` in the **CertPolicy** section of `pkiserv.conf` to your customized value.

- 
5. Optionally, determine your value for the `CRLDistURI` parameter. Specifying this value allows PKI Services to build a URI-formatted name for the DP CRL in each `CRLDistributionPoints` extension, if you also specified a `CRLDistSize` value greater than 1 in Step 2 on page 278. The URI format name is built in *addition* to the LDAP distinguished name of the DP CRL in each `CRLDistributionPoints` extension. If you do not specify a `CRLDistURI` value, the URI format name is not created. See "Specifying the URI format" on page 275. You can specify multiple entries for the `CRLDistURI` parameter, using the parameters `CRLDistURI1`, `CRLDistURI2`, and so forth.

- 
6. If necessary, update the value of `CRLDistURI` in the **CertPolicy** section of `pkiserv.conf` to your customized value or values.

- 
7. If all the protocol definitions for the URIs you specified with `CRLDistURI` in Step 5 are the LDAP protocol, decide whether you want to enable support for large CRLs. If you choose to enable large CRLs, follow the instructions in "Enabling support for large CRLs" on page 281. Then skip to Step 10.

- 
8. If a protocol definition for the URI you specified with `CRLDistURI` in Step 5 is HTTP protocol, determine your value for the `CRLDistDirPath` parameter. The `CRLDistDirPath` parameter specifies the full path of the `var` directory where PKI Services saves each DP CRL. The default value is `/var/pkiserv/`. The value can be specified with or without the trailing slash. See "Determining `CRLDistDirPath`" on page 277.

- 
9. If necessary, update the value of `CRLDistDirPath` in the **CertPolicy** section of `pkiserv.conf` to your customized value.

- 
10. Optionally, determine your value for the `ARLDist` parameter. Specifying this parameter creates a distribution point ARL so you can check revocation status for CA certificates without accessing the global ARL. See "Creating a distribution point ARL" on page 280.

- 
11. If necessary, update the value of `ARLDist` in the **CertPolicy** section of `pkiserv.conf` to your customized value.
- 
12. If you made any updates to `pkiserv.conf`, stop and restart PKI Services to make your changes effective.
- 

**When you have finished:** If you selected a `CRLDistSize` value greater than zero, you have set up distribution point CRLs. Now, created certificates contain the `CRLDistributionPoints` extension indicating the location of the DP CRL that is checked for revocation information. If you specified a URI-formatted name with `CRLDistURIn`, now your `CRLDistributionPoints` extensions also contains a URI name for each DP CRL, containing the protocol type and server domain name. If you enabled the `ARLDist` option, you have set up a distribution point ARL for CA certificates.

---

## Creating a distribution point ARL

You can choose to create a distribution point (DP) authority revocation list (ARL) to support revocation status checking for certificate authority (CA) certificates. You choose DP ARL processing by customizing the `ARLDist` parameter in the **CertPolicy** section of the `pkiserv.conf`. If you do not customize this parameter, PKI Services does not partition the ARL and, therefore, applications must check the global ARL to check the revocation status of a CA certificate.

### **ARLDist=F (default)**

No distribution point ARL is created.

### **ARLDist=T**

When distribution point CRLs are also enabled (when `CRLDistSize` is greater than zero), you can specify **T (True)** to create a distribution point ARL.

When DP ARL processing is enabled, PKI Services provides the following support:

- Create a single distribution point (DP) for all CA certificates
- Build a `CRLDistributionPoints` extension containing both the distinguished name and the URI format for the DP. Use the same values specified (`CRLDistSize`, `CRLDistName`, `CRLDistURIn`, `CRLDistDirPath`) in the `pkiserv.conf` file for the DP CRL processing.

DP ARL processing for CA certificates is similar to the DP CRL processing for non-CA certificates with the following differences:

- There is only one DP ARL. Its name is formed by the value that is specified in the `CRLDistName` parameter in the **CertPolicy** section of the `pkiserv.conf`, appended with **0** (zero). By appending a zero, the name of the DP ARL never conflicts with the name of a DP CRL. For example, if `CRLDistName=CRL`, then the DP ARL is named `CRL0`, and the DP CRLs are named `CRL1`, `CRL2`, and so forth.
- The DP ARL is a mirror copy of the global ARL. In other words, each revoked CA certificate appears in both the DP ARL and the global ARL. By contrast, a revoked non-CA certificate is listed in the DP CRL but not in the global CRL when DP CRL processing is enabled.
- The attribute string that is appended to the URI format for the LDAP protocol is `?authorityRevocationList`. Otherwise, the `CRLDistributionPoints` extension of a CA certificate appears similar to that of a non-CA certificate. See Figure 28 on page 281

page 281 for a sample CRLDistributionPoints extension for a CA certificate. This sample contains several different name formats. Notice the URI format at the end of the sample.

```

                UTF8String (1997) 'Retail'
              }
            }
          SET {
            SEQUENCE {
              OBJECT IDENTIFIER
              commonName (2 5 4 3)
              UTF8String (1997) 'CRL0'
            }
          }
        }
      }
    }
  }
  SEQUENCE {
    [0] {
      [0] {
        [6]
        'http://cr1.MyCompany.de/CRL0.cr1'
      }
    }
  }
  SEQUENCE {
    [0] {
      [0] {
        [6]
      }
    }
  }
  '1dap://1dap.MyCompany.de/CN=CRL0,OU=Retail,O=Mycompany,C=US?authorityRevocationList'
}
}
```

Figure 28. A sample CRLDistributionPoints extension for a certificate authority (CA) certificate

## Enabling support for large CRLs

When LDAP posting of certificate revocation lists (CRLs) is enabled, by default PKI services temporarily stores CRLs in its object store for posting to LDAP. However, PKI Services imposes a limit on the size of records in the object store of approximately 32 KB, which limits the size of the CRLs stored there to approximately 32 KB. As certificates are revoked or suspended within the scope of

## Advanced customization

a CRL, the size of the CRL increases, and can exceed the limit. If a CRL exceeds the 32 KB limit, PKI Services cannot post it to the LDAP directory.

To avoid this problem, you can configure PKI Services to store CRLs for posting to LDAP in the z/OS UNIX file system instead of in the object store. The distribution point CRLs and the distribution point ARLs are stored by using the same file name format that is used when an `http format CRLDistURI` is specified. However, when large CRL support is enabled, the global CRLs and ARLs are also stored in the z/OS UNIX file system by using file names that are formed by using the `CRLDistName` value followed by `_MCRL.cr1` or `_MARL.cr1`. For example, if using `CRLDistName=CRL`, the global CRL file name is `CRL_MCRL.cr1`. When you do this, there is no limit for the size of CRLs.

**Note:** When `EnableLargeCRLPosting` is set to `T`, it is recommended that the `CRLEnhancements` keyword is enabled, by setting the value to `T`, to reduce the CPU and memory usage that is required for building CRLs and posting CRLs to LDAP.

## Steps for enabling support for large CRLs

Perform the following steps to enable support for CRLs larger than the limit of approximately 32KB.

### Before you begin

You need to be familiar with the z/OS UNIX file systems.

### Procedure

1. Configure a z/OS file system to hold CRLs. If you run multiple instances of PKI Services in a Parallel Sysplex (one per image), ensure that the file system is shared with each PKI Services instance in the sysplex. For information about managing the z/OS UNIX file system, see *z/OS UNIX System Services Planning*.
2. Set the value of the `LargeCRLPostPath` parameter in the **CertPolicy** section of the PKI Services configuration file, `pkiserv.conf`, to the full path of the `var` directory where PKI Services is to save each CRL for posting to LDAP. The default value is `/var/pkiserv/`. You can specify the value with or without the trailing slash. The value of `LargeCRLPostPath` can be the same as the value of `CRLDistDirPath`.  
**Guideline:** If you are customizing this value for a CA domain, specify a directory name that contains the CA domain name, for example `/var/pkiserv/employees/`, where `employees` is the domain name.
3. Set the value of the `EnableLargeCRLPosting` parameter in the **CertPolicy** section of the PKI Services configuration file, `pkiserv.conf`, to `T`.
4. Restart PKI Services. Your changes to the `pkiserv.conf` file do not take effect until you do this. For information about starting PKI Services see Chapter 10, "Starting and stopping PKI Services," on page 121.

### Results

When you are done, you have enabled support for large CRLs, and CRLs are no longer limited to approximately 32KB in size.

---

## Using the OCSP responder

As an alternative, or in addition to publishing revocation information with CRLs, you can choose to enable an Online Certificate Status Protocol (OCSP) responder. An OCSP responder is enabled when `OCSPType` is set to `basic` in the **CertPolicy** section of the PKI Services configuration file. See Table 21 on page 68, and the certificate contains the necessary OCSP responder information in the `AuthInfoAccess` extension. (Also, see “TEMPLATE sections” on page 142.)

To use an OCSP responder, you must add `/usr/lpp/pkiserv/lib` to the `LIBPATH` environment variable for the HTTP Server. This setting is shown by adding it to the `vhost80.conf` (host file for non-SSL requests) configuration file by using the `SetEnv HTTP` directive.

---

## Adding an application domain

This topic describes adding a new application domain. If you want to add a new certificate authority (CA) domain, see “Adding a new CA domain” on page 287.

By default, all CGIs or JSPs (depending on the method you are using to implement the PKI Services web application) reside under a common URL. Based on this, all users, including PKI administrators, have the same PKI Services home page, web content and supported certificate templates. In other words, by default, there is a single application domain: `PKISERV`.

The sample PKI Services template files (`pkiserv.tpl` and `pkitmpl.xml`) contain two application sections: `PKISERV` and `CUSTOMERS`. Using these two application sections, your users can be easily divided between two subsets - customers and administrators.

You might want to separate your administration users and your end users. You might also need to further subset your end user population by adding different application domains for different groups of end users. Both of these objectives can be accomplished by using multiple applications. The PKI administrators and the different subsets of end users can be directed to different application domains at different URLs.

## Creating application domains when you use REXX CGIs to implement the web application

To create multiple application domains, execute the subtasks in Table 49. Both are tasks for the web server programmer.

*Table 49. Task roadmap for creating multiple application domains*

Subtask	Associated procedures (See ...)
Update the PKI Services template file	“Steps for creating multiple application sections in the PKI Services template file”
Update the web server configuration files	“Steps for adding application domains to the web server configuration files” on page 284

### Steps for creating multiple application sections in the PKI Services template file

Perform the following steps to create multiple application sections to the PKI Services template file:

## Advanced customization

1. Edit the `pkiserv.tpl` file and find the CUSTOMERS application section.

---
2. Replicate the CUSTOMERS section and specify a unique name for the new application section.  
`<APPLICATION NAME=appl-section-name>`  
**Rule:** The application section name must be one word, all uppercase characters.

---
3. Determine which certificate types are required by this user subset. Based on these requirements, select the certificate templates that belong in the new application set by adding or removing template names from this new section as needed.

---
4. Customize the content of the web pages for this application by modifying the `<CONTENT>...</CONTENT>` subsection. (See “TEMPLATE sections” on page 142 for a description of each subsection.)

---
5. Similarly, customize the original CUSTOMERS application by re-executing Steps 3 and 4, this time editing the content of the CUSTOMERS web pages.

---
6. Repeat Steps 1–4 for each application section you need to add.

---
7. Optionally, rename the original CUSTOMERS application to a new section name, if you want.  
`<APPLICATION NAME=section-name>`  
**Rule:** The application section name must be one word, all uppercase characters.

---

## Steps for adding application domains to the web server configuration files

### Before you begin

- This procedure requires web server programming skills and requires editing the `vhost.conf` configuration file.
- The home page URL for the new or renamed domains would be as follows:  
`http://<webserver-fully-qualified-domain-name>/<new-appl-domain-name>/public-cgi/camain.rexx`

where *new-appl-domain-name* corresponds to the new section name added in the template file in “Steps for creating multiple application sections in the PKI Services template file” on page 283. However, in the web server files, the new name is case-sensitive but does not need to be in uppercase only.

- Make note of the case you select for each character of the new *new-appl-domain-name* name. This case-sensitive value becomes part of the URL for your home page. You must use it consistently in each set of HTTP Server directives as indicated in the `vhost.conf` configuration files:
  - `vhost80` - Virtual host file for non-SSL requests.
  - `vhost443` - Virtual host file for SSL requests with server authentication.
  - `vhost1443` - Virtual host file for SSL requests with client authentication.
- The administration home page URL does not change. (There is one common administration application that handles all application domains.)

- If your PKI installation has changed the name of the Customers domain, you must change all occurrences of Customers to its new value in both files. (The new value is not case-sensitive.)
- If your installation has added a new application domain, use the following procedure.

### Procedure

Perform the following steps to add application domains or rename the Customers application domain in web server virtual host configuration files for each new application section added to `pkiserv.tmp1`:

- Modify each of the following HTTP Server directives in the virtual host configuration files:

`vhost80.conf` (host file for non-SSL requests):

```
RewriteRule ^/(PKIServ|Customers|Employees)/ssl-cgi/(.*) https://<server-domain-name>/$1/ssl-cgi-bin/$2 [R,NE]
RewriteRule ^/(PKIServ|Customers|Employees)/clientauth-cgi/(.*) https://<server-domain-name>:1443/$1/clientauth-cgi-bin/$2 [R,NE]
ScriptAliasMatch /(PKIServ|Customers|Employees)/public-cgi/(.*) <application-root>/PKIServ/public-cgi/$2
```

`vhost443.conf` (host file for SSL request with server authentication):

```
RewriteRule ^/(PKIServ|Customers|Employees)/public-cgi/(.*) http://<server-domain-name>/$1/public-cgi/$2 [R,NE,L]
RewriteRule ^/(PKIServ|Customers|Employees)/ssl-cgi/(.*) https://<server-domain-name>/$1/ssl-cgi-bin/$2 [R,NE]
RewriteRule ^/(PKIServ|Customers|Employees)/clientauth-cgi/(.*) https://<server-domain-name>:1443/$1/clientauth-cgi-bin/$2 [R,NE,L]
ScriptAliasMatch ^/(PKIServ|Customers|Employees)/(public-cgi|ssl-cgi-bin)/(.*) "<application-root>/PKIServ/$2/$3"

<LocationMatch "^/(PKIServ|Customers|Employees)/ssl-cgi-bin/(auth|surrogateauth)"/?>cagetcert.rexx">
CharsetOptions TranslateAllMimeTypes
</LocationMatch>
```

`vhost1443.conf` (host file for SSL requests with client authentication):

```
RewriteRule ^/(PKIServ|Customers|Employees)/public-cgi/(.*) http://<server-domain-name>/$1/public-cgi/$2 [R,NE,L]
RewriteRule ^/(PKIServ|Customers|Employees)/ssl-cgi/(.*) https://<server-domain-name>/$1/ssl-cgi-bin/$2 [R,NE,L]
ScriptAliasMatch ^/(PKIServ|Customers|Employees)/(clientauth-cgi|clientauth-cgi-bin)/(.*) "<application-root>/PKIServ/clientauth-cgi-bin/$3"

<LocationMatch "^/(PKIServ|Customers|Employees)/clientauth-cgi-bin/auth/pkiCMP">
CharsetOptions NoTranslateRequestBodies
</LocationMatch>
```

In contrast to the application section name, the domain name value is case-sensitive and does not need to be uppercase. However, you must use it consistently in each of the HTTP Server directives in the virtual host configuration files. This value becomes part of the URL for your home page.

When you are done, you have defined a new PKI Services application domain at:

### Example

`http://<webserver-fully-qualified-domain-name>/employees/public-cgi/camain.rexx`

## Creating application domains when you use JSPs to implement the web application

An application, or application domain, is a grouping of certificate request templates that are typically targeted at a subset of end users. The Customers application is the default end user application. But the `web.xml` file that ships as part of `PKIServ.ear` also defines mappings for a second application called `Application2`, making it easy to set up a second application domain.

To set up `Application2`, edit `pkitmp1.xml` and use the `<tns:application>` tag to define which certificate request templates should be part of `Application2`. For example:

```
<tns:application>
<tns:appName>Application2</tns:appName>
<tns:appTemplate>1-Year PKI SSL Browser Certificate</tns:appTemplate>
<tns:appTemplate>5-Year PKI SSL Server Certificate</tns:appTemplate>
<tns:appTemplate>5-Year PKI Intermediate CA Certificate</tns:appTemplate>
```

## Advanced customization

```
<tns:appltemplate>2-Year PKI Authenticode - Code Signing Certificate</tns:appltemplate>
<tns:appltemplate>n-Year PKI Certificate for Extensions Demonstration</tns:appltemplate>
<tns:appltemplate>1-Year SAF Browser Certificate</tns:appltemplate>
</tns:application>
```

While you access the Customers home page at the URL:

```
http://hostname.com:9080/PKIServ_Web/Customers/pkimain.jsp
```

you would access the Application2 home page at:

```
http://hostname.com:9080/PKIServ_Web/Application2/pkimain.jsp
```

To change the name of Application2, or to add another application, you need to edit the web.xml file in PKIServ.ear.

### Steps for creating application domains other than Application2

Perform the following steps to create different application domains when you use JSPs to implement the web application.

#### Before you begin

You must have the **jar** command in your path. If you do not, define the **JAVA\_HOME** variable (you can find its value on the WebSphere administration console) and add the **\$JAVA\_HOME/bin** directory to your path. For example:

```
export JAVA_HOME=/WebSphere/V6R1/AppServer/java
export PATH=$JAVA_HOME/bin:$PATH
```

#### Procedure

1. Follow steps 1 on page 256 to 4 on page 256.
2. Edit the web.xml file. You can use the following command, or use your preferred editor:  

```
oedit WEB-INF/web.xml
```
3. Copy the lines that begin with the comment:  

```
<!-- Start: For new application: Application2 -->
```

  
and end with the comment:  

```
<!-- End: For new application: Application2 -->
```
4. Change all occurrences of "Application2" in the copied lines to the name of the application you want to create. Save the updated file.
5. Update the WAR file with the edited template file.  

```
jar -uvf PKIServ_Web.war WEB-INF/web.xml
```
6. Update the EAR file with the updated WAR file:  

```
jar -uvf PKIServ.ear PKIServ_Web.war
```
7. Make sure the PKIServ.ear file is publicly readable by issuing the **chmod** command.  

```
chmod 755 PKIServ.ear
```

## Results

When you are done, you created another application domain. You can now deploy the updated files following the directions in “Deploying the EAR file to a WebSphere Application Server” on page 257. When you edit the file `pkitmpl.xml` and add your new application, if its name is “NewApplication” your new application is available at:

```
http://hostname.com:9080/PKIServ_Web/NewApplication/pkimain.jsp
```

---

## Adding a new CA domain

When you want to operate more than one certificate authority (CA) on a single z/OS image, you must create a separate CA domain for each CA. Each CA domain uses its own daemon and operates as its own instance of PKI Services. This topic describes how to add a new CA domain. (If you want to add a new *application* domain, see “Adding an application domain” on page 283.)

When you add CA domains, you can create a PKI infrastructure that contains subsets of end user populations (application domains), each supported by its own unique PKI Services application (PKI Services daemon and URL) and optionally by its own dedicated set of PKI administrators. If you already use multiple application domains, the key advantage of adding multiple CA domains is that you can build a certificate hierarchy of CAs and optionally provide certificate services to multiple organizations.

When you add a new CA domain, your users still have a unique URL and set of certificate templates to choose from, but they also have the services of their own CA including the CA's certificate, signing key, object store, and issued certificate list (ICL), and LDAP repository. Enabling multiple CAs is a natural extension for multiple application domains. Each CA domain can represent one instance of a CA, backed by a unique instance of the PKI Services daemon (and all its associated components), yet requiring no more than a single HTTP Server and a single set of CGIs.

Figure 29 on page 288 contains an illustration showing two CA domains, one for employees and one for customers. In the illustration, a single shared administrator supports both CA domains. (You can decide to share a common administrator across multiple CA domains or have separate administrators who are each dedicated to only one CA domain.)

## Advanced customization

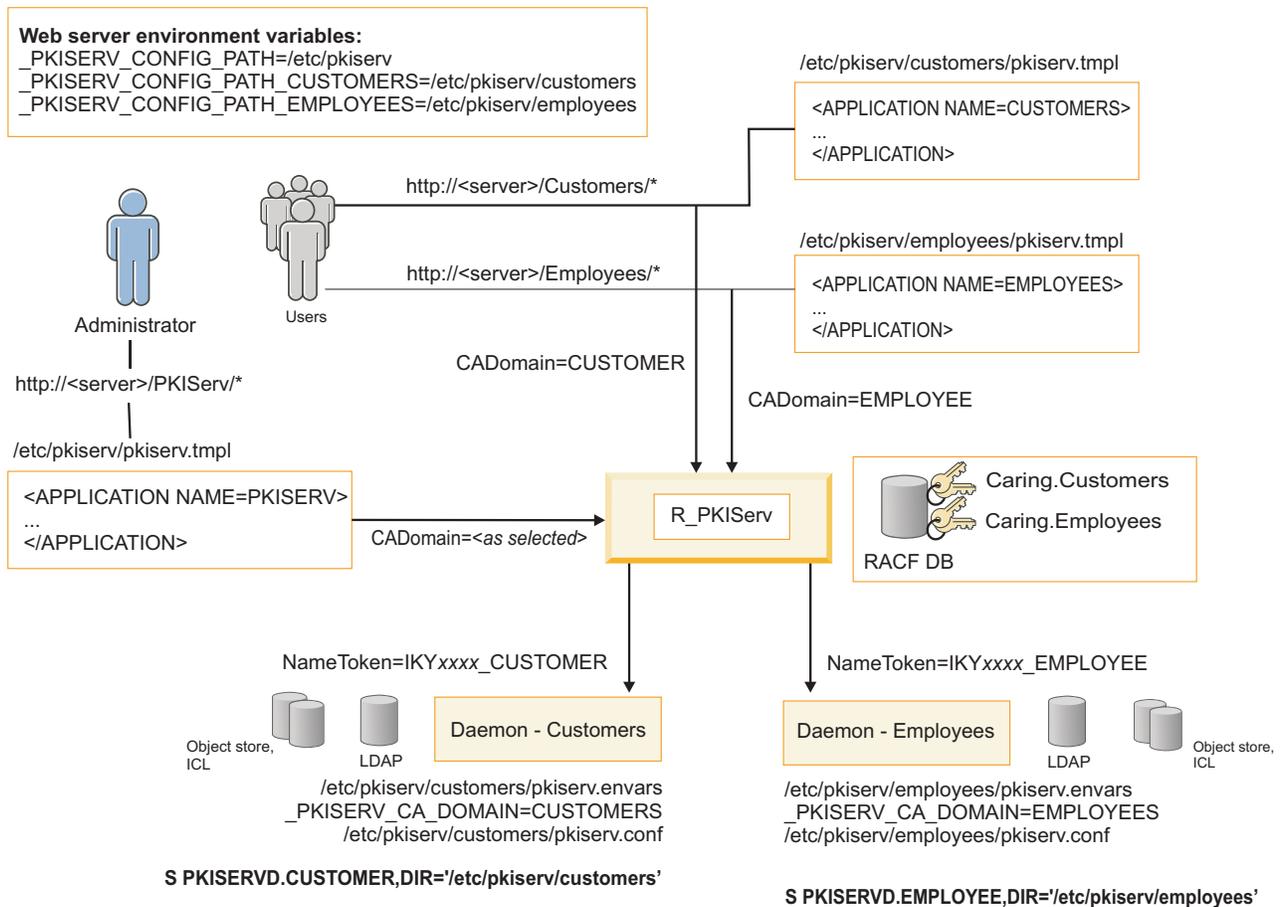

Figure 29. Illustration of two CA domains, one for employees and one for customers, administered by a single shared administrator who administers both domains. This illustration assumes that you are implementing the web application using REXX CGI execs. If you are using JSPs, the name of the template and the tags used differ from those shown.

## Task overview

This topic includes a task roadmap that you can use to add a new CA domain. The roadmap includes several subtasks, which are listed in Table 50 on page 289. It is intended to direct you to add a new CA domain after you have completed all required tasks in Part 2, “Configuring your system for PKI Services,” on page 33. Before you begin this task, you have already implemented and tested the default setup for PKI Services and ensured that it operates properly as a single CA domain.

For each CA you add, you create a dedicated copy of the object store and issued certificate list (ICL), CA certificate, key ring, and LDAP namespace. You also create a dedicated copy of the PKI Services configuration file (`pkiserv.conf`), templates file (`pkiserv.tpl` or `pkitmpl.xml`), and environment variables file (`pkiserv.envars`), each in its own directory. You update the following CA-specific information in these files:

- `pkiserv.conf` - contains the CA-specific key ring name, VSAM data set names or DB2 subsystem and package name for the object store and ICL, and optionally `CRLDistDirPath`.
- `pkiserv.envars` - contains a variable `_PKISERV_CA_DOMAIN` to specify CA domain and the variable `_PKISERV_CONFIG_PATH` sets the directory for each CA domain.

- The template file that you are using:
  - `pkiserv.tmp1` - contains the name of the end-user application section (default is CUSTOMER) that you rename to a CA-specific name, such as `<APPLICATION NAME=EMPLOYEE>`. It also contains the name of the administrative application section (default is PKISERV) that you can rename to a CA-specific name, such as `<APPLICATION NAME=ADMEMPLOYEES>`.
  - `pkitmpl.xml` - defines the applications and certificate request templates that you use for this CA domain.

If you are implementing the web application using REXX CGI execs, see “Subtask 2: Steps for reconfiguring your initial CA domain to allow it to coexist with other CA domains” on page 292 and “Subtask 6: Steps for updating the web server configuration” on page 299 for more information about adding application domains.

If you are implementing the web application using JavaServer pages (JSPs), you need to edit the `web.xml` file with the `PKIServ.EAR`. It helps to understand the URLs used for multiple CA domains and multiple application domains. The JSP code parses the URL to determine the CA domain and application name. The first directory after the root context of `PKIServ_Web` is the CA domain name if there is one and the second directory is either the application name or `PKIServ` (for the PKI Services administration web pages). When the JSPs are run without a named CA domain, the first directory after the root context of `PKIServ_Web` is the application name or `PKIServ` (for the PKI Services administration pages).

## Task roadmap for adding CA domains

### Before you begin

- Complete all required tasks in Part 2, “Configuring your system for PKI Services,” on page 33. This task roadmap is intended to direct you to add a new CA domain *after* you have already implemented and tested the default setup for PKI Services and ensured that it operates properly as a single CA domain.
- Review Table 50 to see the subtasks that are involved and the skills that are required for each subtask. (The team members that are listed are based on role definitions that are established in “Identifying skill requirements” on page 13.)

### Procedure

To create a new CA domain, complete the subtasks in Table 50. Subtask 1 guides you through planning. Subtask 2 is a one-time setup that you do when you add your first additional CA domain. Subtasks 3 - 8 are each done once for every CA domain you add. (See Part 2, “Configuring your system for PKI Services,” on page 33 for additional details about these subtasks.)

After you complete Subtasks 1 and 2 (planning and reconfiguring), perform Subtasks 3 - 8 for your *first* new CA domain and ensure that it operates properly before adding your second CA domain.

Table 50. Task roadmap for adding a new CA domain

Subtask	Team member	Associated procedure (See...)
1. Plan additional CA domains.	UNIX programmer	“Subtask 1: Steps for planning additional CA domains” on page 290.

## Advanced customization

Table 50. Task roadmap for adding a new CA domain (continued)

Subtask	Team member	Associated procedure (See...)
2. Reconfigure your initial CA domain to allow it to coexist with other CA domains. (This is a one-time setup.)	UNIX programmer	"Subtask 2: Steps for reconfiguring your initial CA domain to allow it to coexist with other CA domains" on page 292.
3. Run IKYSETUP.	MVS programmer	"Subtask 3: Steps for running the IKYSETUP exec" on page 294.
4. Configure the UNIX environment.	UNIX programmer	"Subtask 4: Steps for configuring the UNIX environment" on page 296.
5. Update the PKI Services template file.	Web server programmer	"Subtask 5: Steps for updating the PKI Services template file" on page 297.
6. Update the web server configuration.	Web server programmer	"Subtask 6: Steps for updating the web server configuration" on page 299.
7. Set up the object store and ICL.	MVS programmer or DB2 programmer, depending on how you implement the object store and ICL	"Subtask 7: Creating the object store and ICL" on page 301.
8. Start PKI Services.	MVS programmer	"Subtask 8: Steps for starting PKI Services" on page 302.

## Recording your progress adding CA domains

As you complete each subtask for adding a new CA domain, use Table 51 to mark your progress. The tasks correspond to the subtasks listed in the roadmap in Table 50 on page 289.

Table 51. Multiple CA domains: Worksheet #1 for recording progress adding new CA domains

	Subtask	First CA domain	Second CA domain	Third CA domain
1.	Plan additional CA domains.	<input type="checkbox"/>		
2.	Reconfigure initial domain. (once only)	<input type="checkbox"/>		
3.	Run IKYSETUP.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4.	Configure the UNIX environment.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5.	Update the PKI Services template file. (Perform this task only if you implement the web application using REXX CGI execs.)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6.	Update the web server configuration.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7.	Set up the object store and ICL.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8.	Start PKI Services.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

**Guideline:** Perform Subtasks 1 - 8 for your *first* new CA domain and ensure that it operates properly before adding your second CA domain.

## Subtask 1: Steps for planning additional CA domains

Perform the following steps to plan additional CA domains.

1. Determine how many instances of PKI Services (CA domains) you operate in addition to the initial domain you configured when you originally customized PKI Services.

For each CA domain, you need to pick a nickname to use as the CA domain name. The CA domain name is used to qualify the resources used by that CA domain. For example, the CA domain named Employees uses the following resources:

**Examples:**

- Web page URLs (in mixed case)
  - If you implement the web application using REXX CGI execs:  
`http://webserver-domain-name/Employees/public-cgi/camain.rexx`
  - If you implement the web application using JSPs:  
`http://webserver-domain-name/PKIServ_Web/Employee/ApplicationName/pkimain.jsp`

Note that the CA domain name is independent of the application domain name.

- Data set qualifiers (in uppercase) - VSAM ICL data set  
`PKISRV.D.EMPLOYEE.VSAM.ICL`
- Path names (in lowercase)  
`/etc/pkiserv/employees/pkiserv.conf`

If you are implementing the object store and ICL using DB2, you need a unique DB2 package name for each CA domain. Use the CA domain name for the package name. You should also use a unique name for the DB2 plan.

- 
2. Decide how you want to administer multiple CA domains. Will you share a *common* set of administrators across all your CA domains or will you have a *dedicated* set of administrators for each CA domain?

If you use a *dedicated* set for each CA domain, you need to pick a second nickname for each CA domain, for its administrative domain.

- 
3. Determine your CA domain names. Unless you renamed the default domain names when you originally customized PKI Services, the initial name for the application domain is Customers and its administrative domain name is PKIServ. Your new CA domain names (nicknames) must differ from these values.

**Rules for domain names:**

- Domain names are 1 - 8 characters.
  - For REXX CGI execs, domain names can exceed 8 characters if the first 8 characters are unique from your other domain names.
  - For JavaServer pages (JSPs) domain names cannot exceed 8 characters.
- The characters in the domain name are limited to the following character set: alphanumeric characters (a - z, A - Z, 0 - 9) and the hyphen (-).
- The first character must not be a number or hyphen.

- 
4. Record information about your CA domains in Table 52 on page 292 and Table 53 on page 292.

Row 1 in each table is already filled in with the defaults for an initial CA domain (Customers). Row 2 in each table is an example of a new CA domain

## Advanced customization

managed by the same (shared) group of administrators. Row 3 in each table is an example of the same CA domain from Row 2 managed by a *dedicated* group of administrators.

The rows in each table that are already filled in use the default values for the following variables when PKI Services was installed. (Your MVS programmer might have chosen different directories.)

### Installation variable

#### Default directory name

#### *install-dir*

/usr/lpp/pkiserv

#### *runtime-dir*

/etc/pkiserv

- a. Fill in the values for new CA domains, administrative domains, and directories in Table 52. You can add your information in the blank lines below or you can modify or cross out the sample rows.

Table 52. Multiple CA domains: Worksheet #2 for planning your domain names

CA domain name (runtime directory)	Truncated CA domain name	Administrative domain name (runtime directory)
1. Customers (/etc/pkiserv)	CUSTOMER	PKIServ (/etc/pkiserv)
2. Employees (/etc/pkiserv/employees)	EMPLOYEE	PKIServ (/etc/pkiserv)
3. Employees (/etc/pkiserv/employees)	EMPLOYEE	AdmEmployees (/etc/pkiserv/employees)
4.		
5.		

- b. Fill in your RACF user IDs, groups, and VSAM data set qualifiers or DB2 package names in Table 53. You can add your information in the blank lines below or you can modify or cross out the sample rows.

Table 53. Multiple CA domains: Worksheet #3 for planning your RACF identifiers, z/OS UNIX identifiers, and VSAM data set names or DB2 package names. Use row 2 for shared administrators, row 3 for dedicated administrators. Row 4 is the same as row 3 but specifies a DB2 package name instead of VSAM data set qualifiers.

Daemon user ID (UID)	Surrogate user ID (UID)	PKI administration group name (GID)	VSAM data set qualifiers or DB2 package name
1. PKISRVD (554)	PKISERV (555)	PKIGRP (655)	PKISRVD.VSAM
2. PKISRVD (554)	PKISERV (555)	PKIGRP (655)	PKISRVD.EMPLOYEE.VSAM
3. PKIDEMP (556)	PKISEMP (557)	PKIGEMP (657)	PKISRVD.EMPLOYEE.VSAM
4. PKIDEMP (556)	PKISEMP (557)	PKIGEMP (657)	MasterCA
5.			

## Subtask 2: Steps for reconfiguring your initial CA domain to allow it to coexist with other CA domains

Perform the following steps to reconfigure your initial CA domain to allow it to coexist with other CA domains. (This is a one-time setup that suffices no matter how many CA domains you add.)

1. If PKI Services is running, stop it by issuing the following MVS console command:  
P PKISRVD

- 
2. Update the PKI Services environment variables in the `pkiserv.envars` file as follows.
    - a. (Optional) If your initial CA domain does not use its own `pkiserv.envars` file, copy the default `pkiserv.envars` file from the PKI Services install directory by issuing the following command from the UNIX command line:
 

```
cp -p /usr/lpp/pkiserv/samples/pkiserv.envars /etc/pkiserv
```
    - b. Edit the new copy of `pkiserv.envars` file by entering the following command:
 

```
oedit /etc/pkiserv/pkiserv.envars
```
    - c. Add a PKI Services environment variable identifying your initial CA domain name (see Table 52 on page 292) in uppercase characters.

**Example:**

```
_PKISERV_CA_DOMAIN=CUSTOMERS
```

---

3. Update the HTTP server's environment variables and configuration directives as follows.

- a. Update the HTTP server's environment variables. This setting is shown by adding it to the `vhost80.conf` (host file for non-SSL requests) by using the `SetEnv HTTP` directive. Similar changes must be made to the `vhost443` (host file for SSL requests with server authentication) and `vhost1443` (host file for SSL requests with client authentication) configuration files.

- 1) Edit the `vhost80.conf` file by entering the following command:

```
oedit /etc/websrv1/conf/vhost80.conf
```

- 2) Add an environment variable identifying the runtime directory of your initial CA domain. (Check Table 52 on page 292.)

**Example:**

```
SetEnv _PKISERV_CONFIG_PATH_CUSTOMERS "/etc/pkiserv"
```

- 3) (Optional) If you intend to have a dedicated set of administrators for each CA domain, add an environment variable that specifies the runtime directory for the administrative domain. (Check Table 52 on page 292.)

**Example:**

```
SetEnv _PKISERV_CONFIG_PATH_PKISERV "/etc/pkiserv"
```

---

4. Update the RACF access controls for the `R_PKIServ` SAF callable service as follows. (Any change to environment variables in Step 3 requires a corresponding change to RACF access control.)
  - a. Determine the PKI Services surrogate user ID (default is `PKISERV`) and the PKI Services administrators group (default is `PKIGRP`). To do this, refer to the log file created when the `IKYSETUP` REXX exec was originally run for your initial CA domain.
  - b. Execute the following RACF commands from the TSO command line. Replace the highlighted values with your own, if different:

**Examples:**

```
RDELETE FACILITY IRR.RPKISERV.**
RDEFINE FACILITY IRR.RPKISERV.*.CUSTOMER
PERMIT IRR.RPKISERV.*.CUSTOMER CLASS(FACILITY) ID(PKISERV) ACCESS(CONTROL)
RDELETE FACILITY IRR.RPKISERV.PKIADMIN
RDEFINE FACILITY IRR.RPKISERV.PKIADMIN.CUSTOMER
PERMIT IRR.RPKISERV.PKIADMIN.CUSTOMER CLASS(FACILITY) ID(PKIGRP)
```

## Advanced customization

```
ACCESS(UPDATE)
PERMIT IRR.RPKISERV.PKIADMIN.CUSTOMER CLASS(FACILITY) ID(PKISERV)
ACCESS(NONE)
SETROPTS RACLIST(FACILITY) REFRESH
```

**Restriction:** If the name of your initial CA domain is longer than 8 characters, you must truncate it to exactly 8 characters when you define the resource name in the FACILITY class profiles. (In this example, the name CUSTOMERS was truncated to CUSTOMER in the second RDEFINE FACILITY command.)

- 
5. (Optional) You have reconfigured your initial CA domain to allow it to coexist with other CA domains. If you want, you can test the reconfiguration now. To test it, follow these steps:
    - a. Restart PKI Services using the following MVS console command. Replace the highlighted values with your own, if different.

**Guideline:** To simplify your environment, start this instance of PKI Services using a JOBNAME that matches the truncated name of the CA domain. (See your truncated value in Table 52 on page 292.) If you use the truncated values as job names, it is easier to distinguish multiple jobs that run PKI Services after you add other CA domains.

**Example:**

```
S PKISERVD, JOBNAME=CUSTOMER, DIR='/etc/pkiserv/'
```
    - b. Restart the HTTP servers to enable your environment variable changes.

```
F IMWEBSRV, APPL=-restart
```
    - c. Test that your PKI Services application is functioning properly. Go to your web pages by entering the following URL from your browser:

```
http://webserver-fully-qualified-domain-name/PKIServ/public-cgi/camain.rexx
```

The *webserver-fully-qualified-domain-name* is the common name (CN) portion of the web server's distinguished name; see Table 11 on page 38. You should be able to go through your web pages to request, retrieve, and revoke a certificate of type “PKI browser certificate for authenticating to z/OS”. Ensure you can do this before adding an additional CA domain.

---

**When you are done:** You have successfully reconfigured your initial CA domain to allow it to coexist with other CA domains. You can now perform each of the remaining subtasks once for each new CA domain.

Continue to the next subtask. **Guideline:** Complete Subtasks 3 - 8 for your *first* new CA domain and ensure that it operates properly before adding another CA domain.

### Subtask 3: Steps for running the IKYSETUP exec Before you begin

This procedure requires you to be familiar with the information in Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35. There are more details about the following steps there.

#### Procedure

Perform the following steps to customize a unique execution of the IKYSETUP REXX exec for this new CA domain.

1. Locate the IKYSETUP exec that you originally customized for your initial CA domain and copy it to a data set member that you can edit.

---

2. Edit the new copy of IKYSETUP and set the `ca_domain` variable to the name of this new CA domain. Type the domain name preserving the case of each character as you want it to appear in web page URLs.

---

3. If you intend to have a dedicated set of administrators for each CA domain, customize the following variables with your values for this CA domain.

Variable name	Use your value from ...
<code>daemon_uid</code>	Table 11 on page 38
<code>pki_gid</code>	Table 11 on page 38
<code>pkigroup_mem</code>	Table 11 on page 38
<code>surrog_uid</code>	Table 11 on page 38
<code>daemon</code>	Table 19 on page 51
<code>surrog</code>	Table 19 on page 51
<code>pkigroup</code>	Table 52 on page 292 (Use the truncated name of the administrative domain.)

4. (Optional) If you are creating multiple CAs as part of a certificate hierarchy where a previous CA domain is to be superior (as issuer or signer) of this CA domain, set `signing_ca_label` to match the label of the certificate in RACF that issues the certificate for this CA domain.  
Otherwise, skip to Step 5 and leave `signing_ca_label=""` (the default).

---

5. Update any other values, such as `ca_dn` and `ra_dn`, that you choose to differ from your initial settings or the defaults.  
You need *not* change any values in this step unless you choose to set these values to something particular for your installation. (This is because when you specify a `ca_domain` value, the IKYSETUP exec automatically qualifies any value that PKI Services requires to be unique by adding the CA domain name.)

---

6. Execute IKYSETUP by entering the following TSO command:  
EX '`data-set-name(new-member-name)`' 'RUN(NO)'

---

7. Review the log data set to ensure that the commands created by IKYSETUP match your expectations. (For more information about these commands, see "Actions IKYSETUP performs by issuing RACF commands" on page 589.) Edit again as needed and rerun.

---

8. When you are satisfied with the commands and information in the log data set, rerun the IKYSETUP exec by entering the following TSO command:  
EX '`data-set-name(new-member-name)`' 'RUN(YES)'

---

9. Check your IKYSETUP log and record the name of the SAF key ring (your `ca_ring` value).  
**Name of the SAF key ring:**

**When you are done:** You have customized and run the IKYSETUP exec for this CA domain. Record your progress in Table 51 on page 290.

Continue to the next subtask. **Guideline:** Complete all subtasks for this new CA domain and ensure that it operates properly before adding another CA domain.

### Subtask 4: Steps for configuring the UNIX environment

#### Before you begin

This procedure requires you to be familiar with the information in Chapter 5, “Configuring the UNIX runtime environment,” on page 61. There are more details about the following steps there.

#### Procedure

Perform the following steps to configure the UNIX environment for this new CA domain.

1. Set up a var directory for this CA domain. Perform the steps in “Steps for setting up the var directory” on page 87.
2. Locate the `pkiserv.conf`, `pkiserv.envars`, and `pkiserv.tmpl` files you originally used to create your initial CA domain. Copy them into the appropriate runtime directory for your new CA domain. (Check Table 52 on page 292.) For a new CA domain called `Employees`, run the following commands from the UNIX command line. (You might have to make the directory first.)

#### Examples:

```
mkdir /etc/pkiserv/employees
chown pkisrzd /etc/pkiserv/employees
cp -p /etc/pkiserv/* /etc/pkiserv/employees
```

3. Edit the new `pkiserv.conf` file by entering the following command:

#### Example:

```
oedit /etc/pkiserv/employees/pkiserv.conf
```

4. Change the following sections of `pkiserv.conf` as described for this CA domain. (Find detailed information for each variable in Table 21 on page 68.)

#### ObjectStore

If you are implementing the object store and ICL using VSAM, qualify each VSAM data set name with the CA domain name. **Example:**  
`ObjectDSN='pkisrzd.employee.vsam.ost'`

If you are implementing the object store and ICL using DB2, set the DB2 package name to the CA domain name. **Example:**  
`DBPackage=employee`

(See “Subtask 7: Creating the object store and ICL” on page 301.)

#### CertPolicy

If `CRLDistDirPath` is not null, modify it to reference the correct subdirectory. (You might have to create this directory.) **Example:**  
`CRLDistDirPath=/var/pkiserv/employees`. See “Determining `CRLDistDirPath`” on page 277 for more information.

**General**

Update each path name to the correct subdirectory. **Example:**  
 ReadyMessageForm=/etc/pkiserv/employees/readymsg.form

**SAF** Update the key ring name to match the `ca_ring` value you recorded.  
**Example:** PKISRVD/Caring.Employees

**LDAP** Do not update the **LDAP** section unless you need to change the LDAP directory. If you need to change it, see “Steps for tailoring the LDAP section of the configuration file” on page 100.

Make sure that the LDAP directory is configured with a suffix for this CA domain. (See the explanation for the `Suffix` variable in Table 22 on page 89.)

---

5. (Optional) Change other values in any section of `pkiserv.conf` as you want for this CA domain.

---

6. Edit the new `pkiserv.envars` file by entering the following command:

**Example:**

```
oedit /etc/pkiserv/employees/pkiserv.envars
```

---

7. Define the `_PKISERV_CA_DOMAIN` environment variable for this CA domain name. (For details, see “The `pkiserv.envars` environment variables file” on page 587.)

**Example:**

```
_PKISERV_CA_DOMAIN=EMPLOYEE
```

---

**When you are done:** You have updated the `pkiserv.conf` and `pkiserv.envars` files for this CA domain. Record your progress in Table 51 on page 290.

Continue to the next subtask. **Guideline:** Complete all subtasks for this new CA domain and ensure that it operates properly before adding another CA domain.

## Subtask 5: Steps for updating the PKI Services template file

Perform this task only if you implement the web application using REXX CGI execs. If you implement the web application using JavaServer pages (JSPs), each CA domain has a separate template file. Each template file describes the application domains for the CA domain. Each application domain is essentially a subset of the users and certificate request templates for the CA domain.

### Before you begin

This procedure requires you to be familiar with the information in Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127. More information about the following steps is found there.

### Procedure

Perform the following steps to customize the PKI Services template file (`pkiserv.tpl`) for this new CA domain.

1. Edit the new `pkiserv.tpl` file (you copied it in Step 2 on page 296 of “Subtask 4: Steps for configuring the UNIX environment” on page 296) by entering the following command from the UNIX command line:

## Advanced customization

### Example:

```
oedit /etc/pkiserv/employees/pkiserv.tpl
```

2. Locate all occurrences of the CA domain named Customers (in mixed case, uppercase, or lowercase) and change them to the name of this new CA domain, being careful to preserve the case.

**Example:** If the new CA domain is Employees (in mixed case), change the default values to the name of your new CA domain.

Default values for the Customers CA domain	New values for the Employees CA domain
ACTION="/Customers/..." (in mixed case)	ACTION="/Employees/..." (also in mixed case)
<APPLICATION NAME=CUSTOMERS> (in uppercase)	<APPLICATION NAME=EMPLOYEES> (also in uppercase)

3. If you intend to have the *same* set of administrators for all your CA domains, *skip* this step and proceed to Step 4.

If you intend to have a *dedicated* set of administrators for each CA domain, change the name of the PKISERV application section to the corresponding name of the administrative domain in Table 52 on page 292. This value must be specified in uppercase characters only.

**Example:** If the new administrative domain is named AdmEmployees, change the default value (PKISERV) to the name of your new administrative CA domain.

Default value for the PKISERV administrative CA domain	New value for the new AdmEmployees administrative CA domain
<APPLICATION NAME=PKISERV> (in uppercase)	<APPLICATION NAME=ADMEMPLOYEES> (also in uppercase)

4. If you intend to have the same set of administrators for all your CA domains, edit the main templates file (/etc/pkiserv/pkiserv.tpl) as follows:

Do not update the PKISERV application section in this domain-specific pkiserv.tpl file; it is *not* used. The PKISERV application section in the templates file for your initial CA domain is used instead.

- a. Replicate the following lines in the APPLICATION section of the PKISERV application:

```
<h3>Go the Customers' home page </h3>
<FORM name=admform METHOD=GET
  ACTION="/Customers/public-cgi/camain.rexx">
<p>
<INPUT TYPE="submit" VALUE="Customers' Home Page">
</FORM>
```

- b. Change all occurrences of the string Customers in the replicated lines to the name of this CA domain, being careful to preserve case.

**Example:** Change ACTION="/Customers/public-cgi/camain.rexx"> to ACTION="/Employees/public-cgi/camain.rexx">.

- c. Uncomment the %%SelectCADomain%% directive in the ADMINSCOPE subsection of the APPLICATION section for the PKISERV application by removing the leading # character. (The %%SelectCADomain%% directive enables multiple CA administration.)
- d. Update the SelectCADomain insert to include an OPTION entry for this CA domain. If this CA domain is used more often than any other, mark the entry SELECTED and remove SELECTED from any other entry.

**Example:**

```
<INSERT NAME=SelectCADomain>
<p> <LABEL for="selectcadomfield">Select the CA domain to work with </LABEL>
<SELECT NAME="domain" id="selectcadomfield">
# rename and replicate the following line for every CA domain and
# determine which one should be SELECTED by default, if any
<OPTION VALUE="Employees" SELECTED>Employees
<OPTION VALUE="Customers">Customers
</SELECT>
```

**When you are done:**

You have customized the PKI Services template file (pkiserv.tpl) for this CA domain. Record your progress in Table 51 on page 290.

Continue to the next subtask. **Guideline:** Complete all subtasks for this new CA domain and ensure that it operates properly before adding another CA domain.

**Subtask 6: Steps for updating the web server configuration**

If you are implementing the web application using REXX CGI execs, perform the steps in “Updating the web server configuration if you use REXX CGI execs”

If you are implementing the web application using JavaServer pages (JSPs), perform the steps in “Updating the web server configuration if you use JavaServer pages (JSPs)” on page 301

**Updating the web server configuration if you use REXX CGI execs****Before you begin**

This procedure requires you to be familiar with the information in the following topics, where you find additional details:

- “Steps for adding application domains to the web server configuration files” on page 284
- Chapter 7, “Updating IBM HTTP Server - Powered by Apache configuration and starting the server,” on page 93.

**Procedure**

Perform the following steps to customize the IBM HTTP Server configuration files for this new CA domain.

1. Add this new CA domain (check Table 52 on page 292 for domain name and directory) following the instructions in “Steps for adding application domains to the web server configuration files” on page 284. If you have a CRLDistDirPath configured in your pkiserv.conf file for HTTP protocol URI format CRL distribution points, uncomment the AliasMatch HTTP server

## Advanced customization

directive statement in the vhost80.conf (host file for non-SSL requests) configuration file to map the virtual path name in the URI to the CRLDistDirPath value.

```
#AliasMatch /Employees/cacerts/(.*) /var/pkiserv/employees/$1
```

- (Optional) If you intend to have a dedicated set of administrators for each CA domain, repeat Step 1 on page 299 for the administrative domain. (Check Table 52 on page 292 for domain name and directory.) Otherwise, skip to Step 3.
- Update the environment variables for the HTTP Server. The following changes must be made to the vhost80.conf (host file for non-SSL requests), vhost443.conf (host file for SSL requests with server authentication), and vhost1443.conf (host file for SSL requests with client authentication) configuration files. The setting is shown by using the SetEnv HTTP directive in the vhost80.conf file. Edit the vhost80.conf file by entering the following command from the UNIX command line:

```
oedit /etc/websrv1/conf/vhost80.conf
```

Uncomment the SetEnv HTTP directive statement.

```
#SetEnv _PKISERV_CONFIG_PATH_EMPLOYEES "/etc/pkiserv/employees"
```

- Add the environment variable identifying the runtime directory of this CA domain. (Check Table 52 on page 292.)

```
_PKISERV_CONFIG_PATH_EMPLOYEES=/etc/pkiserv/employees
```

- (Optional) If you intend to have a dedicated set of administrators for each CA domain, add the environment variable identifying the pkiserv.tmp directory of this administrative CA domain.

```
_PKISERV_CONFIG_PATH_ADMEMPLOYEES=/etc/pkiserv/employees
```

Uncomment SetEnv HTTP directive statement.

```
#SetEnv _PKISERV_CONFIG_PATH_ADMEMPLOYEES "/etc/pkiserv/employees"
```

- Update the HTTP server virtual host configuration files to support the new CA Domain. Uncomment the following statements in each of the virtual host configuration files.

vhost80.conf

```
• #RewriteRule ^(AdmEmployees|Employees)/ssl-cgi/(.*) https://<server-domain-name>/$1/ssl-cgi-bin/$2 [R,NE]
• #RewriteRule ^(AdmEmployees|Employees)/clientauth-cgi/(.*) https://<server-domain-name>:1443/$1/clientauth-cgi-bin/$2 [R,NE]
• #ScriptAliasMatch /(AdmEmployees|Employees)/public-cgi/(.*) <application-root>/PKIServ/public-cgi/$2
• #AliasMatch /Employees/cacerts/(.*) /var/pkiserv/$1
```

vhost443.conf

```
• #RewriteRule ^(AdmEmployees|Employees)/public-cgi/(.*) http://<server-domain-name>/$1/public-cgi/$2 [R,NE,L]
• #RewriteRule ^(AdmEmployees|Employees)/ssl-cgi/(.*) https://<server-domain-name>/$1/ssl-cgi-bin/$2 [R,NE]
• #RewriteRule ^(AdmEmployees|Employees)/clientauth-cgi/(.*) https://<server-domain-name>:1443/$1/clientauth-cgi-bin/$2 [R,NE,L]
• #ScriptAliasMatch ^(AdmEmployees|Employees)/public-cgi|ssl-cgi-bin/(.*) "<application-root>/PKIServ/$2/$3"
• #<LocationMatch "^(AdmEmployees|Employees)/ssl-cgi-bin/(auth|surrogateauth)?/cagetcert.rexx">
  # CharsetOptions TranslateAllMimeTypes
#</LocationMatch>
```

vhost1443.conf

```
• #RewriteRule ^(AdmEmployees|Employees)/public-cgi/(.*) http://<server-domain-name>/$1/public-cgi/$2 [R,NE,L]
• #RewriteRule ^(AdmEmployees|Employees)/ssl-cgi/(.*) https://<server-domain-name>/$1/ssl-cgi-bin/$2 [R,NE,L]
• #ScriptAliasMatch /(AdmEmployees|Employees)/(clientauth-cgi|clientauth-cgi-bin)/(.*)
  "<application-root>/PKIServ/clientauth-cgi-bin/$3"
• #<LocationMatch "^(AdmEmployees|Employees)/clientauth-cgi-bin/auth/pkiomp">
  #CharsetOptions NoTranslateRequestBodies
#</LocationMatch>
```

**When you are done:** You have customized the IBM HTTP Server configuration files for this CA domain. Record your progress in Table 51 on page 290.

Continue to the next subtask. Complete all subtasks for this new CA domain and ensure that it operates properly before adding another CA domain.

## Updating the web server configuration if you use JavaServer pages (JSPs)

To add a new CA domain when you implement the web application using JavaServer pages (JSPs), you need to edit the `web.xml` file to define additional environment variables and URL mappings to the WebSphere application, `PKIServ_EAR`. The shipped `web.xml` file contains the definitions to use either an unnamed domain or a domain named "Master". Use the definition of the CA domain Master as a model for defining additional CA domains. This section in the `web.xml` file is delimited by the two comments:

```
<!-- Start: For new domain: Master -->
:
:
<!-- End: For named domain Master with application Customers: Master/Customers -->
```

## Subtask 7: Creating the object store and ICL

### Before you begin

This procedure requires you to be familiar with the information in Chapter 9, "Creating the object store and ICL," on page 107. There are more details about the following steps there.

You can implement the object store and ICL using either VSAM data sets or DB2 tables.

### Procedure

If you are implementing the object store and ICL using VSAM data sets, perform the following steps to allocate the needed VSAM files for this new CA domain.

1. Locate the IKYCVSAM JCL job that you originally customized for your initial CA domain and copy it to a data set that you can edit.

- 
2. Change all occurrences of `PKISRVD.VSAM` to include the corresponding VSAM data set qualifier from Table 53 on page 292. For example, if this new CA domain is `Employees`, then the VSAM data sets might be qualified as follows:

**Example:**

```
PKISRVD.EMPLOYEE.VSAM.data-set-suffix
```

---

3. Submit the JCL job when your changes are complete.
- 

**When you are done:** You have allocated the needed VSAM files for this CA domain. Record your progress in Table 51 on page 290.

If you are implementing the object store and ICL using DB2 tables, perform the following steps to create the needed DB2 tables, package, and plan.

1. Locate the IKYCDDB2 sample that you originally customized for your initial CA domain and copy it to a data set that you can edit.

- 
2. Change all occurrences of `MASTERCA` to the package name from Table 53 on page 292. For example, if this new CA domain is `Employees`, and you are using the domain name for the package name, the table created for the object store would be named `EMPLOYEE.OST`.
- 

3. When your changes are complete, run the modified sample using `SPUFI`.

- 
4. Locate the IKYSBIND sample job that you originally customized for your initial CA domain and copy it to a data set that you can edit.
- 
5. Change all occurrences of MASTERCA to the package name from Table 53 on page 292.
- 
6. Submit the JCL job when your changes are complete.
- 

**When you are done:** You have create the needed DB2 tables, package, and plan for this CA domain. Record your progress in Table 51 on page 290.

Continue to the next subtask. **Guideline:** Complete all subtasks for this new CA domain and ensure that it operates properly before adding another CA domain.

### Subtask 8: Steps for starting PKI Services Before you begin

This procedure requires you to be familiar with the information in Chapter 10, "Starting and stopping PKI Services," on page 121. There are more details about the following steps there.

#### Procedure

Perform the following steps to start a separate instance of PKI Services for this new CA domain.

1. Start the PKI Services daemon for this CA domain by entering the MVS console START command qualified with the appropriate runtime directory. (Check Table 52 on page 292.)

**Example:**

```
S PKISERVD,JOBNAME=EMPLOYEE,DIR='/etc/pkiserv/employees'
```

**Guideline:** To simplify your environment, give this instance of PKI Services a JOBNAME that matches or relates to this CA domain name. When you add additional CA domains, it is easier to distinguish multiple jobs running PKI Services.

- 
2. Restart the HTTP servers to enable the environment variables you changed for this CA domain. Optionally, you can wait to do this until after you have started all the new domain-specific daemons.

```
S WEBSRV1,ACTION='stop'
```

Then

```
S WEBSRV1
```

- 
3. Test that your new domain-specific PKI Services daemon is functioning properly. Go to your web pages by entering the following URL from your browser:

```
http://<webserver-fully-qualified-domain-name>/<new-admin-domain-name>/public-cgi/camain.rexx
```

The *webserver-fully-qualified-domain-name* is the common name (CN) portion of the web server's distinguished name; see Table 11 on page 38.

You should be able to go through your web pages to request, retrieve, and revoke an applicable certificate for this CA domain, possibly “PKI browser certificate for authenticating to z/OS”. Ensure you can do this before adding new CA domains.

---

**When you are done:** You have customized the IBM HTTP Server configuration files for this CA domain. Record your progress in Table 51 on page 290.

Once your new CA domain works properly, proceed to add another CA domain, if needed. **Guideline:** Perform Subtasks 3 - 8 for each new CA domain and ensure that the new CA domain operates properly before proceeding to add another.

---

## Enabling Simple Certificate Enrollment Protocol (SCEP)

The Simple Certificate Enrollment Protocol (SCEP) allows you to securely issue certificates to large numbers of network devices using an automatic enrollment technique. The network devices, usually IPSEC devices such as Cisco routers, must be SCEP-enabled and preregistered (to your CA domain) before they can successfully request certificates from you. To request a certificate, the preregistered SCEP client sends a message (the certificate request) to your CA using the HTTP protocol. (The message is a PKCS #10 request enveloped in a signed PKCS #7 structure.)

You can configure PKI Services to respond automatically to some (or all) SCEP certificate requests, or to submit some (or all) SCEP certificate requests to the PKI administrator for approval or rejection. When you enable automatic enrollment, certificate requests can be automatically approved and synchronously fulfilled, based on the requestor's knowledge of a predetermined secret, the challenge passphrase.

### Overview of SCEP preregistration

To request certificates using SCEP, a SCEP requestor must be *preregistered* to PKI Services, your CA. You can preregister SCEP clients in batches using the `pkiprereg` utility (see “Using the `pkiprereg` utility” on page 419) or the PKI administrators can preregister individual SCEP clients (one client at a time) using the end-user web pages.

When PKI administrators preregister a SCEP client, they do so by using the end-user web page for requesting a certificate and selecting the SCEP (preregistration) certificate template called 5-Year SCEP Certificate – Preregistration. (See “Steps for preregistering an SCEP client” on page 386.) The PKI administrator fills out the request form by specifying the device or client name of the SCEP client, a passphrase for client authentication, and additional (optional) subject name and alternate name information. You can customize the `<CONSTANT>` section of the SCEP (preregistration) certificate template to supply the additional optional information.

When a PKI administrator submits the form for a SCEP (preregistration) certificate request, PKI Services creates a preregistration record, not an actual certificate request, in the VSAM ObjectStore data set (request database). The client name is translated to lowercase characters, truncated to 32 characters if longer, and saved as the Requestor to support searching of the ObjectStore. (Each preregistration record must have a client name that is unique in the first 32 characters, regardless of upper or lowercase.)

## Advanced customization

The preregistration record contains the template nickname, passphrase, and additional (optional) subject name and alternate name values. Any other information (unrelated to the subject name or alternate name) specified on the request form is ignored.

When you customize the <CONSTANT> section of the SCEP template to supply additional (optional) values for the following variables, those values are not saved in the preregistration record. However, those values are processed when the preregistered client then requests a certificate.

- AuthInfoAcc
- CertPolicies
- Critical
- ExtKeyUsage (not typically used in a SCEP request)
- KeyUsage (not typically used in a SCEP request)
- NotAfter
- NotBefore

## Overview of certificate request processing for preregistered SCEP clients

Following preregistration, when the preregistered SCEP client requests a certificate (sends a SCEP request), PKI Services searches for a preregistration record matching the client name. If found, PKI Services compares the values in the request to the challenge password and any subject name or alternate name information specified by the PKI administrator or supplied in the <CONSTANT> template section. (If not found, the SCEP request is automatically rejected.)

Based on the comparison of values in the request with those in the preregistration record, PKI Services considers the request to be in one of the following states:

### Authenticated

When the challenge password matches and all other preregistered values are included in the request

### Semiauthenticated

When the challenge password matches but some other preregistered values are missing from the request

### Unauthenticated

When the challenge password does not match or is missing.

Depending on how you customize the variables in the SCEP (preregistration) certificate template, a certificate request from an `Authenticated` SCEP client is either automatically approved and fulfilled synchronously or it is queued for administrator approval. Likewise, a certificate request from an `Unauthenticated` or `Semiauthenticated` SCEP client is either queued for administrator approval or it is automatically rejected.

### Variables used in the <PREREGISTER> section

These are the valid variables that you can customize in the <PREREGISTER> section of the 5-Year SCEP Certificate – Preregistration template. Some variables *must* be present in your <PREREGISTER> section and they are labeled as *required* in the following list.

**AuthenticatedClient** *(required)*

Specifies which action PKI Services takes when an authenticated SCEP client submits a certificate request for the first time. Valid values are:

**AutoApprove** *(default)*

Automatically approves certificate requests from authenticated first-time SCEP clients and automatically creates their certificates.

**AdminApprove**

Submits certificate requests from authenticated first-time SCEP clients to your PKI administrator for verification and approval. The ADMINNUM tag, when present, indicates that multiple approvals are required.

**SemiauthenticatedClient** *(required)*

Specifies which action PKI Services takes when a semiauthenticated SCEP client submits a certificate request for the first time. Valid values are:

**AdminApprove** *(default)*

Submits certificate requests from semiauthenticated first-time SCEP clients to your PKI administrator for verification and approval. The ADMINNUM tag, when present, indicates that multiple approvals are required.

**Reject** Automatically rejects certificate requests from semiauthenticated first-time SCEP clients.

**UnauthenticatedClient** *(required)*

Specifies which action PKI Services takes when an unauthenticated SCEP client submits a certificate request for the first time. Valid values are:

**AdminApprove**

Submits certificate requests from unauthenticated first-time SCEP clients to your PKI administrator for verification and approval. The ADMINNUM tag, when present, indicates that multiple approvals are required.

**Reject** *(default)*

Automatically rejects certificate requests from unauthenticated first-time SCEP clients.

**SubsequentRequest** *(optional)*

Specifies which action PKI Services takes when a previously approved SCEP client submits an additional certificate request. If not set, PKI Services uses the **AuthenticatedClient** value. Valid values are:

**AutoApprove** *(default)*

Automatically approves certificate requests from previously approved SCEP clients and automatically creates their certificates.

**AdminApprove**

Submits certificate requests from previously approved SCEP clients to your PKI administrator for verification and approval. The ADMINNUM tag, when present, indicates that multiple approvals are required.

**Reject** Automatically rejects SCEP requests from previously approved clients.

**RenewalRequest** *(optional)*

Specifies which action PKI Services takes when a previously approved

## Advanced customization

SCEP client submits a certificate renewal request. If not set, PKI Services uses the **AuthenticatedClient** value. Valid values are:

### **AutoApprove** (*default*)

Automatically approves certificate renewal requests from previously approved SCEP clients and automatically creates their certificates.

### **AdminApprove**

Submits certificate renewal requests from previously approved SCEP clients to your PKI administrator for verification and approval. The ADMINNUM tag, when present, indicates that multiple approvals are required.

**Reject** Automatically rejects certificate renewal requests from previously approved SCEP clients.

**Tags used in the <PREREGISTER> section:** The following tags are allowed in the <PREREGISTER> section of a template. Use of these tags is optional unless otherwise specified.

### <ADMINNUM= *value*>

This optional tag indicates the number of PKI Services administrators that must approve certificate requests queued for approval before a certificate can be issued. If this tag is present, any variables that are assigned the value of **AdminApprove** requires the number of approvals that are specified by this tag. This tag has the form <ADMINNUM= *value*>, where *value* can be a numeric value from 1 to 32. The tag has the following meanings:

- By default, queued requests require approval by one PKI Services administrator. If the **ADMINNUM** tag is not present, all queued requests require approval by one PKI Services administrator.
- If the **ADMINNUM** tag does not occur within the **PREREGISTER** subsection, PKI Services operates as if the tag is not present.
- If the **ADMINNUM** value is greater than 32, a value of 32 is used.
- If the **ADMINNUM** value is less than one or is a non-numeric value, a value of 1 is used.

**Note:** A request created from this template remains Pending Approval state until the required number of individual administrative approvals is made for the request, at which time the request changes to Approved state. If an administrator issues an Approve with Modifications on a request that is in Pending Approval state, any previously made approvals are nullified, and the number of approvals that are made for the request is reset to 1.

## Checking certificate fingerprints

There are two instances when the PKI administrator checks certificate *fingerprints* (the SHA1, MD5, SHA256, and SHA512 hashes) in support of certificate request processing for SCEP clients.

- Preregistered SCEP clients who request certificates from this CA domain must download the correct PKI Services CA certificate to their workstations before they issue their certificate requests. After the download, the client can use the SCEP client software to display the fingerprints of the downloaded CA certificate and then confirm with the PKI administrator of the CA domain that it is the correct CA certificate.

To match CA certificate fingerprints with a SCEP client, the PKI administrator can display the fingerprints of the CA certificate for this domain by issuing the following MODIFY (or F) console command:

```
F PKISERVD,DISPLAY
```

The result of this command is information message IKYP025I. **Sample output:**

```
10.37.39 STC00146: IKYP025I PKI SERVICES SETTINGS:
CA DOMAIN NAME: Customers

```

- When the PKI administrator receives a certificate request from a preregistered SCEP client, the PKI administrator can confirm the integrity of the certificate request by viewing its fingerprints on the “Single Request” web page. (See Figure 64 on page 395 for a sample.)

To ensure the integrity of the certificate request, the PKI administrator can contact the SCEP requestor to match the fingerprints in the received certificate request with the fingerprints in the original certificate request. (The certificate requestor can use the SCEP client software to view the fingerprints that are saved for the original request.)

## Steps for enabling Simple Certificate Enrollment Protocol (SCEP)

### Before you begin

The commands in the steps that follow include several variables that are described in Table 54. Determine the values for these variables and record the information in the blank boxes:

Table 54. Information you need to enable Simple Certificate Enrollment Protocol (SCEP)

Information needed	Where to find this information	Record your value here
<i>ca_label</i> - The label of your CA certificate in RACF.	See Table 11 on page 38.	
<i>ra_label</i> - The label of your RA certificate in RACF.	See Table 11 on page 38.	
<i>ca_ring</i> - The PKI Services SAF key ring.	See Table 19 on page 51.	

## Advanced customization

Table 54. Information you need to enable Simple Certificate Enrollment Protocol (SCEP) (continued)

Information needed	Where to find this information	Record your value here
<i>ca_expires</i> - The date the PKI Services CA certificate expires.	See Table 19 on page 51.	
<i>daemon</i> - The user ID for the PKI daemon.	See Table 19 on page 51.	
<i>ra_backup_dsn</i> - The name of the encrypted data set containing the backup copy of your new RA certificate and private key.	See Table 19 on page 51.	
<i>ra_dn</i> - The RA's distinguished name.	See Table 19 on page 51.	

### Procedure

Perform the following steps to enable PKI Services to process Simple Certificate Enrollment Protocol (SCEP) requests:

1. (Optional) Create your PKI Services RA certificate by following these steps, if you have not done so already. (This is optionally done by IKYSETUP.) If you already created an RA certificate, skip to Step 2.
  - a. To create an RA certificate, execute the following RACF command from the TSO command line:
 

```
RACDCERT ID(daemon) GENCERT SUBJECTSDN(ra_dn) KEYUSAGE(HANDSHAKE)
          SIGNWITH(CERTAUTH LABEL('ca_label')) NOTAFTER(DATE(ca_expires))
          WITHLABEL('ra_label')
```
  - b. Back up the new PKI Services RA certificate and private key to a password-encrypted data set (*ra\_backup\_dsn*). Remember to record and store your encryption password in case you ever need to recover the certificate or private key.
 

```
RACDCERT ID(daemon) EXPORT(LABEL('ra_label')) DSN(ra_backup_dsn)
          FORMAT(PKCS12DER) PASSWORD('encryption-pw')
```
  - c. Add the new RA certificate to the PKI Services key ring.
 

```
RACDCERT ID(daemon) CONNECT(LABEL('ra_label') RING(ca_ring))
```
2. Edit the PKI Services configuration file (/etc/pkiserv.conf) and set the RALabel directive in the **SAF** section to specify the label (*ra\_label*) of your PKI Services RA certificate. (The default in IKYSETUP is Local PKI RA. For details, see “(Optional) Steps for updating the configuration file” on page 68.)
 

```
[SAF]
KeyRing=PKISRVD/CARing
# The label of the PKI Services RA certificate
RALabel=Local PKI RA
```
3. Edit the PKI Services configuration file (/etc/pkiserv.conf) to change the EnableSCEP directive in the **CertPolicy** section setting from F(False) to T(True).
 

```
[CertPolicy]
# Enable the Simple Certificate Enrollment Protocol, (T) rue or (F) alse
EnableSCEP=T
```
4. Edit the PKI Services template file (/etc/pkiserv.tpl or pkitmpl.xml) and customize the <PREREGISTER> section of the 5-Year SCEP Certificate – Preregistration template as you want or create a new preregistration template. (Refer to the list in “Variables used in the <PREREGISTER> section” on page 304 for valid variables and values.
 

(defaults)

```
AuthenticatedClient=AutoApprove
SemiauthenticatedClient=AdminApprove
UnauthenticatedClient=Reject
SubsequentRequest=AutoApprove
RenewalRequest=AutoApprove
```

5. Edit the <CONTENT> section of your preregistration template to allow the PKI administrator to specify subject distinguished name and alternate name fields that the SCEP client must provide to authenticate. Specify only subject distinguished name and alternate name fields here. All other fields are ignored. (For about customizing the end-user web pages, see Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127.)

(defaults)

```
%%SerialNumber (Optional)%%
%%UnstructAddr (Optional)%%
```

6. Edit the <CONSTANT> section of your preregistration template to supply any other value you want, such as MAIL or ORG, that must be included for every SCEP preregistration request. Any subject distinguished name and alternate name fields you specify here must match the information (in the subsequent certificate request) sent by the SCEP client to authenticate the certificate request.

```
%%Org=The Firm%%
```

7. Edit the HTTP Server environment variables file, vhost80.conf file, and update the LIBPATH variable to include /usr/lpp/pki serv/lib.
8. Stop and restart PKI Services.

When you are done, you have enabled your CA domain to accept SCEP preregistration requests and process certificate requests from preregistered SCEP clients. The URL used by the SCEP clients is `http://webserver-domain-name/CA-domain-name/public-cgi/pkiclient.exe`.

---

## Customizing email notifications sent to users

You can optionally notify a user by sending an email message when:

- A certificate request is rejected
- A certificate is ready for retrieval
- A certificate is about to expire (unless it is already renewed or revoked).
- A certificate is automatically renewed.
- Requests are pending for the user's approval, when the user is the PKI administrator.

In addition, when a user requests that PKI Services recover one or more certificates for which PKI Services created the keys, PKI Services sends that user an email message listing the possible certificates to be recovered.

On the days that are specified by the `MaintRunDays` parameter in the `pki serv.conf` file, the PKI Services daily maintenance task checks the issued certificate list (ICL) for expiring certificates. (The `ExpireWarningTime` parameter (see the **CertPolicy** section in Table 21 on page 68) determines at what point before the certificate expires that it is considered to be an expiring certificate.) When PKI Services finds an expiring certificate, it takes one of the following actions:

- If automatic renewal of certificates is in effect, PKI Services renews the certificate and sends it to the client.
- If automatic renewal of certificates is not in effect, PKI Services sends an expiration warning message to the client (unless the certificate is already revoked). Regardless of whether sending the expiration warning message is

## Advanced customization

successful, PKI Services makes only one attempt to send a notification message. If the email address is incorrect or the user renews the certificate and retrieves it before the expiration message is sent, no expiration messages are sent.

You can set the `AdminNotifyNew` keyword in the `CertPolicy` section of the configuration file to specify one or more email addresses of PKI administrators to be notified immediately whenever there is a request pending for approval. The notification is sent only once, when the request is created. You can also set the `AdminNotifyReminder` keyword to specify one or more email addresses of PKI administrators to be reminded once a day of any requests pending for approval. An administrator receives a daily reminder of a pending request until the request is processed. To receive both the immediate notifications and the daily reminders, an administrator's email must be specified on both the `AdminNotifyNew` and `AdminNotifyReminder` keywords.

If you are not sending email notifications, see Step 6b on page 216 for directions.

If you are sending email notifications, you need to do the following things:

- Have copies of the forms in the runtime directory. (For information about copying the message forms to the runtime directory, see Step 3 on page 64.
- Customize the forms. (For details, see “Steps for customizing email notification forms” on page 314.)
- For notifications that a request is rejected, that a certificate is ready for retrieval, that a certificate is about to expire, and that a certificate is renewed automatically, include the `NotifyEmail` field on certificate requests. This field is already included in the `pkiserv.tpl` certificate template file. If you are *not* sending email notifications, you need to delete the `NotifyEmail` lines in the `pkiserv.tpl` file; for details, see Step 6b on page 216.)

For more information about the `NotifyEmail` field, see Table 32 on page 132. For information about fields on request forms, see Table 63 on page 365.

The following examples (of notices you can send to users) are in the sample directory:

```
From:dime-o-cert PKI
Subject:Certificate Ready For Pick Up
Attention - Please do not reply to this message as it was automatically sent
by a service machine.
Dear %%requestor%,
Thank you for choosing dime-o-cert PKI. The certificate you requested
for subject %%dn% is now ready for pickup.
Please visit:
(edit the following link if using the REXX CGI Web Application)
https://www.dimeocert.com/Customers/ssl-cgi-bin/caretrieve.rexx?%%quicklink%
(edit the following link if using the JSP WebSphere Application)
https://www.dimeocert.com:9080/PKIServ_Web/Customers/certretrieve.jsp?%%quicklink%
to retrieve your certificate.
If that link does not work, try to go to
(edit the following link if using the REXX CGI Web Application)
http://www.dimeocert.com/Customers/public-cgi/camain.rexx
(edit the following link if using the JSP WebSphere Application)
http://www.dimeocert.com:9080/PKIServ_Web/Customers/pkimain.jsp
And enter the transaction ID listed below:
%%transactionid% You will need to input your passphrase that you
entered when you submitted the request.
```

Figure 30. Sample of `readymsg.form`

```

From:dime-o-cert PKI
Subject:Certificate Request Rejected

Attention - Please do not reply to this message as it was
automatically sent by a service machine.

Dear %%requestor%%,

Thank you for choosing dime-o-cert PKI. We are sorry to inform you that
your certificate request for subject %%dn%% has been rejected
with the following explanation [if any]:
%%rejectreason%.
Please contact the PKI Services administrator at 1-800-xxx-xxxx.
You will need the transaction ID listed below.

%%transactionid%

```

Figure 31. Sample of rejectmsg.form

```

From:dime-o-cert PKI
Subject:Certificate Expiration
Attention - Please do not reply to this message as it was automatically sent by a service machine.
Dear %%requestor%%,
Thank you for choosing dime-o-cert PKI. The certificate your requested for
subject %%dn%% expires at %%notafter%% local time. If you wish to renew
your certificate, please visit:
(edit the following link if using the REXX CGI Web Application)
http://www.dimeocert.com/Customers/public-cgi/camain.rexx
(edit the following link if using the JSP WebSphere Application)
http://www.dimeocert.com:9080/PKIServ_Web/Customers/pkimain.jsp
If this is a browser certificate, you must use the same workstation and browser that
you used when you requested the original certificate. If this is a server
certificate, you will have to submit a #10 certificate request.

```

(edit the following link if using the JSP WebSphere Application)
https://www.dimeocert.com:9080/PKIServ_Web/Customers/certrecover.jsp?%%recoverylink%
You will need to input your pass phrase that you entered when you submitted the request.
    
```

Figure 36. Sample of recoverymsg.form

### Notes:

1. PKI Services automatically provides the To: value in the forms. You can include From: or Subject: or both at the top of the file.
2. You must have a blank line between the Subject and the body of the form.

The following table summarizes the variables that you can use in the forms when you customize them. At run time, PKI Services replaces these with their actual values.

Table 55. Descriptions of variables for forms

Variable	Description
%%cadomain%	The CA domain that this message comes from. It is truncated if longer than 8 characters. (This variable is valid only in the pending requests form, pendingmsg.form. It is ignored in the other forms.)
%%dn%	The subject's distinguished name. (This variable is valid in all the forms except the pending requests form, pendingmsg.form.)
%%printcert%	A renewed certificate in Base64-encoded format. (This variable is valid only in the renewed certificate form, renewcertmsg.form. It is ignored in the other forms.)
%%modreqlist%	A list of pending approval requests (or a single request) that are modified by an administrator. (This variable is valid only in the pending modified message form, pendingmsg2.form. It is ignored in the other forms.)

Table 55. Descriptions of variables for forms (continued)

Variable	Description
%%notafter%%	The certificate expiration date and time in local time in the format YYYY/MM/DD HH:MM:SS. (This variable is valid only in the expiring.form. It is ignored in the other forms.)
%%pendreqlist%%	A list of pending approval requests (or a single request). Each request contains the transaction ID followed by the corresponding requestor. Each request should be on a line of its own. (This variable is valid only in the pending message form, pendingmsg.form. It is ignored in the other forms.)
%%quicklink%%	<p>A link to a certificate that is ready for pickup. It contains the transaction ID, the “&amp;” character, and the string of the template name or alias, with escaped characters. The following string (broken into two lines so that it fits in the column) is an example:</p> <pre>TransactionId=1j86b0wokkoQ2SHV%2B%2B%2B%2B%2B%2B%2B%2B&amp;Template=PKI+Browser+Certificate</pre> <p>The template name or alias is located from the apldata field of the certificate from the issued certificate list (ICL). The apldata field corresponds to the value of the NICKNAME directive in the template. If PKI Services cannot determine the template name or alias, the %%quicklink%% variable is an empty string, and a warning level message IKYC056I is logged.</p>
%%recoverylink%%	Part of the link to a certificate that can be recovered. It contains the serial number, the “&” character, and the KeyId of the recovery certificate. This part of the link is at the end of the line, which is appended to the URL link. The entire line is repeated for each entry in the list of certificates that can be recovered.
%%recoverylist%%	The list of certificates that meet the criteria for recovery; that is, the email address for the certificate matches the email address of the user requesting the recovery of the certificate, the password used for the original certificate request matches the password provided by the user, and PKI Services created the keys for the certificate. The URL for each recovered certificate is on a line by itself.
%%rejectreason%%	The reason for the rejection of a certificate request. (This variable is valid for the reject form only.)
%%requestor%%	The requestor of the certificate.
%%transactionid%%	The transaction ID (CertId) returned. (This variable is valid for the ready and reject forms only. It is ignored in the other forms.)

Table 56 summarizes which substitution variables are supported by which forms:

Table 56. Summary of substitution variables in forms

Substitution variable	readymsg	rejectmsg	expiringmsg	pendingmsg	pendingmsg2	renewcertmsg	recoverymsg
%%cadomain%%	(ignored)	(ignored)	(ignored)	X	(ignored)	(ignored)	(ignored)
%%dn%%	X	X	X	(ignored)	(ignored)	X	(ignored)
%%printcert%%	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)	X	(ignored)

## Advanced customization

Table 56. Summary of substitution variables in forms (continued)

Substitution variable	readymsg	rejectmsg	expiringmsg	pendingmsg	pendingmsg2	renewcertmsg	recoverymsg
%%modreqlist%%	(ignored)	(ignored)	(ignored)	(ignored)	X	(ignored)	(ignored)
%%notafter%%	(ignored)	(ignored)	X	(ignored)	(ignored)	(ignored)	(ignored)
%%pendreqlist%%	(ignored)	(ignored)	(ignored)	X	(ignored)	(ignored)	(ignored)
%%quicklink%%	X	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)
%%recoverylink%%	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)	X
%%recoverylist%%	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)	X
%%rejectreason%%	(ignored)	X	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)
%%requestor%%	X	X	X	(ignored)	(ignored)	X	X
%%transactionid%%	X	X	(ignored)	(ignored)	(ignored)	(ignored)	(ignored)

## Steps for customizing email notification forms

Perform the following steps to customize the forms:

1. Make sure the forms you want to use (readymsg.form, rejectmsg.form, expiringmsg.form, renewcertmsg.form, pendingmsg.form, and recoverymsg.form) are present in the runtime directory. (By default, the runtime directory is /etc/pkiserv/. For information about copying files, see Step 3 on page 64.)

2. Update the form. At minimum:

- a. Specify your company (instead of dime-o-cert) in the From: line and in the first line of the main paragraph
- b. If appropriate, update the subject.

**Note:** There must be a blank line between the subject and the body of the note.

- c. If you are updating a ready, expiring, or recovery form, change the URL in the main paragraph to customize it for your company. The sample forms have URLs for both REXX CGI exec and JavaServer page (JSP) use. Modify the URL that applies for the method you are using to implement the web application, and remove the URL that does not apply. Remove the comment lines above each URL.

For example, if you are modifying the ready form, and you are implementing the web application using JSPs, change:

```
Please visit:
(edit the following link if using the REXX CGI Web Application)
https://www.dimeocert.com/Customers/ssl-cgi-bin/caretrieve.rexx?%%quicklink%%
(edit the following link if using the JSP WebSphere Application)
https://www.dimeocert.com:9080/PKIServ_Web/Customers/certretrieve.jsp?%%quicklink%%
to retrieve your certificate.
```

to

```
Please visit:
https://www.dimeocert.com:9080/PKIServ_Web/Customers/certretrieve.jsp?%%quicklink%%
to retrieve your certificate.
```

and modify the URL for your company.

- d. If you are updating a reject form, change the telephone number in the main paragraph to customize it for your company.

Make any other needed changes. (You can use variables in the body of the form, but you cannot include `%%transactionid%%` in the expiring form or `%%notafter%%` in the ready or reject form.)

- 
3. Save the file.
- 

---

## Setting up automatic renewal of certificates

You can optionally set up PKI Services to automatically renew certificates when they approach their expiration date, and email the new certificates to their owners. This option is controlled on a template basis.

### Steps for setting up automatic certificate renewal

Perform the following steps to set up automatic certificate renewal.

#### Before you begin

You need to decide for which certificate templates you want to set up automatic certificate renewal. For a description of the templates provided by PKI Services, see “Supported certificate types” on page 7.

#### Procedure

1. In the CertPolicy section of the `pkiserv.config` configuration file, set the field `ExpireWarningTime` to specify how soon (in days or weeks) before a certificate expires to renew it and send the renewed certificate to its owner. For example, to automatically renew certificates two weeks before they expire:

```
ExpireWarningTime=2w
```

---

2. Set up the renewed certificate email notification form.
  - a. Copy the sample renewed certificate notification form, `renewcertmsg.form`, from the samples directory to the runtime directory. For more information, see “Steps for copying files” on page 63.
  - b. Customize the renewed certificate notification form with your company's information. For more information, see “Customizing email notifications sent to users” on page 309.
  - c. In the General section of the `pkiserv.config` configuration file, set the field `RenewCertForm` to indicate the file that contains the renewed certificate notification form. For example:

```
RenewCertForm=/etc/pkiserv/renewcertmsg.form
```

---

3. If you are implementing the web application using REX CGI execs, in each template for which you want certificates to be automatically renewed, insert the `AUTORENEW` tag immediately following the `NICKNAME` tag, if it is not already there, and set it to `Y`. For example:

```
<TEMPLATE NAME=1-Year PKI SSL Browser Certificate>
<TEMPLATE NAME=PKI Browser Certificate>
<NICKNAME=1YBSSL>
<AUTORENEW=Y>
```

## Advanced customization

If you are implementing the web application using JavaServer pages (JSPs), for each certificate request template for which you want certificates to be automatically renewed, include the tag `<tns:AutoRenew>Y</tns:AutoRenew>`. For example:

```
<tns:certreq_template>
<tns:certname>1-Year SAF Browser Certificate</tns:certname>
<tns:certtype>SAF Browser Certificate</tns:certtype>
<tns:AutoRenew>Y</tns:AutoRenew>
:
```

- 
4. For each certificate type that you want to be automatically renewed, except the PKI generated key certificate, make NotifyEmail a required field.

To do this if you are implementing the web application using REX CGI execs, in each template for which you want certificates to be automatically renewed (except the PKI generated key certificate), remove the string (optional) following the NotifyEmail tag, if it is specified. For example, change

```
%%NotifyEmail (optional)%%
```

to

```
%%NotifyEmail%%
```

If you are implementing the web application using JavaServer pages (JSPs), for each certificate request template for which you want certificates to be automatically renewed (except the PKI generated key certificate), remove the string `optional="true"` following the NotifyEmail tag, if it is specified. For example, change:

```
<tns:NotifyEmail optional="true" />
```

to

```
<tns:NotifyEmail />
```

**Note:** For a PKI generated key certificate, the requestor name is an email address and overrides the NotifyEmail value if specified.

---

## Results

When you are done, you have set up automatic certificate renewal.

---

## Setting up PKI Services to generate keys for certificate requests

There are two ways to generate the key pair (public key and private key) for a certificate request:

- The requestor can generate the key pair and send the public key to PKI Services with the request. In this case, PKI Services has no knowledge of the private key, and cannot recover it if the requestor loses it.
- The requestor can ask PKI Services to generate the key pair. PKI Services uses the PKCS #11 API provided by ICSF to generate the key pair and store it in the token data set (TKDS). The requestor's email address is used as the requestor name. The certificate and private key are packaged in PKCS #12 format and the requestor is sent a link from email to retrieve the package. In this case PKI Services can recover the certificate package if the requestor needs it.

Before PKI Services can generate key pairs for certificates, you must do some setup. For example, you must set the `TokenName` keyword in the `pki serv.conf` configuration file.

**Requirement:** The key generation capability requires hardware that supports the PKCS #11 CKM\_RSA\_PKCS\_KEY\_PAIR\_GEN mechanism. For information about which hardware supports this mechanism, see *z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*.

PKI Services can generate both secure keys and clear keys. The sensitive key material of a *secure key* is wrapped under a master key. A *clear key* is not encrypted. You control whether PKI services generates secure keys or clear keys by setting the `SecureKey` keyword in the `pki serv.conf` configuration file. You can restrict the generation of clear keys by defining a profile protecting the resource `CLEARKEY.token_name` in the CRYPTOZ class.

#### Rules:

- The `SecureKey` keyword is ignored if the `TokenName` keyword is not specified.
- If the `SecureKey` keyword is set to T, PKI Services generates secure keys. (The `CKA_IBM_SECURE` attribute is set to TRUE.)
- If the `SecureKey` keyword is set to F or is not specified, PKI Services generates clear keys if profiles in the CRYPTOZ class that protect the CLEARKEY function allow clear key generation. If CLEARKEY profiles do not allow clear key generation, PKI services generates a secure key. For example, the following RACF command prevents clear key generation on the token named PKISRVD.PKITOKEN:

```
RDEF CRYPTOZ CLEARKEY.PKISRVD.PKITOKEN UACC(NONE)
```

## Steps for setting up PKI Services to generate keys for certificate requests

Perform the following steps to set up key generation for certificate requests.

### Before you begin

- You need to know whether the ICSF token data set (TKDS) has already been set up.
- You need to know whether you want PKI Services to generate secure or clear keys.
- You need to know whether you want to restrict the use of clear keys.

### Procedure

1. If the ICSF token data set (TKDS) has not already been set up, ask the ICSF programmer to set it up. (For information about the TKDS, see *z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*.) The TKDS must be set up before PKI Services starts, so if necessary stop and restart PKI Services after the TKDS is set up. (For information about stopping and restarting PKI Services, see Chapter 10, "Starting and stopping PKI Services," on page 121.
2. Edit the **SAF** section of the PKI Services configuration file, `pki serv.conf`, and verify that the `TokenName` parameter is specified. If it is not, choose a name for the token in the TKDS that PKI Services uses for storing the key pairs that it generates, and set `TokenName` to the name you choose.

**Rules:** A token name must follow these rules:

## Advanced customization

- Up to 32 characters in length
  - Permitted characters are:
    - Alphanumeric
    - National: “@” (X'5B'), “#” (X'7B'), or “\$” (X'7C')
    - Period: “.” (X'4B')
  - The first character must be alphabetic or national
  - Lowercase letters can be used, but are folded to uppercase
  - The IBM1047 code page is assumed
- 
3. Edit the **SAF** section of the PKI Services configuration file, `pkiserv.conf` and set the `SecureKey` parameter to `T` if you want PKI Services to generate secure keys, or to `F` if you want PKI Services to generate clear keys.
- 
4. If you want to restrict the generation of clear keys, have the security administrator create a profile in the `CRYPTOZ` class to do so. For example, if you set `TokenName` to `PKISRVD.PKITOKEN`, to restrict PKI Services from generating clear keys the security administrator issues the command:  

```
RDEF CRYPTOZ CLEARKEY.PKISRVD.PKITOKEN UACC(NONE)
```
  5. Edit the **General** section of the PKI Services configuration file, `pkiserv.conf`, and verify that the `ReadyMessageForm` parameter is specified. If it is not:
    - Copy the ready message form from the samples directory to the runtime directory. Follow the instructions in “Steps for copying files” on page 63.
    - Update the `ReadyMessageForm` parameter to specify the full path name or data set name of the ready message form.
    - Customize the ready message form. Follow the instructions in “Customizing email notifications sent to users” on page 309.
- 
6. Set up the email form that is sent if a user requests that PKI Services recover a certificate for which PKI Services generated the keys. The form contains a list of certificates that can be recovered. Edit the **General** section of the PKI Services configuration file, `pkiserv.conf` and verify that the `RecoverForm` parameter is specified. If it is not:
    - Copy the recovery message form from the samples directory to the runtime directory. Follow the instructions in “Steps for copying files” on page 63.
    - Update the `RecoverForm` parameter to specify the full path name or data set name of the recovery message form.
    - Customize the recovery message form. Follow the instructions in “Customizing email notifications sent to users” on page 309.
- 
7. If you want expired certificates whose keys were generated by PKI Services to be deleted from the ICL automatically after a certain time period, edit the **ObjectStore** section of the PKI Services configuration file, `pkiserv.conf` and update the `RemoveExpiredCertsAndKeys` parameter to specify the time period after which the expired certificates should be deleted.
- 
8. The RACF administrator must give the PKI Services daemon the authorization it needs to use the PKCS #11 APIs. The following RACF commands set up the required authorization in the `CRYPTOZ` class. (By default the daemon user ID

is PKISERVD, but you might be using a different user ID. Check the daemon variable in Table 19 on page 51 if you are not sure what your daemon user ID is.)

```
SETROPTS CLASSACT(CRYPTOZ) GENERIC(CRYPTOZ) RACLIST(CRYPTOZ)
RDEFINE CRYPTOZ SO.daemon_id.* UACC(NONE)
RDEFINE CRYPTOZ USER.daemon_id.* UACC(NONE)
PERMIT SO.daemon_id.* CLASS(CRYPTOZ) ID(daemon_id) ACC(UPDATE)
PERMIT USER.daemon_id.* CLASS(CRYPTOZ) ID(daemon_id) ACC(CONTROL)
SETROPTS RACLIST(CRYPTOZ) REFRESH
```

**Note:** These commands are included in the IKYSETUP REXX exec. If you have another reason to rerun IKYSETUP, you can update the exec to set up the daemon user ID's authorization in the CRYPTOZ class at the same time. If you do not have another reason to rerun IKYSETUP, the RACF administrator can issue the commands manually.

- 
9. (Optional) Because PKI Services stores certificates for which it generates the keys in the TKDS, it can recover those certificates from the TKDS. To recover a certificate, a user must provide the passphrase that was entered when the certificate was originally requested. If the user has forgotten the passphrase, you can use the PKI Services exit to allow the user to recover the passphrase by responding to security questions. For more information, see “Scenario 4: Allow users to recover a PKI generated key certificate when the passphrase is lost” on page 342. Decide whether you want to implement passphrase recovery, and if so, write exit code to implement the function.
  10. (Optional) When PKI Services generates the keys for certificate requests, it returns both the certificate and the private key in PKCS#12 format when retrieved by the requester. By default, the PKCS#12 contains the CA certificate that signed the requested certificate. The contents of the PKCS#12 may be tailored to contain only the issued certificate with private key, the issued certificate with private key, and the CA certificate that signed the issued certificate, or the issued certificate with private key and the complete CA signing chain. Use the PKCS12Content keyword in the pkiserv.conf file to specify the PKCS#12 content. When PKCS12Content is set to either I or E, no further configuration is required. However, when PKCS12Content=C is set, if the PKI CA certificate is not a root CA (self-signed), each of the CA certificates in the signing chain must be connected to the PKI Services key ring with CERTAUTH usage. For example, If the PKI Services CA certificate is signed by a CERTAUTH certificate with a Label of "Dime-o-Cert Root CA", and the pkiserv.conf file has Keyring=PKISRVDC/CAring in the [SAF] section, the following RACF command is issued to connect the root CA certificate to the PKI Services key ring:

```
RACDCERT ID(PKISRVDC) CONNECT(CERTAUTH LABEL('Dime-o-Cert Root CA') ring(CAring))
```

## Results

When you are done, PKI Services can generate key pairs for certificate requests if asked to do so.

---

## Adding custom extensions to certificates

PKI Services supports the following standard certificate extensions:

- Authority Key Identifier
- Subject Key Identifier
- Key Usage

## Advanced customization

- Extended Key Usage
- Subject Alternate Name
- BasicConstraints
- CRL Distribution Point
- HostIDMapping
- Authority Information Access
- Certificate Policies

In addition, PKI Services supports custom extensions. You can include any extension in your certificates that is in the form:

```
Extension ::= SEQUENCE {
    extnID      OBJECT IDENTIFIER,
    critical    BOOLEAN DEFAULT FALSE,
    extnValue   OCTET STRING }
```

PKI Services provides a CustomExt INSERT and a CustomExt JSP that you can use to add custom extensions to your certificate templates. The *n*-year PKI browser certificate template demonstrates the use of custom extensions.

**Restriction:** Do not add a critical extension to a certificate template for which PKI Services generates the keys.

## Steps for adding a custom extension to a certificate template if you are using REXX CGI execs

### Procedure

1. Copy the CustomExt INSERT from `pkiserv.tpl`.

---

2. Rename the copy of the CustomExt INSERT. The name is the string that is formed by concatenating the following values:
  - a. The string "CustomExt".
  - b. The OID. You are responsible for ensuring that you use a registered OID, PKI Services does not check this.
  - c. The critical flag - C for a critical extension, N for a non-critical extension.
  - d. The value type. Supported types are:
    - INT (integer in a printable hexadecimal format)
    - IA5 (IA5 string)
    - PRT (printable string)
    - BMP (BMP string)
    - OCT (Octet string)
    - UTF (UTF 8 string)

---

3. Customize the INSERT to contain any inputs that you want, and to have the corresponding JavaScript code manipulate and verify the inputs.

---

4. Add the customized INSERT to the certificate template that you want to use it in.

---

5. Update the CONTENT subsection of the certificate template to add new input fields.

---

## Results

When you are done, you have added a customized extension to a certificate template using REXX CGI execs.

## Steps for adding a custom extension to a certificate template if you are using JSPs

### Procedure

1. Copy the CustomExt JSP from the `mod.inc` directory, and the certificate template file, `pkitmpl.xml`, by default in the `/etc/pkiserv/` directory.

---

  2. Rename the copy of the CustomExt JSP. The name is the string formed by concatenating the following values:
    - a. The string “CustomExt”.
    - b. The OID. You are responsible for ensuring that you use a registered OID, PKI Services does not check this.
    - c. The critical flag - C for a critical extension, N for a non-critical extension.
    - d. The value type. Supported types are:
      - INT (integer in a printable hexadecimal format)
      - IA5 (IA5 string)
      - PRT (printable string)
      - BMP (BMP string)
      - OCT (Octet string)
      - UTF (UTF 8 string)

---

  3. Customize the certificate template file, `pkitmpl.xml` to contain any inputs that you want, and customize the JSP file to manipulate and verify the inputs.

---

  4. Use the TemplateTool utility to validate your updated XML template file. When you have completed your updates and successfully validated them, use the TemplateTool utility to create an updated CGI template file, `pkixgen.tmp`

---

  5. Update the EAR file with the modified JSP file, and deploy the EAR file to a WebSphere Application Server. For information on how to do this, see “Customizing the PKI Services web application” on page 255.
- 

## Results

When you are done, you have added a customized extension to a certificate template using JSPs.

## Forming the CustomExt value for CertPlist for the R\_PKIServ callable service

The INSERT or JSP code that you write for a custom extension must be able to call the R\_PKIServ callable service with a properly formed CustomExt value for the

## Advanced customization

CertPlist parameter list. The CustomExt CertPlist entry is a comma-separated 4-part string with a maximum length of 1024 bytes:

1. The first part is the OID of the extension.
2. The second part is the critical flag:
  - C or c indicates critical
  - N or n indicates non-critical
3. The third part is the encode type:
  - INT indicates integer
  - IA5 indicates IA5 string
  - PRT indicates printable string
  - BMP indicates BMP string
  - OCT indicates octet string
  - UTF indicates UTF string
4. The fourth part is the value.

For example, given the following ASN.1 notation for an x.509 extension:

```
Extension ::= SEQUENCE {
    extnID OBJECT IDENTIFIER,
    critical BOOLEAN DEFAULT FALSE,
    extnValue OCTET STRING
}
```

and the following definition of an ASN.1 custom extension:

```
SEQUENCE {
    . OBJECT IDENTIFIER '1 2 3 4'
    . OCTET STRING, encapsulates {
    . . INTEGER 240
    . . }
    . }
```

the CustomExt value to produce this would be:

```
1.2.3.4,N,INT,F0
```

**Rules:** The OID value must follow these rules:

- Its length must not exceed 64 characters.
- It must be comprised of decimal digits and the dot (period) character).
- It cannot start or end with a dot (period) character and cannot contain adjacent dots.
- The first integer value must be 0, 1, or 2. If the first integer is 0 or 1, the second integer must not be greater than 39.
- It must contain a minimum of 3 dot-separated segments (for example 1.2.3).
- The value of the first segment must be 0, 1, or 2. If the first integer is 0 or 1, the second integer must not be greater than 39.
- The largest integer value for all segments after the second segment is the largest 31-bit integer value: 2 147 483 647.

**Rules:** The critical flag must follow these rules:

- Only mark an extension critical if all applications that use the certificate know and understand the extension. Applications that do not know and understand an extension that is marked critical are required to deny the use of the certificate.
- Do not mark an extension critical if PKI Services creates the public and private keys for the certificate.

**Rules:** The encoding types and values must follow these rules:

- The INT encoding type indicates that the extension value encapsulated in the extension value's octet string is a primitive integer type.
- Because the INTEGER type in the ASN.1 specification is not limited to fit in a 4-byte construct, the value specified for INT is a hexadecimal string rather than decimal. If the specified hexadecimal string for an INTEGER type contains an odd number of characters, the high-order bit of the first character is propagated in the encoded value. For example, if the CustomExt value is 12.3.4,N,INT,800, because there are only 3 characters in 800, and the high order of the first character is on, the encoded value is F800 in hexadecimal, or -2048 decimal.
- The PRT encoding type indicates that the extension value encapsulated in the extension value's octet string is a primitive printableString type. The characters specified in the CustomExt value must conform to the PrintableString character set, which is a subset of the 7-bit ASCII or IA5 character set.
- The IA5 encoding type indicates that the extension value encapsulated in the extension value's octet string is a primitive IA5String type. The characters specified in the CustomExt value must conform to the IA5String character set. Control characters that part of the IA5 character set are not allowed.
- THE UTF encoding type indicates that the extension value encapsulated in the extension value's octet string is a primitive UTF8String type. The characters specified in the CustomExt value must conform to the Basic Latin and Latin-1 characters except for control characters. To encode a UTF8String extension value with characters that fall outside the range supported, you must use the OCT encoding type.
- The BMP encoding type indicates that the extension value encapsulated in the extension value's octet string is a primitive BMPString type. The characters specified in the CustomExt value must conform to the Basic Latin and Latin-1 characters except for control characters. To encode a BMPString extension value with characters that fall outside the range supported, you must use the OCT encoding type.
- The OCT encoding type indicates that the extension value specified in the CustomExt value is the extension's octet string value. You must specify an even number of printable hexadecimal characters, and the OctetString value should not include the tag and length bytes for the OctetString.

**Example:** You want to build a custom extension whose extnID is 1.2.3.4, is not marked critical, and has an extnValue composed of a SEQUENCE containing an INTEGER value of 1024 (decimal) followed by a UTF-8 string with the value "AB£¬¥YZ". The ASN.1 definition is:

```
SEQUENCE {
. OBJECT IDENTIFIER '1 2 3 4'
. OCTET STRING, encapsulates {
. . SEQUENCE {
. . . INTEGER 1024
. . . UTF8String 'AB£¬¥YZ'
. . . }
. . }
. }
```

Use the following value for CustomExt:

```
CustomExt=1.2.3.4,N,OCT,3010020204000C0A4142C2A3C2ACC2A5595A
```

For the OCT value:

## Advanced customization

```
3010 = SEQUENCE(0x30) of length 0x10  
02020400 = INTEGER(0x02) of length 0x02, value 0x0400 = 1024 decimal  
0C0A4142C2A3C2ACC2A5595A = UTF8String(0x0C) of length 0x0A,  
value = 41(A) 42(B) C2A3(£) C2AC(→) C2A5(¥) 59(Y) 5A(Z)
```

---

## Chapter 15. Customizing with installation exit routines

### Programming Interface Information

PKI Services supports the use of installation exit routines in the following ways:

- The PKI Services daemon can call an installation-provided exit routine for automatic renewal processing.
- If you implement the PKI Services web application using REXX CGI execs, the PKI Services web application CGIs can call an installation-provided exit routine for end-user functions except VERIFY.
- If you implement the PKI Services web application using JavaServer pages (JSPs), exit methods are called before and after end-user functions except VERIFY.

PKI Services provides a sample exit routine, `pkixit.c`, written in the C language. It is intended to demonstrate the power of the exit routine for the daemon and REXX CGI execs, and to provide a guide for you to write your own exit routine. The main routine of the program determines which subroutine to call, based on the `R_PKIServ` function being called and whether this is a pre- or post-processing call.

No sample is provided for the exit methods used with JSPs.

You can implement the exit routines for the PKI Services daemon and the PKI Services web application CGIs in the same program (as shown in the sample, `pkixit.c`) or in separate programs.

PKI Services provides the following files for the daemon and CGI exit routine. Both files are, by default, in: `/usr/lpp/pkiserv/samples/`.

*Table 57. Files for the `pkixit.c` exit routine*

File name	Description
<code>pkixit.c</code>	Code sample for the exit routine (in the C programming language). You probably need to update the exit routine code before using it.
<code>Makefile.pkixit</code>	Makefile for <code>pkixit.c</code> .

---

### Exit routine processing for automatic certificate renewal

The PKI Services daemon supports an installation-provided exit routine for automatic renewal processing. An exit routine can be written to provide additional automatic renewal criteria, and to capture the renewed certificate for further processing. If you choose to implement this exit routine, it must be a UNIX executable program residing in a file system, with appropriate permission assigned. The PKI Services daemon identifies the exit routine as the program specified by the value of the `_PKISERV_EXIT` environment variable in the `pkiserv.envars` file. The value that is specified is limited to a maximum of 256 characters. The exit routine is invoked by the PKI Services daemon using standard UNIX parameters (that is, `argc` and `argv[]`). The exit routine communicates its results back to the PKI Services daemon by way of a return code. The exit routine is called for preprocessing and post-processing before and after automatic certificate renewal processing. Unlike the PKI Services CGI exit routines, messages

that are written to either STDOUT or STDERR do not appear in either the web server or PKI Services daemon logs. If you want to write messages in the exit program, you need to open a file and write messages to that file. The sample exit routine that is provided in `/usr/lpp/pkiserv/samples/pkiexit.c` illustrates writing messages to a file in both the preprocessing and post-processing exit functions.

**Note:** This exit routine can be implemented in the same program as the exit routines for the PKI Services CGIs (as illustrated in the sample `pkiexit.c` exit program) or can be implemented as a separate program.

The `ExitTimeout` keyword in the General section of the `pkiserv.conf` file specifies the maximum time PKI Services waits for the exit routine to return. If `ExitTimeout` is not specified, PKI Services waits at most 30 seconds for the exit routine to return. If `ExitTimeout` is specified with a value greater than 1 hour, PKI Services waits 1 hour at the most for the exit routine to return.

## Steps for updating the exit routine code sample

To update the exit routine code sample, `pkiexit.c`, perform the following steps:

1. Copy the sample exit routine and makefile to the current directory by entering the following commands:

```
cp /usr/lpp/pkiserv/samples/pkiexit.c pkiexit.c
cp /usr/lpp/pkiserv/samples/Makefile.pkiexit Makefile
```

2. Compile and link to produce the executable program, `pkiexit`, by entering the following command:

```
make
```

3. Move the executable program to its execution directory and set the permissions by entering the following commands:

```
mv pkiexit /full-directory-name
chmod 755 /full-directory-name/pkiexit
```

4. Edit the web server environment variables to include `_PKISERV_EXIT`, and set its value to the full path name of the exit program. You may set the environment variable in each of the virtual host configuration files or in the main `httpd.conf` file with a `SetEnv` directive. For example, if the exit program is called `pkiexit` and is in the `/usr/local/bin` directory, the `SetEnv` directive would be entered as follows:

```
SetEnv _PKISERV_EXIT /usr/local/bin/pkiexit
```

## Using the exit routine for pre- and post-processing

This exit routine is called for preprocessing and postprocessing by the PKI Services daemon before and after it renews a certificate respectively. Automatic certificate renewal processing is performed by the daily maintenance task. By default this task runs when the PKI Services daemon is started and every day at midnight, but you can customize the days on which it runs and the time at which it runs. (For information about customizing when the maintenance task runs, see “Optionally updating the `pkiserv.conf` configuration file” on page 66.)

Table 58. Values of arguments for pre- and post-processing

Time of processing	Argument 1	Argument 2
Preprocessing	0	The function number in EBCDIC: 500 automatic renewal processing
Post-processing	1	The function number in EBCDIC: 500 automatic renewal processing

## Automatic renewal - preprocessing

### Purpose

Provide additional criteria for automatic renewal of certificates.

### Arguments

#### *argument 3*

The Base64-encoded original certificate.

### Return codes

Return code	Meaning
0	Continue with the request for automatic renewal processing.
4	Disallow automatic renewal processing for the current request.
8	Disallow automatic renewal processing from now on.

**Note:** Any value other than 0, 4, and 8 is treated as 4.

### STDOUT

Non-applicable.

**Note:** The automatic renewal exit routine cannot write to STDOUT or STDERR like other exit routines. The output must be written to a file.

## Automatic renewal - post-processing

### Purpose

Capture the renewed certificate for further processing.

### Arguments

#### *argument 3*

The Base64-encoded renewed certificate.

### Return codes

Return code	Meaning
0	Normal return.

**Note:** The return code is not checked from the post exit processing.

## STDOUT

Non-applicable.

**Note:** The automatic renewal exit routine cannot write to STDOUT or STDERR like other existing exit routines. The output must be written to a file.

## Scenario for using the exit routine

This scenario disables the automatic renewal of certificates for contractors, postpones the renewal if the expiration date is more than 30 days away, and logs the subject name and serial number of certificates that are automatically renewed.

For sample code illustrating this scenario, see the sample exit routine `pkixit.c` shipped with PKI Services.

The preprocessing exit routine for the automatic renewal function (subroutine `preProcessAutoRenewExit`) disables the automatic renewal of certificates for contractors and postpones the renewal if the expiration date is more than 30 days away. Here are the steps:

- Get the current time and format it for output.
- Call subroutines to decode the Base64 certificate data and decode the certificate.
- Get a printable version of the subject name from the certificate.
- Get a printable version of the serial number from the certificate.
- Check the subject name for an `organizationalUnitName` of “Contractors”. If found, log a message indicating that the renewal was disabled, and return with a return code of 8 to disable the automatic renewal.
- Call a subroutine to determine how many days there are until the certificate expires.
- If there are more than 30 days before the certificate expires, log a message indicating that the renewal was postponed, and return with a return code of 4 to postpone the automatic renewal.
- If there are 30 or fewer days before the certificate expires, log a message indicating that renewal of the certificate was allowed, and return with a return code of 0 to continue with the automatic renewal.

The postprocessing exit routine for the automatic renewal function (`postProcessAutoRenewExit`) logs the subject name and serial number of certificates that are automatically renewed. Here are the steps:

- Get the current time and format it for output.
- Call subroutines to decode the Base64 certificate data and decode the certificate.
- Get a printable version of the subject name from the certificate.
- Get a printable version of the serial number in hexadecimal from the certificate.
- Log a message indicating that the certificate was renewed, containing the subject name, serial number, and time.

---

## Exit routine processing for the PKI Services CGIs

For the end-user functions except VERIFY, the PKI Services web application CGIs support calling an installation-provided exit routine. The exit routine can perform tasks such as:

- Provide additional authorization checking
- Validate and change parameters
- Capture certificates for further processing
- Recover a passphrase that is used in a certificate request

If the exit routine exists, it must be a UNIX executable program residing in the file system, and it must have appropriate permission assigned. To specify the exit routine, the UNIX programmer sets the `_PKISERV_EXIT` environment variable in the web server's environment variables file. The environmental variable may also be added to the web server's configuration file (`httpd.conf`) by using the `SetEnv` HTTP Directive. On input, it receives standard UNIX parameters (that is, `argc` and `argv []`). It communicates back to PKISERV through the return code and by writing to `STDOUT`.

### Steps for updating the exit routine code sample

To update the exit routine code sample, `pkixit.c`, perform the following steps:

1. Copy the sample exit routine and makefile to the current directory by entering the following commands:

```
cp /usr/lpp/pkiserv/samples/pkixit.c pkixit.c
cp /usr/lpp/pkiserv/samples/Makefile.pkiexit Makefile
```

2. Compile and link to produce the executable program, `pkixit`, by entering the following command:

```
make
```

3. Move the executable program to its execution directory and set the permissions by entering the following commands:

```
mv pkixit /full-directory-name
chmod 755 /full-directory-name/pkixit
```

4. Edit the web server environment variables to include `_PKISERV_EXIT`, and set its value to the full path name of the exit program. You may set the environment variable in each of the virtual host configuration files or in the main `httpd.conf` file with a `SetEnv` directive. For example, if the exit program is called `pkixit` and is in the `/usr/local/bin` directory, the `SetEnv` directive would be entered as follows:

```
SetEnv _PKISERV_EXIT /usr/local/bin/pkixit
```

### Using the exit routine for pre- and post-processing

The exit routine is called:

- For preprocessing before calling the `R_PKIServ (IRRSPX00)` SAF callable service.
- For post-processing after returning from the callable service.

The following table summarizes the values of the first two arguments for pre- and post-processing. (Additional arguments vary, depending on the function to perform.)

Table 59. Values of arguments for pre- and post-processing

Time of processing	Argument 1	Argument 2
Preprocessing	0	The function number from the R_PKIServ SAF callable service in EBCDIC: 1      GENCERT 2      EXPORT 9      REQCERT 11     REVOKE 12     GENRENEW 13     REQRENEW 17     QRECOVER
Post-processing	1	The function number from the R_PKIServ SAF callable service in EBCDIC: 1      GENCERT 2      EXPORT 9      REQCERT 11     REVOKE 12     GENRENEW 13     REQRENEW 17     QRECOVER

**Note:** The parameters that are input to the CGIs and the values that are resolved by the CGIs (argument 3...argument *n* for all functions) vary based on how you have customized the templates.

### Return codes

The topics that follow contain tables of expected return codes. If calling the exit routine produces an unexpected return code, that is, one that is not listed, PKI Services treats it as a failure. Processing for the request stops and an error message is issued.

The return code is a one-byte value.

## GENCERT and GENRENEW - preprocessing

### Purpose

Provide additional authorization checking, parameter validation and modification, and a mapping of the passphrase to a set of security answers to use during QRECOVER processing, if the passphrase is forgotten.

### Arguments

#### *argument 3...argument n*

The parameters as input to the CGI plus values resolved by the CGI in *name=value* form, for example, "CommonName=Sam Smith".

### Return codes

Return code	Meaning
0	Continue with the request with possible modifications.
4	Continue with the request with possible modifications, but change it to require administrator approval.
8 - 49	Deny the request and return to the caller immediately.

### STDOUT

Zero or more additional *CertPlist* parameters to add to the request in *name=value* form, one per line. For those fields defined as non-repeating (according to the documentation for the IRRSPX00 callable service, for example, *CommonName*), specifying the parameters here in effect replaces the CGI input values.

## GENCERT and GENRENEW - post-processing Purpose

Capture the *TransactionId* or failing return codes for further processing.

### Arguments

***argument 3...argument n-3***

The final set of parameters as determined by the preprocessing exit in *name=value* form.

***argument n-2***

The RACF return code from the callable service.

***argument n-1***

The RACF reason code from the callable service.

***argument n***

The *TransactionId*. This is a string of undetermined value if the request was unsuccessful.

### Return codes

Return code	Meaning
0	Normal

### STDOUT

Optional replacement *TransactionId*.

## REQCERT and REQRENEW - preprocessing

### Purpose

Provide additional authorization checking, parameter validation and modification, and a mapping of the passphrase to a set of security answers to use during QRECOVER processing, if the passphrase is forgotten.

### Arguments

#### *argument 3...argument n*

The parameters as input to the CGI plus values resolved by the CGI in *name=value* form, for example, "CommonName=Sam Smith".

### Return codes

Return code	Meaning
0	Continue with the request with possible modifications.
4	Continue with the request with possible modifications, but change it to not require administrator approval.
8 - 49	Deny the request and return to the caller immediately.

### STDOUT

Zero or more additional *CertPlist* parameters to add to the request in *name=value* form, one per line. For those fields defined as non-repeating (according to the documentation for the IRRSPX00 callable service, for example, *CommonName*), specifying the parameters here in effect replaces the CGI input values.

## REQCERT and REQRENEW - post-processing Purpose

Capture the *TransactionId* or failing return codes for further processing.

### Arguments

#### *argument 3...argument n-3*

The final set of parameters as determined by the preprocessing exit routine in *name=value* form.

#### *argument n-2*

The RACF return code from the callable service.

#### *argument n-1*

The RACF reason code from the callable service.

#### *argument n*

The *TransactionId*. This is a string of undetermined value if the request was unsuccessful.

### Return codes

Return code	Meaning
0	Normal

### STDOUT

Optional replacement *TransactionId*.

## EXPORT - preprocessing

### Purpose

Provide additional authorization checking and parameter validation and modification.

### Arguments

#### *argument 3...argument n*

The parameters as input to the CGI in *name=value* form, for example, "TransactionId=12345".

### Return codes

Return code	Meaning
0	Continue with the export.
8 - 49	Deny the request and return to the caller immediately.

### STDOUT

Optional replacement *TransactionId* and *ChallengePassPhrase* parameters in *name=value* form, one per line. If these values are provided, they replace the user-provided values on the call to the SAF callable service. If *TransactionId* is specified without *ChallengePassPhrase*, the user-provided *ChallengePassPhrase* is used. If *ChallengePassPhrase* is specified without *TransactionId*, the user-provided *TransactionId* is used.

## EXPORT - post-processing

### Purpose

Capture the certificate or failing return codes for further processing.

### Arguments

#### *argument 3...argument n-3*

The parameters as input to the CGI in *name=value* form, followed by any modified value provided by the preprocessing exit routine, also in *name=value* form.

#### *argument n-2*

The RACF return code from the callable service.

#### *argument n-1*

The RACF reason code from the callable service.

#### *argument n*

The base64-encoded certificate with header and footer. This is a string of undetermined value if the request was unsuccessful.

### Return codes

Return code	Meaning
0	Normal

### STDOUT

Non-applicable.

## REVOKE - preprocessing

### Purpose

Provide additional authorization checking and parameter validation.

### Arguments

#### *argument 3...argument n*

The parameters as input to the CGI in *name=value* form, for example, "reason=1".

### Return codes

Return code	Meaning
0	Continue with the request.
8 - 49	Deny the request and return to the caller immediately.

### STDOUT

Non-applicable.

## REVOKE - post-processing

### Purpose

Capture the certificate or failing return codes or both for further processing.

### Arguments

#### *argument 3...argument n-2*

The parameters as input to the CGI in *name=value* form, for example, "reason=1".

#### *argument n-1*

The RACF return code from the callable service.

#### *argument n*

The RACF reason code from the callable service.

### Return codes

Return code	Meaning
0	Normal

### STDOUT

Non-applicable.

## QRECOVER - preprocessing

### Purpose

Provide a mechanism to retrieve a passphrase needed to recover a certificate, in case it was forgotten. The exit routine is called when a user has entered answers to the security questions instead of a passphrase.

### Arguments

#### *argument 3...argument n*

The parameters as input to the CGI in *name=value* form, for example, "Security1=Brazil".

### Return codes

Return code	Meaning
0	Continue with the query.
4	Cannot determine the passphrase.
8 - 49	Deny the request and return to the caller immediately.

### STDOUT

Optional replacement of Requestor and add the PassPhrase parameters in *name=value* form, one per line.

## QRECOVER - post-processing

### Purpose

Capture the list of the recovery certificates for further processing.

### Arguments

**argument 3...argument n-3**

The input and output set of parameters of the preprocessing exit routine in the *name=value* form.

**argument n-2**

The RACF return code from the callable service.

**argument n-1**

The RACF reason code from the callable service.

**argument n**

The list of the recovery certificates.

### Return codes

Return code	Meaning
0	Normal

### STDOUT

Non-applicable.

## Scenarios for using the exit routine

The sample exit routine supplied with PKI Services, `pkixit.c`, illustrates the following scenarios. The main routine of the program determines which subroutine to call, based on the `R_PKIServ` function being called and whether this is a pre- or post-processing call. Individual subroutines in the program handle the scenarios.

### Scenario 1: Allow only selected users to request PKI browser certificates for authenticating to z/OS

This scenario is for allowing only selected local z/OS users to request PKI browser certificates for authenticating to z/OS. Additionally, this scenario is for providing a customized TITLE value for the subject's distinguished name based on the user's role in the organization. Permission and the user's role in the organization is indicated by access to the `BPX.SERVER` resource in the `FACILITY` class and by the user's level of access to `FACILITY` class resources called `PROJ.MEMBER` and `PROJ.PARTNER`. The access values are as follows:

#### NONE

No access for either resource. The user is not permitted to request this type of certificate. The certificate request is denied.

#### READ to PROJ.MEMBER

The user is a team member and is permitted to request the certificate. The TITLE value is set to Team Member. Certificate requests for team members are automatically approved. (No administrator approval is required.)

#### UPDATE to PROJ.MEMBER

The user is the team's leader and is permitted to request the certificate. The

TITLE value is set to Team Leader. A certificate request by the team leader is automatically approved. (No administrator approval is required.)

#### **READ to PROJ.PARTNER**

The user is considered to be a general partner of the team, not an active team member. The user is allowed to request certificates, but the requests require administrator approval before being issued. The TITLE value is set to Team Partner.

#### **UPDATE to PROJ.PARTNER**

The user is considered to be a trusted partner of the team, not an active team member. The user is allowed to request certificates, and unlike requests of the general partner, the certificate request are automatically approved. The TITLE value is set to Team Trusted Partner.

The preprocessing exit routine call for the GENCERT and REQCERT functions (subroutine `preProcessGenReqCertExit`) handles the logic described in the preceding. Here are the steps:

- The request values are passed into the exit routine through *argv* in *field-name=field-value* pairs, and the subroutine looks for the `Template=` and `UserId=` in the input parameters.
- When the exit routine code finds a `Template=` value containing PKI Browser Certificate For Authenticating To z/OS, the `__check_resource_auth_np()` system function examines the user ID. This determines the user's access to the preceding profiles.
  - If the user has no authority to either of these resources, return code 8 is set. This causes the request to be denied.
  - Otherwise the user's TITLE is set by writing the `TITLE=title-value` string to STDOUT.

By default, administrator approval is not required for the PKI browser certificate for authenticating to z/OS.

- When the user has only READ access to PROJ.PARTNER, the function must be changed to require administrator approval. This is done by setting return code 4.
- For all other accesses the function does not need to be changed.

### **Scenario 2: Maintain a customized certificate repository (database) independent of PKI Services**

This scenario is for maintaining a customized certificate repository (database) that is independent of PKI Services. After a successful submission of a certificate request, PKI Services returns the transaction ID. This is saved in a new customer-provided database entry. An alias for this database entry is then returned to the end user as the transaction ID. Later, when the user wants to pick up the certificate, the user-entered alias name is used to retrieve the actual PKI Services transaction ID. The retrieved certificate is saved in the database entry before being returned to the user.

Three different exit routine calls handle the preceding logic.

- Post-processing for the GENCERT or REQCERT functions (subroutine `postProcessGenReqCertExit`) returns a pretend alias entry name by suffixing the actual transaction ID with either SAF or PKI. This is where the database entry should be created. (Note that the exit routine performs no actual database calls because this would be too customer-specific.)

- Preprocessing for the EXPORT function (subroutine `preProcessExportExit`) reverts the transaction ID to its original value. This emulates retrieval from the database entry.
- Post-processing for the EXPORT function (subroutine `postProcessExportExit`) saves the returned certificate to a database entry. This is emulated by writing it to a file.

### Scenario 3: Mandate a policy for certificate renewal only within 30 days of expiration

This scenario is for mandating a policy that allows users to renew their certificates only when certificates are within 30 days of expiring. When the condition is met, you can change the expiration date for the renew request so that the new certificate's validity period is extended by the number of days that are specified by the `NotAfter` parameter. In other words, the new certificate should expire  $n$  days from the current date, where  $n = \text{number of days left in the old certificate's validity period} + \text{number of days specified by NotAfter}$ .

The preprocessing exit routine call for `GENRENEW` and `REQRENEW` functions (subroutine `preProcessGenReqRenewExit`) handles the preceding logic. Here are the steps:

- The user's certificate is extracted from the environment variable `HTTPS_CLIENT_CERT`.
- The `NotAfter` value is extracted from the input parameters (*argv*), converted to a number, and saved in the variable `RequisitePro`.
- Subroutine `determineExpiration` is called to extract the expiration date from the user's certificate. This subroutine calls several lower subroutines to base64 decode the certificate, DER decode the binary certificate, and convert the expiration date to a seconds value.
- Upon return from `determineExpiration`, the variable `timeBeforeExp` is the number of seconds from now that the certificate expires. This is compared against the number of seconds in 30 days ( $86400 \times 30$ ) to see if it is greater than 30 days.
  - If it is greater than 30, the request is rejected by setting return code 8.
  - If it is not greater than 30, the new `NotAfter` value is computed as  $\text{timeBeforeExp}/86400 + \text{requestPeriod}$ .
- This new `NotAfter` value is set by writing it to `STDOUT`.

### Scenario 4: Allow users to recover a PKI generated key certificate when the passphrase is lost

To recover a certificate for which PKI Services generated the keys, the user must provide the passphrase that was provided when the certificate was requested. This scenario illustrates how PKI Services can recover lost passphrases for PKI generated key certificates. To be able to recover a lost passphrase, the user must provide answers to security questions in addition to the passphrase when the user initially requests the PKI generated key certificate. PKI Services saves the passphrase and the answers to the security questions in a passphrase mapping database. To recover the lost passphrase, the user provides the answers to the security questions through the PKI Services web page. PKI Services searches the passphrase mapping database, and if the security answers match those provided by the user when the certificate was requested, the passphrase is returned to the CGI. The recovered passphrase is then used to retrieve the PKI generated key certificate.

Two exit routine calls are required:

- When the user requests the PKI generated key certificate, the preprocessing exit routine for the GENCERT and REQCERT functions (subroutine `preProcessGenReqCertExit`) collects the requestor name, the passphrase, and the answers to the security questions from the exit routine's parameter list. The exit routine records the information as an entry in a passphrase mapping database.
- When the user attempts to recover the PKI generated key certificate, the preprocessing exit routine for the QRECOVER function (subroutine `preProcessQRecoverExit`) collects the requestor name and the answers to the security questions from the exit routine's parameter list. The exit routine then searches the passphrase mapping database for entries that match the requestor name and the security answers provided by the user. If a match is found, the passphrase recorded in that entry is returned to the CGI through `STDOUT`.

---

## Exit routine processing for JavaServer pages (JSPs)

If you implement the PKI Services web application using JavaServer pages (JSPs), you can use methods in the class `com.ibm.pki.web.exits.UserExit` to customize the web application. These methods are called before and after each of the following `R_PKIServ` requests:

- GENCERT
- REQCERT
- EXPORT
- GENRENEW
- REQRENEW
- REVOKE
- QRECOVER

The methods are empty stub methods in which you can add code to audit or modify parameters being passed to PKI Services. This topic describes these methods and related classes.

The `R_PKIServ` callable service is described in *z/OS Security Server RACF Callable Services*.

*Table 60. Package and class summary for JSP exit processing*

Package	Class
<code>com.ibm.pki.web.exits</code>	<ul style="list-style-type: none"> <li>• <code>UserExit</code></li> <li>• <code>ExportCert</code></li> <li>• <code>QRecover</code></li> <li>• <code>RevokeCert</code></li> <li>• <code>UserExitException</code></li> </ul>
<code>com.ibm.pki.rpkiserv</code>	<ul style="list-style-type: none"> <li>• <code>CertPlist</code></li> <li>• <code>PkiCertificate</code></li> <li>• <code>QrecoverResultsList</code></li> <li>• <code>RpkiservException</code></li> </ul>

### Class `UserExit`

Package: `com.ibm.pki.web.exits`

```
public class UserExit
extends java.lang.Object
```

UserExit defines the following static constant integer values:

```
UserExit.SUCCESSFUL = 0;  
UserExit.CHANGE_APPROVAL_STATUS = 4;  
UserExit.QRECOVER_PASSPHRASE_NOT_FOUND = 4;  
UserExit.DENY_REQUEST = 8;
```

*Table 61. Methods in class UserExit*

<b>Method</b>	<b>Purpose</b>
preGenReqCert	Called before GENCERT or REQCERT requests
postGenReqCert	Called after GENCERT or REQCERT requests
preGenReqRenew	Called before GENRENEW or REQRENEW requests
postGenReqRenew	Called after GENRENEW or REQRENEW requests
preExport	Called before EXPORT requests
postExport	Called after EXPORT requests
preRevoke	Called before REVOKE requests
postRevoke	Called after REVOKE requests
preQRecover	Called before QRECOVER requests
postQRecover	Called after QRECOVER requests

## preGenReqCert method

```
public int preGenReqCert(java.lang.String domain,  
                        com.ibm.pki.rpkiserv.CertPlist plist,  
                        java.lang.String[] security)  
    throws UserExitException
```

### Purpose

Called before GENCERT or REQCERT requests.

### Parameters

#### domain

domain name

#### plist

CertPlist with input parameters for GENCERT or REQCERT processing whose values can be modified by this method

#### security

An array of responses to security questions. These correspond to form fields with names security1, security2, and so forth, in ascending numerical order.

### returns

#### Value Meaning

##### 0 (UserExit.SUCCESSFUL)

Continue with the request.

##### 4 (UserExit.CHANGE\_APPROVAL\_STATUS)

If the certificate request required administrator approval, change it to not require administrator approval (a GENCERT). If the certificate request did not require administrator approval (a GENCERT), change it to require administrator approval (a REQCERT).

##### 8 (UserExit.DENY\_REQUEST) or greater

Deny the request.

### throws

Exception	Result
UserExitException	Handled the same as a return value of 8, and exception text is displayed on the resulting web page

## postGenReqCert method

```
public java.lang.String postGenReqCert(java.lang.String domain,  
                                       com.ibm.pki.rpkiserv.CertPlist plist,  
                                       int RACFrc,  
                                       int RACFrnscode,  
                                       java.lang.String transactionid)
```

### Purpose

Called after GENCERT or REQCERT requests

### Parameters

#### domain

Domain name

#### plist

CertPlist that was input to R\_PKIServ processing, including modifications made by the preGenReqCert method

#### RACFrc

RACF return code

#### RACFrnscode

RACF reason code

#### transactionid

Transaction ID, null if GENCERT processing was unsuccessful

### returns

transaction ID

## preGenReqRenew method

```
public int preGenReqRenew(java.lang.String domain,  
                          com.ibm.pki.rpkiserv.CertPlist plist,  
                          java.lang.String serialnum)  
    throws UserExitException
```

### Purpose

Called before GENRENEW or REQRENEW requests

### Parameters

#### domain

Domain name

#### plist

CertPlist with input parameters for renew request, whose values can be modified by this method

**Note:** Most values for a certificate renewal are taken from the existing certificate and therefore are not in the certPlist. The following values can occur in the certPlist:

- CertPlist.CERTPLIST\_NOTIFYEMAIL
- CertPlist.CERTPLIST\_PASSPHRASE
- CertPlist.CERTPLIST\_NOTAFTER
- CertPlist.CERTPLIST\_CERTPOLICIES
- CertPlist.CERTPLIST\_AUTHINFOACC
- CertPlist.CERTPLIST\_CRITICAL

#### serialnum

Serial number of certificate being renewed

### returns

#### Value Meaning

##### 0 (UserExit.SUCCESSFUL)

Continue with the request.

##### 4 (UserExit.CHANGE\_APPROVAL\_STATUS)

If the renewal request required administrator approval, change it to not require administrator approval (a GENRENEW). If the certificate request did not require administrator approval (a GENRENEW), change it to require administrator approval (a REQRENEW).

##### 8 (UserExit.DENY\_REQUEST) or greater

Deny the request.

### throws

Exception	Result
UserExitException	Handled the same as a return value of 8, and exception text is displayed on the resulting web page

## postGenReqRenew method

```
public java.lang.String postGenReqRenew(java.lang.String domain,  
                                       com.ibm.pki.rpkiserv.CertPlist plist,  
                                       int RACFrc,  
                                       int RACFrnscode,  
                                       java.lang.String transactionid)
```

### Purpose

Called after GENRENEW or REQRENEW requests

### Parameters

#### domain

Domain name

#### plist

The CertPlist that was input to the R\_PKIserv request, including any modifications that were made by the preGenReqRenew method

#### RACFrc

RACF return code

#### RACFrnscode

RACF reason code

#### transactionid

Transaction ID, null if REQCERT processing was unsuccessful

### returns

transactionid

## preExport method

```
public int preExport(java.lang.String domain,  
                    com.ibm.pki.rpkiserv.ExportCert exportobject)
```

### Purpose

Called before EXPORT requests

### Parameters

#### domain

Domain name

#### exportobject

ExportCert object containing transaction ID and passphrase

### returns

#### Value Meaning

#### 0 (UserExit.SUCCESSFUL)

Continue with the EXPORT.

#### 8 (UserExit.DENY\_REQUEST) or greater

Deny the request.

### throws

Exception	Result
UserExitException	Handled the same as a return value of 8, and exception text is displayed on the resulting web page

## **postExport method**

```
public void postExport(java.lang.String domain,  
                        com.ibm.pki.rpkiserv.ExportCert exportobject,  
                        int RACFrc,  
                        int RACFrncode)
```

### **Purpose**

Called after EXPORT requests

### **Parameters**

#### **domain**

Domain name

#### **exportobject**

ExportCert object containing transaction ID and passphrase. The ExportCert object contains a base64-encoded certificate with header and footer if the request was successful.

## preRevoke method

```
public int preRevoke(java.lang.String domain,  
                    RevokeCert revokeobject)
```

### Purpose

Called before REVOKE requests

### Parameters

**domain**

Domain name

**revokeobject**

RevokeCert object containing reason number and serial number

### returns

**Value Meaning****0 (UserExit.SUCCESSFUL)**

Continue with the REVOKE request.

**8 (UserExit.DENY\_REQUEST) or greater**

Deny the request, do not revoke.

### throws

Exception	Result
UserExitException	Handled the same as a return value of 8, and exception text is displayed on the resulting web page

### **postRevoke method**

```
public void postRevoke(java.lang.String domain,  
                        RevokeCert revokeobject,  
                        int RACFrc,  
                        int RACFrnsnocode)
```

### **Purpose**

Called after REVOKE requests

### **Parameters**

#### **domain**

Domain name

#### **revokeobject**

RevokeCert object containing reason number and serial number

## **preQRecover method**

```
public int preQRecover(java.lang.String domain,  
                      QRecover qrecoverobject)
```

### **Purpose**

Called before QRECOVER requests

### **Parameters**

#### **domain**

Domain name

#### **qrecoverobject**

QRecover object containing recovery email, passphrase, and security responses

### **returns**

#### **Value Meaning**

#### **0 (UserExit.SUCCESSFUL)**

Continue with the request.

#### **4 (UserExit.QRECOVER\_PASSPHRASE\_NOT\_FOUND)**

Cannot determine the passphrase.

#### **8 (UserExit.DENY\_REQUEST) or greater**

Deny the request.

## postQRecover method

```
public int postQRecover(java.lang.String domain,  
                        QRecover qrecoverobject,  
                        int RACFrc,  
                        int RACFrnsnocode)
```

### Purpose

Called after QRECOVER requests

### Parameters

#### domain

Domain name

#### qrecoverobject

QRecover object containing recovery email, passphrase, security responses, and a QrecoverResultsList array containing data for certificates that matched the search criteria

## Class ExportCert

```
public class ExportCert  
extends java.lang.Object
```

ExportCert contains the parameters passed on an R\_PKIServ EXPORT request.

Method summary	
com.ibm.pki.rpkiserv.PkiCertificate	<b>getCertificate()</b>
java.lang.String	<b>getPassphrase()</b>
java.lang.String	<b>getTransactionid()</b>
void	<b>setPassphrase</b> (java.lang.String passphrase)
void	<b>setTransactionid</b> (java.lang.String transactionid)

## Class QRecover

Package: com.ibm.pki.web.exits

```
public class QRecover  
extends java.lang.Object
```

QRecover contains the parameters passed on an R\_PKIServ QRECOVER request.

Method summary	
java.lang.String	<b>getPassphrase()</b>
com.ibm.pki.rpkiserv.QrecoverResultsList[]	<b>getQrecover_results()</b>
java.lang.String	<b>getRequestor()</b>
java.lang.String[]	<b>getSecurity_answers()</b>
void	(java.lang.String passphrase) <b>setPassphrase</b>
void	<b>setRequestor</b> (java.lang.String requestor)
void	<b>setSecurity_answers</b> (java.lang.String[] security_answers)

## Class RevokeCert

Package: com.ibm.pki.web.exits

```
public class RevokeCert
extends java.lang.Object
```

RevokeCert contains the parameters passed on an R\_PKIServ REVOKE request.

Method summary	
int	<b>getReason()</b>
java.lang.String	<b>getSerial_number()</b>
void	<b>setReason(int reason)</b>
void	<b>setSerial_number(java.lang.String serial_number)</b>

## Class UserExitException

Package: com.ibm.pki.web.exits

```
public class UserExitException
extends java.lang.Exception
```

An exception thrown from the UserExit class. The PKI Services function that detects this exception treats it the same as a return code greater than or equal to 8, and stops processing. Additionally, any exception text is displayed on the web page that reports the unsuccessful processing.

Constructors
<b>UserExitException</b> (java.lang.String message)
<b>UserExitException</b> (java.lang.Throwable cause)

## Class CertPlist

Package: com.ibm.pki.rpkiserv

```
public class CertPlist
extends java.lang.Object
```

The CertPlist (certificate parameter list) is used to pass certificate information to the R\_PKIServ callable service. It defines the following static constant strings, which should be used for the name parameter:

```
CERTPLIST_UNSTRUCTNAME
CERTPLIST_EMAILADDR
CERTPLIST_MAIL
CERTPLIST_TITLE
CERTPLIST_ORGUNIT
CERTPLIST_ORG
CERTPLIST_STREET
CERTPLIST_LOCALITY
CERTPLIST_STATEPROV
CERTPLIST_POSTALCODE
CERTPLIST_COUNTRY
CERTPLIST_KEYUSAGE
CERTPLIST_EXTKEYUSAGE
CERTPLIST_NOTBEFORE
CERTPLIST_NOTAFTER
CERTPLIST_ALTIPADDR
CERTPLIST_ALTURI
CERTPLIST_ALTEMAIL
CERTPLIST_ALTDOMAIN
```

CERTPLIST\_ALTOOTHER  
 CERTPLIST\_CUSTOMEXT  
 CERTPLIST\_NOTIFYEMAIL  
 CERTPLIST\_PUBLICKEY  
 CERTPLIST\_SIGNWITH  
 CERTPLIST\_HOSTIDMAP  
 CERTPLIST\_REQUESTOR  
 CERTPLIST\_PASSPHRASE  
 CERTPLIST\_USERID  
 CERTPLIST\_LABEL  
 CERTPLIST\_CERTPOLICIES  
 CERTPLIST\_AUTHINFOACC  
 CERTPLIST\_CRITICAL  
 CERTPLIST\_SERIALNUMBER  
 CERTPLIST\_DNQUALIFIER  
 CERTPLIST\_UID  
 CERTPLIST\_COMMONNAME  
 CERTPLIST\_DOMAINNAME  
 CERTPLIST\_EMAIL  
 CERTPLIST\_CLIENTNAME  
 CERTPLIST\_STARTDATE  
 CERTPLIST\_ENDDATE  
 CERTPLIST\_AUTORENEW  
 CERTPLIST\_KEYSIZE  
 CERTPLIST\_KEYALG  
 CERTPLIST\_BUSINESSCAT  
 CERTPLIST\_JURLOCALITY  
 CERTPLIST\_JURSTATEPROV  
 CERTPLIST\_JURCOUNTRY

Method summary	
void	<b>addValue</b> (java.lang.String name, java.lang.String value) Adds a value to the certPlist.
void	<b>addValues</b> (java.lang.String name, java.lang.String[] values) Adds values to the certPlist.
java.util.Vector	<b>getNames</b> () Gets the names of all name and value pairs in the certPlist.
java.util.Vector	<b>getValues</b> (java.lang.String name) Gets the vector of string values for this name in the certPlist.
void	<b>removeAllValues</b> (java.lang.String name) Deletes all of the values associated with a name in the certPlist.
void	<b>removeValue</b> (java.lang.String name, java.lang.String value) Deletes one of the values associated with a name in the certPlist.
java.lang.String	<b>toString</b> () Returns the string representation of this object.

## Class PkiCertificate

Package: com.ibm.pki.rpkiserv

```
public class PkiCertificate
extends java.lang.Object
```

Contains a certificate generated by PKI Services. The PkiCertificate class defines the following static constant integers to be used in determining the type (format) of certificate exported:

### Integer Meaning

**PkiCertificate.PKIS\_CERTIFICATE\_TYPE\_BASE64**

Certificate is BASE64-encoded

**PkiCertificate.PKIS\_CERTIFICATE\_TYPE\_DER**

Certificate is DER-encoded

**PkiCertificate.PKIS\_CERTIFICATE\_TYPE\_PKCS12**

Certificate is DER-encoded PKCS #12

**PkiCertificate.PKIS\_CERTIFICATE\_TYPE\_PKCS7\_CHAIN**

Certificate is DER-encoded PKCS #7 chain

Method summary	
public java.lang.String	<b>getBase64Encoded()</b> Certificate in Base64 format. Use this method if the certificate type is PKIS_CERTIFICATE_TYPE_BASE64.
public byte[]	<b>getDerEncoded()</b> Certificate in DER format. Use this method if the certificate type is one of the DER types: <ul style="list-style-type: none"><li>• PKIS_CERTIFICATE_TYPE_DER</li><li>• PKIS_CERTIFICATE_TYPE_DER_PKCS7_CHAIN</li><li>• PKIS_CERTIFICATE_TYPE_DER_PKCS12</li></ul>
public int	<b>getType()</b> Returns the certificate type.

## Class QrecoverResultsList

Package: com.ibm.pki.rpkiserv

```
public class QrecoverResultsList
extends java.lang.Object
```

Contains QRECOVER results from R\_Pkiserv.

Method summary	
java.lang.String	<b>getIssuerDn()</b> Returns the issuer's distinguished name.
java.lang.String	<b>getKeyId()</b> Returns the key Id.

Method summary	
java.lang.String	<b>getPassPhrase()</b> Returns the passphrase provided when the certificate request was made.
java.lang.String	<b>getSerialNum()</b> Returns the serial number.
java.lang.String	<b>getSubjectDn()</b> Returns the subject's distinguished name.
java.lang.String	<b>getValidityDates()</b> Returns the validity period in local time.

## Class RpkiservException

Package: com.ibm.pki.rpkiserv  
public class **RpkiservException**  
extends java.lang.Exception  
implements java.io.Serializable

Exception thrown by classes in the package com.ibm.pki.rpkiserv.

Constructor summary
<b>RpkiservException()</b> Constructor to create an empty RpkiservException object.
<b>RpkiservException(java.lang.String exceptionText)</b> Constructor to create an RpkiservException object with only exception text.

\_\_\_\_\_ **End Programming Interface Information** \_\_\_\_\_

---

## Part 4. Using PKI Services

This part explains how to use the PKI Services web pages and utilities.

- Chapter 16, “Using the end-user web pages,” on page 361 shows the web pages for the end user and explains how to perform tasks such as requesting a certificate, obtaining the certificate, and renewing or revoking a certificate.
- Chapter 17, “Using the administration web pages,” on page 389 shows the administration web pages and explains how to process certificate requests and certificates.
- Chapter 18, “Using PKI Services utilities,” on page 413 explains using the PKI Services utilities.

### **createcrls**

A UNIX program that initiates the certificate revocation list (CRL) creation task immediately.

### **iclview**

A UNIX program that displays the entries in the issued certificate list (ICL).

### **pkiprereg**

A UNIX program that creates Simple Certificate Enrollment Protocol (SCEP) preregistration records

### **postcerts**

A UNIX program that creates posting objects for existing certificates. The PKI Services daemon later posts the certificates to an LDAP server.

### **TemplateTool**

A Java program that validates an XML certificate template file and converts it to a text CGI template file, and converts a text CGI template file to an XML template file.

### **vosview**

A UNIX program that displays the entries contained in the object store (request database).

### **vsam2db2**

A UNIX program that converts data from the issued certificate list (ICL) and object store VSAM data sets into DB2 tables.

- Chapter 19, “Using the certificate management protocol (CMP) with PKI Services,” on page 435 describes the support for CMP that PKI Services provides.

---

## Chapter 16. Using the end-user web pages

This topic describes how the end user can use the PKI Services web pages.

### Notes:

1. The PKI Services web pages in this topic might differ slightly from those on the web. If your installation customized the templates, the web pages in this topic might differ greatly from those you view on the web. Additionally, the pages might contain differences depending on the browser you are using. (This topic assumes you are using Internet Explorer.) If you need to see the exact content, view the pages on the web.
2. If you are using Internet Explorer on a Microsoft Windows system, you might need to set up the Windows system and Internet Explorer to work with PKI Services. For information about how to do this, see Appendix D, "Using the PKI Services web application with Internet Explorer on Windows systems," on page 671.

By default, the end user can perform the following tasks:

- Install a CA certificate into the browser.
- Request a new certificate.
- Pick up a previously requested certificate.
- Renew or revoke a previously issued browser certificate.
- Recover a certificate and private key, if PKI Services generated the keys for the certificate.
- Install the PKI Services ActiveX program needed to install a renewed certificate using the Internet Explorer browser.

Table 62 lists the types of certificates you can request:

*Table 62. Types of certificates you can request*

Type of certificate	Use
One-year PKI SSL browser certificate	End-user client authentication using SSL
One-year PKI S/MIME browser certificate	Browser-based email encryption
One-year PKI generated key certificate	Generation of public and private keys by PKI Services
Two-year PKI browser certificate for authenticating to z/OS	End-user client authorization using SSL when logging on to z/OS
Two-year PKI Authenticode - code signing server certificate	Software signing
Two-year PKI Windows logon certificate	End-user client authentication for an Active Directory user logging in to a Windows desktop using a smart card
Two-year EV SSL server certificate	Extended Validation (EV) server certificate for a private organization
Five-year PKI SSL server certificate	SSL web server certification
Five-year PKI IPSEC server (firewall) certificate	Firewall server identification and key exchange

## Using the end-user web pages

Table 62. Types of certificates you can request (continued)

Type of certificate	Use
Five-year PKI intermediate CA server certificate	Subordinate (non-self-signed) certificate authority certification
Five-year SCEP certificate	Creation of a preregistration record for certificate requestors. (Certificate requestors using Simple Certificate Enrollment Protocol (SCEP) must be preregistered.)  Unlike other templates, this template is intended for administration use only.
<i>n</i> -year PKI browser certificate for extensions demonstration	Demonstration of all extensions supported by PKI Services
One-year SAF browser certificate	End-user client authentication where the security product (RACF, not PKI Services) is the certificate provider <b>Note:</b> The certificate generated by this template cannot be managed by the PKI Services administrator.
One-year SAF server certificate	Web server SSL certification where the security product (RACF, not PKI Services) is the certificate provider <b>Note:</b> The certificate generated by this template cannot be managed by the PKI Services administrator.

Special consideration for using SAF templates:

The templates that control processing of the SAF certificates listed in Table 62 on page 361 perform only a subset of the function available natively in RACF through the RACDCERT TSO command or the ISPF panels. They are provided to enable a web interface for requesting certificates from RACF for browsers and off-platform servers. They are not intended to be a complete replacement for RACF certificate function.

Restriction: If you want to generate a certificate for a server running on the local z/OS system (in other words, for a system using the RACF database where the signing certificate resides), do not use the "One-year SAF server certificate" template. Instead, use the RACDCERT TSO command or ISPF panels directly. Using the "One-year SAF server certificate" template might cause the loss of the private key if the authenticating user ID is not the same as the user ID specified when generating the certificate request in RACF.

---

## Steps for accessing the end-user web pages

Perform the following preliminary steps to access the PKI Services web pages:

1. Get your organization's URL for accessing the PKI Services web pages. Enter this URL in your browser. This takes you to the end-user "PKI Services Certificate Generation Application" web page, shown in the following figure:

---

## PKI Services Certificate Generation Application

[Install the CA certificate to enable SSL sessions for PKI Services](#)

### Choose one of the following:

- Request a new certificate using a model

Select the certificate template to use as a model: 1-Year PKI SSL Browser Certificate ▾

Request Certificate

- Pick up a previously requested certificate

Enter the assigned transaction ID

Select the certificate return type: PKI Browser Certificate ▾

Pick up Certificate

- Renew or revoke a previously issued browser certificate

Renew or Revoke Certificate

- Recover a previously issued certificate whose key was generated by PKI Services

Recover Certificate

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 37. PKI Services end-user home page for certificate generation

- 
2. If this is the first time you have accessed the forms on these web pages, you must install the CA certificate into your browser. Click **Install the CA certificate** and follow the directions.

The following instructions are a sample of the directions to follow for installing the CA certificate on Internet Explorer:

- a. After you click **Install the CA certificate**, a window labeled “File download” opens. Make sure that “Open this file from its current location” is selected (rather than “Save this file to disk”). Then click **OK**. Figure 38 on page 364 is an example of the window you might see, depending on the CA certificate you have installed.

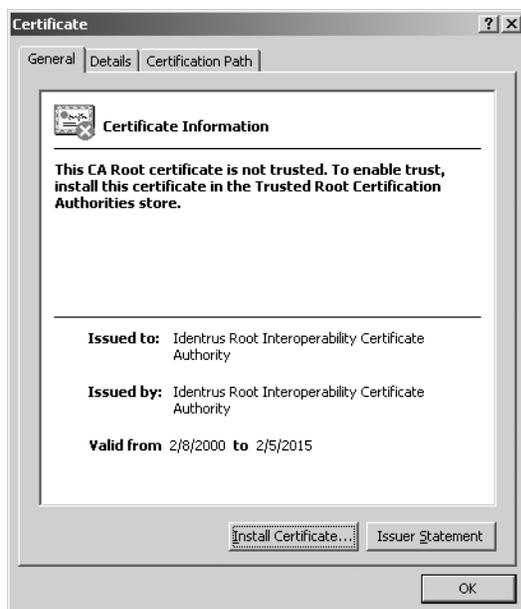

Figure 38. The certificate window for installing the CA certificate

- b. Click **Install certificate**. (This initiates a series of windows in which you need to click **Next** and finally **Finish**, culminating in a window that says “The import was successful”.)

**Note:** If you are using the Internet Explorer browser on a Microsoft Windows Vista and later versions of Windows, you must explicitly select a store to place the certificate in. For more information, see “Installing the PKI Services CA certificate on a Microsoft Windows system” on page 676.

3. If you are using the Internet Explorer browser, now you can install the PKI Services ActiveX program that is used to install renewed certificates. For more information, see “Installing the PKI Services ActiveX program” on page 671. If you do not install it now, when you attempt to install a renewed certificate PKI Services checks whether you have the PKI Services ActiveX program installed. If it is not installed, PKI Services prompts you to install it.

**Note:** **Install the PKI ActiveX Control to renew certificates** appears on the PKI Services home page only if you are using the Internet Explorer browser.

You are now ready to perform tasks, such as:

- Requesting a new certificate
- Picking up a previously requested certificate
- Renewing or revoking a previously issued browser certificate

## Summary of fields

When you request certificates, you provide information for the fields in certificate request forms. The following table describes the fields in the end-user web pages:

Table 63. Summary of fields in end-user web pages

Field	Description
Certificate fields	
	<p><b>Certificate fields related to Subject's Distinguished Name</b></p> <p><b>Notes:</b></p> <ol style="list-style-type: none"> <li>1. The values for these fields are the relative distinguished names (RDNs) that are saved in the subject's distinguished name (DN) in the certificate.</li> <li>2. For a server certificate, a base64-encoded PKCS #10 certificate request is required. If you specify one or more of these fields, the subject's distinguished name supplied in the PKCS #10 certificate request is ignored and only the fields you specify are in effect. For example, suppose that the subject's distinguished name specified in the PKCS #10 certificate request contains three RDNs - common name, organizational unit, and country. If you specify a value for organizational unit, you must also specify values for common name and country, even though you are not changing them. If you do not, these two RDNs have no values.</li> </ol>
Business Category	<p>The business category. This field is a text field of up to 64 characters.</p> <p>This field is intended for use in Extended Validation (EV) certificates.</p>
Common name	<p>Your name, such as John Smith. (You can use your first and last name, in that order.) This is a text field of up to 64 characters.</p> <p>For SSL servers, the common name is the server's fully qualified domain name, for example, <code>www.ibm.com</code>.</p>
Country	The country where your organization is located. This is a 2-character text field.
Distinguished name qualifier	Specifies information to add to the subject distinguished name of an entry to make it unambiguous.
Domain component	One component of a domain name associated with the subject distinguished name. For example, the domain name <code>www.ibm.com</code> is represented by 3 components: <code>www</code> , <code>ibm</code> , and <code>com</code> .
Email address	Email address with attribute EMAIL for the distinguished name. This is a text field of up to 64 characters.
Jurisdiction Country	<p>The jurisdiction of incorporation country name. This field is a two-character text field.</p> <p>This field is intended for use in Extended Validation (EV) certificates.</p>
Jurisdiction Location	<p>The jurisdiction of incorporation locality name. This field is a text field of up to 64 characters.</p> <p>This field is intended for use in Extended Validation (EV) certificates.</p>
Jurisdiction State or Province	<p>The jurisdiction of incorporation state or province name. This field is a text field of up to 64 characters.</p> <p>This field is intended for use in Extended Validation (EV) certificates.</p>
Locality	The city or municipality where your organization is located, such as Pittsburgh or Paris. This is a text field of up to 64 characters.
Mail	<p>Email address with attribute MAIL for the distinguished name. This is a text field of up to 64 characters.</p> <p><b>Restriction:</b> If you specify a value for this parameter and for Notification e-mail address, the two values <i>must</i> be the same.</p>

## Using the end-user web pages

Table 63. Summary of fields in end-user web pages (continued)

Field	Description
Organization	The legally registered name (or trademark name, for example, IBM) of your organization. This is a text field of up to 64 characters.
Organizational unit	The name of your division or department. (There can be more than one organizational unit field on a request form. For example, one could be for your department and another for your division.) This is a text field of up to 64 characters.
Postal code	Your postal code or zip code. This is a text field of up to 64 characters.
Serial number	Serial number of the subject device. This is a text field of up to 64 characters.
State or Province	The state or province where your organization is located. Your registration policies determine whether you spell out the full name of the state or province or use an abbreviation. This is a text field of up to 64 characters.
Street	Your street address. This is a text field of up to 64 characters.
Title	Your job title. This is a text field of up to 64 characters.
Unstructured address	The unstructured address of the subject device.
Unstructured name	The unstructured name of the subject device.
User ID	The system login name associated with the subject distinguished name.
<b>Certificate fields related to validity period</b>	
Not after (date)	A number of days, added to the current date after which the certificate expires. By default, you can select either one year or two years for the time at which the certificate expires.
Not before (date)	A number of days, added to the current date (by default, you can select either 0 or 30), before which the certificate is not valid.
<b>Certificate fields related to extensions</b>	
Alternate domain name	Domain name for alternate name. This is the host name of the machine where a certificate is installed. This is a text field of up to 100 characters. <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.
Alternate email address	Email address for alternate name, including the @ character and any periods (.). This is a text field of up to 100 characters. <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.
Alternate IP address	The IP address for the alternate name. This unique IP address specifies the location of each device or workstation on the Internet. PKI Services supports both IP version 4 and IP version 6 addresses. The IP address is a text field of up to 45 characters: <ul style="list-style-type: none"> <li>For IP version 4, the IP address is in dotted decimal format; for example, 9.67.97.103.</li> <li>For IP version 6, the IP address is divided into eight 16-bit hexadecimal blocks separated by colons. Leading zeros in each 16-bit field are optional, and successive fields of zeros can be represented by double colons, but only once; for example 1:2::3:4 is equivalent to 0001:0002:0000:0000:0000:0000:0003:0004.</li> <li>In a mixed IP version 4 and IP version 6 environment, the IP address can be expressed in the format <i>x:x:x:x:d.d.d.d</i>, where the <i>x</i> values are the hexadecimal values of the six high-order 16-bit pieces of the address, and the <i>d</i> values are the decimal values of the four low-order 8-bit pieces of the address in standard IP version 4 representation; for example, 0:0:0:0:ABCD:1.2.3.4, or the equivalent value ::ABCD:1.2.3.4</li> </ul> <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.

Table 63. Summary of fields in end-user web pages (continued)

Field	Description
Alternate other name	Additional identifier for the alternate name. See your PKI Services administrator for information about this field.
Alternate uniform resource identifier (URI)	Uniform resource identifier for the alternate name. This is a name or address referring to an Internet resource; a URL is one kind of uniform resource identifier. This is a text field of up to 100 characters. <b>Note:</b> The value is one of the list of subject's alternate names that is saved in the subject alternate name extension in the certificate.
Extended key usage	This indicates the intended purpose of the certificate. Possible values are: <b>clientauth</b> Client side authentication <b>codesigning</b> Code signing <b>emailprotection</b> Email protection <b>mssmartcardlogon</b> Smart card logon for Microsoft Windows users <b>ocspsigning</b> OCSP response signing <b>serverauth</b> Server side authentication <b>timestamping</b> Digital timestamping
HostIdMapping	This is the user ID for authorization purposes in the format: subject-id@host-name <b>Example:</b> DSmith@ibm.com This is a text field of up to 100 characters.
Key usage	The intended purpose of the certificate. Each possible value is shown in Table 64 on page 368 with its intended purpose and possible PKIX bits.
<b>Base64-encoded PKCS #10 certificate request</b>	
Base64-encoded PKCS #10 certificate request	(This is for server or device enrollment only.) You create a certificate request on behalf of another server (which could be a z/OS server or other type of server) or device for which you are requesting a certificate. You use software specific to that server to generate the PKCS #10 request before going to the PKI Services website. Save the request in a file. Then open the file in a text editor such as Windows Notepad and copy and paste the contents into the text box on the enrollment form. A text area of 70 columns and 12 rows is allocated for this certificate request. Here is an example of the certificate request:  -----BEGIN NEW CERTIFICATE REQUEST----- MIIBiDCB8gIBADAZMRcwFQYDVQQDEw5Kb2huIFEuIFB1YmtpYzCBnzANBghkqhkig 9w0BAQEFAAOBjQAwwYkCgYEAAsCT1cJHAGPqi60jAyl+xNbt8z5ngmvq02V003oYu /mEnQtRM96e+2jbmDCRo5tWVklG40Yf9ZVB5biURMJFLztfa4AVdEVtun8DH2pwc wiNIZZcC1Zym5adurUmyDk64Pgi iIPMQS/t0ttG4c5U8uWSK0b1J4V4f7ps+tlag t+cCAwEAAAwMC4GCSqGSIb3DQEJJDjEhMB8wHQYDVRO0BBYEFA1KTovBBvnFqDA0 1oIhtRinwRC9MA0GCSqGSIb3DQEBBQUAA4GBAIBCVpwYvppIX3HHmpKZPNY8Snsz AJrDsgAEH51W0IRGywhqKcLLxa9htoQai6cdc8RpFVTwk6UfdCOGxMn4aFb34Tk3 5WYdz0iHXg8MhH1B3EruwdWs+S7Fv3JhU3FLwU6lFLFAjbi+35iEWQymOR6mE5W CathprmGfKRSD5E -----END NEW CERTIFICATE REQUEST-----  For a sample of the enrollment form showing the text box for a PKCS #10 request, see Figure 40 on page 372.

## Using the end-user web pages

Table 63. Summary of fields in end-user web pages (continued)

Field	Description
<b>PKI Services internal use fields</b>	
Challenge passphrase	This is the passphrase you entered when requesting a certificate. You type the same passphrase, exactly as you typed it on the request form. This is a case-sensitive text field of up to 32 characters.
KeySize	The size of the key pair (public key and private key) that you want PKI Services to generate for you.
Label	The label assigned to the requested certificate. This is a text field of up to 32 characters. This field applies only to SAF certificates.
Notification email address	Email address for notification purposes. This is a text field of up to 64 characters. <b>Note:</b> If you specify a value for this parameter and for Mail, the two values <b>must</b> be the same.
Passphrase	You decide this value when requesting a certificate (and must later supply this value when retrieving the certificate). You enter and then reenter this when requesting a certificate. This is a case-sensitive text field of up to 32 characters. (There is no minimum number of characters, and you can use any characters, but alphanumeric characters (A–Z, a–z, and 0–9) are suggested.)
Requestor's name	Your name (for tracking purposes). This can be in any format, for example, John Smith or John. J. Smith. This is a text field of up to 32 characters. <b>Note:</b> For a PKI generated key certificate, the requestor name needs to be in the form of an email address.
Transaction ID	This is assigned after you request your certificate. When it is displayed, you need to record this number. This is a text field of up to 56 characters.
<b>Browser-specific fields</b>	
Cryptographic service provider	(This is for the Internet Explorer browser only.) The cryptographic service provider to generate your public/private key pair. You select a value from the drop-down list. Larger keys are more secure, but they also increase the time that is needed for connecting to a secure session.
Key protection	(This is for the Internet Explorer browser only.) This asks if you want to enable private key protection. (The drop-down choices are <b>Yes</b> and <b>No</b> .)
Key size	(This is for Mozilla-based browsers only.) This is the key size for your public/private key pair. Select a value from the drop-down list. Larger keys are more secure, but they also increase the time needed for connecting to a secure session.

Table 64. KeyUsage values and their intended purpose and possible PKIX bits

KeyUsage value	Intended purpose	PKIX bits
certsign	Certificate and CRL signing	KeyCertSign and cRLSign
crlsign	CRL signing	cRLSign
dataencrypt, dataencipherment, or dataenciph	Data encryption	dataEncipherment
digitalsig or digitalsignature	Authentication	digitalSignature
docsign or nonrepudiation	Document signing	nonRepudiation
handshake	Protocol handshaking (for example, SSL)	digitalSignature and keyEncipherment
keyagree or keyagreement	Key agreement	keyAgreement
keycertsign	Certificate signing	keyCertSign

Table 64. KeyUsage values and their intended purpose and possible PKIX bits (continued)

KeyUsage value	Intended purpose	PKIX bits
keyencrypt, keyencipherment, or keyenciph	Key transport	keyEncipherment

---

## Steps for requesting a new certificate

To request a new certificate, first go to the PKI Services home page. (See Figure 37 on page 363.)

Perform the following steps to request a new certificate:

1. Click the down arrow to the right of the field beside Request a new certificate using a model. This displays a list of certificate templates from which you can select.

**For SCEP preregistration:** Do not follow these steps to request a SCEP (preregistration) certificate template. Instead, go to “Steps for preregistering an SCEP client” on page 386.

The following list shows the certificate templates that PKI Services provides by default. This list might differ from the certificate templates your installation provides because your installation can customize the certificate templates and web pages.

- One-year SAF server certificate
- One-year SAF browser certificate
- One-year PKI SSL browser certificate (See Figure 39 on page 370 to see a sample of this web page.)
- One-year PKI SSL S/MIME browser certificate
- One-year PKI generated key certificate
- Two-year PKI browser certificate for authenticating to z/OS
- Two-year PKI Authenticode - code signing server certificate
- Two-year PKI Windows logon certificate
- Two-year EV SSL server certificate
- Five-year PKI SSL server certificate
- *n*-year PKI browser certificate for extensions demonstration
- Five-year SCEP certificate - Preregistration
- Five-year PKI IPSEC server (firewall) certificate
- Five-year PKI intermediate CA server certificate

2. Click one of the items in the list. The drop-down list then collapses so that only the certificate you selected appears in the field and is highlighted.

3. Click **Request certificate**. A form where you fill in information is displayed.

**Note:** You might need to click through some additional panels specific to your browser (for example, clicking **Next** on a Mozilla-based browser or answering Do you want to proceed? on Internet Explorer) before the certificate request form appears.

4. Fill in the necessary information in the certificate request form.

## Using the end-user web pages

The form that appears depends on the certificate you are requesting and, in some instances, the fields that appear on the form depend on the browser you are using. **Example:** If you request a one-year SSL browser certificate, the form shown in Figure 39 appears.

### 1-Year SSL Browser Certificate

Choose one of the following:

- **Request a New Certificate**

Enter values for the following field(s)

Your name for tracking this request (optional)

Email address for distinguished name (optional)

Common Name

Email address for notification purposes (optional)

Pass phrase for securing this request. You will need to supply this value when retrieving your certificate

Reenter your pass phrase to confirm

Select the following key information

Cryptographic Service Provider

Enable strong private key protection?

- **Pick Up a Previously Issued Certificate**

email: [webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 39. One-year SSL browser certificate request form

**Note:** In the case of the one-year SSL browser certificate, fill in your common name. (See Table 63 on page 365 for descriptions of fields.) If you are using a Mozilla-based browser, select a key size from a drop-down list. Alternately, if you are using Internet Explorer, click the drop-down lists to select your cryptographic service provider and to specify whether to use strong private key protection.

5. If you are requesting a server or device certificate, you need to supply a base64-encoded PKCS #10 certificate request. Use software specific to that server to generate the PKCS #10 request before going to the PKI website. Paste the request into the web page as shown in Figure 40 on page 372.

For example, you could use the RACDCERT command to generate the PKCS #10 request. Assume that the server has the distinguished name OU=Inventory,O=XYZZY,C=US and a domain name xyzzy.com. This server

runs on z/OS with the user ID INVSERV. First, generate a self-signed certificate for the server and assign the label "Inventory Server" to the certificate. The certificate is associated with the user ID that is associated with the server (INVSERV).

```
RACDCERT ID(INVSERV)
          GENCERT
          SUBJECTSDN(CN('xyzy.com')
                    OU('Inventory')
                    O('XYZZY')
                    C('US'))
          WITHLABEL('Inventory Server')
```

Next, generate a PKCS #10 Base64-encoded certificate request based on the certificate you just created, and write the request to a data set.

```
RACDCERT ID(INVSERV)
          GENREQ(LABEL('Inventory Server'))
          DSN('WAIC.INVSERV.GENREQ')
```

Copy the PKCS #10 request from the data set WAIC.INVSERV.GENREQ and paste it into the field **Base64 encoded PKCS#10 certificate request**.

## 5-Year PKI SSL Server Certificate

Choose one of the following:

- **Request a New Certificate**

Enter values for the following field(s)

Your name for tracking this request (Optional)

Email address for distinguished name (Optional)

Common Name (Optional)

Organizational Unit (Optional)

Organizational Unit (Optional)

Organization (Optional)

Street address (Optional)

Locality (Optional)

State or Province (Optional)

Zipcode or postal code (Optional)

Country (Optional)

Email address for alternate name (Optional)

Domain name for alternate name (Optional)

Uniform Resource Identifier for alternate name (Optional)

IP address for alternate name in dotted decimal form (Optional)

Email address for notification purposes (Optional)

Pass phrase for securing this request. You will need to supply this value when retrieving your certificate

Reenter your pass phrase to confirm

Base64 encoded PKCS#10 certificate request

Submit certificate request

Clear

- **Pick Up a Previously Issued Certificate**

Retrieve your certificate

email [webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 40. Supplying the PKCS #10 certificate request for a server or device certificate

For server certificates where a base64-encoded PKCS #10 certificate request is supplied, specify one or more of the fields related to the subject's distinguished name only if you want to change the distinguished name supplied in the PKCS

#10 certificate request. If you change one of these fields, the subject's distinguished name specified in the PKCS #10 certificate request is ignored and you must respecify the entire distinguished name (all fields). For a list of the fields related to the subject's distinguished name, see Table 63 on page 365.

6. Fill in the passphrase on the certificate request form (twice). This is a value known only to you. Pick a value that you can easily remember because you need to supply the same passphrase when you pick up your certificate. Do not use a sensitive value such as your ATM pin or login password.
7. Fill in any optional information you want. When you are satisfied with the information you have entered, click **Submit certificate request**. If the request is successful, the results depend on the type of certificate you requested.
  - For all certificate types except one-year PKI generated key certificates, you see a page like the one shown in Figure 41, which tells you your transaction ID.

### Request submitted successfully

Here's your transaction ID. You will need it to retrieve your certificate. Press 'Continue' to retrieve the certificate.

1jL+PdXDzuFOVknDWBrf3ls+

Continue

email: [webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 41. Successful request displays transaction ID

- a. Make a note of the transaction ID. (You can copy and paste the transaction ID to a file so that you have it for future reference, or you can write it in the box below. The reason for keeping a record of the transaction ID is that, depending on how you go to the web page to retrieve your certificate (see Figure 42 on page 374), you might have to fill in the transaction ID on that web page.)

**Transaction ID:**

- b. Click **Continue**. This displays the following web page:

## Retrieve Your 1-Year PKI SSL Browser Certificate

### Please bookmark this page

Since your certificate may not have been issued yet, we recommend that you create a bookmark to this location so that when you bookmark, the browser will display your transaction ID. This is the easiest way to check your status.

Enter the assigned transaction ID

1kgSy+CYaqmQ2SHV++++++

If you specified a pass phrase when submitting the certificate request, type it here, exactly as you typed it on the request form

Retrieve and Install Certificate

Home page

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 42. Web page to retrieve your certificate

- c. Bookmark this web page.

#### Notes:

- 1) After you submit the request for a certificate, your PKI Services administrator might need to approve the request before you can pick up your certificate. The amount of time that this takes can vary from a few minutes to a few days, depending on your installation. You bookmark this web page so that you can return to it at a later time.
  - 2) If your installation has enabled email notification and you supplied a valid email address when submitting your certificate request, then you receive an email message when your certificate is ready for pick-up or if PKI Services rejects your certificate request.
- d. From this web page, you can start the steps to retrieve your certificate (see “Steps for retrieving your certificate from the bookmarked web page” on page 375) or you can return to the PKI Services home page (by clicking **Home**).
- For a one-year PKI generated key certificate, you see a page like the one shown in Figure 43

## Request submitted successfully

A link to pick up the certificate was sent to the specified requestor's email address at lewallen@us.ibm.com.

Home Page

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 43. Successful request for a one-year PKI generated key certificate

Unlike other types of certificates, this page does not show you the transaction ID for your certificate. Instead, PKI Services sends an email to the address you specified in the request. The email contains a link to the certificate.

---

---

## Retrieving your certificate

For most certificate types, you can retrieve your certificate:

- From the web page you bookmarked in Step 7c on page 374. (This web page contains your transaction ID, so you do not have to enter it.) (See “Steps for retrieving your certificate from the bookmarked web page.”)
- From the PKI Services home page. (See Figure 37 on page 363 and “Steps for retrieving your certificate from the PKI Services home page” on page 376.)

For a one-year PKI generated key certificate, you receive an email to notify you when your certificate is ready for retrieval. The email contains a link to the certificate. (See “Steps for retrieving a PKI generated key certificate” on page 377.)

If your company has enabled email notification for non-SAF certificates and you supplied a valid email address when submitting your certificate request, you receive an email to notify you when your certificate is ready for retrieval (or if your certificate request has been rejected).

**Note:** When a certificate is retrieved, it can be of different formats:

- If the keys are not generated by PKI Services, the returned format can be a single X.509 certificate or a chain of certificates, depending on the authority of the surrogate ID that does the EXPORT.
- If the keys are generated by PKI Services, the returned format is always a single certificate and the private key in a PKCS #12 package.

## Steps for retrieving your certificate from the bookmarked web page

Perform the following steps to retrieve your certificate from the bookmarked web page:

1. Go to the bookmarked web page. (See Figure 42 on page 374.)
2. If you entered a passphrase when requesting your certificate, enter the passphrase.
3. Click **Retrieve and install certificate**. If you are using a Mozilla-based browser, go to Step 5 on page 376. If you are using Internet Explorer and the retrieval of a certificate is successful, this displays the web page shown in Figure 44. (This is for a browser certificate. For a server certificate, Figure 45 on page 376 shows an example of the web page.)

### Internet Explorer certificate install

Click "Install Certificate" to store your new certificate into your browser

email: webmaster@your-company.com

Figure 45. Server certificate installation web page

4. Click **Install certificate**. If the certificate installs successfully, you get a popup window that says Your new certificate installed successfully.
5. Check that your certificate installed correctly:
  - For a Mozilla-based browser, click **Security**, then Certificates → Yours. Your certificate should appear in the list. Select it and click **Verify**.
  - For Internet Explorer, click Tools → Internet Options, then Content, **Certificates**. Your certificate should appear in the Personal list. Click **Advanced** to see additional information.

## Steps for retrieving your certificate from the PKI Services home page

### Before you begin

To retrieve your certificate from the PKI Services home page, you must first know your transaction ID. You should have recorded this when your certificate request was successful. (See Figure 41 on page 373.)

### Procedure

Perform the following steps to retrieve your certificate from the PKI Services home page:

1. Enter your transaction ID and select the certificate type using the drop-down. Then click **Pick up certificate** on the PKI Services home page. (See Figure 37 on page 363.) This displays the web page that Figure 42 on page 374 shows.
2. Enter your passphrase (this is the challenge passphrase) if you specified one when requesting your certificate.
3. Click **Retrieve and install certificate**. If you are using a Mozilla-based browser, go to Step 5 on page 377. If you are using Internet Explorer and the retrieval of the certificate is successful, this displays the web page that Figure 44 on page 375 shows. (This is for a browser certificate. For a server certificate, Figure 45 shows an example of the web page.)

4. Click **Install certificate**. If the certificate installs successfully, you get a popup window that says Your new certificate installed successfully.
- 
5. Check that your certificate installed correctly:
    - For a Mozilla-based browser, click **Security**, then Certificates → Yours. Your certificate should appear in the list. Select it and click Verify.
    - For Internet Explorer, Click Tools → Internet Options, then Content, Certificates. Your certificate should appear in the Personal list. Click Advanced to see additional information.
- 

## Steps for retrieving a PKI generated key certificate

Perform the following steps to retrieve your PKI generated key certificate.

### Before you begin

You need to have received an email indicating that your certificate is ready to be picked up.

### Procedure

1. The email informing you that your certificate is ready to be picked up appears similar to the one shown in Figure 46. You have two alternatives:
  - Click the link for your certificate in the email.
  - Copy the transaction ID from the email. Go to the PKI Services home page (see Figure 37 on page 363). Paste the transaction ID into the field labeled “Enter the assigned transaction ID” and click **Pick up certificate**.

```

Attention - Please do not reply to this message as it was automatically
sent by a service machine.

Dear lewallen@us.ibm.com,

Thank you for choosing dime-o-cert PKI. The certificate you requested for
subject CN=Rocky,OU=Class 1 Internet Certificate CA,O=The Firm is now ready for pickup.

Please visit:
http://alps4027.pok.ibm.com/Customers/ssl-cgi-bin/caretrieve.rexx?TransactionId=1kkLpBzVA%2
Bq%2F2SHV%2B%2B%2B%2B%2B%2B%2B&Template=PKI+Key+Certificate
to retrieve your certificate.

If that link does not work, try to go to
http://alps4027.pok.ibm.com/Customers/public-cgi/camain.rexx?
And enter the transaction ID listed below:
1kkLpBzVA+q/2SHV+++++++

You will need to input your passphrase that you entered when you submitted the request.

```

Figure 46. Email notification that your PKI generated key certificate is ready for pickup

2. The web page shown in Figure 47 on page 378 is displayed. Note that the transaction ID is filled in. Enter the passphrase that you entered when you submitted the certificate request, and click **Retrieve Certificate**.

### Retrieve Your PKI Key Certificate

Enter the assigned transaction ID  
1kkUMYLFvU+e2SHV++++++

If you specified a pass phrase when submitting the certificate request, type it here, exactly as you typed it on the request form

email: [webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 47. Web page for retrieving a PKI generated key certificate

3. A window opens asking whether you want to open or save the PKCS #12 package containing the certificate and private key. This window is shown in Figure 48.

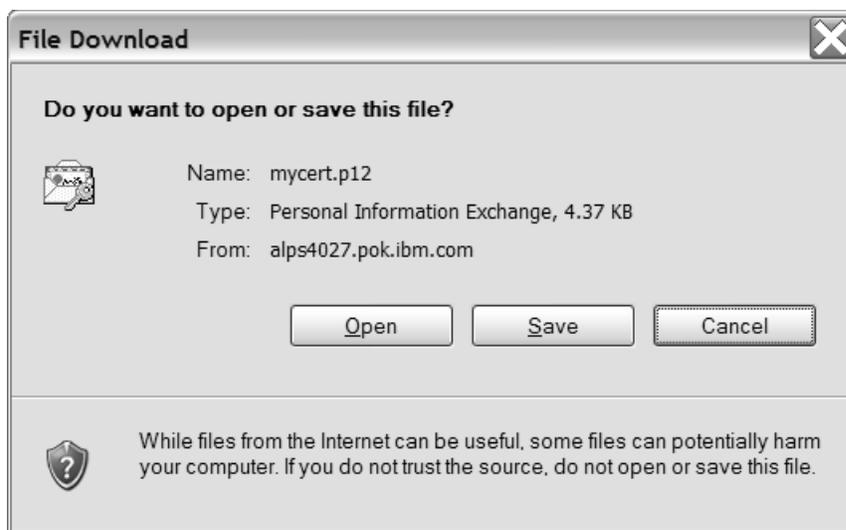

Figure 48. Window asking whether to open or save the PKCS #12 package

Click **Open** to invoke the Certificate Import Wizard to copy the certificate to a certificate store. Click **Save** to save the PKCS #12 package in a file.

### Results

When you are done, you have retrieved your PKI generated key certificate and private key.

## Steps for renewing a certificate

**Note:** For a PKI generated key certificate, if you have changed your email address since you originally requested the certificate, and the administrator has changed your email in the requester field in the certificate, you cannot renew the certificate.

Perform the following steps to renew a certificate:

1. On the PKI Services home page (see Figure 37 on page 363), click **Renew or revoke certificate**. This displays a popup window with a list of certificates,

such as the following figure shows:

Figure 49. Popup window listing certificates

2. The popup window might list more than one certificate. The certificates are listed by nickname in the order they are installed in the browser. Therefore, you might not be able to identify the PKI Services certificate you want to renew. Highlight the entry you think is the right one and click **OK**. If the certificate you selected is one that PKI Services issued and it is not expired or revoked, Figure 50 on page 380 shows an example of the web page you might see, depending on the certificate you are renewing:

## Renew or Revoke a Browser Certificate

**Here is the certificate you selected:**

**Requestor:** Gumby **Created:** 2007/04/04  
**Status:** Active **Modified:** 2007/04/04  
**Template:** 1-Year PKI SSL Browser Certificate  
**Serial #:** 5

---

**Subject:** MAIL=ymc@us.ibm.com,CN=Gumby,OU=Class 1 Internet Certificate CA,O=The Firm  
**Issuer:** OU=Master CA,O=IBM,C=US  
**Validity:** 2007/04/04 00:00:00 - 2008/04/02 23:59:59  
**Usage:** handshake(digitalSignature, keyEncipherment)  
**Extended Usage:** clientauth

**If this is the correct certificate, choose one of the following:**  
(otherwise you need to restart your browser to pick another certificate)

- **Renew the above certificate**  
Email address for notification purposes (optional)  
  
Pass phrase for securing this request. You will need to supply this value when retrieving your certificate  
  
Reenter your pass phrase to confirm
- **Revoke the above certificate**
- **Suspend the above certificate**

email: [webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 50. Renew or revoke a certificate web page

**Notes:**

- a. If this is not the PKI Services certificate you want to renew, you need to close your browser (because the browser caches information) before again clicking **Renew or revoke certificate** as in Step 1 on page 378.
- b. If the certificate has the MAIL attribute in the subject's distinguished name, the value of NotifyEmail must match it.

- 
3. Under the Renew the above certificate section, enter your passphrase in the two fields requesting it.
- 
4. Click **Renew**.

- 
5. If you are using Internet Explorer, and you do not have the appropriate PKI Services ActiveX program installed, PKI Services prompts you to install the ActiveX program. Follow the directions in the prompt. For more information, see “Installing the PKI Services ActiveX program” on page 671.
  6. If the renewal request is successful, this displays a web page that says Request submitted successfully and displays the transaction ID. Click **Continue** on this web page.
- 
7. This takes you the web page from which you retrieve your certificate. (See Figure 42 on page 374 for an example of this web page and “Steps for retrieving your certificate from the bookmarked web page” on page 375 for the directions to follow.)
- 

## Steps for revoking or suspending a certificate

Revoking or suspending a certificate means that you cannot continue to use the certificate. You might want to permanently *revoke* your certificate if you suspect your private key has been compromised. You might want to *suspend* (temporarily revoke) your certificate if you want to discontinue using it for a period of time (known as the suspension *grace period*).

If you suspend your certificate, the PKI administrator can *resume* (reactivate) the certificate, or permanently revoke it, if the certificate has not yet expired and the grace period has not elapsed. If the grace period has elapsed, the certificate is permanently revoked the next time the certificate revocation lists (CRLs) are issued.

Perform the following steps to revoke or suspend a certificate:

1. On the PKI Services home page (see Figure 37 on page 363), click **Renew or revoke certificate**. This displays a popup window with a list of certificates, as in Figure 49 on page 379.
- 
2. The popup window might list more than one certificate. The certificates are listed by nickname in the order they are installed in the browser. You might not be able to identify the PKI Services certificate you want to revoke or suspend. Highlight the entry that you think is the right one and click **OK**. If the certificate you selected is one that PKI Services issued and it is not expired or revoked, this displays the “Renew or revoke a browser certificate” web page. (See “Steps for renewing a certificate” on page 378.)

**Note:** If this is not the PKI Services certificate you want to revoke or suspend, you need to close your browser before again clicking **Renew or revoke certificate** as in Step 1.

- 
3. Make sure the certificate you want is the one described at the top of the web page. Click **Revoke** or **Suspend**. Note that when you revoke a certificate, you can click the drop-down list (of reasons) to select a reason, if you want.
- 
4. This displays a web page that says Request submitted successfully. You can click **Home page** to return to the PKI Services home page.
-

## Using the end-user web pages

**When you are done:** You can no longer use the certificate. If you suspended the certificate, contact your PKI administrator when you want to have it resumed.

---

## Recovering a certificate whose keys were generated by PKI Services

If you request a PKI generated key certificate, PKI Services generates the public and private keys for the certificate and stores the certificate and keys in the ICSF token database (TKDS). If you lose the original certificate, PKI Services can recover the stored certificate and private key and return them to you in a PKCS #12 package.

### Steps for recovering a certificate whose keys were generated by PKI Services

#### Before you begin

You need to know the email address you used when you requested the certificate. You also should know the passphrase that you entered on the certificate request. However, if you have forgotten the passphrase, and your company has implemented security questions, and you answered the security questions when you requested the certificate, you can provide those answers instead of the passphrase.

#### About this task

Perform the following steps to recover a certificate whose keys were generated by PKI Services.

#### Procedure

1. On the PKI Services home page (see Figure 37 on page 363), click **Recover Certificate**. A window similar to the one shown in Figure 51 opens.

---

## Recover previously issued certificate

Enter the email address when the original certificate was requested

Enter the same pass phrase as on the request form

[Click here if you forget the pass phrase](#)

Recover Certificate

Home Page

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 51. web page to recover a certificate

---

2. On the "Recover previously issued certificate" window, take one of the following actions:
  - a. If you remember the passphrase you used when you requested the certificate that you want to recover, enter the passphrase and the email address you used when you requested the certificate and click **Recover Certificate**.
  - b. If you have forgotten the passphrase you used, click **Click here if you forget the pass phrase**. A web page similar to the one shown in Figure 52 is displayed. Enter the email address you used when you requested the certificate and the answers to the security questions, and click **Recover Certificate**.

### Recover your certificate

Security questions - answer the following with the same answers you provided in the original request if you forget the pass phrase.

Enter the email address when the original certificate was requested

What's the intended use of this certificate?

What's the name of your elementary school?

email: webmaster@your-company.com

Figure 52. web page requesting answers to security questions when you have forgotten the passphrase

3. The web page shown in Figure 53 is displayed listing the certificates that you can recover, and an email with links to those certificates is sent to your email address.

### Certificate(s) to be recovered

The following issued certificates were requested by the specified email address `lewallen@us.ibm.com` with the specified pass phrase or security answers.

A note has been sent to the above address. Use the supplied link from the note to recover the one you need.

[Show Pass phrase](#)

Serial #: 0000000000000008

Subject: CN=Nancy Lewallen,OU=Class 1 Internet Certificate CA,O=The Firm

Validity: 2008/10/10 00:00:00 - 2008/10/12 00:00:00

Figure 53. web page listing certificates that can be recovered

Click **Show Pass phrase** to find out the pass phrase for the certificate you want to recover, if you have forgotten it. You need it to recover the certificate. The passphrase is displayed as shown in Figure 54 on page 384. Click **Hide Pass phrase** to hide the passphrase again.

## Retrieve your recovered certificate

Key ID

Serial number

Enter the requestor's email address

Enter the same pass phrase as on the request form

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 56. web page to retrieve a recovered certificate

Fill in the email address and passphrase you used on the original certificate request, and click **Retrieve Certificate**.

- A window opens asking whether you want to open or save the PKCS #12 package containing the certificate and private key. This window is shown in Figure 57.

Figure 57. Window asking whether to open or save the PKCS #12 package

Click **Open** to invoke the Certificate Import Wizard to copy the certificate to a certificate store. Click **Save** to save the PKCS #12 package in a file.

## Results

When you are done, you have recovered your PKI generated key certificate.

## Steps for preregistering an SCEP client

These steps are performed by the PKI administrator using the end-user web pages. To preregister an SCEP client, first go to the PKI Services home page. (See Figure 37 on page 363.)

Perform the following steps to complete a preregistration request and preregister an SCEP client:

1. Click the down arrow to the right of the field beside Request a new certificate using a model. (This displays a list of certificate templates from which you can select.) Select 5-Year SCEP Certificate - Preregistration from the list. The drop-down list then collapses so that only the preregistration template appears in the field and is highlighted.
2. Click **Request certificate**. A form where you fill in information is displayed.
3. The preregistration form appears. (See Figure 58.) Fill in the necessary information in the preregistration form for this SCEP client. The form that appears depends how this template is customized for your CA domain.

### 5-Year SCEP Certificate - Preregistration

• **Enter values the client must provide to authenticate**

The name of the person or device that the certificate represents

Pass phrase for securing this request. You will need to supply this value when retrieving your certificate

Reenter your pass phrase to confirm

Device serial number (Optional)

Unstructured device address (Optional)

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 58. SCEP preregistration request form

4. Fill in the passphrase on the certificate request form (twice). This SCEP client must match this passphrase to successfully request a certificate. Do not use a sensitive value such as your ATM pin or login password.
5. Fill in any optional information as needed. This SCEP client must match all subject and alternate name information you enter to successfully request a certificate. When you are satisfied with the information you have entered, click **Submit certificate request**.

If your preregistration request is successful, you see a page like the one shown in Figure 59, which tells you your temporary transaction ID.

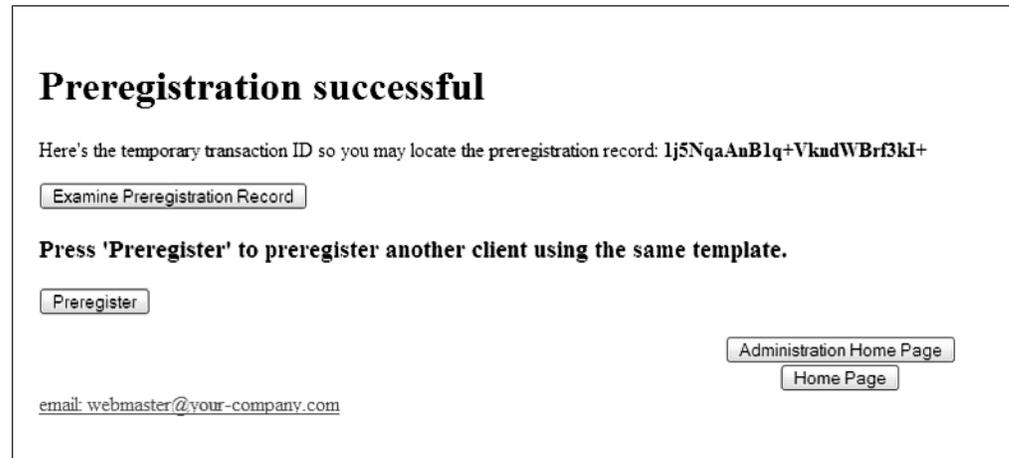

Figure 59. Successful preregistration request

- 
- (Optional) Click **Examine Preregistration Record**.
  - (Optional) Click **Preregister** to preregister another client using the same template.
- 

**When you are done:** You have successfully preregistered a SCEP client. Return to the PKI Services home page (by clicking **Home Page**) or return to the administration home page (by clicking **Administration Home Page**).

---

## Chapter 17. Using the administration web pages

This topic presents background information about certificate requests and certificates and explains how the administrator can use the administration web pages to perform the following tasks:

- Process a certificate request
  - Approve a request without making changes
  - Approve a request with changes
  - Reject a request
  - Delete a request
- Process a preregistration record
  - Delete a certificate request from a preregistered client  
(For information about preregistering clients, see “Steps for preregistering an SCEP client” on page 386.)
- Process a certificate
  - Revoke a certificate
  - Suspend a certificate
  - Resume a certificate
  - Delete a certificate
- Perform searches for certificate requests, certificates, and preregistration records

**Note:** The PKI Services web pages in this topic might differ slightly from those on the web. If you need to see the exact content, view the pages on the web. Additionally, the pages might contain differences depending on the browser you are using. This topic assumes that you are using Internet Explorer.

---

### Steps for accessing the administration home page

Perform the following preliminary steps to access the administration home page:

1. Get your organization's URL for accessing the PKI Services web pages. Enter this URL in your browser. This takes you to the PKI Services administration start page.

The administration start page contains a button for the administration home page (see the default “PKI Services Administration” home page in Figure 63 on page 394) and a button for each end-user home page (see the default “PKI Administrators Start Page” in Figure 60 on page 390).

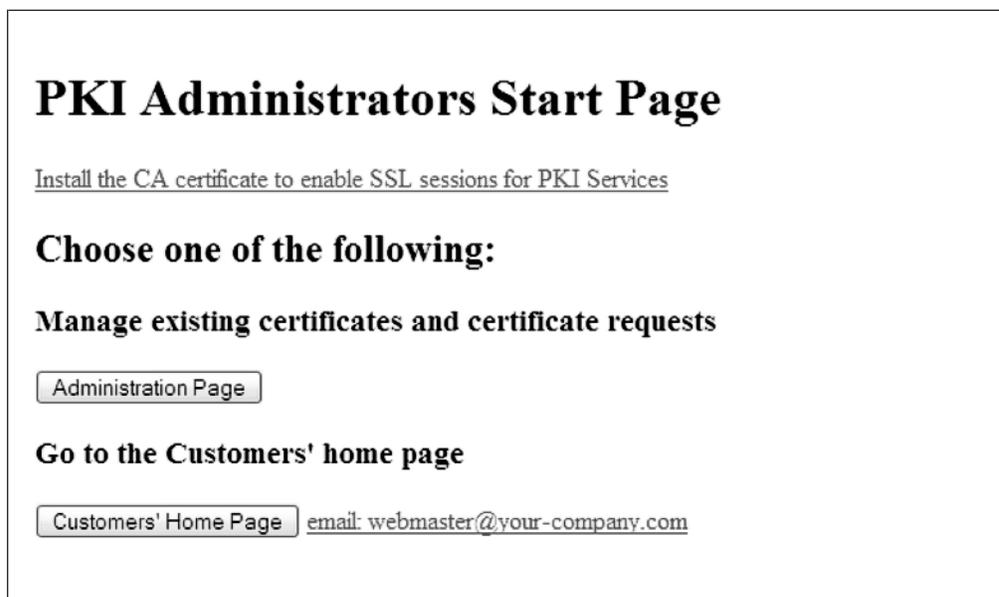

Figure 60. PKI Services administration start page

2. If this is the first time you have accessed these web pages, you must install the CA certificate into your browser. Click the **Install the CA certificate** link and follow the directions.

The following is a sample of the directions to follow for installing the CA certificate on Internet Explorer:

- a. After you click the **Install the CA certificate** link, a popup window called “File download” appears. Make sure that the “Open this file from its current location” radio button is selected (rather than “Save this file to disk”). Then click **OK**. The following is an example of the popup window you might see, depending on the CA certificate you have installed:

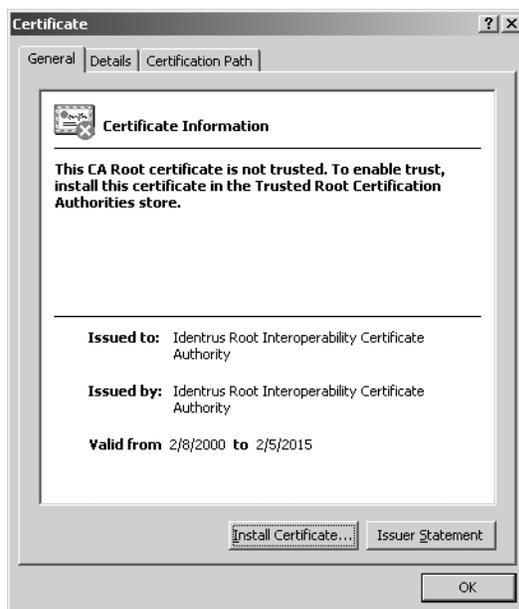

Figure 61. The certificate popup window for installing the CA certificate

- b. Click **Install certificate**. (This initiates a series of pop-ups in which you need to click **Next** and finally **Finish**, culminating in a popup window that says “The import was successful”).

**Note:** If you are using the Internet Explorer browser on a Microsoft Windows Vista and later versions of Windows, you must explicitly select a store to place the certificate in. For more information, see “Installing the PKI Services CA certificate on a Microsoft Windows system” on page 676.

3. Click **Go to administration page**.
4. You are prompted to authenticate, as shown in the following figure. Provide the necessary information:

Figure 62. Entering your user ID and password

- a. Fill in your z/OS user ID and password.
- b. If you want to eliminate having to reenter your user ID and password each time you access the administration pages, check the check box.
- c. Click **OK**.

This calls up the “PKI Services Administration” web page. (See Figure 63 on page 394.)

**Notes:**

- Your web server programmer might provide you with an alternate URL for accessing the administration home page. You might also have to authenticate using a certificate instead of a user ID and password.
- Your browser caches the authentication information that you provide. Therefore, if you need to change this information, you first must close all instances of your browser. Then open the browser and, when the panel shown in Figure 62 appears, enter the correct information.

### Fields in the administration web pages

When you process certificates requests and certificates, you provide information for various fields in the web pages. The following table describes the fields in the administration web pages:

*Table 65. Summary of fields in the administration pages*

Field	Description
Recent activity	This specifies a time range for searches. Possible values include: <ul style="list-style-type: none"><li>• Not selected</li><li>• Within the past day</li><li>• Within the past week</li><li>• Within the past month</li><li>• Within the past six months</li></ul>
Requestor name	The name of the person requesting the certificate, as it appears in the common name field of the certificate request form.
Serial number	PKI Services assigns this number to a certificate when you approve it.
Transaction ID	PKI Services assigns this number to a request when a user requests it. This is a text field of up to 56 characters.

### Processing certificate requests

Before you can use the web page to process certificate requests, you need to understand the statuses of certificate requests and the actions you can perform on these certificate requests.

#### Status of certificate requests

Requests for certificates are kept in a request database while they are active. This is from the moment they are created until an event occurs that causes them to be deleted. The following table summarizes possible statuses. During the time period when a certificate request is active, it can have only one of the following statuses at a time:

*Table 66. Statuses of certificate requests*

Status	Meaning
Pending Approval	The request requires administrative approval. No action has been taken on the request yet.  If the template that is used to create the certificate request specified an <ADMINNUM> value greater than 1, the request status might remain in Pending Approval state if the required number of individual administrator approvals have yet to be made for this request. If an Approve with Modifications is issued on a request that requires multiple approvals, all prior approvals are nullified and the current approval count for the request is set to 1.
Approved	The administrator explicitly approved the request or it was submitted as an auto-approved certificate request. The actual certificate might or might not have been created.
Completed	The certificate has been issued and the requestor has retrieved it. This is a final state.

Table 66. *Statuses of certificate requests (continued)*

Status	Meaning
Preregistered	The certificate request is from a preregistered Simple Certificate Enrollment Protocol (SCEP) client.
Rejected	The administrator rejected the request, and the requestor has <i>not</i> been informed of this action (because the user has not tried to retrieve the certificate).
Rejected, User notified	The administrator rejected the request and the requestor has been informed of this action when attempting to retrieve the certificate. This is a final state.

A request is deleted from the request database when the administrator explicitly deletes it or when the request expires. This expiration time period is configurable and varies depending on whether the request was finalized or not.

## Actions on certificate requests

The following table summarizes actions on certificate requests and the required status for each of these actions:

Table 67. *Summary of actions to perform on requests and required status*

Action	Meaning	Required status of request
Approve	Approve the request in its current form. If this is the last required approval, queue a request to generate a certificate.	Pending Approval
Approve with modifications	Nullify any previous approvals for this request, alter the request as specified, and approve the request. If this request requires multiple approvals, the approval count is reset to 1, and the request remains in Pending Approval state.	Pending Approval
Reject	Reject the request and not allow for any future modifications of the request.	Pending Approval
Delete	Permanently remove the request.	All statuses (Pending Approval, Approved, Completed, Preregistered, Rejected, or Rejected, Notified)

## Using the PKI Services administration home page

Figure 63 on page 394 shows the “PKI Services Administration” home page.

# PKI Services Administration

Choose one of the following:

- Work with a single certificate request

Enter the Transaction ID:

Process Request

- Work with a single issued certificate

Enter the Serial Number:

Process Certificate

- Specify search criteria for certificates and certificate requests

### Certificate Requests

- Show all requests
- Show requests pending approval
- Show approved requests
- Show completed requests
- Show rejected requests
- Show rejections in which the client has been notified
- Show preregistered requests

### Issued Certificates

- Show all issued certificates
- Show revoked certificates
- Show suspended certificates
- Show expired certificates
- Show active certificates (not expired, not revoked, not suspended)
- Show disabled certificates (suspended or revoked, not expired)
- Show active, automatic renewal enabled certificates
- Show active, automatic renewal disabled certificates
- Show active, not renewable certificates

### Additional search criteria (Optional)

Requestor's name

Show recent activity only

Show certificates that will expire

(Only applicable to active certificates when recent activity is not selected)

Find Certificates or Certificate Requests

Home Page

Figure 63. PKI Services administration home page

This web page allows you to:

- Process a single certificate request (by specifying its transaction ID)
- Process a single certificate (by specifying its serial number)
- Search for groups of certificate requests or certificates by status and additional search criteria so that you can process them
- Search for certificates based on when they expire.

You can process a single certificate request or a single preregistered (certificate) request if you know its transaction ID. Otherwise, you can perform a search to display all certificate requests of a particular status.

## Steps for processing a single request

To process a single request, perform the following steps:

1. On the PKI Services administration home page (see Figure 63), enter the transaction ID in the field provided for it, and click **Process request**. This displays the “Single Request” web page shown in Figure 64 on page 395.

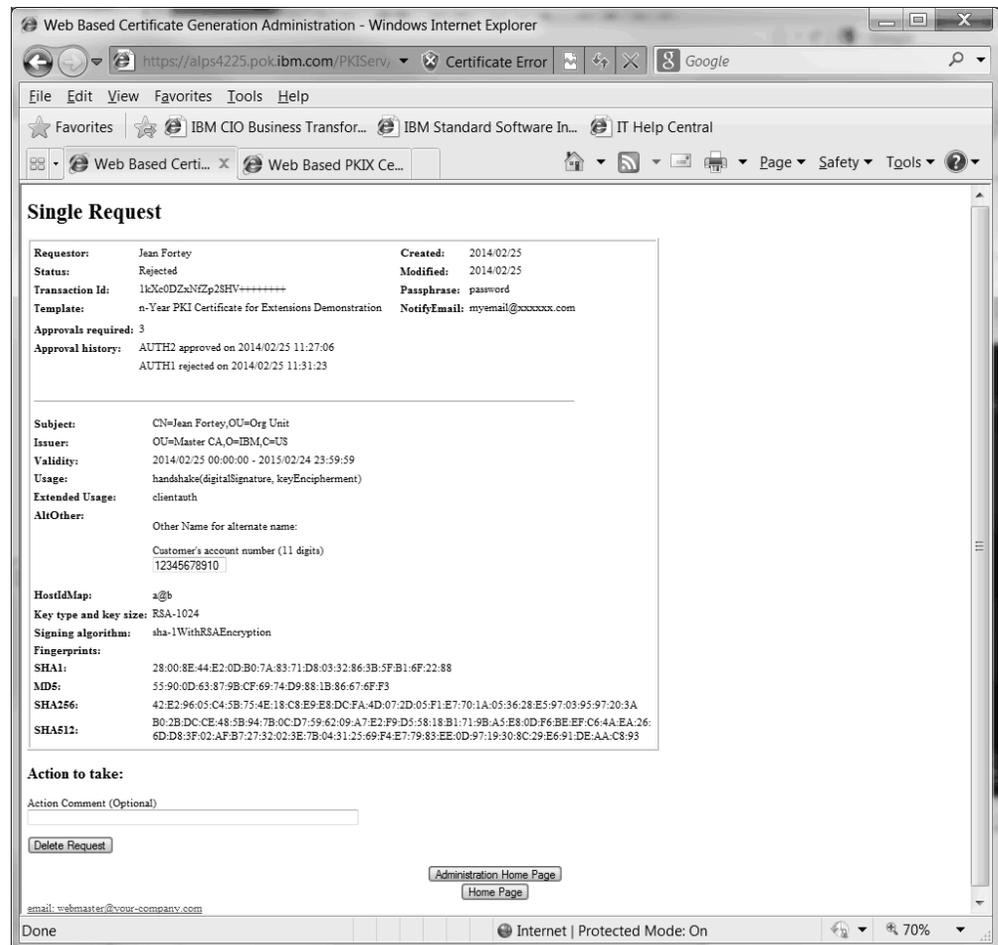

Figure 64. Single request approval web page

2. Make sure that the request is the correct one by reviewing the information in the top part of the web page.

**Guideline:** If this is a preregistered certificate request, examine the *fingerprints* (the SHA1, SHA256, SHA512, and MD5 hashes) and contact the certificate requestor to confirm that the fingerprints in this received request match the fingerprints in the original request. These actions ensure the integrity of the request. (The requestor can use the SCEP client software to display the fingerprints saved for the original request.)

3. Optionally insert a comment.
4. Click one of the choices on the "Single Request" web page to process the request.
  - Approve the request as is
  - Approve the request with modifications
  - Reject request
  - Delete request

The choices on the "Single Request" web page appear based on the status of the request. For example:

## Using the administration web pages

- If the status of a request is Pending Approval, only the first three choices in the preceding list appear.
- If the administrator has already processed the request or if the request is Preregistered, only **Delete request** appears.
- a. When you click **Approve the request as is** and processing is successful, the result is a web page that says “Processing is successful”, such as the one shown in Figure 65. (Otherwise, the web page says “Processing is not successful”.)

### Processing successful

Request with transaction ID 1jL/SxMOCqKIVkndWBrf3ls+ is successfully approved.

**You may continue to approve/reject/delete more request(s) by clicking the button below:**

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 65. Processing successful web page

From these web pages, you can then click **Process more request(s)** to return to the PKI Services administration home page (Figure 63 on page 394).

- b. When you click **Approve the request with modifications**, this displays a “Modify and Approve Request” web page similar to the one shown in Figure 67 on page 397.

If the subject's distinguished name contained in the current request is not in the proper format for RACF processing, you see the note (Figure 66) on the “Modify and Approve Request” web page.

**Note - the existing subject's name is not in a format that can be re-created by PKI Services. Therefore, specifying any subject's name field below causes the existing name to be deleted and completely replaced.**

Figure 66. Restriction note on the modify and approve request web page

**Restriction:** If you receive the note shown in Figure 66, you cannot change any field of the subject's distinguished name (the common name, organizational unit, or organization field) without causing PKI Services to delete the entire subject's distinguished name and replace it with your changed values. (This is because the subject's distinguished name is not in the proper format for RACF processing.)

## Modify and Approve Request

Requestor	Request Information	Dates
Gumby	<b>Trans ID:</b> 1k/HqP0V+YUI2SHV+++++++ <b>Template:</b> 1-Year PKI SSL Browser Certificate <b>Subject:</b> CN=Gumby,OU=Class 1 Internet Certificate CA,O=The Firm	<b>Created:</b> 2007/04/02 <b>Modified:</b> 2007/04/02

You may modify the following fields by providing new values. To remove a field simply blank it out or de-select it.

### • Subject Distinguished Name:

Common Name (optional)

Organizational Unit (optional)

Organizational Unit (optional)

Organization (optional)

### • Extensions:

Indicate the key usage for the certificate (optional)

Certificate and CRL signing (keyCertSign, cRLSign)  
 Document signing (nonRepudiation)  
 Data encryption (dataEncipherment)  
 Authentication (digitalSignature)  
 Key Transport (keyEncipherment)  
 Key agreement (keyAgreement)  
 Certificate signing (keyCertSign)  
 CRL signing (cRLSign)

Indicate the extended key usage the certificate

Code signing (codeSigning)  
 Email protection (emailProtection)  
 Digital time stamping (timeStamping)  
 OCSP response signing (OCSPSigning)  
 Microsoft Smart Card Logon (msSmartCardLogon)

HostIdMappings Extension value(s) in subject-id@host-name form (optional)

### • Validity Period:

Date certificate becomes valid    Date certificate expires (at end of day)

Automatic Renewal:

Action Comment (Optional)

Figure 67. Modifying the request web page

On the “Modify and Approve Request” web page, you can change the following fields.

- Common name, unless noted as in Figure 66 on page 396
- Organizational unit (this can be multiple fields), unless noted as in Figure 66 on page 396
- Organization, unless noted as in Figure 66 on page 396
- Email address

## Using the administration web pages

**Note:** If you change the value of the email address field (Email) and if the original request included the notification email address field (NotifyEmail), the value of the latter field is changed to match the changed email address value.

- Street
- Postal code
- Certificate purpose
- Date certificate becomes valid
- Date certificate expires
- HostIdMappings extensions (This can be multiple fields.)
- Optional comment about action you perform on the certificate.
- Automatic renewal

When you are satisfied with the changes you have made, click **Approve with specified modifications**; or, if you change your mind, you can click **Reset modified fields**. Alternately, you can click **Home page** to go to the PKI Services home page. (See Figure 37 on page 363.)

**Note:** When you click Approve with specified modifications for a request that requires multiple approvals, any previous made approvals are nullified. The request remains in Pending Approval state, and the current approval count for the request is set to 1.

- When you click **Reject request**, this displays a web page that informs you that “Processing is successful” or that “Processing is not successful”. From these web pages, click **Process more request(s)** to return to the PKI Services administration home page. (See Figure 63 on page 394.)
- When you click **Delete request**, this displays a web page that informs you that “Processing is successful” or that “Processing is not successful”. On these web pages, click **Process more request(s)** to return to the PKI Services administration home page. (See Figure 63 on page 394.)

---

### Steps for processing requests by performing searches

The administrator can use the web page to search for certificate requests of various statuses. The following table summarizes the searches that are listed on the web page and the certificate requests that are displayed as a result:

*Table 68. Searches to display certificate requests*

Search criteria	Results
Show all requests	Displays all certificate requests (all statuses (Pending Approval, Approved, Completed, Preregistered, Rejected, or Rejected, User Notified).
Show requests pending approval	Displays only certificate requests whose status is Pending Approval.
Show approved requests	Displays certificate requests whose status is Approved or Completed.
Show completed requests	Displays certificate requests whose status is Completed.
Show preregistered requests	Display certificate requests whose status is Preregistered.
Show all rejected requests	Displays certificate requests whose status is Rejected, or Rejected, User Notified.

Table 68. Searches to display certificate requests (continued)

Search criteria	Results
Show rejections in which the client has been notified	Displays certificate requests whose status is Rejected, User Notified.

To process requests by performing a search for requests of a particular status, perform the following steps:

1. On the PKI Services administration home page (see Figure 63 on page 394), select one of the searches by clicking the appropriate choice under **Certificate Requests**. (Table 68 on page 398 describes these searches.) You can optionally fill in additional search criteria (**Requestor's name** and **Show recent activity only**).

**Guideline:** Queries against the request database might time out if the database contains a large number of records. The performance of the query can be vastly improved by supplying **Requestor's name** as additional search criteria if the saved requestor data is meaningful to your organization and it is recallable. In this case, a PKI exit can be used to supply a meaningful value, such as a Lotus Notes short name or customer account number.

- 
2. Click **Find certificates or certificate requests**. The following window opens:

## Using the administration web pages

The screenshot shows a web browser window titled "Web Based Certificate Generation Administration - Windows Internet Explorer". The address bar shows the URL "https://alps4225.pok.ibm.com/PKIServ/". The page content includes a search results section for "Certificate Requests".

The following certificate requests matched the search criteria specified:

All <input type="checkbox"/>	Requestor	Certificate Request Information	Status	Processed by	Modified time
<input checked="" type="checkbox"/>	W. M. Fortey	Trans ID: 1kXcVZ6GPa3b2SHV Template: 1-Year PKI SSL Browser Certificate Subject: CN=W. M. Fortey, OU=Class 1 Internet Certificate CA, O=The Firm Creation date: 2014/02/25 Approvals required: 2	Approved Serial #: 13	AUTH1 (approved) AUTH2 (approved)	2014/02/25 11:23:46 2014/02/25 11:27:06
<input checked="" type="checkbox"/>	Jean Fortey	Trans ID: 1kXc0DZzNz2e2SHV Template: n-Year PKI Certificate for Extensions Demonstration Subject: CN=Jean Fortey, OU=Org Unit Creation date: 2014/02/25 Approvals required: 3	Rejected	AUTH2 (approved) AUTH1 (rejected)	2014/02/25 11:27:06 2014/02/25 11:31:23
<input checked="" type="checkbox"/>	scop client 1234	Trans ID: 1kXc0G6G0p3p2SHV Template: 5-Year SCEP Certificate - Preregistration Subject: scop client 1234 Creation date: 2014/02/25 Approvals required: 0	Preregistered	n/a	n/a
<input checked="" type="checkbox"/>	Yui	Trans ID: 1kXc2wRkn8h2SHV Template: 2-Year PKI Browser Certificate For Authenticating To z/OS Subject: CN=RACF User ID=AUTH1, OU=Class 1 Internet Certificate CA, O=The Firm Creation date: 2014/02/25 Approvals required: 0	Approved Serial #: 13	n/a	n/a
<input checked="" type="checkbox"/>	Liz	Trans ID: 1kXcW8YQWU2SHV Template: 1-Year PKI S/MIME Browser Certificate Subject: CN=Both, OU=Class 1 Internet Certificate CA, O=The Firm Creation date: 2014/02/25 Approvals required: 2	Pending Approval	AUTH3 (approved with modification)	2014/02/25 11:53:13

Choose one of the following:

- Click on a transaction ID to see more information or to modify, approve, reject, or delete requests individually
- Select and take action against multiple requests at once

Action Comment (Optional):

- Approve without modification all requests selected above that are "Pending Approval"

- Reject all requests selected above that are "Pending Approval"

- Delete all requests selected above

email: webmaster@your-company.com

Figure 68. Processing requests after searching

**Note:** The table at the top of the web page shows the certificate requests that match your search criteria. (If multiple certificates requests match the search criteria, up to ten appear on a web page, and a button at the bottom of the web age allows you to view the next set.)

### 3. You can use this web page:

- To process a single certificate request
- To perform the same action on all of the certificate requests that are listed
- To process selected requests.

To process a single certificate request:

- Click on its transaction ID in the table at the top of the web page. This transfers you to the Single Request web page; see Figure 64 on page 395.
- From the Single Request web page, you can perform the steps in the preceding section, starting with Step 2 on page 395).

To perform the same action on all the certificate requests that are listed:

- Optionally enter a comment.
- Click one of the actions below the comment field to perform that action on all listed requests:

**Approve**

Approves without modification all requests that are pending approval.

**Reject**

Rejects all requests that are pending approval.

**Delete** Deletes all requests.

**Note:** The **Approve** and **Reject** actions appear only if certificate requests are pending approval. Otherwise, only the **Delete** action appears.

To process selected certificate requests:

- a. Clear the check box beside the **Select** column header. (When the check box beside **Select** is selected, all the individual check boxes in the body of the table are selected. This means all these certificate requests are selected. Clearing the box in the header clears all the boxes in the body of the table.)
- b. Select the check boxes of all the certificate requests for which you want to perform a particular action.
- c. Optionally enter a comment.
- d. Click one of the actions below the comment field to perform that action on all listed requests. The actions include:

**Approve**

Approves without modification all requests that are pending approval.

**Reject**

Rejects all requests that are pending approval.

**Delete** Deletes all requests.

**Note:** The **Approve** and **Reject** actions appear only if certificate requests are pending approval. Otherwise, only the **Delete** action appears.

**Tip:** If you select **Show all requests** (see Figure 63 on page 394) and click **Approve** on this web page, only the certificate requests whose status is Pending Approval are approved.

Instead of processing one or more certificate requests, you can click **Respecify your search criteria web page** to return to the PKI Services administration home page (see Figure 63 on page 394) or **Home page** to return to the PKI Services home page (see Figure 37 on page 363).

- 
4. After you click an action, you see one of the following web pages:
    - Processing successful (see Figure 69 on page 402)
    - Processing was not successful (see Figure 70 on page 402)
    - Processing partially successful (see Figure 71 on page 403)

If Processing was not successful, you can click on the transaction ID to display the Single Request web page; see Figure 64 on page 395. Processing can be unsuccessful because requests do not have the status required for the action you selected; see Table 67 on page 393.

If you get Processing partially successful, you can click on the transaction ID to display the Single Request web page; see Figure 64 on page 395. This message can occur when your organization has more than one administrator and involves the following sequence:

- a. One administrator performs a search.

## Using the administration web pages

- b. Another administrator performs a search before the first administrator has approved requests displayed in the search results.
- c. One of the administrators approves only some of the requests.
- d. The other administrator tries to approve requests including at least one the preceding administrator has already approved and one that the preceding administrator has not already approved.

### Processing successful

Requests with specified transaction IDs are successfully approved.

**You may continue to approve/reject/delete more request(s) by clicking the button below:**

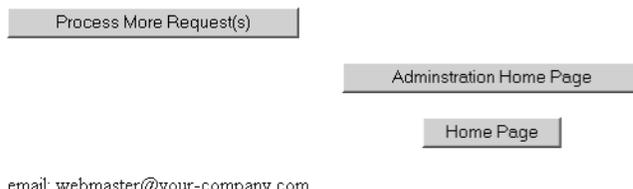

Figure 69. Request processing was successful web page

### Processing was not successful

Problem(s) encountered when attempting to approve the following request(s). Click on link(s) for more information. Note that if the request has been deleted, you will not be able to view additional information.

Request Transaction ID	Error Description
1kSzhf011+F12SHV+++++	Record not found
1kSzhh+it06W2SHV+++++	Record not found
1kSzhhaCF2UL2SHV+++++	The object type or state was not appropriate for this operation
1kSzhhOa16AK2SHV+++++	The object type or state was not appropriate for this operation
1kSzh13mXUW2SHV+++++	The object type or state was not appropriate for this operation

**You may continue to approve/reject/delete more request(s) by clicking the button below:**

Figure 70. Request processing was not successful web page

## Processing was partially successful

Problem(s) encountered when attempting to approve the following request(s). Click on link(s) for more information.  
Note that if the request has been deleted, you will not be able to view additional information.

Transaction ID	Error Description
lkGp8Gpk114c2Tc+++++	Not authorized to approve requests created under this template
lkGAapK114c2Gc+++++	Request already approved

You may continue to process more request(s) by clicking the button below:

Figure 71. Request processing was partially successful web page

- 
5. After approving requests as appropriate, you can:
    - Click **Process more request(s)** to return to Figure 68 on page 400.
    - Click **Administration home page** to return to Figure 63 on page 394.
    - Click **Home page** to return to Figure 37 on page 363.
- 

## Processing certificates

Before you can use the web page to process certificates, you need to understand the statuses of certificates and actions you can perform on certificates.

### Status of certificates

Certificates that have been created from requests are maintained permanently in an issued certificate database. Another name for this is the issued certificate list (ICL). Issued certificates are also published in an LDAP directory.

A certificate can have only one of the following states (statuses) at a time:

Table 69. Status of certificates

Status	Meaning
Active	The certificate has not yet expired, has not been revoked, and is not currently suspended.
Active, AutoRenew	The certificate is eligible for automatic renewal and this capability is enabled.
Active, AutoRenewDisabled	The certificate is eligible for automatic renewal but this capability is disabled.
Active, NotRenewable	The certificate cannot be renewed.
Expired	The certificate's validity period expired while it was active.
Revoked	The certificate has not expired but it has been revoked. Such certificates are published on the next certificate revocation list (CRL).

## Using the administration web pages

Table 69. Status of certificates (continued)

Status	Meaning
Revoked, Expired	The certificate was either revoked or suspended, and time has elapsed so that it is now also expired. Such certificates are not published on the next CRL.
Suspended	The certificate has not expired but it is currently suspended. Such certificates are published on the next certificate revocation list (CRL).

The administrator must approve a request for the certificate to have a status (as enumerated in the preceding list) or for the administrator to delete the certificate from the ICL. (An administrator can delete a certificate from the ICL, but this would not be a normal situation.) Alternately, the administrator can reject a request or delete the request from the request database (RDB). If the administrator does not approve the request, it is never listed in the ICL.

### Actions for certificates

The following table summarizes actions on certificates and the required status to perform these actions:

Table 70. Summary of actions to perform and required status to do so

Action	Required status of certificate	Who performs action
Renew	Active	End user
Resume	Suspended	Administrator
Revoke	Active or Suspended	End user or administrator
Suspend	Active	End user or administrator
Delete	All statuses (Active, Expired, Suspended, Revoked, or Revoked, Expired)	Administrator
Enable automatic renewal	Active or Active,AutoRenewDisabled	Administrator
Disable automatic renewal	Active or Active,AutoRenew	Administrator
Change requester email	All statuses <b>Note:</b> This action applies only to certificates for which PKI Services generated the key pair.	Administrator

**Note:** You can resume (reactivate) a suspended certificate, or permanently revoke it, if the certificate has not yet expired and the suspension grace period has not elapsed. If the grace period has elapsed, the certificate is permanently revoked the next time certificate revocation lists (CRLs) are issued.

### Steps for processing a single certificate

To process a single certificate, perform the following steps:

1. On the PKI Services administration home page (see Figure 63 on page 394), enter the serial number of the certificate you want to process in the field provided for it. Figure 72 on page 405 shows an example of the web page that is displayed:

## Single Issued Certificate

<b>Requestor:</b>	s@s	<b>Created:</b>	2012/09/27
<b>Status:</b>	Revoked	<b>Modified:</b>	2013/06/07
<b>Template:</b>	1-Year PKI Generated Key Certificate	<b>PassPhrase:</b>	s
<b>Serial #:</b>	4D4		
<b>Previous Action Comment:</b>	Suspension grace period lapsed		
<b>Archived KeyId:</b>	8F71C0080D368D31B5F7230750EF1D88F5938A6C		

<b>Subject:</b>	CN=end to end test,OU=Class 1 Internet Certificate CA,O=The Firm
<b>Issuer:</b>	OU=DCEIMGUN CA,O=IBM,C=US
<b>Validity:</b>	2012/09/27 00:00:00 - 2013/09/26 23:59:59
<b>Usage:</b>	digitalSignature
<b>Extended Usage:</b>	not specified
<b>Key type and key size:</b>	BPECC-160
<b>Signature algorithm:</b>	sha-1WithRSAEncryption

### Action to take:

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 72. Processing a certificate from the single certificate web page

2. Make sure the certificate is the correct one by reviewing the information in the top part of the web page.
3. If you are going to process a certificate from this web page, you can optionally insert a comment.
4. Click one of the following actions to process the certificate:
  - Disable automatic renewal**  
Disables automatic renewal for the certificate
  - Enable automatic renewal**  
Enables automatic renewal for the certificate
  - Revoke certificate**  
Revokes the certificate.

## Using the administration web pages

### Suspend certificate

Suspends the certificate.

### Resume certificate

Resumes the certificate.

### Delete certificate

Deletes the certificate. (This is for cleanup purposes.)

### Change Requestor email

Changes the requestor's email to the value that you supply in the field next to the button. Use this function when the email address of the requestor of a PKI generated key certificate has changed. If you change the requestor's email, the certificate cannot be renewed.

#### Note:

- The **Suspend** and **Revoke** buttons appear only if the status of the certificate is *Active*.
- The **Resume** button appears only if the status of the certificate is *Suspended*.
- The **Enable Automatic Renewal** button appears only if the status of the certificate is *Active,AutoRenwDisabled*.
- The **Disable Automatic Renewal** button appears only if the status of the certificate is *Active,AutoRenew*.
- The **Change Requestor email** button appears only for a PKI generated key certificate.

---

## Steps for processing certificates by performing searches

The administrator can use the web page to search for certificates of various statuses. The following table summarizes the searches listed on the web page and the certificates that are displayed as a result:

*Table 71. Searches to display certificates*

Searches	Results
Show all issued certificates.	Displays all certificates (can be any status).
Show revoked certificates.	Displays certificates whose status is <i>Revoked</i> or <i>Revoked, Expired</i> .
Show suspended certificates.	Displays certificates whose status is <i>Suspended</i> .
Show expired certificates.	Displays certificates whose status is <i>Expired</i> or <i>Revoked, Expired</i> .
Show active certificates (not expired, not revoked, not suspended).	Displays certificates whose status is <i>Active</i> .
Show disabled certificates (suspended or revoked, not expired).	Displays certificate requests whose status is <i>Suspended</i> or <i>Revoked</i> .
Show certificates with automatic renewal enabled.	Displays certificates whose status is <i>Active,AutoRenew</i> .
Show certificates with automatic renewal disabled.	Displays certificates whose status is <i>Active,AutoRenewDisabled</i> .
Show certificates that cannot be renewed.	Displays certificates whose status is <i>Active,NotRenewable</i> .

To process certificates by performing a search for certificates of a particular status, perform the following steps:

1. On the PKI Services administration home page (see Figure 63 on page 394), select one of the searches by clicking the appropriate choice under **Issued Certificates**. (The preceding table describes these searches.) You can optionally fill in additional search criteria (**Requestor's name** and **Show recent activity only**).
2. Click **Find certificates or certificate requests**. This displays the following web page.

## Issued Certificates

The following issued certificates matched the search criteria specified:

All <input checked="" type="checkbox"/>	Requestor	Certificate Information	Status	Dates
<input checked="" type="checkbox"/>	Jim Renew	Serial #: <a href="#">19092</a> Template: 1-Year PKI SSL Browser Certificate Subject: CN=Jim Renew,OU=Class 1 Internet Certificate CA,O=The Firm	Active	Created: 2003/07/17 Modified: 2003/07/22
<input checked="" type="checkbox"/>	W.M. Fortey	Serial #: <a href="#">19093</a> Template: 1-Year PKI SSL Browser Certificate Subject: MAIL=forteywm@somecompany.com,CN=W.M. Fortey,OU=Class 1 Internet Certificate CA,O=The Firm	Active	Created: 2003/07/21 Modified: 2003/07/22
<input checked="" type="checkbox"/>	W. M. Fortey Jr.	Serial #: <a href="#">19094</a> Template: 1-Year PKI SSL Browser Certificate Subject: MAIL=forteywmjr@somecompany.com,CN=W. M. Fortey Jr.,OU=Class 1 Internet Certificate CA,O=The Firm	Active	Created: 2003/07/21 Modified: 2003/07/22
<input checked="" type="checkbox"/>	Doollee Dorbie	Serial #: <a href="#">19095</a> Template: 1-Year PKI SSL Browser Certificate Subject: MAIL=dorbied@somecompany.com,CN=Doollee Dorbie,OU=Class 1 Internet Certificate CA,O=The Firm	Active	Created: 2003/07/21 Modified: 2003/07/22

Choose one of the following:

- Click on a serial number to see more information or to revoke or delete certificates individually
- Select and take action against multiple requests at once

Action Comment (Optional)

- Revoke all selected active or suspended certificates

- Suspend all selected active certificates

- Delete all selected certificates

[email: webmaster@your-company.com](mailto:webmaster@your-company.com)

Figure 73. Processing certificates using searches

## Using the administration web pages

**Note:** The table at the top of the web page shows the certificates that match your search criteria. (If multiple certificates match the search criteria, up to ten appear on a web page, and a button at the bottom of the web page allows you to view the next set.)

---

3. You can use this web page:

- To process a single certificate
- To perform the same action on all of the certificates that are listed
- To process selected certificate

To process a single certificate:

- a. Click on its serial number in the table at the top of the web page. This transfers you to the single certificate web page; see Figure 72 on page 405.
- b. From the single certificate web page, you can perform the steps in “Steps for processing a single certificate” on page 404, starting with Step 2 on page 405).

To perform the same action on all the certificates that are listed:

- a. Optionally enter a comment.
- b. Click one of the actions below the comment field to perform that action on all listed certificates:

**Revoke**

Revokes all selected active certificates.

**Suspend**

Suspends all selected active certificates.

**Resume**

Resumes all selected suspended certificates.

**Delete** Deletes all selected certificates.

**Notes:**

- 1) **Suspend** and **Revoke** appear only when your search matches at least one certificate whose status is Active.
- 2) **Resume** appears only when your search matches at least one certificate whose status is Suspended.
- 3) **Enable Automatic Renewal**, **Disable Automatic Renewal**, and **Change Requestor email** are not shown on this page. They only appear on the page showing the individual certificate.

To process selected certificates:

- a. Clear the check box beside the **Select** column header. (When the check box beside **Select** is selected, all the individual check boxes in the body of the table are selected. This means all these certificates are selected. Clearing the box in the header clears all the boxes in the body of the table.)
- b. Select the check boxes of all the certificates for which you want to perform a particular action.
- c. Optionally enter a comment.
- d. Click one of the actions below the comment field to perform that action on all listed requests. The actions include:

**Revoke**

Revokes all selected active certificates.

### Suspend

Suspends all selected active certificates.

### Resume

Resumes all selected suspended certificates.

**Delete** Deletes all selected certificates.

### Notes:

- 1) The **Suspend** and **Revoke** actions appear only when your search matches at least one certificate whose status is **Active**.
- 2) The **Resume** action appears only when your search matches at least one certificate whose status is **Suspended**.

Instead of processing one or more certificates, you can click **Respecify your search criteria Web page** to return to the PKI Services administration home page (see Figure 63 on page 394) or **Home page** to return to the PKI Services home page (see Figure 37 on page 363.)

---

4. After you click an action, the next web page tells you:

- “Processing was successful” (see Figure 74)
- “Processing was not successful” (see Figure 75 on page 410)
- “Processing was partially successful” (see Figure 76 on page 410)

If “Processing was not successful”, you can click on a serial number to display the Single Certificate web page; see Figure 72 on page 405. Processing can be unsuccessful because certificates do not have the status required for the action you selected; see Table 70 on page 404.

If you get “Processing partially successful”, you can click on the serial number to display the Single Certificate web page; see Figure 72 on page 405. The “Processing partially successful” message can occur when your organization has more than one administrator and involves the following sequence:

- a. One administrator performs a search.
- b. Another administrator performs a search before the first administrator has revoked or deleted certificates displayed in the search results.
- c. One of the administrators revokes or deletes some of the certificates.
- d. The other administrator tries to revoke or delete certificates including at least one the preceding administrator has already revoked or deleted and at least one the preceding administrator has not already revoked or deleted.

## Processing successful

Certificates with specified serial numbers are successfully revoked.

**You may continue to revoke/delete more certificate(s) by clicking the button below:**

Process More Certificate(s)

You can click **Home page** to return you to the PKI Services home page. (See Figure 37 on page 363.)

---

## Relationship between certificate requests and matching certificates

PKI Services maintains two databases:

- The request database (RDB), also called the object store
- The issued certificate list (ICL)

RDB records are temporary in nature. They exist only to track active requests. PKI Services automatically removes these records when they are complete or go inactive. ICL records are permanent. Requests for certificates (both new and renewal) are stored in the RDB. Once approved, a matching certificate is created

from the request and stored in the ICL. (Note, the creation of the certificate might not be instantaneous.) At this point, the two database records, though related, exist independently of each other.

- After a request is approved, there is no way for you to *un*-approve a request. If you mistakenly approve a request that you meant to reject, you should immediately delete the RDB entry. This prevents the user from retrieving the certificate. You should then search the issued certificates to see if the certificate has been issued. If it has, you should revoke it in case the user has already picked it up.
- Revoking a certificate (an ICL action) has no effect on its matching RDB entry. If you revoke a certificate, you should also delete its matching RDB entry if it exists. This prevents the user from retrieving the certificate, if the user has not already done so.
- You can delete RDB entries any time after they have been completed to save space in the database if you want.
- Under normal circumstances, ICL entries should not be deleted. If you delete an ICL entry, you are no longer able to revoke or renew the certificate.
- You can delete entries in any state in either database to clean up error conditions.

## Using the administration web pages

---

## Chapter 18. Using PKI Services utilities

This topic describes the following utility programs, which are shipped with PKI Services. These programs are installed in the */install-dir/pkiserv/bin* directory.

### **createcrls**

A UNIX program that initiates the certificate revocation list (CRL) creation task immediately.

### **iclview**

A UNIX program that displays the entries in the issued certificate list (ICL).

### **pkiprereg**

A UNIX program that creates Simple Certificate Enrollment Protocol (SCEP) preregistration records

### **postcerts**

A UNIX program that creates posting objects for existing certificates. The PKI Services daemon later posts the certificates to an LDAP server.

### **TemplateTool**

A Java program that validates an XML certificate template file and converts it to a text CGI template file, and converts a text CGI template file to an XML template file.

### **vosview**

A UNIX program that displays the entries contained in the object store (request database).

### **vsam2db2**

A UNIX program that converts data from the issued certificate list (ICL) and object store VSAM data sets into DB2 tables.

---

## Using the createcrls utility

### Purpose

The createcrls program initiates the task that creates certificate revocation lists (CRLs). Later, depending on how PKI Services is configured, the PKI Services daemon either posts the CRLs to an LDAP server (for LDAP) or saves them in the HFS (for the URI format). (The PostInterval parameter in the LDAP section of the configuration file determines when the posting to LDAP occurs.) You can use this program to create a CRL immediately, instead of waiting for PKI Services to do it automatically based on the TimeBetweenCRLs parameter in the configuration file.

### Path setup

Update your PATH, LIBPATH, and NLSPATH environment variables with the appropriate pkiserv directory before you run createcrls. (Note that you are updating the environment variables for the user running the utility, not updating values in the PKI Services environment variables file, pkiserv.envars.) Once you have updated these variables, you can run createcrls from the UNIX command line.

Variable name	You must add ...
PATH	<i>/install-dir/pkiserv/bin</i>
LIBPATH	<i>/install-dir/pkiserv/lib</i>
NLSPATH	<i>/install-dir/pkiserv/lib/nls/msg/%L/%N</i>

The default directory for *install-dir* is */usr/lpp*.

### Format

```
createcrls [-D CA-Domain-name]
```

### Parameters

#### **-D** *CA-Domain-name*

Specifies the 1-8 character name of the CA domain for which CRLs are to be created. The name can be entered using uppercase or lowercase letters. This option is required only if PKI Services is running with multiple CA domains.

### Examples

To create a CRL for the domain mydomain and post the CRL to LDAP, enter the command:

```
createcrls -D mydomain
```

To create a CRL and post it to LDAP if you are not running PKI Services with multiple CA domains, enter the command:

```
createcrls
```

## Using the iclview utility

### Purpose

The `iclview` program displays the entries contained in an issued certificate list (ICL). Depending on how you have configured PKI Services, the ICL can be in a VSAM data set or in a DB2 table. Each ICL record consists of a fixed header followed by a variable-length section containing the BER-encoded certificate. For each entry `iclview` displays the header information and optionally calls a user-provided program to process the BER-encoded certificate.

### Path setup

Update your `PATH`, `LIBPATH`, and `NLSPATH` environment variables with the appropriate `pkiserv` directory before you run `iclview`. (Note that you are updating the environment variables for the user running the utility, not updating values in the PKI Services environment variables file, `pkiserv.envars`.) Once you have updated these variables, you can run `iclview` from the UNIX command line.

Variable name	You must add ...
<code>PATH</code>	<code>/install-dir/pkiserv/bin</code>
<code>LIBPATH</code>	<code>/install-dir/pkiserv/lib</code>
<code>NLSPATH</code>	<code>/install-dir/pkiserv/lib/nls/msg/%L/%N</code>

The default directory for `install-dir` is `/usr/lpp`.

### Format

```
iclview {-d vsam-dataset-name [-r] | -b db2-subsystem-name -k db2-package-name
        | -c [-p path]}
        [-D CA-domain-name] [-s decode-command-string]
```

### Parameters

You can display usage information about the `iclview` command format and parameters when you issue the `iclview` utility command with no parameters.

#### **-d** *vsam-dataset-name*

Specifies the MVS data set name of the VSAM issued certificate list (ICL).

If you specify `-d`, do not specify `-b`, `-k` or `-c`. If you do, the utility issues an error message and the command fails.

**Note:** If the data set name has no quotes, the program uses the invoker of the command as the first qualifier. If you specify the fully-qualified data set name, use quotes, and make sure to include the *escape* character, which is a backslash (`\`), before the quotation marks enclosing the data set name. For example, see `'pkisrvd.vsam.ost\'` in “Examples” on page 428.

#### **-r**

Indicates to open in VSAM record-level sharing (RLS) mode the VSAM data set specified with the `-d` option.

`-r` is ignored and the utility issues a warning message if `-b` and `-k` are specified, or if `-c` is specified.

#### **-b** *db2-subsystem-name*

Specifies the name of the DB2 subsystem or group attachment where the ICL is located.

## iclview

If you specify `-b` and you do not specify `-k`, or you specify `-d` or `-c`, the utility issues an error message and the command fails.

### **-k** *db2-package-name*

Specifies the DB2 package name of the ICL.

If you specify `-k` and do not specify `-b`, or you specify `-d` or `-c`, the utility issues an error message and the command fails.

- c** Indicates to retrieve the location of the ICL from the `pkiserv.conf` configuration file. Either the VSAM data set name is retrieved, or the DB2 subsystem name and package name are retrieved, depending which you are using. For VSAM, the `SharedPlex` value determines whether the VSAM data set is opened in record-level sharing (RLS) mode. (For DB2, the `SharedPlex` value has no effect on this utility.)

If you specify `-c`, and you also specify `-d`, `-b`, or `-k`, the utility issues an error message and the command fails.

**Note:** When you also specify the `-D` option, you must use the `-p` option to specify the CA domain configuration directory if it is not `/etc/pkiserv`.

### **-p** *path*

Specifies the directory where the `pkiserv.conf` configuration file resides. If not specified, the directory defaults to `/etc/pkiserv`. This option is only valid when specified with the `-c` option. If specified with the `-b`, `-k`, or `-d` options, the utility issues a warning message, and the `-p` option is ignored.

### **-D** *CA-domain-name*

Specifies the CA domain name where this utility command is directed.

#### **Notes:**

1. The `-D` option is required only if PKI Services is running in multiple-CA mode.
2. The `CA-domain-name` value can be entered using uppercase or lowercase letters.
3. When you also specify the `-c` option, you must use the `-p` option to specify the CA domain configuration directory if not `/etc/pkiserv`.

### **-s** *decode-command-string*

Specifies an optional command to call for decoding the ASN.1-encoded data. The command must be able to read and decode binary (BER) data from STDIN.

## Examples

To view the records in the ICL in the VSAM data set 'PKISRVD.VSAM.ICL', passing the certificate to a utility called `dumpasn1`, use the following command:

```
iclview -d \'pkisrvd.vsam.icl\' -s 'dumpasn1 -'
```

To view the records in the ICL for the CA domain `MasterCA` using the information from the `pkiserv.conf` file located in the directory `/etc/pkiserv/MasterCA`, use the following command:

```
iclview -c -p /etc/pkiserv/MasterCA -D MasterCA
```

To view the records in the ICL in the DB2 subsystem `DSN9` with a package name of `MasterCA`, passing the certificate to a utility called `dumpasn1` and directing the output to the file `icl.out`, use the following command:

```
iclview -b DSN9 -k MASTERCA -s 'dumpasn1 -' >icl.out
```

**Note:** A dumpasn1 utility is not shipped with PKI Services.

## Output

The fixed header data that is displayed for each record is similar to the following sample:

```
Cert 8: John Q. Public@someWebProvider.com
ISSUED (Issued certificate)
Issued at 2001-12-19 17:27:41
Last changed 2001-12-19 17:42:30
Subject: CN=John Smith,OU=Class 1 Internet Certificate CA,O=The Firm
Issuer: OU=PKI Services CA,O=IBM,C=US
Requester: John Smith
ApplData: 1YBSSL
Serial Number: CCD
Email flag: Off
AutoRenew flag: Enabled
Additional flags Set: NotRenewable
KeyID: 12FD68977EE1F987DC9CA1440B62CCCD1CD0A9BB
Validity: 2012/07/19 00:00:00 – 2013/07/18 23:59:59
Revocation information location: Distribution Point 151
```

The first line of the output specifies the certificate's sequential position within the ICL, relative to the other certificates, and the requestor's name.

The second line specifies the certificate state, which is one of the following states, and a comment (if any):

- ISSUED
- REVOKED, not posted
- REVOKED, awaiting CRL post
- REVOKED, on posted CRL

### Issued at

Indicates when the certificate was issued.

### Last changed

Indicates when the administrator last changed the certificate.

### Subject

Indicates the name of the person who owns the certificate.

**Issuer** Indicates the name of the certificate authority that issued the certificate.

### Requestor

Indicates the requestor's name.

### Appldata

Indicates the 8-character string identifying to the application the short name or nickname of the certificate template. (PKI Services provides sample certificate templates but it is RACF, or an equivalent security product, rather than PKI Services, that handles the SAF templates.) Table 36 on page 143 shows the nicknames for each certificate template. (These nicknames are supplied in the pkiserv.tmp certificate templates file as defaults but your installation might have changed them or added others during customization. See “TEMPLATE sections” on page 142 for more information.)

**Serial Number**

Indicates the serial number of the certificate as a hexadecimal number.

**Email flag**

Indicates whether or not to send an expiration warning message. The possible values are On or Off.

**AutoRenew flag**

Indicates whether a certificate is AutoRenew enabled, disabled, or not set up for automatic renewal.

**Revoked at**

Indicates the date and time the certificate was revoked or suspended.

**Revocation Reason**

Indicates one of the following reasons:

- No reason.
- User key was compromised.
- Original use no longer valid.
- CA key was compromised.
- User changed affiliation.
- Certificate was superseded.
- Temporarily suspended.

**Additional flags Set**

The NotRenewable flag indicates that the certificate cannot be renewed. This state occurs when the keys for the certificate were generated by PKI Services, the certificate has a Mail RDN, and the user's email address has changed since the certificate was created.

**KeyID**

The SHA1 hash of the public key in EBCDIC format, 40 bytes in length. This line is only displayed if the key was generated by PKI Services.

**Validity**

The validity period of the certificate.

**Revocation information location**

The location of the revocation information of the end entity certificate. This location can be different than the location specified in the CRLDistributionPoint extension in the certificate if the CRLDistName value was changed after the certificate was created. This line is displayed only if there is revocation information and it can be retrieved successfully. The information can be a distribution point number, or "Master CRL".

**Note:** CA certificates issued by the PKI Services CA are always placed in the master authority revocation list (ARL) and the ARL distribution point if configured. The revocation information location is therefore not displayed for issued CA certificates.

## Using the pkiprereg utility

### Purpose

The pkiprereg program creates Simple Certificate Enrollment Protocol (SCEP) preregistration records in batch.

### Path setup

Update your PATH, LIBPATH, and NLSPATH environment variables with the appropriate pkiserv directory before you run pkiprereg. (Note that you are updating the environment variables for the user running the utility, not updating values in the PKI Services environment variables file, pkiserv.envars.) Once you have updated these variables, you can run pkiprereg from the UNIX command line.

Variable name	You must add ...
PATH	<i>/install-dir/pkiserv/bin</i>
LIBPATH	<i>/install-dir/pkiserv/lib</i>
NLSPATH	<i>/install-dir/pkiserv/lib/nls/msg/%L/%N</i>

The default directory for *install-dir* is */usr/lpp*.

### Format

```
pkiprereg {-m mode [-t tmpl-file] -s SCEP-file [-o out-file] [-d domain]
          | [-h | -?]}
```

### Parameters

You can display usage information about the pkiprereg command format and parameters when you execute the pkiprereg utility command with the *-h* or *-?* option or when you enter an incorrect parameter.

#### *-m mode*

Indicates one of the following modes of operation for this pkiprereg utility execution.

Mode name	Function
<b>verify</b>	Checks the data file for format errors but does <i>not</i> load the records into PKI Services.
<b>generate</b>	Generates a random 8-character passphrase whenever it finds a passphrase <i>placeholder</i> (the * character) in the file. It does <i>not</i> load the records into PKI Services.
<b>load</b>	Calls PKI Services to load the preregistration records.
<b>remove</b>	Calls PKI Services to remove the preregistration records.

You can specify the mode value as the mode name or any number of initial characters of the mode name. **Example:** You can specify **verify** mode using any of the following options:

- *-m verify*
- *-m ve*
- *-m v*

#### *-t tmpl-file*

When used in **verify** or **load** mode, specifies the path name of the PKI Services certificate templates file (*pkiserv.tmpl* if you are implementing the web application using REXX CGI scripts, or *pkixgen.tmpl* if you are implementing

## pkiprereg

the web application using JavaServer pages), which is used as input. When used in other modes, the `-t` option is ignored.

**-s** *SCEP-file*

Specifies the path name of the file containing the preregistration data that is input for all modes.

**-o** *out-file*

When used in **generate** mode, specifies the path name of the output file for the preregistration data. When used in other modes, the `-o` option is ignored.

**-d** *domain*

When used in **load** or **remove** mode, specifies the PKI Services CA domain name where this utility command is directed.

**Notes:**

1. When used in other modes, the `-d` option is ignored.
2. The `-d` option is required only if PKI Services is running in multiple-CA mode.
3. The *domain* value can be entered using uppercase or lowercase letters.

**-h or -?**

Displays the syntax of the `pkiprereg` command.

## Input

The input for the `pkiprereg` utility is a data file (*SCEP-file*) containing preregistration records. The rules regarding format of the preregistration records are as follows:

**Rules:**

- Each preregistration record consists of multiple consecutive *name=value* pairs, terminated by a blank line or an end-of-file indicator.
- Each line consists of single field name and its value, separated by a = character, forming one *name=value* pair per line.
- Each *name=value* pair (except the Template *name=value* pair) represents data that the client must supply at enrollment time for authentication purposes.
- In `pkiprereg` **verify** and **load** modes, the Template and ClientName *name=value* pairs are required. All other *name=value* pairs are optional.
- In `pkiprereg` **remove** mode, only the ClientName *name=value* pair is required.
- Any line beginning with a # character is considered a comment.
- All characters before the = character, except any leading and trailing white space, are considered the *name*.
- All characters after the = character, except any leading and trailing white space, are considered the *value*.
- The field name supplied as a *name* is case-sensitive and must match one of the field names listed in Table 72 on page 421.
- Line length is limited to 300 characters. After 300 characters, any additional characters are truncated.

The following field names are supported in the preregistration record.

Table 72. List of valid field names for use in the preregistration record as input to the pkiprereg utility

Field name	Maximum length	Description
Template	8 characters	The nickname of the preregistration template to be used.
ClientName	64 characters	The name of the person or device being preregistered. The first 32 characters are case-insensitive and must be unique for each user preregistered in PKI Services.
PassPhrase	32 characters	The password to be communicated to the requestor. The * value can be used as a <i>placeholder</i> when running in <b>generate</b> mode.
SerialNumber	64 characters	Serial number of the subject device.
UnstructAddr	64 characters	Unstructured address of the subject device.
EmailAddr	64 characters	Email address for the EMAIL= attribute for subject distinguished name.
Mail	64 characters	Email address for the MAIL= attribute for subject distinguished name.
DNQualifier	64 characters	Specifies information to add to the subject's distinguished name to make it unambiguous.
Uid	64 characters	The system login name associated with the subject.
Title	64 characters	Title for subject distinguished name.
DomainName	64 characters	One component of a domain name. For example, domain name www.ibm.com is represented by 3 components: www, ibm, and com.
OrgUnit	64 characters	Organizational unit for subject distinguished name.
Org	64 characters	Organization for subject distinguished name.
Street	64 characters	Street for subject distinguished name.
Locality	64 characters	Locality for subject distinguished name.
StateProv	64 characters	State or province for subject distinguished name.
PostalCode	64 characters	Postal code for subject distinguished name.
Country	2 characters	Country abbreviation for subject distinguished name.
AltIPAddr	45 characters	<p>The IP address for the subject alternate name extension. PKI Services supports IP version 4 and IP version 6 addresses.</p> <ul style="list-style-type: none"> <li>For IP version 4, the IP address is in dotted decimal format; for example, 9.67.97.103.</li> <li>For IP version 6, the IP address is divided into eight 16-bit hexadecimal blocks separated by colons. Leading zeros in each 16-bit field are optional, and successive fields of zeros can be represented by double colons, but only once; for example 1:2::3:4 is equivalent to 0001:0002:0000:0000:0000:0000:0003:0004.</li> <li>In a mixed IP version 4 and IP version 6 environment, the IP address can be expressed in the format <code>x:x:x:x:d.d.d.d</code>, where the <i>x</i> values are the hexadecimal values of the six high-order 16-bit pieces of the address, and the <i>d</i> values are the decimal values of the four low-order 8-bit pieces of the address in standard IP version 4 representation; for example, 0:0:0:0:ABCD:1.2.3.4, or the equivalent value ::ABCD:1.2.3.4</li> </ul>
AltURI	255 characters	URI for subject alternate name extension.
AltEmail	100 characters	Email address for subject alternate name extension.

## pkiprereg

Table 72. List of valid field names for use in the preregistration record as input to the pkiprereg utility (continued)

Field name	Maximum length	Description
AltDomain	100 characters	Domain name for subject alternate name extension.
AltOther	255 characters	Other Name for subject alternate name extension.

The following field names are supported as input to the pkiprereg utility, but they are not intended for use with SCEP certificates.

Table 73. List of valid field names for use in the preregistration record as input to the pkiprereg utility but not intended for use with SCEP certificates

Field name	Maximum length	Description
BusinessCat	64 characters	Business category for subject distinguished name.
JurCountry	2 bytes	Jurisdiction country for subject distinguished name.
JurStateProv	64 characters	Jurisdiction state/province for subject distinguished name.
JurLocality	64 characters	Jurisdiction locality for subject distinguished name.

For information about the format required for these values, see the R\_PKIServ (IRRSPX00) section of *z/OS Security Server RACF Callable Services*.

### Examples

The following example shows two preregistration records in the /etc/scep.txt file.

```
Template=5YSCEPP
ClientName=www.ibm.com
PassPhrase=gumby
Org=IBM
Template=5YSCEPP
ClientName=scep.company.com
PassPhrase=*
```

The following command examples produce the actions listed:

Example 1:

```
pkiprereg -m v -t /etc/pkiserv/pkiserv.tmpl -s /etc/scep.txt
```

**Action:** Verifies the /etc/scep.txt file, indicating that one PassPhrase has an incorrect value, the placeholder (\*).

Example 2:

```
pkiprereg -m g -s /etc/scep.txt -o /etc/scepfinal.txt
```

**Action:** Generates a passphrase for the placeholder and saves the records in the /etc/scepfinal.txt output file.

Example 3:

```
pkiprereg -m l -t /etc/pkiserv/pkiserv.tmpl -s /etc/scepfinal.txt
```

**Action:** Loads the preregistration records into PKI Services. If the template identified by the nickname 5YSCEPP contains any subject or alternate name information in the <CONSTANT> section, that information overrides any matching information specified in the /etc/scepfinal.txt file.

## Using the postcerts utility

### Purpose

The postcerts program creates LDAP posting objects for certificates, which the PKI Services daemon later posts to an LDAP directory. (The `PostInterval` parameter in the `LDAP` section of the configuration file determines when the posting occurs.) You can use this utility if you have created certificates that PKI Services did not automatically post to an LDAP directory; for example if you created certificates before you configured PKI Services to automatically post them.

### Path setup

Update your `PATH`, `LIBPATH`, and `NLSPATH` environment variables with the appropriate `pkiserv` directory before you run `postcerts`. (Note that you are updating the environment variables for the user running the utility, not updating values in the PKI Services environment variables file, `pkiserv.envars`.) After you have updated these variables, you can run `postcerts` from the UNIX command line.

Variable name	You must add ...
<code>PATH</code>	<code>/install-dir/pkiserv/bin</code>
<code>LIBPATH</code>	<code>/install-dir/pkiserv/lib</code>
<code>NLSPATH</code>	<code>/install-dir/pkiserv/lib/nls/msg/%L/%N</code>

The default directory for `install-dir` is `/usr/lpp`.

### Format

```
postcerts -s serial-numbers [-D CA-domain-name] [-c comment]
```

### Parameters

#### **-s** *serial-numbers*

The serial numbers of the certificates to be posted. This parameter contains one or more serial number specifiers, which are separated by commas, where a serial number specifier can be:

- A single serial number
- Two serial numbers that are separated by a dash, indicating a range of serial numbers

#### **-D** *CA-domain-name*

The 1-8 character name of the CA domain for which certificates are to be posted. The name can be entered using uppercase or lowercase letters. This option is required only if PKI Services is running with multiple CA domains.

#### **-c** *comment*

A comment to be stored in the issued certificate list (ICL).

### Examples

To post a single certificate with serial number `X'17'`:

```
postcerts -s 17
```

To post multiple certificates with a comment:

```
postcerts -s 17,18,8A -c 'Posting Certificates for Coop'
```

## postcerts

To post certificates whose serial numbers are in the range X'20' to X'3B':

```
postcerts -s 20-3B
```

To post certificates whose serial numbers are in the ranges X'20' to X'3B' and to also post a single certificate with serial number X'17':

```
postcerts -s 20-3B,17
```

## Using the TemplateTool utility

### Purpose

The TemplateTool utility works with certificate template files. It performs functions that you need if you implement the web application using JavaServer pages (JSPs). There are three certificate template files that are used by PKI Services:

- A text CGI template file, `pkiserv.tpl`, used to implement the web application using REXX CGI execs.
- An XML template file, `pkitmpl.xml`, used to implement the web application using JavaServer pages (JSPs).
- A text CGI template file, `pkixgen.tpl`, generated from the XML template file, and used by the PKI Services daemon if you implement the web application using JSPs. Any time that you update `pkitmpl.xml`, you must use TemplateTool to create an equivalent copy of `pkixgen.tpl`. If you do not do this, the daemon writes the following message to the daemon log file when it determines that `pkixgen.tpl` is not current:

```
IKYC068I The templates file used may not be current
```

The TemplateTool utility performs the following functions:

- `validateXML`  
The `validateXML` function validates an XML template file against the XML schema file. It can optionally convert the XML template file to a text CGI template file. Use this function after you make changes to your XML schema file, `pkiserv.tpl`, to validate the changes and create a CGI template file, `pkixgen.tpl`, for use by the PKI Services daemon.
- `convertCGI`  
The `convertCGI` function converts a text CGI template file to an XML template file. This function can assist PKI Services administrators in converting the web application from the REXX CGI execs to the JSPs. The conversion process might not convert all tags, so you should always verify the contents of the resulting XML template file.
- `help`  
The help function prints the format of the utility.

**Requirement:** You must have Java V5.0 or higher installed to run the TemplateTool utility.

### Path setup

Update your PATH and CLASSPATH environment variables with the appropriate directories before you run TemplateTool. (Note that you are updating the environment variables for the user running the utility, not updating values in the PKI Services environment variables file, `pkiserv.envars`.) When you have updated these variables, you can run TemplateTool from the shell script or from Java.

Variable name	You must add ...
PATH	<code>/install-dir/pkiserv/bin</code> The directory containing the java command.
CLASSPATH	<code>/install-dir/pkiserv/lib/pki_xml.jar</code>

The default directory for `install-dir` is `/usr/lpp`.

## TemplateTool

### Format

```
TemplateTool -help |  
  
-validateXML [-XMLTemplate XML_template_file]  
              [-CGITemplate CGI_template_file] |  
  
-convertCGI [-CGITemplate CGI_template_file]  
            [-XMLTemplate XML_template_file]
```

To run the utility from Java:

```
java com.ibm.pki.template.TemplateTool function parameters
```

To run the utility from the shell script:

```
TemplateTool function parameters
```

### Parameters

#### **-XMLTemplate XML\_template\_file**

An XML template file. Specify the name of the XML template file if it is in the current directory, or the full path name.

For the validateXML function, this parameter is required. The specified XML template file is validated against the XML schema file PKIServ.xsd, which must be in the same directory.

For the convertCGI function, this parameter is required. The CGI template file specified as input is converted to an XML template file using the XML schema file PKIServ.xsd, and output to the file specified by -XMLTemplate.

#### **-CGITemplate CGI\_template\_file**

A CGI template file. Specify the name of the CGI template file if it is in the current directory, or the full path name.

For the validateXML function, this parameter is optional. If specified, the XML template file specified as input is converted into CGI format and output to the file specified by -CGITemplate. If the CGI template file is to be used by the PKI Services daemon, it must be named pkixgen.tmp1.

For the convertCGI function, this parameter is required. The CGI template file specified is converted to an XML template file using the XML schema file PKIServ.xsd, which must be in the same directory, and output to the file specified by -XMLTemplate.

### Examples

Example 1:

```
TemplateTool -validateXML -XMLTemplate pkitmpl.xml -CGITemplate pkixgen.tmp1
```

**Action:** Invokes TemplateTool from the shell script. Validates that the XML template file pkitmpl.xml is valid, and generates a text CGI template file from it named pkixgen.tmp1, for use by the PKI Services daemon.

Example 2:

```
java com.ibm.pki.template.TemplateTool -convertCGI -CGITemplate pkiserv.tmp1  
-XMLtemplate pkitmpl.xml
```

**Action:** Invokes TemplateTool from Java. Converts the text CGI template file named pkiserv.tmp1 to an XML template file named pkitmpl.xml.

## Using the vosview utility

### Purpose

The vosview program displays the data in the PKI Services object store (the request database). Depending on how you have configured PKI Services, the object store can be in a VSAM data set or in a DB2 table. Each request record consists of a fixed header, followed by a variable-length section. For each entry vosview displays the header information and optionally calls a user-provided program to process the BER-encoded request.

### Path setup

Update your PATH, LIBPATH, and NLSPATH environment variables with the appropriate pkiserv directory before you run vosview. (Note that you are updating the environment variables for the user running the utility, not updating values in the PKI Services environment variables file, pkiserv.envars.) Once you have updated these variables, you can run vosview from the UNIX command line.

Variable name	You must add ...
PATH	<i>/install-dir/pkiserv/bin</i>
LIBPATH	<i>/install-dir/pkiserv/lib</i>
NLSPATH	<i>/install-dir/pkiserv/lib/nls/msg/%L/%N</i>

The default directory for *install-dir* is */usr/lpp*.

### Format

```
vosview {-d vsam-dataset-name [-r] | -b db2-subsystem-name -k db2-package-name
        | -c [-p path]}
        [-D CA-domain-name] [-s decode-command-string]
```

### Parameters

You can display usage information about the vosview command format and parameters when you issue the vosview utility command with no parameters.

#### -d vsam-dataset-name

Specifies the MVS data set name of the VSAM object store.

If you specify -d, do not specify -b, -k or -c. If you do, the utility issues an error message and the command fails.

**Note:** If the data set name has no quotes, the program uses the invoker of the command as the first qualifier. If you specify the fully qualified data set name, use quotes, and make sure to include the *escape* character, which is a backslash (\), before the quotation marks enclosing the data set name. For example, see `'pkisrvd.vsam.ost'` in “Examples” on page 428.

#### -r

Indicates to open in record-level sharing (RLS) mode the VSAM data set specified with the -d option.

-r is ignored and the utility issues a warning message if -b and -k are specified, or if -c is specified.

#### -b db2-subsystem-name

Specifies the name of the DB2 subsystem or group attachment where the object store is located.

If you specify `-b` and you do not specify `-k`, or you specify `-d` or `-c`, the utility issues an error message and the command fails.

**-k *db2-package-name***

Specifies the DB2 package name of the object store.

If you specify `-k` and do not specify `-b`, or you specify `-d` or `-c`, the utility issues an error message and the command fails.

- c** Indicates to retrieve the location of the object store from the `pkiserv.conf` configuration file. Either the VSAM data set name is retrieved, or the DB2 subsystem name and package name are retrieved, depending which you are using. For VSAM, the `SharedPlex` value determines whether the VSAM data set is opened in record-level sharing (RLS) mode. (For DB2, the `SharedPlex` value has no effect on this utility.)

If you specify `-c`, and you also specify `-d`, `-b`, or `-k`, the utility issues an error message and the command fails.

**Note:** When you also specify the `-D` option, you must use the `-p` option to specify the CA domain configuration directory if it is not `/etc/pkiserv`.

**-p *path***

Specifies the directory where the `pkiserv.conf` configuration file resides. If not specified, the directory defaults to `/etc/pkiserv`. This option is only valid when specified with the `-c` option. If specified with the `-b`, `-k`, or `-d` options, the utility issues a warning message, and the `-p` option is ignored.

**-D *CA-domain-name***

Specifies the CA domain name where this utility command is directed.

**Notes:**

1. The `-D` option is required only if PKI Services is running in multiple-CA mode.
2. The `CA-domain-name` value can be entered using uppercase or lowercase letters.
3. When you also specify the `-c` option, you must use the `-p` option to specify the CA domain configuration directory if not `/etc/pkiserv`.

**-s *decode-command-string***

Specifies an optional command to call for decoding the ASN.1-encoded data. (The command must be able to read and decode binary (BER) data from STDIN.)

## Examples

To view the records in the VSAM object store data set 'PKISRVD.VSAM.OST', passing the request data to a utility called `dumpasn1`, use the following command:

```
vosview -d \'pkisrvd.vsam.ost\' -s 'dumpasn1 -'
```

To view the records in the object store for the CA domain `MasterCA` using the information from the `pkiserv.conf` file located in the directory `/etc/pkiserv/MasterCA`, use the following command:

```
vosview -c -p /etc/pkiserv/MasterCA -D MasterCA
```

To view the records in the object store in the DB2 subsystem `DSN9` with a package name of `MasterCA`, passing the request data to a utility called `dumpasn1`, and redirecting the output to the file `vos.out`, use the following command:

```
vosview -b DSN9 -k MASTERCA -s 'dumpasn1 -' >vos.out
```

**Note:** A dumpasn1 utility is not shipped with PKI Services.

## Output

Records with an object key value of 100 or higher display common information stored for each record. Records with an object key value less than 100 are special records maintained by the PKI Services daemon and the information displayed is specific to the record.

### Sample record 1

```
Object key = 1
Last used key = 14627, CRL serial number = 2185, ARL serial number = 2185
  High DP = 219, Low DP = 1
Creation time is: 2013/01/21 12:59:18
Last modified time is: 2013/05/10 08:16:08
```

#### Last used key

The primary index for the last record in the data set.

#### CRL serial number

The number to be used for the next CRL.

#### ARL serial number

The number to be used for the next ARL.

#### High DP

The number of the highest distribution point CRL issued by PKI Services.

#### Low DP

The number of the lowest currently active distribution point CRL.

### Sample record 2

```
Object key = 2
The next CRL event is scheduled for 2013/05/10 at 08:19:08
Creation time is: 2013/01/21 12:59:19
Last modified time is: 2013/05/10 08:16:08
```

### Sample record 3

```
Object key = 3
The CRL Distribution Point name in effect is: CN=CRLSUBCA1%u,
CN=SUBCA1,OU=RACF,O=IBM,L=Pok,ST=NY,C=US
(Note: A CRL DP number is substituted for the %u in the CRL DP name above)
Creation time is: 2013/01/21 12:59:18
Last modified time is: 2013/01/21 12:59:18
```

### Sample certificate request record

```
Object key = 12035
name = "weglinsk@us.ibm.com"
tid = 1kRk91pnjIgpVknDWBrf31k+
appldata = 1YKRC
comment =
data len = 1664
flags = 2021010 - Type = Cert State = CA CertSigned NeedsConfirm
Creation time is: 2013/05/02 13:37:00
Last modified time is: 2013/05/02 13:37:25
```

**Object key**

The index into the VSAM data set name.

**name**

The requestor's name.

**tid**

The transaction ID data.

**appldata**

Indicates the 8-character string identifying to the application the short name or nickname of the certificate template. (PKI Services provides sample certificate templates but it is RACF, or an equivalent security product, rather than PKI Services, that handles the SAF templates.) Table 36 on page 143 shows the nicknames for each certificate template. (These nicknames are supplied in the `pki serv.tmpl` certificate templates file as defaults but your installation might have changed them or added others during customization. See “TEMPLATE sections” on page 142 for more information.)

**comment**

A comment the administrator supplied the last time that the request was updated.

**data len**

The length of the variable data portion (that is, the BER-encoded request).

**flags**

Represent the current state of the request:

**Type**

- Cert** Certificate request (new or renewal).
- CRL** Certificate revocation list (CRL).
- Rev** Revocation request.
- Post** Certificate waiting to be posted to LDAP.

**State**

The prefix (RA or CA) and one of the following values:

**CertPreregistered**

Certificate preregistration record.

**CertReqActive**

Certificate request in some state of being completed.

**CertSigned**

Certificate request where the certificate has been created.

**CertReqRejected**

Certificate request that has been rejected.

**RevReqActive**

Revocation request in some state of being completed.

**CRLWaitingForRA**

CRL to be posted to LDAP.

**CertPostPending**

Certificate to be posted to LDAP.

**CaInfoPostPending**

PKI Services' CA certificate to be posted to LDAP.

**State Flag**

Optional. If present, is one of the following values:

**Complete**

Request is complete. For approved requests, the end user has retrieved the certificate.

**Error** The certificate could not be posted to LDAP.

**NeedsConfirm**

Approved or rejected. End user has yet to be notified of the outcome.

**AutoRenewEnabled**

The certificate returned automatic renewal and this capability is enabled.

**AutoRenewCapable**

The certificate returned active certificates capable for auto renewal but disabled.

**Synchronous**

Request is an in-progress synchronous certificate request.

## Using the vsam2db2 utility

### Purpose

The vsam2db2 program copies data from the issued certificate list (ICL) and object store VSAM data sets into DB2 tables. Use this utility if you have been using VSAM data sets for the ICL and object store and want to use DB2 tables instead. Run vsam2db2 when PKI Services is not running. You must create the DB2 tables before you run vsam2db2. For more information, see “Converting the object store and ICL from VSAM to DB2” on page 117.

### Path setup

Update your PATH, LIBPATH, and NLSPATH environment variables with the appropriate pkiserv directory before you run vsam2db2. (Note that you are updating the environment variables for the user running the utility, not updating values in the PKI Services environment variables file, pkiserv.envars.) When you have updated these variables, you can run vsam2db2 from the UNIX command line.

Variable name	You must add ...
PATH	<i>/install-dir/pkiserv/bin</i>
LIBPATH	<i>/install-dir/pkiserv/lib</i>
NLSPATH	<i>/install-dir/pkiserv/lib/nls/msg/%L/%N</i>

The default directory for *install-dir* is */usr/lpp*.

### Format

```
vsam2db2 -o ostvsam-dataset-name -i iclvsam-dataset-name [-r]
          -b db2-subsystem-name -k db2-package-name
          [-D CA-domain-name] [-a]
```

### Parameters

- o *ostvsam-dataset-name***  
Specifies the MVS data set name of the VSAM object store.
- i *iclvsam-dataset-name***  
Specifies the MVS data set name of the VSAM issued certificate list (ICL).
- r** Specifies that the VSAM data set is to be opened in record-level sharing (RLS) mode.
- b *db2-subsystem-name***  
Specifies the DB2 subsystem name or the group attachment name of the object store and issued certificate list (ICL)
- k *db2-package-name***  
Specifies the DB2 package name of the object store and issued certificate list (ICL)
- D *CA-domain-name***  
Specifies the CA domain name
- a** If specified, all records in the object store and issued certificate list (ICL) are copied from the VSAM data sets to the DB2 tables. If not specified:
  - For the object store, all objects except completed certificate request objects are copied.
  - For the ICL, all certificate objects except expired certificates for which the user provided the public key are copied.

**Note:** It takes longer to run the utility with the -a option if you did not remove the completed certificate requests and the expired certificates for which the user provided the public key from the VSAM data sets.

## Examples

In this sample script, the object store for the domain MasterCA is in the VSAM file pkisrvd.vsam.ost, and the ICL is in the VSAM file pkisrvd.vsam.icl. They are to be copied to DB2 tables in the DB2 subsystem DSN9 and the DB2 package MasterCA. The VSAM data sets are to be opened in RLS mode. All records in the VSAM data sets are to be copied, including those for completed requests and expired certificates.

```
vsam2db2 -o \pkisrvd.vsam.ost\ \
         -i \pkisrvd.vsam.icl\ \
         -b DSN9 \
         -k MasterCA \
         -r \
         -D MasterCA \
         -a
```

## Output

As the vsam2db2 utility runs, it reports its progress. For every 2000 records that are copied from VSAM data sets to DB2 tables, the utility reports the total number of records copied.

If an error occurs, vsam2db2 displays a count of processed records and a count of copied records. (If -a is specified, these counts should be the same.)

---

## Chapter 19. Using the certificate management protocol (CMP) with PKI Services

Certificate management protocol (CMP) is an internet protocol used to manage X.509 digital certificates within a PKI. It is described in RFC 4210 and uses the certificate request message format (CRMF) described in RFC 4211. A certificate request message object is used within the protocol to convey a request for a certificate to a certificate authority. CMP messages are ASN.1-encoded. PKI Services allows a CMP client to communicate with it to request, revoke, suspend and resume certificates.

**Restrictions:** The following restrictions apply to the PKI Services support for CMP:

1. PKI Services supports only a subset of the CMP messages, and only some fields in those messages. See “Support for CMP messages” on page 436 for a description of the support.
2. PKI Services supports only the HTTP protocol for CMP messages.

PKI Services implements CMP through a CGI program. The tcp-message is sent to the PKI CMP CGI program by HTTPS POST, as specified in *Internet X.509 Public Key Infrastructure -- Transport Protocols for CMP*. The entire POST body is the message and the mime-type for both requester and responder (client and server) is application/pkixcmp.

**Note:** The application/pkixcmp mime-type requires that the entire tcp-message be Base64-encoded.

When a CMP client sends a request to the HTTP Server, it must send the request directly to the HTTP Server (and port number) that handles the client authentication requests. The request cannot be handled by a redirect statement.

Table 74 shows the format of version 10 tcp-messages (the only existing version):

Table 74. Format of tcp-messages

Field	Length	Contents
Length	32 bits	The length of the rest of the tcp-message (the length of the CMP message + 3)
Version	8 bits	10
Flags	8 bits	The least significant bit indicates a closed connection. The other bits are unused.
Message type	8 bits	Supported types are: <ul style="list-style-type: none"><li>• pkiReq, value X'00', indicating a synchronous request</li><li>• pkiRep, value X'05', indicating a synchronous response</li><li>• errorMsgRep, value X'06', indicating an error</li></ul>

Table 74. Format of tcp-messages (continued)

Field	Length	Contents
Value	Variable, based on the length of the CMP message	The ASN.1 encoded CMP message

The communication between the CMP client and the CGI program is over HTTPS only. Client authentication is required. The client (the CMP requester) needs to have a certificate installed in RACF under the client's ID. This certificate is used by the requester to authenticate itself, and its owner ID is used to access the PKI Services functions.

## Support for CMP messages

PKI Services supports the following request message types from the client:

- Certificate request message (type cr)
- Revocation request message (type rr)
- PKCS #10 certificate request message (type p10cr)

and responds with one of the following response messages:

- Certificate response message (type cp)
- Revocation response message (type rp)
- Error message (type error)

Each message supported by PKI Services contains the following parts:

- The header, containing information common to many messages
- The body, containing information specific to the message
- Optionally, certificates that might be useful to the recipient

Table 75 identifies the fields in the PKIMessage structure defined in RFC 4210 that PKI Services supports.

Table 75. Supported fields in the PKIMessage structure

Field name	Notes
header	See Table 76 on page 437.
body	See Table 77 on page 437.
extraCerts	<p>This field can be used by the client on a certificate request message (cr) when PKI Services is generating the public and private key for the requested certificate. This field can contain a list of x.509 certificates to be used as recipients of the private key to be returned by PKI Services. If this field is present, the <code>_PKISERV_CMP_HONOR_CLIENT_CERTS</code> environment variable determines whether extra certificates are allowed, and how many are allowed. If allowed, and if PKI Services generates the public and private key pair for the request, each certificate has a recipientInfo structure added to the returned encrypted private key (PKCS #7 EnvelopedData structure).</p> <p>For information about the <code>_PKISERV_CMP_HONOR_CLIENT_CERTS</code> environment variable, see Table 86 on page 453.</p>

Table 76 identifies the fields in the PKIHeader structure defined in RFC 4210 that PKI Services supports.

Table 76. Supported fields in the PKIHeader structure

Field name	Notes
pvno	
sender	
recipient	If this GeneralName field is in the form of a directoryName in a cr, p10cr, or rr message, it can be used to determine the PKI Services CA domain to which the request is directed.  For information about how PKI Services determines the CA domain, see "Determining the CA domain to which a request is routed" on page 441.
transactionID	
generalInfo	The only InfoTypeAndValue recognized by PKI Services is ImplicitConfirm, which is required for cr and p10cr messages. This field is ignored if present on an rr request message.

Table 77 identifies the values in the PKIBody structure defined in RFC 4210 that PKI Services supports. These are the CMP message types.

Table 77. Supported values in the PKIBody structure. These are the CMP message types that PKI Services supports.

Value	Description	Notes
cr	Certificate request	See Table 78.
cp	Certificate response	See Table 80 on page 439.
p10cr	PKCS #10 certificate request	See Table 79 on page 439.
rr	Revocation request	See Table 81 on page 440.
rp	Revocation response	See Table 82 on page 441.
error	Error message	See Table 83 on page 441.

## Support for the CMP certificate request message (type cr)

Table 78 identifies the fields that PKI Services supports in the data structure defined in RFC 4211 for the CMP certificate request message (type cr).

Table 78. Supported fields in the CMP certificate request message (type cr)

	Field name	Notes
In the CertReqMsg structure:		PKI Services supports a single CertReqMsg in the CertReqMessages field, and rejects a cr message with more than one CertReqMsg.
	certReq	
	popo	
In the ProofOfPossession structure:		

Table 78. Supported fields in the CMP certificate request message (type cr) (continued)

	Field name	Notes
	signature	signature is the only supported choice. It should only be present if the CMP client has supplied publicKey in the CertTemplate structure. The POPOSigningKey structure must not contain a poposkInput field.
In the CertRequest structure:		
	certReqId	
	certTemplate	
In the CertTemplate structure:		
	version	
	serialNumber	
	signingAlg	
	issuer	If supplied, this field is used with the <code>_PKISERV_CMP_DOMAIN_ISSUER<sub>n</sub></code> environment variables to determine to which PKI Services CA domain to route the request. For information about the <code>_PKISERV_CMP_DOMAIN_ISSUER<sub>n</sub></code> environment variables, see Table 84 on page 448. For information about how PKI Services determines the CA domain, see “Determining the CA domain to which a request is routed” on page 441.
	validity	If supplied, the <code>_PKISERV_CMP_HONOR_CLIENT_DATES</code> environment variable must set to <b>1</b> ; otherwise the cr message is rejected.  For information about the <code>_PKISERV_CMP_HONOR_CLIENT_DATES</code> environment variable, see Table 85 on page 449.
	subject	If omitted, the cr message is rejected.
	publicKey	Optional; if omitted PKI Services generates the public and private keys for the certificate request using environment variables to determine the key type and size.
	extensions	If the <code>_PKI_CMP_HONOR_CLIENT_EXTS</code> environment variable is not set to <b>1</b> and extensions is specified, the message is rejected. If the environment variable is set to <b>1</b> , extensions is honored if present, but is not required.

## Support for the CMP PKCS #10 certificate request message (type p10cr)

Table 79 identifies the fields that PKI Services supports in the data structure defined in RFC 4210 for the CMP PKCS #10 certificate request message (type p10cr).

Table 79. Supported fields in the CMP PKCS #10 certificate request message (type p10cr)

	Field name	Notes
In the CertificationRequest structure:		When this message type is received by PKI Services, the recipient field is used with the <code>_PKISERV_CMP_DOMAIN_ISSUER<i>n</i></code> environment variables to determine to which PKI Services CA domain to route the request, provided the recipient is encoded as a <code>directoryName</code> .
		For information about the <code>_PKISERV_CMP_DOMAIN_ISSUER<i>n</i></code> environment variables, see Table 84 on page 448.
	certificationRequestInfo	
	signatureAlgorithm	
	signature	
In the CertificationRequestInfo structure:		
	version	
	subject	
	subjectPKInfo	
	attributes	If the <code>_PKI_CMP_HONOR_CLIENT_EXTS</code> environment variable is not set to <b>1</b> and the <code>extensionReq</code> attribute is specified, the message is rejected. If the environment variable is set to <b>1</b> , the <code>reqExtensions</code> attribute is honored if present, but is not required.

## Support for the CMP certificate response message (type cp)

Table 80 identifies the fields that PKI Services supports in the data structure defined in RFC 4210 for the CMP certificate response message (type cp). The cp message is returned to the CMP client for a successful cr or p10cr request.

Table 80. Support for fields in the CMP certificate response message (type cp)

	Field name	Notes
In the CertRepMessage structure:		<code>privateKey</code> is only returned in response to a cr message that does not specify <code>publicKey</code> .
	caPubs	PKI Services does not use this element.
	response	
In the CertResponse structure:		PKI Services returns only one CertResponse for a certificate request.

Table 80. Support for fields in the CMP certificate response message (type cp) (continued)

	Field name	Notes
	certReqId	
	status	
	certifiedKeyPair	
	rspInfo	PKI Services does not use this element.
In the CertifiedKeyPair structure:		
	certOrEncCert	
	privateKey	PKI Services sets the object ID for intendedAlg to the PKCS #7 OID, which is 1.2.840.113549.1.7.  encValue is a bit string encapsulation of a PKCS #7 EnvelopedData structure whose encrypted content is the DER-encoded private key for the issued certificate.

## Support for the CMP revocation request message (type rr)

Table 81 identifies the fields that PKI Services supports in the data structure defined in RFC 4210 for the CMP revocation request message (typerr).

Table 81. Supported fields in the CMP revocation request message (type rr)

	Field name	Notes
In the RevDetails structure:		PKI Services supports a single RevDetails in the RevReqContent message, and rejects an rr message with more than one RevDetails sequence.
	certDetails	PKI Services requires that certDetails contains the serial number of the certificate to be revoked, suspended, or resumed.
	crlEntryDetails	PKI Services recognizes only the cRLReason extension and ignores all other non-critical extensions in crlEntryDetails. If an extension other than the cRLReason extension is present and marked critical, PKI Services rejects the rr message.

## Support for the CMP revocation response message (type rp)

Table 82 on page 441 identifies the fields that PKI Services supports in the data structure defined in RFC 4210 for the CMP revocation response message (typerrp). PKI Services returns the rp message to the CMP client for a successful rr request.

If PKI Services receives a type rp message from a CMP client, it returns an errorMessage response.

Table 82. Supported fields in the CMP revocation response message (type rp)

	Field name	Notes
In the RevRepContent structure:		
	status	
	revCerts	PKI Services returns revCerts in the rp message when the corresponding rr message contains an issuer in certDetails or specifies a recipient in the form of a directoryName.
In the PKIStatusInfo structure:		
	status	
	statusString	
	failInfo	

## Support for the CMP error message (type error)

Table 83 identifies the fields that PKI Services supports in the data structure defined in RFC 4210 for the CMP revocation request message (type error). The error codes and details that can be returned are described in “Messages and codes returned from the CMP functions” on page 454.

If PKI Services receives a type error message from a CMP client, it returns an errorMessage response.

Table 83. Supported fields in the CMP error message (type error)

	Field name	Notes
In the ErrorMessageContent structure:		
	pKIStatusInfo	
	errorCode	This field is present in all type error messages that PKI Services returns. For the error codes and corresponding details that can be returned, see “Messages and codes returned from the CMP functions” on page 454.
	errorDetails	

## Determining the CA domain to which a request is routed

To determine the CA domain to which it routes a request, the CMP CGI program first tries to determine the issuer distinguished name:

- If the message type is cr (certificate request), the issuer field of the CertTemplate structure is used as the issuer distinguished name if it is present. If it is not, the recipient field in the message header is used as the issuer distinguished name if it is in the form of a Directory Name (distinguished name). If the recipient field is not in the form of a Directory Name, an issuer distinguished name is not used to determine the CA domain name; instead, the URL to which the CMP request was sent is used to determine the CA domain.

- If the message type is p10cr (PKCS #10 certificate request message), the recipient field in the message header is used as the issuer distinguished name if it is in the form of a Directory Name (distinguished name). If the recipient field is not in the form of a Directory Name, an issuer distinguished name is not used to determine the CA domain name; instead, the URL to which the CMP request was sent is used to determine the CA domain.
- If the message type is rr (revoke request), the issuer and serial number fields of the CertDetails field are used as the issuer distinguished name and certificate serial number to be revoked or suspended. If the serial number is not present, the request is rejected. If the issuer field is not present, the recipient field in the message header is used as the issuer distinguished name if it is in the form of a Directory Name (distinguished name). If the recipient field is not in the form of a Directory Name, an issuer distinguished name is not used to determine the CA domain name; instead, the URL to which the CMP request was sent is used to determine the CA domain.

If the CMP CGI program was able to determine the issuer distinguished name, and the request is a certificate request (type cr or p10cr), the CMP CGI program does the following processing to determine to which CA domain it routes the request:

1. The CMP CGI program compares the issuer distinguished name extracted from the request in string format to the values defined in the `_PKISERV_CMP_DOMAIN_ISSUER $i$`  environment variables (where  $i$  is 1 through the number of CA domains). The comparison is made by comparing the relative distinguished names in order of specification (first from most specific to least specific, then least specific to most specific). For example, if the issuer distinguished name in a request message is `OU=STG,O=IBM,C=US`, it would match a `_PKISERV_CMP_DOMAIN_ISSUER $i$`  environment variable whose value was set to either of the following values:
  - `OU=STG, O=IBM, C=US` (most specific first)
  - `c=us,o=ibm,ou=stg` (least specific first)

The comparison is made without regard to the character case (case-insensitive). Some differences in spacing are allowed. For example, `"O=IBM"` matches `"O = IBM"`, but not `"O=I B M"`

If a match is found for the issuer distinguished name, the CMP CGI continues to step 2. If no match is found, it uses the URL to which the CMP request was sent to determine the CA domain.

2. The number ( $i$ ) of the matching `_PKISERV_CMP_DOMAIN_ISSUER $i$`  environment variable is used to read the domain name environment variable `_PKISERV_CMP_DOMAIN_NAME $i$  $n$` . The `_PKISERV_CMP_DOMAIN_NAME $i$  $n$`  with the highest value of  $n$  is used because it represents the current domain name for the CA for accepting new certificate requests. (When the value of  $n$  is greater than 1, at least one CA roll over occurred.) For example, if the issuer distinguished name in a cr message matched the value in `_PKISERV_CMP_DOMAIN_ISSUER3`, and one CA roll over occurred for that CA, the CA domain name is retrieved from the `_PKISERV_CMP_DOMAIN_NAME3_2` environment variable. If the `_PKISERV_CMP_DOMAIN_NAME $i$  $n$`  environment variable cannot be read, the CMP request is rejected.

If the CMP CGI program was able to determine the issuer distinguished name, and the request is a revoke request (type rr), and a serial number was present in the request, the CMP CGI program does the following processing to determine to which CA domain it routes the request:

1. The CMP CGI program compares the issuer distinguished name that is extracted from the request in string format to the values defined in the `_PKISERV_CMP_DOMAIN_ISSUERi` environment variables (where *i* is 1 through the number of CA domains). The comparison is made in the same manner as described in step 1 on page 442 for `cr` and `p10cr` requests. If a match is found for the issuer distinguished name, the CMP CGI continues to step 2. If no match is found, it uses the URL to which the CMP request was sent to determine the CA domain.
2. The number (*i*) of the matching `_PKISERV_CMP_DOMAIN_ISSUERi` environment variable is then used to read the serial number domain name environment variables `_PKISERV_CMP_DOMAIN_FSTSNi_n`. Each `_PKISERV_CMP_DOMAIN_FSTSNi_n` environment variable is read, starting with an *n* value of 1, and compared to the serial number retrieved from the `rr` request.
  - If there are no `_PKISERV_CMP_DOMAIN_FSTSNi_n` environment variables that are defined, the domain name is read from the `_PKISERV_CMP_DOMAIN_NAMEi_1` environment variable.
  - If the serial number is greater than the environment variable value and less than the next environment variable value (or is the last environment variable), the domain name is read from the corresponding `_PKISERV_CMP_DOMAIN_NAMEi_n` environment variable.

**Example:** An `rr` request is made by a CMP client specifying an issuer distinguished name of `OU=STG, O=IBM, C=US`, and the following sample is an excerpt from the defined environment variables:

```
_PKISERV_CMP_DOMAIN_ISSUER3= OU=STG, O=IBM, C=US
_PKISERV_CMP_DOMAIN_NAME3_1=STG_CA
_PKISERV_CMP_DOMAIN_NAME3_2=STG_CA2
_PKISERV_CMP_DOMAIN_NAME3_3=STG_CA3
_PKISERV_CMP_DOMAIN_FSTSN3_1=3
_PKISERV_CMP_DOMAIN_FSTSN3_2=12500
_PKISERV_CMP_DOMAIN_FSTSN3_3=25000
```

If the serial number specified in the `rr` request is 20000 decimal, the revocation request is routed to the `STG_CA2` domain because `STG_CA2`'s first serial number is less than 20000, and the first serial number that is issued by `STG_CA3` is greater than 20000.

## How PKI Services interprets distinguished names (DNs) on CMP requests

The subject distinguished name is encoded in a CMP certificate request from the CMP client. The order in which the relative distinguished names (RDNs) are placed in the subject field by the client is the order in which the RDNs appear in the issued certificate. PKI Services interprets the order to be least significant RDN first and most significant RDN last. This becomes important when PKI Services posts the issued certificate to an LDAP server, because the LDAP server defines a root suffix that it allows objects and attributes to be stored under. If the LDAP server has a defined root suffix of `"C=US"`, and PKI Services attempts to post a certificate with a subject name `"CN=Gumby,O=IBM,C=US"`, the request succeeds because the string format of the subject name has the `C=US` as the rightmost RDN, and that is the defined LDAP root suffix. If however, the CMP client encoded the subject name in the reverse order, the subject name string that PKI uses to post the certificate would be `"C=US,O=IBM,CN=Gumby"`. This post request fails because the interpreted root suffix of `CN=Gumby` would not exist in LDAP. **Guideline:** When encoding a subject distinguished name in a certificate request, clients should place the least significant RDN first and the most significant RDN last.

**Example:** This example shows the encoded form of CN=Gumby,O=IBM,C=US:

```
SEQUENCE {
. SET {
. . SEQUENCE {
. . . OBJECT IDENTIFIER countryName (2 5 4 6)
. . . PrintableString 'US'
. . . }
. . }
. SET {
. . SEQUENCE {
. . . OBJECT IDENTIFIER organizationName (2 5 4 10)
. . . PrintableString 'IBM'
. . . }
. . }
. SET {
. . SEQUENCE {
. . . OBJECT IDENTIFIER commonName (2 5 4 3)
. . . PrintableString 'Gumby'
. . . }
. . }
. }
```

When the PKI Services CMP CGI program receives a CMP request from a CMP client, it attempts to determine the target CA domain to route the request to using the supplied issuer DN or the recipient (if it is in the form of a DN). The CMP CGI program interprets the encoded DN values to be the least significant RDN first and most significant RDN last. The program builds a string representation of the issuer or recipient DN from left to right starting with the last RDN in the sequence and ending with the first RDN. The CMP CGI program then compares the string that it built to the values of the `_PKISERV_CMP_DOMAIN_ISSUERx` environment variables. During the comparison of the strings, the program tries the comparison in both ways, both right to left and left to right, so if the distinguished name in the request is OU=Master CA,O=IBM,C=US it matches a `_PKISERV_CMP_DOMAIN_ISSUERx` value of either OU=Master CA,O=IBM,C=US, or C=US,O=IBM,OU=Master CA.

---

## Setting up a client to make CMP requests to PKI Services

Before a client (the CMP requester) can make requests to PKI Services through CMP, the client must have a certificate installed in the RACF database under the client's RACF user ID. The certificate is used by the requester to authenticate the client, and the client's user ID is used to access the PKI Services functions. It must be signed by a CA certificate that is connected to the HTTP Server's key ring.

There are several ways to set up the client certificate. For example, you can have it generated elsewhere (not by PKI Services) and add it to the RACF database using the RACDCERT ADD command. Alternatively, you can generate the certificate yourself and add it to the RACF database using RACDCERT commands. The following instructions illustrate the latter approach.

### Steps for setting up a certificate for a CMP requester

Perform the following steps to set up a certificate in the RACF database for a CMP requester.

## Before you begin

You need to have RACF SPECIAL authorization, or authorization to the RACDCERT commands shown. For more information, see *z/OS Security Server RACF Command Language Reference*.

## Procedure

1. Generate a certificate for the CMP requester in the RACF database, signed by a certificate that is in the HTTP Server's key ring.

### Example:

```
RACDCERT ID(User123) GENCERT
SUBJECT(CN('Messenger') OU('OrgUnitA') O('OrgA') C('AU'))
WITHLABEL('client') SIGNWITH(CERTAUTH LABEL('Master PKI CA'))
```

---

2. Export the certificate and its private key to a data set.

### Example:

```
RACDCERT ID(User123) EXPORT(LABEL('client'))
DSN('User123.private.eecert') FORMAT(PKCS12B64)
PASSWORD('secret')
```

**Tip:** You could use FORMAT(PKCS12DER) if you do not plan to use copy and paste operations to transport the certificate and private key to the client system.

---

3. Transport the certificate to the system where the CMP client will run. You can do this using FTP, or perhaps by copy and paste operations, depending on the CMP client software.
- 

## Results

When you are done, the client can make CMP requests to PKI Services.

---

## Setting up PKI Services to process CMP requests

Before PKI Services can process CMP requests, you must do the following tasks:

1. Enable the CMP support by setting the EnableCMP configuration parameter.
2. If you want PKI Services to create private keys for CMP clients, you must set up ICSF and set up PKI Services to encrypt the private keys.

## Enabling the CMP support

The PKI Services configuration file, `pkiserv.conf`, contains a parameter in the **CertPolicy** section that enables the CMP support. By default this parameter, `EnableCMP`, is set to false. If the parameter is set to false or omitted from the configuration file, PKI Services rejects all CMP requests.

To enable the CMP support, find the following lines in the configuration file:

```
# Enable the Certificate Management Protocol (CMP)
# T = True, CMP is enabled
# F = False, CMP is disabled (default if not specified)
#
EnableCMP=F
```

Change `EnableCMP=F` to `EnableCMP=T`, and restart PKI Services.

## Setting up PKI Services to create private keys for CMP clients

PKI Services can create private keys for CMP clients and return a private key with a certificate. It uses the PKCS #11 API provided by ICSF to create private keys. Note, however, that PKI Services does not archive the private keys in the ICSF token data set (TKDS), as it does for private keys that it creates for certificate requests it receives from the end-user web application. To allow PKI Services to create private keys, you must ensure that the ICSF programmer has installed and configured ICSF, and has set up the TKDS. For more information, see “Installing and configuring ICSF (optional)” on page 29.

**Note:** You do not need to perform any of the other tasks that are described in “Steps for setting up PKI Services to generate keys for certificate requests” on page 317, such as setting the `TokenName` parameter in the configuration file, to allow the PKI Services CMP CGI program to generate private keys for CMP clients. Those tasks apply only to private key generation done by the PKI Services daemon, for certificates requested from the PKI Services web application.

### Determining the source of certificates used to encrypt the returned private key

If a CMP client requests a certificate for which PKI Services creates the keys, PKI Services must encrypt the private key before returning it with the certificate to the recipient. There are three ways that the encryption of the private key can be done, and the method that is used is determined in the following order:

1. If the client provides an `extraCerts` field in the `PKIMessage` structure and the number of certificates in the `extraCerts` field does not exceed the value of the `_PKISERV_CMP_HONOR_CLIENT_CERTS_domain_name` environment variable, the CMP CGI program encrypts the private key in a manner in which it can be decrypted by each of the certificates in the `extraCerts` field.
2. If the `extraCerts` field is not specified in the request message, and the `_PKISERV_CMP_KEYRING_domain_name` environment variable is set, the private key is encrypted in a manner in which it can be decrypted by each of the certificates in the specified key ring.
3. If the `extraCerts` field is not specified in the request message, and no key ring is defined, the private key is encrypted with the public key of the certificate used to establish the secure client authentication session to the CMP CGI program.

### Steps for setting up PKI Services to encrypt returned private keys with certificates in a key ring

For PKI Services to encrypt private keys using certificates in a key ring, you must set up a key ring containing a digital certificate for each recipient.

#### Before you begin

- You need to have RACF SPECIAL authorization, or sufficient authority to the following resources in the FACILITY class:
  - IRR.DIGTCERT.ADDRING
  - IRR.DIGTCERT.ADD
  - IRR.DIGTCERT.CONNECT
- You must have a certificate for each certificate recipient, in a data set.

**Note:** This example assumes that you are using certificates that were created somewhere else. Alternatively, you could create the certificates using the RACF command `RACDCERT GENCERT`. If you take this approach, you need authorization to the resource `IRR.DIGTCERT.GENCERT` in the FACILITY class.

## Procedure

1. Set the HTTP Server environment variable `_PKISERV_CMP_KEYRING`:  
`_PKISERV_CMP_KEYRING_domain_name=RACF_userID/ring_name`

*RACF\_userID* can be any RACF user ID; for example, the PKI Services daemon user ID, or the CMP requester user ID. *ring\_name* is a name that you choose, and use when you create the key ring.

- 
2. Create a RACF key ring, specifying the RACF user ID and the ring name that you specified in step 1.

```
RACDCERT ID(RACF_userID) ADDRING(ring_name)
```

- 
3. Add certificates for each recipient to the RACF database, using the RACF user ID that you specified in step 1.

```
RACDCERT ID(RACF_userID) ADD(dataset_1) WITHLABEL('label_1') TRUST
RACDCERT ID(RACF_userID) ADD(dataset_2) WITHLABEL('label_2') TRUST
:
RACDCERT ID(RACF_userID) ADD(dataset_n) WITHLABEL('label_n') TRUST
```

*dataset\_n* is the name of the data set containing the certificate for recipient *n*.  
*label\_n* is the label to be associated with the certificate for recipient *n*.

- 
4. Add the digital certificates to the key ring that you created in step 2.

```
RACDCERT ID(RACF_userID) CONNECT(LABEL('label_1') RING(ring_name))
RACDCERT ID(RACF_userID) CONNECT(LABEL('label_2') RING(ring_name))
:
RACDCERT ID(RACF_userID) CONNECT(LABEL('label_n') RING(ring_name))
```

*label\_n* is the label you associated with the certificate for recipient *n* in step 3.

- 
5. Authorize the PKI Services CMP CGI program to access the key ring. This program runs with the RACF user ID that the client-supplied certificate maps to, so you must give that RACF user ID access to the key ring. You can use one of two methods:

- (Preferred) Define a profile in the `RDATA LIB` class for the key ring and give each CMP client user ID `READ` access:

```
RDEFINE RDATA LIB ring_owner.ring_name.LST UACC(NONE)
PERMIT ring_owner.ring_name.LST CLASS(RDATA LIB) ID(client_user_id) ACCESS(READ)
SETROPTS RA CLIST(RDATA LIB) REFRESH
```

*ring\_owner* is the RACF user ID you that specified in step 2, and *ring\_name* is the ring name that you specified.

- (Alternative) Define a profile in the `FACILITY` class for `IRR.DIGTCERT.LISTRING`. Give the ring owner `READ` access and the client user IDs `UPDATE` access:

```
RDEFINE FACILITY IRR.DIGTCERT.LISTRING UACC(NONE)
PERMIT IRR.DIGTCERT.LISTRING ID(ring_owner) ACCESS(READ)
PERMIT IRR.DIGTCERT.LISTRING ID(client_user_id) ACCESS(UPDATE)
```

- 
6. If either the `DIGTCERT` or `DIGTRING` class is `RACLISTed`, refresh the `RACLISTed` classes to activate your changes.

```
SETROPTS RA CLIST(DIGTCERT, DIGTRING) REFRESH
```

## Results

When you are done, you have set up PKI Services to encrypt returned private keys with certificates in a RACF key ring.

## Setting up the HTTP Server for CMP

You can pass information about CMP requests through HTTP Server environment variables.

- For IBM HTTP Server - Powered by Apache, the environment variables are specified using the SetEnv directive in the virtual host file for SSL requests with client authentication, which by default is vhost1443.conf.

For information about IBM HTTP Server - Powered by Apache environment variables, see WebSphere Application Server Library (<http://www.ibm.com/software/webservers/appserv/was/library/>). The variables that you can set are described in Table 84, Table 85 on page 449, and Table 86 on page 453.

Table 84. HTTP Server environment variables used to determine the CA

Environment variable name	Description
<code>_PKISERV_CMP_DOMAIN_ISSUERx</code>	CA's subject distinguished name with comma-separated RDNs  <b>Example:</b> <code>_PKISERV_CMP_DOMAIN_ISSUER1=CN=Issuer CA,OU=Lab,O=IBM,C=AU</code>
<code>_PKISERV_CMP_DOMAIN_NAMEx_y</code>	Issuer's PKI CA domain name. The domain name variable is limited to 8 characters beginning with an alphabetic character or an underscore “_” and no embedded spaces. For an unnamed domain, this variable must be set to <NONE>. A roll over of an unnamed domain requires the new domain to be named.  <b>Example:</b> If there are, or have been, 3 domains of certificates for the same issuer, there would be 3 entries in the environment variables file: <code>_PKISERV_CMP_DOMAIN_NAME1_1=CardCA1</code> <code>_PKISERV_CMP_DOMAIN_NAME1_2=CardCA2</code> <code>_PKISERV_CMP_DOMAIN_NAME1_3=CardCA3</code>  <b>Example:</b> The domain is unnamed. <code>PKISERV_CMP_DOMAIN_NAME1_1=&lt;NONE&gt;</code>
<code>_PKISERV_CMP_DOMAIN_FSTSNx_y</code>	Starting serial number, in decimal, for the first certificate that is issued by <code>_PKISERV_CMP_DOMAIN_NAMEx_y</code> .  <b>Example:</b> <code>PKISERV_CMP_DOMAIN_FSTSN1_2=1001</code>

### Notes:

1. *x* represents any of the available certificate issuers from 1 to the maximum number of issuers. If there are 2 issuers of certificates, there would be 2 entries in the configuration file. The values of *x* are consecutive integers starting with 1.
2. *y* represents any of the available CA domains that issue or have issued certificates on behalf of `_PKISERV_CMP_DOMAIN_ISSUERx`. The values of *y* are consecutive integers starting with 1.
3. Environment variable values must not be enclosed in quotations even if they include white space.
4. Any comma in a relative distinguished name (RDN) value must be escaped by placing a backslash immediately before the comma in the `_PKISERV_CMP_DOMAIN_ISSUERx` variable. For example, if your

Organization RDN value is “Widgets, Inc.”, the RDN must be specified as “O=Widgets\, Inc.”. The commas that separate the RDNs must not be escaped.

**Example:**

CN=Issuer CA,OU=Lab,O=Widgets\, Inc.,C=AU

Table 85. HTTP Server environment variables used to control the content of the certificate within a CA

Environment variable name	Description
<code>_PKISERV_CMP_KEYTYPE_domain</code>	<p>Specifies the key type or encryption algorithm to be used to generate the key pair. PKI Services supports RSA, NISTECC and BPECC.</p> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_KEYTYPE_CardCA1=RSA _PKISERV_CMP_KEYTYPE=BPECC</pre>
<code>_PKISERV_CMP_KEYSIZE_domain</code>	<p>A three- or four-digit number that specifies the length of the key.</p> <ul style="list-style-type: none"> <li>For RSA, minimum size is 512 (1024 if <code>_PKISERV_CMP_SECUREKEY</code> is set), maximum size is 4096, and the default is 1024. The value must be a multiple of two (256, if <code>_PKISERV_CMP_SECUREKEY</code> is set).</li> <li>For NISTECC, valid sizes are 192, 224, 256, 384 and 521, and the default is 192.</li> <li>For BPECC, valid sizes are 160, 192, 224, 256, 320, 384, 512, and the default is 192.</li> </ul> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_KEYSIZE_CardCA1=2048 _PKISERV_CMP_KEYSIZE=512</pre>
<code>_PKISERV_CMP_SECUREKEY_domain</code>	<p>Specifies whether to generate secure keys in the TKDS. The value 1 specifies that secure keys are to be generated. The value 0 specifies that clear keys are to be generated.</p> <p>If this variable is not set, the profile protecting the CLEARKEY resource in the CRYPTOZ class determines whether the key generated is a secure key or a clear key. If the profile allows clear key generation, the generated key is a clear key. If the profile restricts clear key generation, the generated key is a secure key. For example, the following command creates a profile that prevents the generation of clear keys from any of the CMP clients:</p> <pre>RDEF CRYPTOZ CLEARKEY.SYSTOK-SESSION-ONLY UACC(NONE)</pre> <p>In this case, AES256 is used to envelop the private key.</p>
<code>_PKISERV_CMP_SECUREKEY_KEYENCALG_dom</code>	<p>Specifies the algorithm to envelop the private key. Valid values are AES256, AES128, and TDES. If not set, it defaults to AES256. This variable is ignored if <code>_PKISERV_CMP_SECUREKEY_domain</code> is not set.</p>

Table 85. HTTP Server environment variables used to control the content of the certificate within a CA (continued)

Environment variable name	Description
<p><code>_PKISERV_CMP_HONOR_CLIENT_DATES_dom</code></p>	<p>Specifies whether to honor client-specified certificate validity dates. Valid values are 0 and 1.</p> <p>The value 1 specifies that PKI Services uses start and end dates specified in the validity field of the certificate request. If validity dates are not specified, PKI Services uses the values in the environment variables <code>_PKISERV_CMP_NOTBEFORE_domain</code> and <code>_PKISERV_CMP_NOTAFTER_domain</code>. If either the start date or the end date is specified and the other is not specified, PKI Services uses the value set by the corresponding environment variable for the unspecified value.</p> <p>The value 0, or the absence of this variable, indicates that PKI Services is to use the values in the environment variables <code>_PKISERV_CMP_NOTBEFORE_domain</code> and <code>_PKISERV_CMP_NOTAFTER_domain</code>. If the client specifies either a start or end date in the validity field of a cr message when the value of this variable is 0 or absent, PKI Services rejects the request.</p> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_HONOR_CLIENT_DATES_CardCA1=1 _PKISERV_CMP_HONOR_CLIENT_DATES=0</pre>
<p><code>_PKISERV_CMP_NOTBEFORE_domain</code></p>	<p>Specifies the number of days from day of issue to when the certificate becomes valid. Valid values are 0 - 30 days. The default is 0, specifying that the certificate is valid from the start of the current day.</p> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_NOTBEFORE_CardCA1=7 _PKISERV_CMP_NOTBEFORE=5</pre>
<p><code>_PKISERV_CMP_NOTAFTER_domain</code></p>	<p>Specifies the number of days from today's date to when the certificate expires. Valid values are 1 - 9999. The default is 365. The value 1 specifies that the certificate is valid until the end of the current day.</p> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_NOTAFTER_CardCA1=1825 _PKISERV_CMP_NOTAFTER=1580</pre>

Table 85. HTTP Server environment variables used to control the content of the certificate within a CA (continued)

Environment variable name	Description
<p><code>_PKISERV_CMP_HONOR_CLIENT_EXTS_domain</code></p>	<p>Specifies whether to honor the client-specified extensions Subject Alternate Name, Keyusage and Extended keyusage. Valid values are 0 and 1.</p> <p>The value 1 specifies that PKI Services uses the extensions Subject Alternate Name, Keyusage and Extended keyusage from the request.</p> <p>The value 0, or the absence of this variable, specifies that PKI Services is to use the extensions Keyusage and Extended keyusage from the environment variables <code>_PKISERV_CMP_KEYUSAGE_domain</code> and <code>_PKISERV_CMP_EXTKEYUSAGE_domain</code>. If the client specifies the extensions field of a cr message or the attributes field of a p10cr message when the value of this variable is 0 or absent, PKI Services rejects the request.</p> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_HONOR_CLIENT_EXTS_CardCA1=1 _PKISERV_CMP_HONOR_CLIENT_EXTS=0</pre>
<p><code>_PKISERV_CMP_KEYUSAGE_domain</code></p>	<p>Blank-separated character strings defining the key usage to be added to requested certificates. Valid values are: handshake, dataencrypt, certsign, docsign, digitalsignature, digitalsig, nonrepudiation, keyencipherment, keyenciph, keyencrypt, dataencipherment, dataenciph, keyagreement, keyagree, keycertsign, and crlsign. The values are not case-sensitive. No default value.</p> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_KEYUSAGE_CardCA1=digitalsig keyencrypt _PKISERV_CMP_KEYUSAGE=handshake</pre>
<p><code>_PKISERV_CMP_EXTKEYUSAGE_domain</code></p>	<p>Blank-separated character strings defining the extended key usage to be added to requested certificates. Valid values are: serverauth, clientauth, codesigning, emailprotection, timestamping, ocspsigning, and msmartcardlogon. The values are not case-sensitive. No default value.</p> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_EXTKEYUSAGE_CardCA1=clientauth _PKISERV_CMP_EXTKEYUSAGE=serverauth</pre>
<p><code>_PKISERV_CMP_AUTHINFOACC_domain</code></p>	<p>Deprecated. Use <code>_PKISERV_CMP_AUTHINFOACCn_domain</code> instead. Ignored if you specify <code>_PKISERV_CMP_AUTHINFOACCn_domain</code>.</p> <p>A comma-separated two-part string specifying information used to create the AuthorityInfoAccess extension. The two-part string identifies the accessMethod and accessLocation. The accessMethod is either OCSP or IdentrusOCSP (case-insensitive). The accessLocation is a URI in the form URI=access-url or URL=access-url. The access-url must be an HTTP protocol. No default value.</p> <p><b>Examples:</b></p> <pre>_PKISERV_CMP_AUTHINFOACC_CardCA1=OCSP, URL=http://www.widgets.com/CardCA1/public-cgi/caocsp _PKISERV_CMP_AUTHINFOACC=OCSP, URI=http://www.widgets.com/PKIServ/public-cgi/caocsp</pre>

Table 85. HTTP Server environment variables used to control the content of the certificate within a CA (continued)

Environment variable name	Description
<code>_PKISERV_CMP_AUTHINFOACC<i>n</i>_domain</code>	<p>Specifies one or more AuthorityInfoAccess extensions in the form of a comma-separated two-part string. The two-part string identifies the accessMethod and accessLocation. The accessMethod is either OCSP or IdentrusOCSP (case-insensitive). The accessLocation is a URI in the form URI=access-url or URL=access-url. The access-url must be an HTTP protocol. No default value. There can be multiple entries, where <i>n</i> is 1 for the first AuthorityInfoAccess extension and increases sequentially for additional entries.</p> <p>Examples:</p> <pre>_PKISERV_CMP_AUTHINFOACC1_CardCA1=OCSP,   URL=http://www.widgets.com/CardCA1/public-cgi/caocsp _PKISERV_CMP_AUTHINFOACC2_CardCA1=OCSP,   URI=http://www.widgets.com/PKIServ/public-cgi/caocsp</pre>
<code>_PKISERV_CMP_CERTPOLICIES_domain</code>	<p>Specifies the certificate policies that are to be included in the issued certificates. The value is a set of numbers, which are separated by blanks, each representing one of the PolicyName values specified in the CertPolicy section of the PKI Services configuration file. Valid values are 1 - 99. No default value.</p> <p>Examples:</p> <pre>_PKISERV_CMP_CERTPOLICIES_CardCA1=1 2 3 _PKISERV_CMP_CERTPOLICIES=1 4</pre>
<code>_PKISERV_CMP_CUSTOMEXT<i>n</i>_domain</code>	<p>Specifies one or more custom extensions in the form of a comma-separated four-part string as indicated in the CustomExt field in the GENCERT CertPlist. There can be multiple entries, where <i>n</i> is 1 for the first custom extension and increases sequentially for additional entries.</p> <p>Example:</p> <pre>_PKISERV_CMP_CUSTOMEXT1_CardCA1=1.3.6.1.4.1.311.20.2,   N,BMP,myDomainController</pre>

**Notes:**

1. *\_domain* or *\_dom* represents the domain name that is contained in the variable `_PKISERV_CMP_DOMAIN_NAMEx_y`. For an unnamed domain, omit *\_domain* or *\_dom*.
2. Environment variable values must not be enclosed in quotations even if they include white space.

Table 86. HTTP Server environment variables used to configure the certificate recipients

Environment variable name	Description
<code>_PKISERV_CMP_HONOR_CLIENT_CERTS_domain</code>	<p>Specifies the maximum number of extra input recipient certificates that can be supplied in the input message, by using the <code>extraCerts</code> construct in the <code>PKIMessage</code> structure. Valid values are 0 - 5. If omitted or set to a value of 0, certificate requests that contain <code>extraCerts</code> are rejected.</p> <p><b>Example:</b>  <code>_PKISERV_CMP_HONOR_CLIENT_CERTS_CardCA1=3</code></p> <p>For more information, see “Determining the source of certificates used to encrypt the returned private key” on page 446.</p>
<code>_PKISERV_CMP_KEYRING_domain</code>	<p>Specifies the RACF user ID and the name of the key ring that is associated with that user ID that contains the certificates that are to be used to encrypt the private key for certificate request messages.</p> <p><b>Example:</b>  <code>_PKISERV_CMP_KEYRING_CardCA1=CMPLNT/CardKeyRing</code></p> <p>For more information, see “Determining the source of certificates used to encrypt the returned private key” on page 446.</p>

Table 87. HTTP Server environment variables used to control tracing

Environment variable name	Description
<code>_PKISERV_CMP_TRACE</code>	<p>Specifies a bit mask enabling CMP trace options. No trace option is enabled if the bit mask is 0 and all trace options are enabled if the bit mask is 0xff. The bit mask can be specified as a decimal (<i>nnn</i>), octal (<i>0nnnn</i>) or hexadecimal (<i>0xhh</i>) value. These trace options are available:</p> <ul style="list-style-type: none"> <li><b>0x01</b> CMP error messages</li> <li><b>0x02</b> CMP informational messages</li> <li><b>0x04</b> R_PKIServ callable service parameter list traces on entry and exit</li> <li><b>0x08</b> Elapse time messages of events within the CMP program</li> <li><b>0x10</b> CMP program function entry and exit trace messages</li> <li><b>0x20</b> DER buffer display messages</li> <li><b>0x40</b> Displays environment variables that are set at CMP program startup</li> </ul>

Table 87. HTTP Server environment variables used to control tracing (continued)

Environment variable name	Description
_PKISERV_CMP_TRACE_FILE	<p>Specifies the name of the trace file. Defaults to /tmp/pkicmp.%.trc. The trace file is not used if the _PKISERV_CMP_TRACE environment variable is not defined or is set to 0. The current process identifier is included as part of the trace file name when the name contains a percent sign (%). For example, if _PKISERV_CMP_TRACE_FILE is set to /tmp/pkicmp.%.trc and the current process identifier is 247, the trace file name is /tmp/pkicmp.247.trc.</p> <p><b>Guideline:</b> Because multiple copies of the CMP CGI program can run concurrently for multiple CMP clients, the value of _PKISERV_CMP_TRACE_FILE should include the percent sign (%) to prevent multiple copies of the CMP CGI program from writing to the same file.</p>

## Tracing the PKI CMP CGI program

You can enable tracing of the PKI Services CMP CGI program using the environment variable \_PKISERV\_CMP\_TRACE to set the trace options, and the environment variable \_PKISERV\_CMP\_TRACE\_FILE to specify the name of the trace file. A single trace file is created for each invocation of the CMP CGI program. For information about these environment variables, see Table 87 on page 453.

## Messages and codes returned from the CMP functions

Most messages are returned to the caller as a CMP error response. In addition, all messages are echoed to the CGI program error log in the format:

*date time pkicmp-> function: (error code) message text*

For example:

Wed Oct 28 09:34:12 2009 pkicmp->processNotDays: (577) NotBefore date supplied is invalid(date is before today).

Table 88. CMP error codes

Error code	Explanation
	<b>Note:</b> Error codes 06 - 99 are the reason codes from the RACF IRRSPX00 callable service.
06	Request queue serialization timeout occurred.
08	Request denied, not authorized.
12	An internal error has occurred during RACF processing.
20	Function code specified is not defined.
28	Certificate generation provider not available for specified CA domain
32	Incorrect value specified for CA domain.
40	Incorrect Reason Specified.
52	Parameter has an incorrect value.
56	Required field is missing from request.
60	Certificate generation provider error.
64	SerialNum has an incorrect length.
72	The status of the certificate has been changed by another process.

Table 88. CMP error codes (continued)

Error code	Explanation
76	Conflicting fields names in CertPlist.
99	General error for other RACF callable service IRRSPX00 errors.
510	(510) Base64 decode of input message failed, error= <i>error-code</i>
511	(511) Base64 encode of output message failed, error= <i>0xhex-error code</i>
512	(512) Storage allocation failed (client certificate storage: <i>error-code</i> )
513	(513) Error occurred, HTTP access is forbidden.
514	(514) Error occurred, HTTP method was <i>HTTP method name</i> instead of POST.
515	(515) Failed to create CMP response message.
516	(516) Unsupported TCP Message protocol version.
517	(517) Unsupported TCP Message message type.
518	(518) Error occurred attempting to read the HTTP input message
519	(519) Unsupported CMP message type: <i>CMP message type specified</i>
520	(520) Key size ( <i>envvar name envvar</i> ) of <i>envvar value</i> is not a multiple of {2   256}.
521	(521) Key size ( <i>envvar name envvar</i> ) of <i>envvar value</i> is not valid for {RSA   secure RSA   NISTECC   BPECC} keys, must be {between 512-4096   1024-4096   192, 224, 256, 384, or 521   160, 192, 224, 256, 320, 384, or 512}.
522	(522) Storage allocation failed <i>element:size</i>
523	(523) HonorClientDates ( <i>envvar name envvar</i> ) value of <i>envvar value</i> is not numeric.
524	(524) HonorClientDates ( <i>envvar name envvar</i> ) value of <i>envvar value</i> is not valid, expected 0 or 1.
525	(525) notBefore ( <i>envvar name envvar</i> ) value of <i>envvar value</i> is not numeric.
526	(526) notAfter ( <i>envvar name envvar</i> ) value of <i>envvar value</i> is not numeric.
527	(527) HonorClientCerts ( <i>envvar name envvar</i> ) value of <i>envvar value</i> is not numeric.
528	(528) HonorClientCerts ( <i>envvar name envvar</i> ) value of <i>envvar value</i> invalid, should be 0-5.
529	(529) HonorClientExts ( <i>envvar name envvar</i> ) value of <i>envvar value</i> is not numeric.
530	(530) HonorClientExts ( <i>envvar name envvar</i> ) value of <i>envvar value</i> invalid, should be 0 or 1.
531	(531) CMP Envar <i>envvar name</i> value is not valid, expected { <i>valid values</i> }
533	(533) CMP Envar <i>envvar name</i> missing in config file.
534	(534) CMP Envar <i>envvar name</i> value of <i>envvar value</i> is not numeric.
535	(535) CMP Envar <i>envvar1 name</i> with value of <i>envvar1 value</i> <= <i>envvar2 name</i> with value of <i>envvar2 value</i> .
536	(536) Key size ( <i>envvar name envvar</i> )not specified, defaulting to <i>default key size value</i> .
537	(537) Key size ( <i>envvar name envvar</i> ) of <i>Key size value specified</i> is not numeric.
538	(538) KeyType ( <i>envvar name envvar</i> ) of <i>KeyType value specified</i> is not valid.

Table 88. CMP error codes (continued)

Error code	Explanation
539	(539) <i>envar name</i> <i>envar value</i> length is greater than the maximum length of <i>maximum length</i> .
543	(543) request.extraCerts[ <i>index value</i> ].write() failed, status= <i>error code</i>
544	(544) gsk_decode_certificate failed, error code=0xSystem SSL error code - System SSL brief error description
545	(545) gsk_decode_base64 failed, error code=0xSystem SSL error code - System SSL brief error description
547	(547) gsk_open_keyring() failed: Error 0xSystem SSL error code - System SSL brief error description
548	(548) gsk_decode_certificate failed, error code=0xSystem SSL error code - System SSL brief error description
549	(549) gsk_get_record_by_index() failed: Error 0xSystem SSL error code - System SSL brief error description
550	(550) Specified Keyring <i>Keyring name</i> contains no certificates
553	(553) gsk_decode_import_certificate failed, error code=0xSystem SSL error code - System SSL brief error description
554	(554) gsk_encode_private_key, error code=0xSystem SSL error code - System SSL brief error description
555	(555) gsk_make_enveloped_data_msg_extended failed, error code=0xSystem SSL error code - System SSL brief error description
556	(556) gsk_encode_export_certificate failed, error code=0xSystem SSL error code - System SSL brief error description
557	(557) gsk_construct_private_key_rsa failed, error code=0xSystem SSL error code - System SSL brief error description
558	(558) gsk_construct_public_key[ECC] failed, error code=0xSystem SSL error code - System SSL brief error description
559	(559) gsk_modify_pkcs11_key_label failed, error code=0xSystem SSL error code - System SSL brief error description
560	(560) gsk_make_enveloped_private_key_msg error failed, error code=0xSystem SSL error code -System SSL brief error description
562	(562) Triple Des Algorithm not available, using Single Des.
563	(563) Gencert succeeded, But no Transaction ID returned.
573	(573) Could not decode CMP message.
576	(576) Missing ImplicitConfirm in PKIHeader.
577	(577) {NotBefore   NotAfter} date supplied is invalid({cannot compute seconds since epoch   date is before today}).
581	(581) Validity supplied when not configured to honor client dates.
582	(582) No CA domain found for issuer <i>Issuer Distinguished name</i> .
584	(584) Number of extraCerts > HonorClientCerts ( <i>envar name</i> <i>envar value</i> of <i>envar value</i> ).
587	(587) Critical crl extension oid= <i>Extension OID value</i> is not supported.
588	(588) crlReason extension value is not valid; decode error <i>error-code</i> .
589	(589) Serial number required in certTemplate.

Table 88. CMP error codes (continued)

Error code	Explanation
590	(590) {Revoke/Suspend   Resume} of serial number <i>decimal-serial-number(0xhex-serial-number)</i> failed for CA Domain <i>Domain name</i> .
600	(600) Error encountered while encoding response body( <i>failing element[:error code]</i> )
601	(601) Error encountered while encoding response header( <i>failing element[:error code]</i> )
602	(602) {Attributes   Extensions} supplied when not configured to honor client extensions.
603	(603) Base64 encode of CertificationRequest failed, error= <i>error-code</i> .
604	(604) CertReqMsg with publicKey has missing or unsupported ProofOfPossession
606	(606) Error encountered while encoding CertReqMsg( <i>failing element[:error code]</i> ).
607	(607) Error obtaining the current time of day( <i>failing step:error code</i> ).
608	(608) Error retrieving information from the CMP request ( <i>failing element[:error code]</i> )
609	(609) {cr   rr} message does not contain only one {CertReqMsg   RevDetails}.
610	(610) Subject name absent from CertTemplate for a cr message
611	(611) Unsupported CMP message version ( <i>version specified not equal 2</i> )
612	(612) Error initializing PKI Services configuration file ( <i>configuration-file-name</i> )
613	(613) CA domain <i>domain-name</i> does not have CMP support enabled
614	(614) Error retrieving CMP environment variables
620	(620) Key type {[null]   <i>specified KEYTYPE value</i> } is not valid.
621	(621) Cannot initialize ICSF PKCS#11 interfaces (C_Initialize return code <i>0xhex-return-code</i> )
622	(622) Error encountered while destroying a {Publik   Private} key object (return code <i>0xhex-return-code</i> )
623	(623) Internal PKCS#11 API failure ( <i>PKCS #11 API</i> ) return code <i>0xhex-return-code</i>
624	(624) {RSA   ECC} key generation failure (C_GenerateKeyPair return code <i>0xhex-return-code</i> )
464453637	VSAM contention caused the request to fail. Retry the request.
464453634	VSAM contention caused the request to fail. Retry the request.

---

## Part 5. Administering security for PKI Services

This part explains how to administer security for PKI Services.

- Chapter 20, “RACF administration for PKI Services,” on page 461 describes how to use RACF to administer security for PKI Services.

The following tasks are covered:

- “Authorizing users for the PKI Services administration group” on page 461
- “Authorizing users for inquiry access” on page 462
- “Administering HostIdMappings extensions” on page 462
- “Locating your PKI Services certificates and key ring” on page 464
- “Establishing PKI Services as an intermediate CA” on page 466
- “Renewing your PKI Services CA and RA certificates” on page 468
- “Recovering a CA certificate profile” on page 470
- “Retiring and replacing the PKI Services CA private key” on page 471
- “R\_PKIServ (IRRSPX00 and IRRSPX64) callable service” on page 475
- “Using encrypted passwords for LDAP servers” on page 481.

---

## Chapter 20. RACF administration for PKI Services

This topic describes the tasks that the RACF administrator performs after PKI Services has been set up and customized.

The following tasks are covered:

- “Authorizing users for the PKI Services administration group”
- “Authorizing users for inquiry access” on page 462
- “Administering HostIdMappings extensions” on page 462
- “Locating your PKI Services certificates and key ring” on page 464
- “Establishing PKI Services as an intermediate CA” on page 466
- “Renewing your PKI Services CA and RA certificates” on page 468
- “Recovering a CA certificate profile” on page 470
- “Retiring and replacing the PKI Services CA private key” on page 471
- “R\_PKIServ (IRRSPX00 and IRRSPX64) callable service” on page 475
- “Using encrypted passwords for LDAP servers” on page 481.

For more information about the RACF commands shown in this topic, see *z/OS Security Server RACF Command Language Reference*.

---

### Authorizing users for the PKI Services administration group

You need to know how to add and delete members from the PKI Services administration group (by default, PKIGRP).

You might have set up multiple administration groups if you are using the PKISERV class to grant authorization on a granular level. For more information, see “Using the PKISERV class to control access to administrative functions” on page 479 and “Deciding the value of AdminGranularControl” on page 44.

### Connecting members to the group

The PKI Services administration group is a RACF group containing the list of user IDs that are authorized to use PKI Services administration functions. To connect a member to the group, issue the following command, replacing *pkigroup\_mem* with the member's user ID and *pkigroup* with the name of the PKI Services administration group (PKIGRP by default). (See Table 19 on page 51 for more information.)

```
CONNECT pkigroup_mem GROUP(pkigroup)
```

**Note:** You need to enter this command for each user ID in turn.

### Deleting members from groups

To remove a user from a group, issue the following command, replacing *pkigroup\_mem* with the user ID of the member you want to delete and *pkigroup* with the name of the PKI Services administration group (PKIGRP by default).

```
REMOVE pkigroup_mem GROUP(pkigroup)
```

### Authorizing users for inquiry access

You can add groups of users who do not need the full administrative authority of users in the PKIGRP group. You can use the following procedure to authorize a new group for inquiry abilities, such as a help desk might require. The commands that are shown include variables whose names are appropriate for this scenario.

#### Steps for authorizing users for inquiry access

##### Before you begin

If you implemented the object store and ICL using VSAM data sets, you need to know the high-level VSAM data set qualifier that is used for the IKYSETUP variable *vsamhlq* value, in case your installation did not use the PKISRVD default. (See Table 19 on page 51.)

##### Procedure

Perform the following steps to add and administer a group that needs authority to query PKI Services information.

1. Add the new group.

```
ADDGROUP HELPDESK OMVS(GID(197312))
```

2. Connect each member to the new group. Repeat for each user ID you need to connect.

```
CONNECT OPER17 GROUP(HELPDESK)
```

3. Authorize the new group for READ access to the resources of PKI Services. Replace your installation's value for the data set's high-level qualifier if your installation did not use the PKISRVD default.

```
PERMIT 'PKISRVD.**' ID(HELPDESK) ACCESS(READ)
PERMIT IRR.RPKISERV.PKIADMIN CLASS(FACILITY)
ID(HELPDESK) ACCESS(READ)
SETROPTS GENERIC(DATASET) REFRESH
SETROPTS RACLIST(FACILITY) REFRESH
```

The SETROPTS commands activate the profiles that authorize READ access.

4. If necessary, you can remove a user from the group. The following example removes the user that you connected in Step 2.

```
REMOVE OPER17 GROUP(HELPDESK)
```

5. If necessary, you can delete the group. The following example deletes the group that you created in Step 1.

```
DELGROUP(HELPDESK)
```

---

### Administering HostIdMappings extensions

You can add a HostIdMappings extension to certificates you create for certain users, allowing you to specify the user IDs that each user is able to use for login to particular servers (or hosts). Controlling an identity that is used for login purposes is an important security objective. Therefore, you must exercise administrative control in the following areas by authorizing:

- PKI Services as a highly trusted certificate authority whose certificates are honored when they contain HostIdMappings extensions
- Particular servers to accept logins from clients whose certificates contain HostIdMappings extensions

## Steps for administering HostIdMappings extensions

Perform the following steps to allow the web server to accept logins from clients who have been issued PKI Services certificates with HostIdMappings extensions:

1. Determine if PKI Services is defined as a highly trusted certificate authority on your system by listing its certificate authority definition by using the RACDCERT CERTAUTH LIST command.

**Example:**

```
RACDCERT CERTAUTH LIST(LABEL('Local PKI CA'))
```

Check the Status information near the top of the output listing for the HIGHTRUST attribute.

- 
2. If not already defined, add the HIGHTRUST attribute to the certificate authority definition for PKI Services.

**Example:**

```
RACDCERT CERTAUTH ALTER(LABEL('Local PKI CA')) HIGHTRUST
```

- 
3. Define a resource in the SERVAUTH class for each server (host) name you want your web server to honor when accepting logins for certificates containing HostIdMappings extensions. The resource name follows the format: IRR.HOST.*hostname*. The *hostname* is the value of the HostIdMappings extension entry pertaining to the z/OS host system you are administering (without the subject ID portion). This is usually a domain name, such as plpsc.pok.ibm.com. The following example shows defining a resource.

**Example:**

```
RDEFINE SERVAUTH IRR.HOST.PLPSC.POK.IBM.COM UACC(NONE)
```

- 
4. Permit your web server to access this resource with READ authority. Be sure that the web server is defined as a RACF user.

**Example:**

```
PERMIT IRR.HOST.PLPSC.POK.IBM.COM CLASS(SERVAUTH) ID(WEBSRV) ACCESS(READ)
```

- 
5. Activate the SERVAUTH class, if not already active.

**Example:**

```
SETOPTS CLASSACT(SERVAUTH)
```

If already active, refresh the SERVAUTH class.

**Example:**

```
SETOPTS CLASSACT(SERVAUTH) REFRESH
```

---

**Note:** On a z/OS system, a HostIdMappings extension is not honored if the target user ID was created after the start of the validity period for the certificate containing the HostIdMappings extension. Therefore, if you are creating user IDs specifically for certificates with HostIdMappings extensions, make sure that you create the user IDs before the certificate requests are submitted. Alternately, when approving the certificate, you can modify the date that the certificate becomes valid so that it is not earlier than the date the user ID was created. For renewed certificates, all of the original information is replicated in the new certificate, including the date that the certificate becomes valid and any HostIdMappings. If

## RACF administration for PKI Services

you want to change a HostIdMappings extension when approving the renewed certificate, you must also modify the date that the certificate becomes valid so that it is not earlier than the date the user ID was created.

See *z/OS Security Server RACF Command Language Reference* for details about syntax and authorization that is required for using the RACDCERT command.

---

## Locating your PKI Services certificates and key ring

The IKYSETUP exec sets up the RACF environment for PKI Services. After the setup is complete, you might need to go back and locate the PKI Services CA certificate, key ring, or the optional RA certificate, possibly to diagnose error conditions. You can do this by using various RACF TSO commands.

### Before you begin

You need to determine the following setup information:

Table 89. Information you need for locating your PKI Services certificates and key ring

Information needed	Where to find this information	Record your value here
<i>ca_label</i> - The label of your CA certificate in RACF	See Table 11 on page 38.	
<i>ra_label</i> - The label of your RA certificate in RACF	See Table 11 on page 38.	
<i>ca_ring</i> - The PKI Services SAF key ring	See Table 19 on page 51.	
<i>daemon</i> - The user ID for the PKI Services daemon	See Table 19 on page 51.	
<i>log_dsn</i> - The data set name of the IKYSETUP log	See Table 19 on page 51.	
<i>cacert_dsn</i> - The data set name of your CA certificate as exported from RACF	See Table 19 on page 51.	

## Steps for locating the PKI Services certificates and key ring

Perform the following steps to locate the PKI Services CA certificate, key ring, and the optional RA certificate:

1. Locate the CA certificate using one of the following two methods (Step 1a or Step 1b on page 465) and examine its information.
  - a. Locate the CA certificate using the name of its export data set. (Get the export data set name from *cacert\_dsn* in Table 89.) Display its information by executing the following RACF command from a TSO command prompt:  
RACDCERT CHECKCERT(*cacert\_dsn*)

### Sample output:

```
Digital certificate information for CERTAUTH:
Label: Local PKI CA
Certificate ID: 2QiJmZmDhZmjgd0Wg4GTQNfSyUDDwUBA
Status: HIGHTRUST
Start Date: 2001/06/04 23:00:00
End Date: 2020/01/01 22:59:59
Serial Number:
>00<
Issuer's Name:
>OU=Human Resources Certificate Authority.0=IBM.C=US<
```

```

Subject's Name:
    >OU=Human Resources Certificate Authority.0=IBM.C=US<
Key Usage: CERTSIGN
Key Type: RSA
Key Size: 1024
Private Key: Yes
    
```

- b. Alternately, locate the CA certificate using its certificate label. (Get the label name from *ca\_label* in Table 89 on page 464.) Display its information by entering the following RACF command from a TSO command prompt.
- ```
RACDCERT CERTAUTH LIST(LABEL('ca_label'))
```

The RACDCERT CERTAUTH LIST command produces the same output as the RACDCERT CHECKCERT (shown in Step 1a on page 464) with the addition of information about any ring associations. For example:

**Sample output:**

```

Ring Associations:
  Ring Owner: PKISRVD
  Ring:
    >CAring<
    
```

- c. Examine the CA certificate information. If you are diagnosing errors, note the following:
- The first line must indicate that this is a CERTAUTH certificate.
  - Label must match your *ca\_label* value (as in the preceding table).
  - If Serial Number is not equal to 00, this indicates that the certificate has been renewed or was issued by another certificate authority.
  - If Issuer's Name differs from Subject's Name, this indicates that the certificate was issued by another certificate authority.
  - Subject's Name must match the original value recorded for the PKI Services SUBJECTSDN in the IKYSETUP log.
  - Private Key must show YES.
  - Key Type indicates whether the key is an RSA, DSA, NISTECC, or BPECC key.
  - If Ring Associations are listed, ensure that an association is displayed for the daemon user ID as ring owner and your *ca\_ring* value (from Table 89 on page 464) as ring name.

---

2. Locate the CA key ring and examine its information.

- a. Get the ring name from *ca\_ring* in Table 89 on page 464 and display its information by executing the following RACF command from a TSO command prompt:
- ```
RACDCERT ID(daemon) LISTRING(ca_ring)
```

**Sample output:**

Digital ring information for user PKISRVD:

```

Ring:
  >CAring<
Certificate Label Name          Cert Owner    USAGE        DEFAULT
-----
Local PKI CA                   CERTAUTH     PERSONAL     YES
Local PKI RA                   PKISRVD      PERSONAL     NO
    
```

- b. Examine the key ring information. If you are diagnosing errors, note the following:

## RACF administration for PKI Services

- The entry for the PKI Services CA certificate must have USAGE PERSONAL and DEFAULT YES.
- If you use an optional RA certificate, you see the second line. If present, the entry for the PKI Services RA certificate must have USAGE PERSONAL and DEFAULT NO.

3. If you use an optional RA certificate, locate it and examine its information.
  - a. Locate the RA certificate using its certificate label. (Get the RA's certificate label from *ra\_label* in Table 89 on page 464 or from the RACDCERT LISTRING output shown in Step 2a on page 465.) Display the RA certificate information by executing the following RACF command from a TSO command prompt:

```
RACDCERT ID(certificate-owner) LIST(LABEL('certificate-label-name'))
```

### Sample output:

```
| Digital certificate information for PKISRVD:
| Label: Local PKI RA
| Certificate ID: 2QiJmZmDhZmjgd0Wg4GTQNfSyUDDwUBA
| Status: TRUST
| Start Date: 2001/06/04 23:00:00
| End Date: 2020/01/01 22:59:59
| Serial Number:
| >01<
| Issuer's Name:
| >OU=Human Resources Certificate Authority.0=IBM.C=US<
| Subject's Name:
| >CN=Registration Authority.OU=Human Resources Certif<
| >icate Authority.0=IBM.C=US<
| Key Usage: HANDSHAKE
| Key Type: RSA
| Key Size: 1024
| Private Key: Yes
```

- b. Examine the RA certificate information. If you are diagnosing errors, note the following:
  - The user ID of the certificate owner (indicated in the first line) must match the user ID of the PKI Services daemon.
  - Issuer's Name must match the Subject's Name of the CA certificate.
  - Private Key must show YES.
  - Key Type indicates the key is an RSA key.

---

## Establishing PKI Services as an intermediate CA

The default setup for PKI Services establishes the PKI Services certificate authority as a root CA, also known as a self-signed CA. Because there is no established trust hierarchy leading to a self-signed certificate, it is impossible to verify that a self-signed certificate is genuine. Accordingly, any person or application that wants to process certificates issued by a root authority must explicitly trust the authenticity of the self-signed CA certificate.

Alternately, you can establish the PKI Services certificate authority as an intermediate (subordinate) certificate authority. An intermediate certificate authority is one whose certificate is signed by another higher certificate authority. This higher certificate authority can be a root CA or another intermediate CA. If the root CA certificate has previously been trusted, you can verify any lower intermediate CA certificate using the higher certificate.

In the following steps, you are replacing the self-signed CA certificate created by IKYSETUP with one signed by another authority.

## Steps for changing PKI Services from a self-signed CA to an intermediate CA

### Before you begin

1. This procedure assumes that the PKI Services CA certificate is issued by a root, or self-signed, CA.
2. The commands in the steps that follow include several variables. The following table describes these variables. Determine the values for these variables and record the information in the blank boxes:

Table 90. Information you need for establishing PKI Services as an intermediate CA

Information needed	Where to find this information	Record your value here
<i>cacert_dsn</i> - The data set name of the new PKI Services CA certificate.		
<i>ca_label</i> - The label of your CA certificate in RACF	See Table 11 on page 38.	
<i>export_dsn</i> - The data set name of the root CA certificate as exported from RACF.		
<i>temp_dsn</i> - The name of the temporary data set to contain your new certificate request and returned certificate.	You decide this based on local data set naming conventions.	

### Procedure

Perform the following steps to change PKI Services from a self-signed certificate authority to an intermediate certificate authority:

1. Determine what certificate authority is acting as a higher authority for PKI Services. (This could be a public certificate authority, such as VeriSign, or a local, internal certificate authority, even another instance of PKI Services.)

---

2. Create a new certificate request from your existing self-signed CA certificate by entering the following RACF command from a TSO command prompt:  
`RACDCERT CERTAUTH GENREQ(LABEL('ca_label')) DSN(temp_dsn)`

---

3. Send the certificate request to the higher certificate authority, following the procedures that the higher authority requires.

---

4. If the root CA is not one that is already known by RACF, then add the root CA to RACF as a certificate authority. To do this:
  - a. Receive the root CA certificate and place it into the certificate data set (*temp\_dsn*).

**Note:** The procedure for doing this can vary greatly depending on how the higher certificate authority delivered the certificate:

- If the certificate is delivered as base64 encoded text, the easiest way to deposit the certificate into the data set is to edit the certificate data set:

## RACF administration for PKI Services

- 1) Delete all existing lines in *temp\_dsn*.
  - 2) Copy the base64 encoded text.
  - 3) Paste the copied text into the ISPF edit window.
  - 4) Save.
- If the certificate is delivered as binary data (also called DER encoded), the easiest way to deposit the certificate into the data set is to use binary FTP.
- b. Add the new root CA certificate into the RACF database by entering the following RACF command from a TSO command prompt:  

```
RACDCERT CERTAUTH ADD(temp_dsn) WITHLABEL('label-for-root-CA')
```
- 
5. Add the new PKI Services CA to RACF as a certificate authority:
    - a. Receive the PKI Services CA certificate and place it into the certificate data set (*cacert\_dsn*). This step is similar to step 4 on page 467, except that it uses *cacert\_dsn* as the data set name instead of *temp\_dsn*, because you want to keep the PKI Services CA certificate permanently in the data set *cacert\_dsn*.
    - b. Add the new PKI Services CA certificate back into the RACF database by entering the following RACF command from a TSO command prompt:  

```
RACDCERT CERTAUTH ADD(cacert_dsn)
```

**Guideline:** Do not specify a label on this command.
- 
6. Export the root CA certificate in DER format to the export data set by entering the following RACF command from a TSO command prompt:  

```
RACDCERT CERTAUTH EXPORT(LABEL('label-for-root-CA')) DSN(export_dsn)  
FORMAT(CERTDER)
```
- 
7. Make your new root CA certificate available to your clients, because it becomes the web server's root CA certificate too. To do this, set up the var directory by performing Step 2 on page 87 through Step 4 on page 88 in “Steps for setting up the var directory” on page 87.
- Note:** Make sure that the root CA certificate, not your intermediate CA certificate, is stored in */var/pkiserv/cacert.der*.

---

## Renewing your PKI Services CA and RA certificates

Eventually, your PKI Services CA and RA certificates expires. To avoid complications that are related to an expired CA or RA certificate, renew those certificates before they expire. (You receive an MVS console message IKYP026E as the expiration date approaches.)

This topic contains these procedures:

- “Steps for renewing your PKI Services CA certificate”
- “Steps for renewing your PKI Services RA certificate” on page 470

### Steps for renewing your PKI Services CA certificate

#### Before you begin

The commands in the steps that follow include several variables. The following table describes these variables. Determine the values for these variables and record the information in the blank boxes:

Table 91. Information you need for renewing your PKI Services certificate authority certificate

Information needed	Where to find this information	Record your value here
<i>cacert_dsn</i> - The data set name of your renewed CA certificate as exported from RACF. (This data set is needed for recovery.)		
<i>ca_label</i> - The label of your CA certificate in RACF	See Table 11 on page 38.	
<i>temp_dsn</i> - The temporary data set to contain your new certificate request and returned certificate.	You decide this based on local data set naming conventions.	

## Procedure

Perform the following steps to renew your PKI Services CA certificate:

1. Create a new certificate request from your current CA certificate by entering the following RACF command from a TSO command prompt:  
`RACDCERT CERTAUTH GENREQ(LABEL('ca_label')) DSN(temp_dsn)`
2. If your PKI Services certificate authority is a root CA (that is, it has a self-signed certificate, which is the default), generate the self-signed renewal certificate by entering the following RACF command from a TSO command prompt. The *ca\_expires* variable indicates the new expiration date.  
`RACDCERT CERTAUTH GENCERT(temp_dsn) NOTAFTER(DATE(ca_expires))  
SIGNWITH(CERTAUTH LABEL('ca_label'))`
3. Alternately, if your PKI Services certificate authority is an intermediate certificate authority, perform the following steps:
  - a. Send the certificate request to the higher (external) CA, following the procedures that the higher authority requires. If your CA retains the original certificate signing requests (CSR), you might not need to create and store a new request based on the expiring certificate. You might be able to request a renewal using the original CSR.
  - b. After the certificate has been issued, receive the certificate back into the certificate data set (*temp\_dsn*).

**Note:** The procedure for doing this can vary greatly depending on how the higher certificate authority delivers the new certificate:

- If the certificate is delivered as base64 encoded text, the easiest way to deposit the certificate into the data set is to edit the certificate data set:
    - 1) Delete all existing lines in *temp\_dsn*.
    - 2) Copy the base64 encoded text.
    - 3) Paste the copied text into the ISPF edit window.
    - 4) Save.
  - If the certificate is delivered as binary data (also called DER encoded), the easiest way to deposit the certificate into the data set is to use binary FTP.
- c. Add the renewed certificate back into the RACF database by entering the following RACF command from a TSO command prompt:  
`RACDCERT CERTAUTH ADD(temp_dsn)`  
Do not specify a label on this command.
  4. Export the certificate in DER format to the CA certificate data set by entering the following RACF command from a TSO command prompt:

## RACF administration for PKI Services

```
RACDCERT CERTAUTH EXPORT(LABEL('ca_label')) DSN(cacert_dsn) FORMAT(CERTDER)
```

Save this data set for recovery if needed later.

5. If your PKI Services certificate authority is a root CA, *and* it is also the web server's root certificate, the renewed root needs to be accessible to the clients. To make your new certificate available to your clients, set up the `/var/pki` directory by performing Step 2 on page 87 through Step 4 on page 88 in “Steps for setting up the var directory” on page 87.
6. Stop and restart PKI Services.

## Steps for renewing your PKI Services RA certificate

### Before you begin

The commands in the steps that follow include several variables. The following table describes these variables. Determine the values for these variables and record the information in the blank boxes:

Table 92. Information you need for renewing your PKI Services RA certificate

Information needed	Where to find this information	Record your value here
<i>ca_label</i> - The label of your CA certificate in RACF	See Table 11 on page 38.	
<i>daemon</i> - The user ID of the PKI Services daemon.	See Table 19 on page 51.	
<i>racert_dsn</i> - The name of the data set to contain your new certificate request.	You decide this based on local data set naming conventions.	
<i>ra_label</i> - The label of your RA certificate in RACF.	See Table 11 on page 38.	

### Procedure

Perform the following steps to renew your PKI Services RA certificate:

1. Create a new certificate request from your existing RA certificate by entering the following RACF command from a TSO command prompt:  

```
RACDCERT ID(daemon) GENREQ(LABEL('ra_label')) DSN(racert_dsn)
```
2. Create the renewed PKI Services certified RA certificate by entering the following RACF command from a TSO command prompt. The *ra\_expires* variable indicates the new expiration date.  

```
RACDCERT ID(daemon) GENCERT(racert_dsn) NOTAFTER(DATE(ra_expires))  
SIGNWITH(CERTAUTH LABEL('ca_label'))
```
3. Stop and restart PKI Services.

---

## Recovering a CA certificate profile

Unless you change the IKYSETUP REXX exec to disable the function, IKYSETUP automatically backs up the PKI Services CA certificate and private key to a passphrase-encrypted data set that has PKCS #12 format, if the certificate and private key were created by software. (If the certificate was created by hardware, for example by RACDCERT with the PCICC keyword, it is not backed up.) If the CA certificate profile in the RACF database is accidentally deleted, you can recover it by adding the certificate and private key back to the RACF database from the backup PKCS #12 data set.

## Steps for recovering a CA certificate profile

### Before you begin

The commands in the steps that follow include several variables. Table 93 describes these variables. Determine the values for these variables and record the information in the blank boxes:

Table 93. Information you need for recovering a CA certificate profile

Information needed	Where to find this information	Record your value here
<i>backup_dsn</i> - The name of the data set containing the backup copy of your original CA certificate and its private key	See Table 19 on page 51.	
<i>cacert_dsn</i> - The data set name of your CA certificate as exported from RACF		
<i>ca_label</i> - The label of your CA certificate in RACF	See Table 11 on page 38.	
<i>ca_ring</i> - The PKI Services SAF key ring	See Table 19 on page 51.	
<i>daemon</i> - The user ID for the PKI Services daemon	See Table 19 on page 51.	
<i>your-passphrase</i> - The passphrase you used when backing up the private key	You specified this when running IKYSETUP.	

### Procedure

Perform the following steps to recover a CA certificate profile:

1. Issue the following TSO commands:

#### Notes:

- a. If you are not using ICSF, omit the ICSF keyword on the first ADD command.
- b. If your CA certificate has been renewed, the second ADD command recovers the most current version using the saved CA certificate. If your certificate has not been renewed, you can omit the second ADD command. For information about renewing your CA certificate, see “Renewing your PKI Services CA and RA certificates” on page 468.

```
RACDCERT CERTAUTH ADD(backup_dsn) PASSWORD(your-passphrase)
  WITHLABEL('ca_label') ICSF
RACDCERT CERTAUTH ADD(cacert_dsn)
RACDCERT ID(daemon) CONNECT(CERTAUTH LABEL('ca_label')
  RING(ca_ring) USAGE(PERSONAL) DEFAULT)
```

## Retiring and replacing the PKI Services CA private key

For certificates that are associated with private keys, such as the PKI Services CA certificate, you should periodically retire the private keys and replace them with new ones. This process is commonly called *certificate rekeying* or *key rollover*. Do this to prevent private keys from being overused. (The more a key is used, the more susceptible it is to being broken and recovered by an unintended party.)

## RACF administration for PKI Services

To rekey and roll over the PKI Services private key, use the REKEY and ROLLOVER operands of the RACF RACDCERT command. The REKEY operand makes a self-signed copy of the original certificate with a new public-private key pair. The ROLLOVER operand finalizes the rekey operation by replacing the use of the original certificate with the new certificate in every key ring to which the original certificate is connected. It also destroys the original private key and copies over information about its serial number base so the new certificate can be used to sign new certificates.

A retired CA certificate cannot be used to sign new certificates. However, until it expires, it can be used to verify previously signed certificates. If you have an RA certificate for SCEP processing that was not replaced when the CA certificate that signed it was retired, you need to reconnect the CA certificate to the CA key ring.

### Steps to retire and replace the PKI Services CA private key for the PKI templates

The commands that are used in this procedure are examples that are based on the following scenario:

#### Assumptions:

- The certificate that you are rekeying is a CERTAUTH certificate with label 'Local PKI CA'. It was issued by a commercial CA and is being used by PKI Services for the PKI templates as a certificate authority (CA) certificate, making the PKI Services CA a subordinate CA.
- The PCI cryptographic coprocessor be used to generate the new key-pair.
- The size of the new private key is 1024 bits (RACF default size).

Perform the following procedure to rekey and replace the private key.

1. Initiate the rekeying by executing the following RACF command:  

```
RACDCERT CERTAUTH REKEY(LABEL('Local PKI CA')) WITHLABEL('Local PKI CA-2') PCICC
```

2. Create a request for a commercial CA to sign the new public key and reissue the certificate. To create a certificate request for the new key and store it in MVS data set 'SYSADM.CERT.REQ', issue the following command:  

```
RACDCERT CERTAUTH GENREQ(LABEL('Local PKI CA-2')) DSN('SYSADM.CERT.REQ')
```

**Restriction:** The certificate request data that is contained in the data set must be sent to, and received from, the commercial CA using the process defined by the CA. Those steps are not included.

3. Receive the newly signed and reissued certificate back from the commercial CA into MVS data set 'SYSADM.CERT.B64'.  

```
RACDCERT CERTAUTH ADD('SYSADM.CERT.B64')
```
4. Add the newly signed certificate into RACF and replace the self-signed rekeyed one by executing the following command:  

```
RACDCERT CERTAUTH ADD('SYSADM.CERT.B64')
```
5. You are now ready to retire the original certificate and must stop all use of the original private key. Stop the PKI Services daemon.

**Note:** At this point, the original certificate and its private key exist in RACF with label 'Local PKI CA'. The new certificate and its private key exist in a separate entry in RACF with label 'Local PKI CA-2'. You can proceed to roll over the key.

- 
6. Finalize the roll over by entering the following command:  

```
RACDCERT CERTAUTH ROLLOVER(LABEL('Local PKI CA')) NEWLABEL('Local PKI CA-2')
```

---

  7. If an RA certificate is in use that was signed by the retired CA certificate, connect the retired CA certificate to the key ring.  

```
RACDCERT ID(daemon) CONNECT(CERTAUTH LABEL('Local PKI CA') RING(ringname) USAGE(CERTAUTH))
```
  8. Restart the PKI Services daemon.
- 

**When you are done:** You have retired and replaced the old PKI Services CA certificate. All the information for the original certificate is updated to reflect the new certificate, including the key ring connections. You can now begin to use the new certificate and its private key. You can continue to use the old certificate for signature verification purposes until it expires. However, you cannot use the old certificate to sign new certificates. Additionally, do not connect the old certificate to any key rings as the default certificate.

## Steps to retire and replace the PKI Services CA private key for the SAF templates: Scenario 1

The commands that are used in this procedure are examples that are based on the following scenario:

### Assumptions:

- The certificate that you are rekeying is a CERTAUTH certificate with label 'taca'.
- It was issued by a local CA certificate that is labeled 'Local RACF CA' that was generated by RACF and is being used by PKI Services for the SAF templates as a certificate authority (CA) certificate.

Perform the following procedure to rekey and replace the private key.

1. Initiate the rekeying by executing the following RACF command:  

```
RACDCERT CERTAUTH REKEY(LABEL('taca')) WITHLABEL('taca-2')
```

---

2. Generate a certificate request that is based on the new self-signed certificate and store it in MVS data set 'SYSADM.CERT.REQ' by executing the following command:  

```
RACDCERT CERTAUTH GENREQ(LABEL('taca-2')) DSN('SYSADM.CERT.REQ')
```

---

3. Issue the following command to sign the new certificate:  

```
RACDCERT CERTAUTH GENCERT('SYSADM.CERT.REQ')  
SIGNWITH(CERTAUTH LABEL('Local RACF CA'))
```

At this point, the original certificate and its private key exist in RACF with the label 'taca'. The new certificate and its private key exist in a separate entry in RACF with the label 'taca-2'. You can proceed to roll over the key.

- 
4. Finalize the roll over by entering the following command:

```
RACDCERT CERTAUTH ROLLOVER(LABEL('taca')) NEWLABEL('taca-2')
```

---

5. Change the certificate label that is used in the SIGNWITH field in the SAF templates to the new label name.
- 

**When you are done:** You have retired and replaced the old certificate. All the information for the original certificate is updated to reflect the new certificate, including the key ring connections. You can now begin to use the new certificate and its private key. You can continue to use the old certificate for signature verification purposes until it expires. However, you cannot use the old certificate to sign new certificates. Additionally, do not connect the old certificate to any key rings as the default certificate.

### Steps to retire and replace the PKI Services CA private key for the SAF templates: Scenario 2

The commands that are used in this procedure are examples that are based on the following scenario:

#### Assumptions:

- The certificate that you are rekeying is a CERTAUTH certificate with label 'taca'.
- It was a self-signed certificate in RACF and is being used by PKI Services for the SAF templates as a certificate authority (CA) certificate.

Perform the following procedure to rekey and replace the private key.

1. Initiate the rekeying by executing the following RACF command:

```
RACDCERT CERTAUTH REKEY(LABEL('taca'))  
WITHLABEL('taca-2')
```

At this point, the original certificate and its private key exist in RACF with the label 'taca'. The new certificate and its private key exist in a separate entry in RACF with the label 'taca-2'. You can proceed to roll over the key.

---

2. Finalize the roll over by entering the following command:

```
RACDCERT CERTAUTH ROLLOVER(LABEL('taca')) NEWLABEL('taca-2')
```

---

3. Change the certificate label that is used in the SIGNWITH field in the SAF templates to the new label name.
- 

**When you are done:** You have retired and replaced the old certificate. All the information for the original certificate is updated to reflect the new certificate, including the key ring connections. You can now begin to use the new certificate and its private key. You can continue to use the old certificate for signature verification purposes until it expires. However, you cannot use the old certificate to sign new certificates. Additionally, do not connect the old certificate to any key rings as the default certificate.

## R\_PKIServ (IRRSPX00 and IRRSPX64) callable service

Authorized applications, such as servers, that invoke the R\_PKIServ callable service (IRRSPX00 for 31 bit and IRRSPX64 for 64 bit) can request the generation, retrieval, and administration of PKIX-compliant X.509 Version 3 certificates and certificate requests. Applications can request end-user functions or administrative functions related to these requests. You authorize these applications by administering RACF resources in the FACILITY class, which is based on whether the application requests end-user functions or administrative functions.

You can authorize access to administrative functions on a more granular level using resources in the RACF PKISERV class. The PKISERV class profiles are checked in addition to the FACILITY class profiles.

See *z/OS Security Server RACF Callable Services* for the details of invoking IRRSPX00.

### Authorizing end-user functions

The end-user functions are:

#### EXPORT

Retrieves (exports) a previously requested certificate, or retrieves (exports) the PKI Services registration authority (RA) certificate or the certificate authority (CA) certificate.

#### GENCERT

Generates an auto-approved certificate.

#### GENRENEW

Generates an auto-approved renewal certificate. (The request submitted is automatically approved.)

#### QRECOVER

Lists certificates whose key pairs were generated by PKI Services under a requestor's email address and passphrase.

#### REQCERT

Requests a certificate that an administrator must approve before it is created.

#### REQRENEW

Requests certificate renewal. The administrator needs to approve the request before the certificate is renewed.

#### RESPOND

Invokes the PKI OCSP responder.

#### REVOKE

Revokes a certificate that was previously issued.

#### SCEPREQ

Generates a certificate request using Simple Certificate Enrollment Protocol (SCEP).

#### VERIFY

Confirms that a given user certificate was issued by this certificate authority and, if so, returns the certificate fields.

For end-user functions, FACILITY class resources protect this interface. Access authority is based on the user ID for the application (the user ID from the ACEE

## RACF administration for PKI Services

associated with the address space). To determine the user ID for the application, the current TCB is checked for an ACEE. If one is found, the authority of that user is checked. If there is no ACEE associated with the current TCB, the ACEE associated with the address space is used to locate the user ID.

The form for the FACILITY class resources is:

`IRR.RPKISERV.function[.ca_domain]`

*function*

Specifies one of the end-user function names in the preceding list.

| *ca\_domain*

|     Optionally specifies the PKI Services certificate authority (CA) domain name.  
|     Use this when your installation has established multiple PKI Services CAs and  
|     the `CA_domain` parameter is provided with IRRSPX00 for 31 bit and IRRSPX64  
|     for 64 bit.

|     **Restriction:** If the name of your initial CA domain is longer than 8 characters,  
|     you must truncate it to exactly 8 characters when you define the resource  
|     name in the FACILITY class.

| **Example:** For the GENCERT function, when the `ca_domain` is named Customers and  
| the `CA_domain` parameter is provided with IRRSPX00 for 31 bit and IRRSPX64 for  
| 64 bit, then the FACILITY class resource controlling the function is  
| IRR.RPKISERV.GENCERT.CUSTOMER. (The name Customers was truncated to  
| CUSTOMER. See the restriction for the `ca_domain` parameter.) When the `CA_domain`  
| parameter is not provided with IRRSPX00 for 31 bit and IRRSPX64 for 64 bit, the  
| FACILITY class resource is IRR.RPKISERV.GENCERT.

The access authorities you can assign for these FACILITY class resources have the following effects:

### NONE

Access is denied.

**READ** Access is permitted based on subsequent access checks against the caller's user ID.

### UPDATE

Access is permitted based on subsequent access checks against the application's user ID.

### CONTROL (or user ID has RACF SPECIAL)

Access is permitted, and no subsequent access checks are made.

**Example:** If you defined the FACILITY class profile  
IRR.RPKISERV.GENCERT.CUSTOMER to control access to the GENCERT function  
on the CA domain named Customers, you can prevent the user ID MYAPP from  
using the GENCERT function on that CA domain by issuing the command:  
PERMIT IRR.RPKISERV.GENCERT.CUSTOMER CLASS(FACILITY) ID(MYAPP) ACCESS(NONE)

For SAF GENCERT and EXPORT requests where the application has READ and UPDATE access, subsequent access checks are performed against the IRR.DIGTCERT.*function* FACILITY resources. These are identical to the checks the RACDCERT TSO command makes. See *z/OS Security Server RACF Command Language Reference* for more information.

For PKI Services EXPORT, GENCERT, GENRENEW, QRECOVER, REQCERT, REQRENEW, RESPOND, REVOKE, SCEPREQ, and VERIFY requests in which the

application has READ and UPDATE access, subsequent access checks are performed against the IRR.DIGTCERT.*function* FACILITY resources.

The following table summarizes the access requirements for the user ID whose access is checked.

Table 94. Summary of access authorities required for PKI Services requests

Request	Access
EXPORT	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.EXPORT                             <ul style="list-style-type: none"> <li>– READ access if PassPhrase is specified or if CertID is specified as PKICACERT.</li> <li>– UPDATE access if the PassPhrase parameter is not specified with IRRSPX00 for 31 bit and IRRSPX64 for 64 bit.</li> <li>– CONTROL access if you want to export a PKCS #7 certificate.</li> </ul> </li> </ul>
GENCERT	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.GENCERT — CONTROL access</li> <li>• IRR.DIGTCERT.ADD                             <ul style="list-style-type: none"> <li>– UPDATE access if any hostIdMappings information is specified in the certificate request parameter list or the UserId field in the certificate request parameter list indicates the certificate is being requested for another user other than the caller</li> <li>– READ access otherwise</li> </ul> </li> </ul>
GENRENEW	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.GENRENEW — READ access</li> <li>• IRR.DIGTCERT.GENCERT — CONTROL access</li> </ul> <p><b>Note:</b> It is assumed that the calling application has already verified the input certificate using the VERIFY function.</p>
QRECOVER	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.QRECOVER — READ access</li> </ul>
REQCERT	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.REQCERT — READ access</li> </ul>
REQRENEW	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.REQRENEW — READ access</li> </ul> <p><b>Note:</b> It is assumed that the calling application has already verified the input certificate using the VERIFY function.</p>
RESPOND	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.RESPOND — READ access</li> </ul>
REVOKE	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.REVOKE — READ access</li> </ul> <p><b>Note:</b> It is assumed that the calling application has already verified the target certificate using the VERIFY function.</p>
SCEPREQ	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.SCEPREQ — READ access</li> </ul>
VERIFY	<ul style="list-style-type: none"> <li>• IRR.DIGTCERT.VERIFY — READ access</li> </ul> <p><b>Note:</b> It is assumed that the calling application has already verified that the end user possesses the private key that correlates to the input certificate.</p>

## Authorizing administrative functions

The administrative functions are:

### CERTDETAILS

Get detailed information about one PKI Services issued certificate.

### MODIFYCERTS

Change PKI Services issued certificates.

## RACF administration for PKI Services

### MODIFYREQS

Change PKI Services certificate requests.

### QUERYCERTS

Query PKI Services issued certificates.

### QUERYREQS

Query PKI Services about certificate requests.

### PREREGISTER

Preregister clients who use Simple Certificate Enrollment Protocol (SCEP).

### REQDETAILS

Get detailed information about one PKI Services certificate request.

To control access to these functions:

- Use resources in the RACF FACILITY class. This class allows you to control access based on the CA domain.
- Use resources in the RACF PKISERV class. This class allows you to control access on a more granular level than the FACILITY class, which is based on the CA domain, the administrative function, and the template.

## Using the FACILITY class to control access to administrative functions

For the all administrative functions, the following single FACILITY class resource protects this interface.

```
IRR.RPKISERV.PKIADMIN[.ca_domain]
```

*ca\_domain*

Optionally specifies the PKI Services certificate authority (CA) domain name. Use this when your installation has established multiple PKI Services CAs and the *ca\_domain* parameter is provided with IRRSPX00 for 31 bit and IRRSPX64 for 64 bit.

**Restriction:** If the name of your initial CA domain is longer than 8 characters, you must truncate it to exactly 8 characters when you define the resource name in the FACILITY class.

- If the caller is RACF SPECIAL, no further access is necessary.
- Otherwise, the caller needs:
  - READ access to perform read operations (QUERYREQS, QUERYCERTS, REQDETAILS, and CERTDETAILS)
  - UPDATE access for the action operations (PREREGISTER, MODIFYREQS, and MODIFYCERTS).

**Example:** For administrative functions, when the *ca\_domain* is named Customers and the *CA\_domain* parameter is provided with IRRSPX00 for 31 bit and IRRSPX64 for 64 bit, the FACILITY class resource controlling this interface is IRR.RPKISERV.PKIADMIN.CUSTOMER. (The name Customers was truncated to CUSTOMER. See the restriction for the *ca\_domain* value.) When the *CA\_domain* parameter is not provided with IRRSPX00 for 31 bit and IRRSPX64 for 64 bit, IRR.RPKISERV.PKIADMIN is the name of the FACILITY class resource.

To determine the appropriate access level of the caller, the current TCB is checked for an ACEE. If one is found, the authority of that user is checked. If there is no ACEE associated with the current TCB, the ACEE associated with the address space is used to locate the user ID.

**Attention:** UPDATE access to the IRR.RPKISERV.PKIADMIN[*ca\_domain*] resource also controls who can act as PKI Services administrators. PKI Services administrators play a very powerful role in your organization. The decisions they make when managing certificates and certificate requests determine who accesses your computer systems and what privileges they have when doing so.

**Guideline:** Give UPDATE authority to only highly trusted individuals, but avoid allowing these same individuals to have direct access to the end-user functions of the R\_PKIServ callable service described in “Authorizing end-user functions” on page 475. This helps to maintain a secure separation of duties.

### Using the PKISERV class to control access to administrative functions

You can use profiles in the PKISERV class to control access to R\_PKIServ administrative functions on a more granular level than you can with profiles in the FACILITY class. If the AdminGranularControl switch in the pkiserv.conf configuration file is set to T, profiles in the PKISERV class are checked in addition to profiles in the FACILITY class to determine authorization to these functions. If no profile is found protecting a function, authorization to the function fails.

To use the PKISERV class, you need to take the following steps:

1. Activate generic profile checking for the class:  

```
SETOPTS GENERIC(PKISERV)
```
2. Define profiles for the PKISERV class resources and authorize users to use the resources:  

```
RDEFINE PKISERV profile_name UACC(NONE)
PERMIT profile_name CLASS(PKISERV) ID(user_ID or group) ACCESS(access_level)
```
3. Activate and RACLIST the class:  

```
SETOPTS CLASSACT(PKISERV) RACLIST(PKISERV)
```

Any time that you update the profiles in the class, refresh the in-storage profiles:  

```
SETOPTS RACLIST(PKISERV) REFRESH
```

For the query functions (QUERYREQS, QUERCERTS, REQDETAILS, and CERTDETAILS), the resources in the PKISERV class are of the form:

*ca\_domain.action.template\_nickname*

where

*ca\_domain*

Specifies the PKI Services certificate authority (CA) domain name.

#### Rules:

- The domain name is at most 8 characters long.
- The domain name can contain only alphanumeric characters and the national characters @, #, and \$.
- If there is no domain name, the qualifier must be NOCADOMAIN.

*action*

Specifies the function. It has one of the following values:

- QUERYREQS
- QUERCERTS
- QUERYREQDETAILS
- QUERCERTDETAILS

## RACF administration for PKI Services

### Rules:

- For the REQDETAILS function, if the administrator has READ access to the QUERYREQDETAILS profile, the password value is replaced by blanks before it is returned. If the administrator has UPDATE access, the password value is returned.
- For the CERTDETAILS function, if the administrator has READ access to the QUERYCERTDETAILS profile, the password value is replaced by blanks before it is returned. If the administrator has UPDATE access, the password value is returned.
- For all other functions, READ access is sufficient.

### *template\_nickname*

Specifies the nickname of the certificate template.

### Rules:

- The template nickname is at most 8 characters long.
- The template nickname can contain only alphanumeric characters and the national characters @, #, and \$.
- If there is no template nickname, the qualifier must be NONICKNAME.

**Example:** An administrator has either READ or UPDATE access to the FACILITY class profile IRR.RPKISERV.PKIADMIN.MYDOMAIN and also has READ access to the PKISERV class profiles MYDOMAIN.QUERYREQS.1YBSSL and MYDOMAIN.QUERYCERTS.1YBSSL. That administrator can perform QUERYREQS and QUERYCERTS functions on the requests and certificates created with the template '1-Year PKI SSL Browser Certificate' in the domain MYDOMAIN. If that same administrator does not have READ or UPDATE access to the PKISERV class profile MYDOMAIN.QUERYREQS.5YSSSL, that administrator would not be able to perform QUERYREQS functions on requests created with the template '5-Year PKI SSL Server Certificate' in the same domain.

For the update functions (MODIFYREQS, MODIFYCERTS, and PREREGISTER), the resources in the PKISERV class are of the form:

*ca\_domain.action.template\_nickname*

where

*ca\_domain*

Specifies the PKI Services certificate authority (CA) domain name.

### Rules:

- The domain name is at most 8 characters long.
- The domain name can contain only alphanumeric characters and the national characters @, #, and \$.
- If there is no domain name, the qualifier must be NOCADOMAIN.

*action*

Specifies the function. It has one of the following values:

- PREGISTER
- APPROVE (for MODIFYREQS)
- APPROVEWITHMODS (for MODIFYREQS)
- REJECT (for MODIFYREQS)
- DELETEREQS (for MODIFYREQS)
- REVOKE (for MODIFYCERTS)
- DELETECERTS (for MODIFYCERTS)

- RESUME (for MODIFYCERTS)
- AUTORENEWENABLE (for MODIFYCERTS)
- AUTORENEWDISABLE (for MODIFYCERTS)
- CHANGEMAIL (for MODIFYCERTS)
- CREATECRL (for MODIFYCERTS)
- POSTCERT (for MODIFYCERTS)

*template\_nickname*

Specifies the nickname of the certificate template.

### Rules:

- The template nickname is at most 8 characters long.
- The template nickname can contain only alphanumeric characters and the national characters @, #, and \$.
- The template is irrelevant for CREATECRL and POSTCERT and the template nickname is not included in the resource name for these actions.
- You must specify a template nickname for the PREREGISTER action.
- For all actions other than CREATECRL, POSTCERT, and PREREGISTER, if there is no template nickname, the qualifier must be NONICKNAME.

Examples:

- READ access to the profile MYDOMAIN.APPROVE.1YBSSL allows the administrator to approve requests under the template '1-Year PKI SSL Browser Certificate' in the domain MYDOMAIN.
- READ access to the profile MYDOMAIN.APPROVEWITHMODS.1YBSSL allows the administrator to modify the content of requests and then approve them under the '1-Year PKI SSL Browser Certificate' template in the domain MYDOMAIN.
- READ access to the profile MYDOMAIN.REVOKE.1YBSSL allows the administrator to revoke or suspend certificates under the '1-Year PKI SSL Browser Certificate' template in the domain MYDOMAIN.
- READ access to the profile MYDOMAIN.PREREGISTER.5YSCEPP allows the administrator to preregister requests under the '5-Year SCEP Certificate - Preregistration' template in the domain MYDOMAIN.

---

## Using encrypted passwords for LDAP servers

PKI Services uses an LDAP directory to store certificates. LDAP requires authenticating (binding) to the directory. You can do this by using a distinguished name and passwords. Passwords for binding (to multiple LDAP directories) can be encrypted or in clear text. The UNIX programmer or LDAP programmer or both determine whether to use encrypted LDAP bind passwords. You store information about passwords in the PKI Services configuration file, `pkiserv.conf`.

If you do not need the bind password for the LDAP server to be encrypted, you specify the values for `Server1`, `AuthName1`, and `AuthPwd1` in the `pkiserv.conf` configuration file. If you want the bind password for the LDAP server to be encrypted, you can use either one of the following profiles:

- A profile named `IRR.PROXY.DEFAULTS` in the `FACILITY` class (This profile stores default binding information. It is the profile where PKI Services looks when there is no binding information.)
- A profile (you select the name) in the `LDAPBIND` class. (You can name this profile whatever you want if it matches the `BindProfile1` value that is specified in the `pkiserv.conf` configuration file. (See Step 3 on page 104.)

## RACF administration for PKI Services

Before creating either of the preceding profiles, the RACF administrator defines the LDAP.BINDPW.KEY profile in the KEYSMSTR class. This profile contains a SSIGNON segment, which holds either the masked or encrypted value for the key that encrypts passwords stored in the RACF database. Then the RACF administrator creates either of the preceding profiles with a PROXY segment that stores the binding information (the server name, bind distinguished name, and password).

### Steps for using encrypted passwords

Perform the following steps to use encrypted LDAP bind passwords:

1. Define a RACF KEYSMSTR class profile by entering the following command, replacing the highlighted value with your own key:

**Example:**

```
RDEFINE KEYSMSTR LDAP.BINDPW.KEY SSIGNON(KEYENCRYPTED(0023528875DECFAC))
```

In this example:

- LDAP BIND passwords are masked by using a key that is saved in the KEYSMSTR class, LDAP.BINDPW.KEY.
- The key is **0023528875DECFAC**. (Replace this with your own key.)
- KEYENCRYPTED is specified (rather than KEYMASKED) because ICSF is active. (If ICSF is not active, replace KEYENCRYPTED with KEYMASKED.)

- 
2. Activate the KEYSMSTR class by entering the following command:  
SETROPTS CLASSACT(KEYSMSTR)

- 
3. If you intend to use the LDAPBIND class, for each LDAP directory, create a RACF LDAPBIND class profile by entering the following command:

```
RDEFINE LDAPBIND MY.LDAP.SERVER1  
  PROXY(LDAPHOST(ldap://some.ldap.host:389)  
  BINDDN('CN=JOE USER,OU=POUGHKEEPSIE,O=IBM,C=US') BINDPW('MYPASS1')
```

Replace the highlighted parameters as follows:

- a. Optionally, replace *MY.LDAP.SERVER1* with the profile name you want to use.
- b. Replace *ldap://some.ldap.host:389* with your LDAP server URL. You can specify the URL with or without the preceding string “ldap:” or “ldaps:”.
- c. Replace *CN=JOE USER,OU=POUGHKEEPSIE,O=IBM,C=US* with the bind DN.
- d. Replace *MYPASS1* with the bind password.

**Note:** All bind DN qualifiers and the bind password are case-sensitive.

- 
4. If you intend to use IRR.PROXY.DEFAULTS instead of the LDAPBIND class for encrypted LDAP bind passwords, issue the following command to create the profile:

```
RDEFINE FACILITY IRR.PROXY.DEFAULTS  
  PROXY(LDAPHOST(ldap://some.ldap.host:389)  
  BINDDN('CN=JOE USER,OU=POUGHKEEPSIE,O=IBM,C=US') BINDPW('MYPASS1')
```

Replace the highlighted parameters as follows:

- a. Replace *ldap://some.ldap.host:389* with your LDAP server URL. You can specify the URL with or without the preceding string “ldap:” or “ldaps:”.

- b. Replace `CN=JOE USER,OU=POUGHKEEPSIE,O=IBM,C=US` with the bind DN.
- c. Replace `MYPASS1` with the bind password.

**Note:** All bind DN qualifiers and the bind password are case-sensitive.

- 
- 5. Optionally, check your work by listing the segment with the `RLIST` command. If you are using the `LDAPBIND` class, issue the following command:

```
RLIST LDAPBIND MY.LDAP.SERVER1 PROXY NORACF
```

Replace `MY.LDAP.SERVER1` with the profile name you used.

**Results:** This command displays information like the following:

```
CLASS      NAME
LDAPBIND   MY.LDAP.SERVER1
```

```
PROXY INFORMATION
```

```
LDAPHOST= LDAP://SOME.LDAP.HOST:389
```

```
BINDDN= CN=LDAP ADMINISTRATOR,OU=POUGHKEEPSIE,O=IBM,C=US
```

```
BINDPW= YES
```

If you are using the `IRR.PROXY.DEFAULTS` profile of the `FACILITY` class, issue the following command:

```
RLIST FACILITY IRR.PROXY.DEFAULTS PROXY NORACF
```

**Results:** This command displays information like the following:

```
CLASS      NAME
FACILITY   IRR.PROXY.DEFAULTS
```

```
PROXY INFORMATION
```

```
LDAPHOST= LDAP://SOME.LDAP.HOST:389
```

```
BINDDN= CN=LDAP ADMINISTRATOR,OU=POUGHKEEPSIE,O=IBM,C=US
```

```
BINDPW= YES
```

---

---

## Part 6. Using the certificate validation service

This part explains how to implement the PKI Services Trust Policy (PKITP) plug-in for OCSF.

- Chapter 21, “PKI Services Trust Policy (PKITP),” on page 487 describes the certificate validation service. It gives an overview of the OCSF plug-in PKITP, describes certificate policies and extensions, and explains additional configuration needed for PKITP and using the Trust Policy API, `CSSM_TP_PassThrough`.

---

## Chapter 21. PKI Services Trust Policy (PKITP)

This topic:

- Provides an overview of PKITP, the PKI Services Trust Policy plug-in for OCSF
- Describes:
  - Certificate policies
  - Revoke status checking
  - Certificate extensions
  - CRL extensions and CRL entry extensions
- Explains how to perform additional OCEP configuration needed for PKITP.
- Describes CSSM\_TP\_PassThrough (the Trust Policy API).

---

### Overview of PKITP

The PKI Services Trust Policy (PKITP) is an OCSF plug-in to perform certificate validation against a SAF key ring that contains a trusted CA or site certificate (called an *anchor certificate*) or a virtual key ring of either CERTAUTH or SITE certificates. For information about creating a SAF key ring using the RACDCERT ADDRING command, see *z/OS Security Server RACF Command Language Reference*. For information about using a virtual key ring with the R\_data1ib callable service, see *z/OS Security Server RACF Callable Services*.

PKITP supports the following two functions through the implementation of CSSM\_TP\_PassThrough:

- **CertGroupVerify**
- **FreeEvidence**

Server applications running on z/OS can use this function to verify certificates that other network entities (for example, users and other servers) present. PKI Services or other certificate authorities might have issued these certificates.

The server application must attach to and open the key ring using the OCEP DL plug-in. (For more information about OCEP and the use of SAF key rings, see *Integrated Security Services Open Cryptographic Enhanced Plug-ins Application Programming* .) The server application must also bind to any needed LDAP directories by attaching to and opening these directories using the OCSF LDAPDL plug-in. These LDAP directories can be internal corporate directories, directories of extranet business partners, directories of public certificate authorities, or combinations of these.

The following figure illustrates this diversity. The uppercase letter boxes are certificate authorities, and the lowercase letter boxes are end-entity certificates.

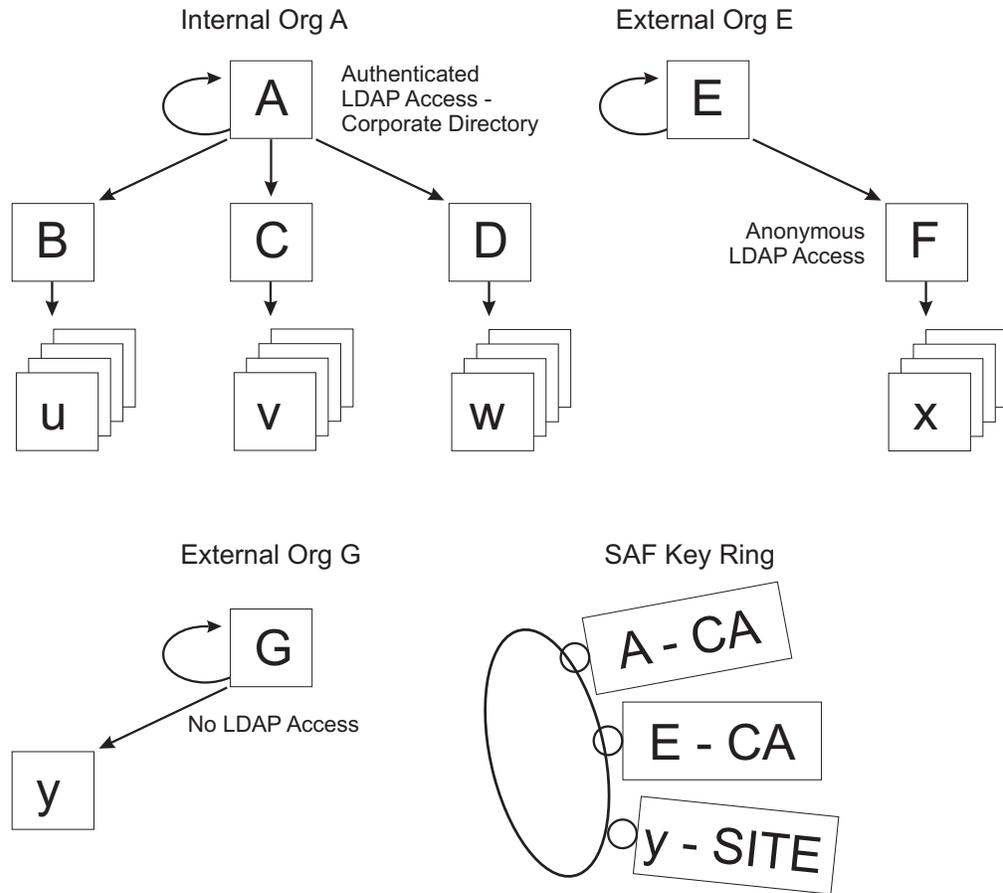

Figure 77. Examples of organizations, certificates, and chains

Organization A represents the local (corporate) certificate hierarchy. It contains one self-signed root certificate A. Perhaps RACF or the Tivoli PKI created this. B, C, and D are intermediate CAs. They could be separate instances of PKI Services. Certificates issued within this hierarchy are stored in an LDAP directory accessible to corporate server applications.

Organization E represents a public or business partner's certificate hierarchy with an LDAP directory that allows anonymous access. Organization G represents some other certificate hierarchy, in which either the directory does not exist or it is not accessible. The key ring contains three anchor certificates. Certificates A and E are trusted CAs, and there is a business need to trust end-entity certificate y, even though it cannot be verified.

If each of these CAs has posted current CRLs to either their default LDAP locations or to distribution point CRLs in LDAP and all certificate chains to be verified are genuine, the PKITP **CertGroupVerify** function can validate the following input chains:

- Single certificates x, u, v, or w (PKITP can extract the missing links from the directories.)
- Chains u-B, v-C, w-D, u-B-A, v-C-A, w-D-A, x-F, or x-F-E (These chains have no missing links.)
- Any chain beginning with certificate y (As Figure 77 shows, y is in the key ring as a SITE. Site certificates are trusted regardless.)

Note that, as with the OCEP Trust Policy, non-self-signed (intermediate) CA certificates can be connected to the key ring to shorten the validation path. Doing so has the following consequences:

- Certificate revocation list (CRL) checking is not performed for the anchor certificate in the chain, even if this happens to be an intermediate CA certificate. If the intermediate CA certificate is revoked, PKITP does not detect it.
- A chain containing the parent chain of the intermediate CA cannot be verified.

**Guideline:** When an intermediate CA certificate is connected to the key ring, the certificates that make up its parent chain should be connected also. This ensures that all chains originating from the intermediate CA or higher can be verified.

---

## Certificate policies

PKITP supports CA and server application-defined certificate policies. CAs can and, in most cases, do establish their own policies for issuing certificates. These policies are declared within issued certificates through the CertificatePolicies extension. When this extension exists and is *not* marked critical, the extension is for informational purposes only - for example, specifying the URL for locating the CA's certificate practice statement (CPS). When this extension exists and is marked critical, the policies identified in the extension restrict the use of the certificate. These restrictions apply to subordinate CA certificates and to end-entity certificates. (For information about how PKI Services support the CertificatePolicies extension, see "Using certificate policies" on page 268.)

Similarly, a server application can be a general application that wants to verify certificates for no specific policy or can be an application that was written for a specific purpose and wants to verify certificates that are issued for that purpose (policy).

If the server application specifies an explicit set of policies, then at least one of these policies must be present in each certificate of the certification path (chain). Additionally, PKITP extracts the certificate policies marked critical from each certificate in the chain to determine the intersection - that is, only policies that are listed in every critically marked CertificatePolicies extension are retained. The server application must indicate that it supports at least one of these policies. If any of these tests are unsuccessful, certificate validation fails.

---

## Checking certificate status with PKITP

PKITP checks the revocation status of a certificate by retrieving certificate revocation lists (CRLs) or, when specified in the certificate, by invoking an online validation service that uses the online certificate status protocol (OCSP).

PKITP certificate revocation checking is performed when useCRLS is set higher than 0. It follows the sequence of validation stages shown in Table 95.

*Table 95. Sequence of validation stages for PKITP certificate revocation checking*

Validation stage	Description
OCSP responder	The trust policy invokes the OCSP responder specified in the AuthInfoAccess extension.  If none is specified or if the trust policy fails to receive certificate status from the OCSP responder, it proceeds to the next stage.

Table 95. Sequence of validation stages for PKITP certificate revocation checking (continued)

Validation stage	Description
DP CRL, using the URI format	<p>The trust policy searches for the DP CRL using the directories, if any, listed in URI format in the CRLDistributionPoints extension in the order they appear.</p> <p>If the DP CRL is found, it is used to determine if the certificate is revoked. If the trust policy fails to find the DP CRL using the URI formats, it proceeds to the next stage.</p>
DP CRL, using the distinguished-name format	<p>The trust policy searches for the DP CRL in the LDAP directories attached through the distinguished name specified, if any, in the CRLDistributionPoints extension.</p> <p>If the trust policy fails to find the DP CRL using the distinguished name and the extension is <i>not</i> marked critical, it proceeds to the next stage.</p> <p>If the trust policy fails to find the DP CRL and the extension is marked critical, the validation fails and error code 8029 (CRL not found) is returned.</p> <p>If DP CRL processing is not to be performed (useCRLS is set to 0) and the target certificate contains a CRLDistributionPoints extension marked critical, validation fails and error code 8029 is returned. No attempt is made to locate the DP CRL.</p>
Global revocation list	<p>The trust policy uses the global CRL to find revocation status information for the certificate.</p>

## Certificate extensions

PKITP supports the following certificate extensions:

**AuthorityInformationAccess**

Checked for form only.

**AuthorityKeyIdentifier**

Checked for form only.

**BasicConstraints**

For CA certificate, cA flag must be on. Also checked for certification path length.

**CertificatePolicies**

See “Certificate policies” on page 489.

**CRLDistributionPoints**

See “Checking certificate status with PKITP” on page 489.

**HostIdMappings**

Checked for form only.

**IssuerAltName**

Checked for form only. Must be marked critical if the issuer DN is empty.

**KeyUsage**

For CA certificates, the key CertSign flag must be on.

**SubjectAltName**

Checked for form only. Must be marked critical if the subject DN is empty.

**SubjectKeyIdentifier**

Checked for form only.

All other extensions are ignored if they are not marked critical. Unsupported critical extensions prevent certificate validation.

---

## CRL extensions and CRL entry extensions

PKITP supports the following CRL and CRL entry extensions, which are checked for form only:

**CRL extensions:**

- AuthorityKeyIdentifier
- CRLNumber
- IssuerAltName
- IssuingDistributionPoint

**CRL entry extensions:**

- CertificateIssuer
- CRLReason
- HoldInstructionCode
- InvalidityDate

All other extensions are ignored if they are not marked critical. Unsupported critical extensions prevent certificate validation.

---

## Files for PKITP

The following table lists files for PKITP:

*Table 96. Summary of information about important files for PKITP*

File	Description	Source location (default)
Makefile.pkitpsamp	Makefile for pkitpsamp.c.	/usr/lpp/pkiserv/samples/
install_pkitp	Program that registers the PKI Services Trust Policy plug-in with OCSF.	/usr/lpp/pkiserv/bin
pkitp_ivp	This program verifies that the plug-in installed successfully.	/usr/lpp/pkiserv/bin
pkitp.h	Contains #define definitions for applications calling the PKI Services OCSF Trust Policy.	/usr/lpp/pkiserv/include/
pkitp.so	This is the OCSF Trust Policy plug-in for PKI Services.	/usr/lpp/pkiserv/lib
pkitpsamp.c	Sample application program (in the C language) to call the PKI Trust Policy plug-in.	/usr/lpp/pkiserv/samples

## Configuring and getting started with PKITP

If you have not already installed and configured OCSF and OCEP, you need to do so now. Follow the instructions in “Tasks to perform before configuring PKITP” on page 31, and then perform the following post-installation instructions.

The PKITP must be registered with OCSF before being used.

### Steps for configuring PKITP

#### Before you begin

If you have not already done so, run the OCSF and OCEP install and verification scripts.

#### Procedure

Perform the following steps to install and configure PKITP:

1. Run the PKITP post installation script by entering the following command:

```
/usr/lpp/pkiserv/bin/install_pkitp
```

The program prompts you for certain information. Assuming PKI Services has been installed in its default location, answer the prompts as follows:

Prompt	Response
addin directory?	/usr/lpp/pkiserv/lib
addin filename?	pkitp.so
action? [install   uninstall]	install

You know you are done and that the installation was successful when you see the following:

```
Installing IBMPKITP...
Addin successfully installed.
```

2. Update your C/C++ environment variable `_CEE_RUNOPTS` to include `XPLINK(ON)` if it does not already include it. For example, execute the following command from a UNIX shell.

```
export _CEE_RUNOPTS=$_CEE_RUNOPTS' XPLINK(ON)'
```

3. To verify that the installation was successful, run the verification program (`/usr/lpp/pkiserv/bin/pkitp_ivp`).

You know you are done and that the verification program ran successfully when you see the following:

```
Starting pkitp IVP
Initializing CSSM
CSSM Initialized
Attaching pkitp
Attach successful, Detaching pkitp
Detach of pkitp successful
Completed pkitp IVP
```

## Trust Policy API

### Programming Interface Information

PKITP supports only one API, `CSSM_TP_PassThrough`. The globally unique identifier (GUID) for this plug-in is: `{01EBC8AC-CC6F-450c-83B4-F0BE0FBE78F9}`. (Before an application can use a module, an installation application must register the module's name, location, and description with OCSF. The name given to a module includes both a logical name and a GUID. The logical name is a string the module developer chooses to describe the module. The GUID is a structure used to differentiate between service provider modules in the OCSF registry.)

## CSSM\_TP\_PassThrough

### Purpose

This function lets applications call TP module-specific operations that have been exported. For PKITP, the module-specific operations support certificate chain validation, based on the CA and SITE certificates that are contained within a key ring.

### Format

```
void * CSSMAPI CSSM_TP_PassThrough
    (CSSM_TP_HANDLE TPHandle,
     CSSM_CL_HANDLE CLHandle,
     CSSM_DL_HANDLE DLHandle,
     CSSM_DB_HANDLE DBHandle,
     CSSM_CC_HANDLE CCHandle,
     uint32 PassThroughId,
     const void *InputParams)
```

### Parameters

#### *TPHandle*

Handle to this Trust Policy module (PKITP).

#### *CLHandle*

Not used. PKITP ignores this.

#### *DLHandle*

Not used. PKITP ignores this.

#### *DBHandle*

Not used. PKITP ignores this.

#### *CCHandle*

Not used. PKITP ignores this.

#### *PassThroughId*

Used to indicate the pass-through service requested. Two services are provided:

- Service 1 **CertGroupVerify** (`TP_VERIFY_PASSTHROUGH`)
- Service 2 **FreeEvidence** (`TP_FREE_EVIDENCE_PASSTHROUGH`)

#### *InputParams*

Pointer to the API-caller-provided input parameter structure. The same structure is used for both pass-through functions. It is declared in `pkitp.h` as follows:

## CSSM\_TP\_PassThrough

```
typedef struct tp_verify_extra {  
  
    /* similar parameters as TP_CertGroupVerify */  
    CSSM_CL_HANDLE CLHandle;  
    CSSM_DL_DB_LIST_PTR DBList;  
    unsigned int reserved; //@L1C  
    CSSM_TP_STOP_ON VerificationAbortOn;  
    CSSM_CERTGROUP_PTR CertToBeVerified;  
  
    /* extra parameters: input */  
    TP_INITIALPOLICY_PTR InitialPolicy;  
    time_t CurrentTime;  
    time_t ValidationTime;  
  
    /* extra parameters: output */  
    CSSM_BOOL result;  
    uint32 DLStatusCode;                // Status code from DL failures  
    uint32 DLIndex;                    // Index (from 0) into DBList  
    TP_EVIDENCE_PTR Evidence;  
  
} TP_VERIFY_EXTRA, *TP_VERIFY_EXTRA_PTR;
```

### The DB list

This DBList contains one or more handles to open DB stores. The last entry in this list must be a handle to an OCEPDL DB (a real or *virtual* SAF key ring). The key ring is used to declare the list of trusted CA and SITE certificates. Like the OCEP Trust Policy, certificate chains to verify must originate from one of these trusted CAs (anchors) or the end-entity certificate must be one of the SITE certificates. Also like the OCEP Trust Policy, if the security product (SAF) marks any certificate in the candidate chain NOTRUST, the certificate chain fails validation.

The other entries in the list are used for LDAPDL DB stores. PKITP runs through these to locate CRLs and intermediate CA certificates. For each item PKITP requests, the LDAPDLs are queried in the order in which they appear in the list. The search stops the first time an LDAPDL returns an item or when the OCEPDL is reached. No query is made to the OCEPDL to locate CRLs or intermediate CA certificates.

### The initial policy

The following optional, caller-provided and initialized structure defines InitialPolicy. PKITP uses the default values if the structure is not provided:

```
typedef struct tp_initialpolicy {  
  
    /* initial-policy-set */  
    uint32 NumberofPolicyIdentifiers; // number of application specific  
                                     // policy OIDs (defaults to 0)  
    CSSM_OID_PTR PolicyIdentifiers;  // Address of array of policy OIDs  
                                     // or 0  
    uint32 useCRLs;                  // 0 - no CRL processing  
                                     // 1 - Check CRLs only if current CRLs found  
                                     // 2 - Strong CRL checking (default)  
  
    /* initial-explicit-policy indicator */  
    CSSM_BOOL initialExplicitPolicy; // If true, indicates PKITP should  
                                     // consider policy set critical  
                                     // defaults to false  
  
    /* initial-policy-mapping-inhibit indicator */  
    CSSM_BOOL initialPolicyMappingInhibit; // not used, ignored  
  
} TP_INITIALPOLICY, *TP_INITIALPOLICY_PTR;
```

## The evidence

The following optional, caller-provided structure defines the evidence. This structure is used to return information relative to the validation decision PKITP makes. The caller must free the data areas returned. (The **FreeEvidence** pass-through function is provided for this.)

```
typedef struct tp_evidence {

    /* valid certification path if validation succeeds */
    CSSM_CERTGROUP_PTR CompleteCertGroup;

    /* relevant CRL if validation fails */
    CSSM_DATA_PTR CRL;

    /* relevant certificate if validation fails */
    CSSM_DATA_PTR Cert;

    /* authority-constrained-policy */
    CSSM_BOOL authAnyPolicy;
    uint32 NumberOfAuthCertPolicyIdentifiers;
    CSSM_OID_PTR AuthCertPolicyIdentifiers;

    /* list of policy mappings that occurred */
    uint32 NumberOfMappedPolicies;
    TP_CSSM_OID_PAIR_PTR mappedPolicies;

} TP_EVIDENCE, *TP_EVIDENCE_PTR;
```

## Error codes

Table 97 lists the error codes that are unique to PKI Services OCSF Trust Policy (PKITP).

*Table 97. PKI Services OCSF Trust Policy (PKITP) error codes*

Decimal value	Error description
8001	Certificate encoding error. Incorrect CertificatePolicies extension.
8002	Certificate policies violation.
8003	Incorrect certificate distinguished name chaining.
8004	Certificate encoding error. Subject name missing.
8006	Incorrect certificate BasicConstraints extension - cA flag off in signing certificate.
8008	Incorrect certificate KeyUsage extension - keyCertSign flag off in signing certificate.
8010	Unsupported AltName form in certificate.
8013	Certificate or CRL encoding error. Signature algorithm mismatch.
8014	Certificate encoding error. Incorrect version.
8015	CRL encoding error. Incorrect version.
8016	Unsupported critical extension in certificate.
8017	Unsupported critical extension in CRL.
8018	Unsupported critical entry extension in CRL.
8019	Certificate encoding error. Duplicate extension.
8020	CRL encoding error. Duplicate extension.
8021	Certificate signature failed verification.
8022	CRL signature failed verification.

Table 97. PKI Services OCSF Trust Policy (PKITP) error codes (continued)

Decimal value	Error description
8023	Incorrect date range in certificate or CRL. NotAfter earlier than NotBefore.
8024	Certificate's date range is in the future.
8025	Certificate has expired.
8026	CRL's date range is in the future.
8027	CRL has expired.
8028	DBList incorrect, no LDAPDL DBs or non-LDAPDL specified.
8029	CRL not found.
8030	Certificate is revoked.
8031	Unable to build certificate chain.
8033	Certificate not trusted.
8034	Incorrect CRLDistributionPoints extension in certificate.
8501	Unexpected status code returned from accessing LDAPDL.
8502	Unexpected status code returned from accessing OCEPDL.
8503	DBList incorrect, no OCEPDL DB or DB empty.

## Building the sample application to invoke the certificate validation service

To perform certificate validation, your server application calls the CSSM\_TP\_PassThrough API (see “CSSM\_TP\_PassThrough” on page 493), passing it the certificate chain to verify. The API returns a Boolean value indicating success or failure, along with additional information about the certificate chain. The `pkitpsamp.c` code sample that follows at “Code sample of the PKITP program (`pkitpsamp.c`)” on page 498 is provided as an aid for developing your own server application. By default, you can find this file in the `/usr/lpp/pkiserv/samples` directory.

### Steps for building the sample application

Perform the following steps to build the sample application:

1. Copy the `pkitpsamp.c` program and `Makefile.pkitpsamp` to the current directory by entering the following commands:

```
cp /usr/lpp/pkiserv/samples/pkitpsamp.c pkitpsamp.c
cp /usr/lpp/pkiserv/samples/Makefile.pkitpsamp Makefile
```
2. Before compiling `pkitpsamp.c`, you need to edit some data (for example, information about how you want the Trust Policy to operate and where your LDAP is located). In the `pkitpsamp.c` code (see “Code sample of the PKITP program (`pkitpsamp.c`)” on page 498), find the section that begins with a block comment that says `// Start of application specific options`. Update the code as necessary up to the block comment that says `// End of application specific options`:
  - a. If the number of LDAP servers is not 1, change `NUM_LDAPS`.
  - b. Update `ldap_info` by specifying your LDAP server and port (`myldap.mycompany.com:389` in the sample program). If you have more than one LDAP server, you need to provide this information for each LDAP server.

- c. Replace the "@USERID@/@KEYRINGNAME@" default value for the char ringname[ ] variable in the code sample. Specify either the name of the real SAF key ring containing your trusted CA or site certificates, or the name of the *virtual* key ring that points to all your trusted CA or site certificates.
- If using a real SAF key ring, specify the owning user ID and ring name of the real SAF key ring. **Example:** patelusr/ring01
  - If using a virtual key ring, replace the default value with either \*AUTH\*/\* or \*SITE\*/\* to point to all your trusted CA or site certificates, respectively. (The name of a virtual key ring is always an asterisk.)
- d. If necessary, change the value of useCRLs:
- 0** This means using no CRL processing. (You must specify 0 if you have no LDAP servers.)
  - 1** This means querying LDAP for CRLs and processing those found. This is the value in the sample.
  - 2** This means using strong CRL checking. (With strong CRL checking, a valid CRL must be found for each CA certificate in the chain.)
- e. If necessary, change NUM\_POLICIES, the policies that the application calling PKITP uses. In the sample, this is 2. For each policy, specify the DER-encoded policy information.
- f. If necessary, change INITIALExplicitPolicy from the default of FALSE to TRUE if you want PKITP to require all certificates in the chain to have at least one policydata in the preceding list.
- 
3. Compile and link to produce the executable, pkitpsamp, by entering the following command:
- ```
make
```
- 
4. Export LIBPATH to include /usr/lpp/pkiserv/lib.
- Example:**
- ```
export LIBPATH=$LIBPATH:/usr/lpp/pkiserv/lib
```
- 
5. Enable program control by setting the extended attribute for pkitpsamp.
- Example:**
- ```
extattr +p pkitpsamp
```
- Restriction:** To execute the **extattr** command with the **+p** option, you must have at least READ access to the BPX.FILEATTR.PROGCTL resource in FACILITY class.
- 
6. Update your C/C++ environment variable \_CEE\_RUNOPTS to include XPLINK(ON) if it does not already include it. For example, execute the following command from a UNIX shell.
- Example:**
- ```
export _CEE_RUNOPTS=$_CEE_RUNOPTS' XPLINK(ON)'
```
- 
7. Run the pkitpsamp.c in your own directory by entering the following command:
- ```
pkitpsamp
```
-

## Code sample of the PKITP program (pkitpsamp.c)

**Note:** The following listing might not be identical to the code sample shipped with the product. For the most current sample, see the /usr/lpp/pki/serve/samples directory.

```

/* Sample use of IBM PKITP program
/*
/* Purpose: Program attaches needed CSSM modules, then prompts
/* the user for filename(s) containing DER encoded
/* certificates. The certificate(s) are read from the
/* file, then passed to PKITP for verification.
/* A summary of the results are printed to stdout.
/*
/* Caution: In order to run this sample program, modification MUST
/* BE MADE to several values assigned to the following
/* variables that are defined between the block comment
/* containing the text "Start of application specific
/* options" and the block comment containing the text
/* "End of application specific options"(without the
/* quotation marks):
/*
/* #define NUM_LDAPS 1
/* Define the number of LDAP servers that PKITP should
/* query for certificates, CRLs and ARLs. This can be 0,
/* if entire certificate chain will be passed as input to
/* PKITP AND caller requests to NOT process CRLs/ARLs (see
/* useCRLs option below).
/*
/* struct ldap_info ldapserver[NUM_LDAPS] =
/* { "@LDAPSERVERNAME:PORTNUMBER@",
/* "@LDAPUSER@",
/* "@LDAPUSERPASSWORD@"};
/* If NUM_LDAPS > 0, then ldapserver array should define
/* the LDAP server:port, user and password for each LDAP
/* server. Replace @LDAPSERVERNAME:PORTNUMBER@ with the
/* appropriate ldap server name and port number (e.g
/* myldap.mycompany.com:389 ). Replace @LDAPUSER@ with the
/* appropriate ldap admin user name (e.g cn=root) and
/* @LDAPUSERPASSWORD@ with the password for the specified
/* ldap user name (e.g rootpw)
/*
/* char keyring[] = "@USERID/@KEYRINGNAME@";
/* Define the SAF keyring containing trusted CA and/or
/* site certificates. Format is "USERID/keyname". Replace
/* @USERID@ with the userid of the keyring owner and
/* @KEYRINGNAME@ with the name of the keyring. (e.g
/* IBMUSER/CAring) Note that the userid and the keyring
/* names are case sensitive so the userid is all
/* uppercase and the keyring name is mixed case in this
/* example.
/*
/* #define USECRLS 1
/* Define how the useCRLs option should be set.
/* Set to 0 if no CRL processing is to be performed
/* Set to 1, if LDAP is to be queried for CRLs and
/* process the CRLs found.
/* Set to 2, for strong CRL checking (With strong CRL
/* checking, a valid CRL must be found for each CA
/* certificate in the chain.)
/*
/* #define NUM_POLICIES 2
/* static unsigned char my_policy1[5] =
/* {0x06,0x03,0x2a,0x03,0x04}; // DER encoded 2.3.4

## Part 7. Troubleshooting

This part explains using logs for troubleshooting, including the following:

- Chapter 22, “Using information from SYS1.LOGREC,” on page 511 contains information about SYS1.LOGREC, which is used to record unusual runtime events, such as an exception.
- Chapter 23, “Using information from the PKI Services logs,” on page 519 contains information about using the PKI Services logs, which are ongoing, to debug problems and explains how to change logging options and display log options settings.

You can also use the iclview and vosview utilities for troubleshooting. For more information about these utilities, see “Using the iclview utility” on page 415 and “Using the vosview utility” on page 427.

---

## Chapter 22. Using information from SYS1.LOGREC

SYS1.LOGREC keeps records of unusual runtime events, such as exceptions or unexpected return codes from calls to system services. It records hardware errors, selected software errors, and selected system conditions in the LOGREC data set. You can use the LOGREC data set as a starting point for diagnosing a problem. It supplies symptom data about the failure and shows the order in which errors occurred. After you have collected this information, you should report the problem to the IBM support center.

The following table describes the contents of the LOGREC data for PKI Services:

Table 98. LOGREC data for PKI Services

| CSECT                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Figure 79. Sample LOGREC data (part 2 of 2)

---

## Chapter 23. Using information from the PKI Services logs

This topic explains viewing SYSOUT information. It describes the `_PKISERV_MSG_LEVEL` environment variable and lists subcomponents and message levels you can select. It explains how to display and change logging options.

---

### Viewing SYSOUT information

To start PKI Services, you use the PKISERVD sample procedure (see “PKISERVD sample procedure to start PKI Services daemon” on page 648 for a code sample of the JCL). When you start PKI Services, error and informational messages for the PKISERVD job are written to the STDOUT and STDERR file streams. Unless you change the DD statements that specify STDOUT and STDERR in the PKISERVD sample procedure, PKI Services writes these messages to SYSOUT.

To view the SYSOUT information of a job, you use the Spool Display Search Facility (SDSF) or a comparable facility. If you are using SDSF, you can use the question mark line command (by entering a question mark in the prefix area in front of the file name) to separate the job files, including STDOUT and STDERR. Figure 80 on page 520 shows this.

Figure 82. Messages contained in the file

### Notes:

1. These messages were produced when Verbose tracing was active.
2. The SYSOUT records have a logical record length of 133, so you might have to scroll to the right to see the entire record.

From left to right, each record contains:

- A time stamp
- The thread identifier, in parenthesis
- The subcomponent name (in the example that follows, this is CORE)
- The message itself, which might span multiple lines

Informational, warning, error, and severe level messages begin with a message number. (See Chapter 24, "Messages," on page 527.) Verbose and diagnostic level messages do not have message numbers and are not documented.

The following is an example of an informational message:

```
Wed Aug 8 15:44:46 2001 (00000001) CORE IKYC026I Deleting inactive object 37.
Last changed at 2001/07/10 17:08:39
```

## **\_PKISERV\_MSG\_LEVEL subcomponents and message levels**

The `_PKISERV_MSG_LEVEL` environment variable specifies the subcomponent and message level for logging messages.

The subcomponents are listed below:

| Subcomponent | Meaning                                                                             |
|--------------|-------------------------------------------------------------------------------------|
| *            | The wildcard character (represents all subcomponents)                               |
| CORE         | The core functions of PKI Services that are not specific to the other subcomponents |
| DB           | Activity related to the object store or issued certificate list repositories        |
| LDAP         | LDAP posting operations                                                             |
| PKID         | The PKI Services daemon address setup and infrastructure                            |
| POLICY       | Certificate creation and revocation policy processing                               |
| SAF          | SAF key ring, OCEP, and R_data1ib calls                                             |
| TPOLICY      | Trust policy plug-in processing                                                     |

The message levels are listed hierarchically below:

| Debug level | Meaning                                                                                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| S           | This indicates logging only severe messages.                                                                                                                                                                    |
| E           | This indicates logging severe and error messages.                                                                                                                                                               |
| W           | This indicates logging severe, error, and warning messages. This is the <i>default</i> message level for all subcomponents if you do not set the environment variable.                                          |
| I           | This indicates logging severe, error, warning, and informational messages.                                                                                                                                      |
| D           | This indicates logging severe, error, warning, informational, and diagnostic messages.                                                                                                                          |
| V           | This indicates logging <i>all</i> messages, including verbose diagnostic messages. This is very verbose.<br><br><b>Guideline:</b> Do not use <b>V</b> level unless IBM support personnel instruct you to do so. |

(For information about updating environment variables during configuration, see “Optionally updating PKI Services environment variables” on page 64.)

After PKI Services is up and running, if a problem occurs, the MVS programmer can:

- Change the logging options dynamically - by using the MODIFY (or F) console command
- Display the current settings - by using another MODIFY console command.

### **Changing logging options**

To change logging options dynamically, execute the following MODIFY (or F) console command:

```
F PKISERVD,LOG sub-component.level[,sub-component.level...]
```

## Using information from the PKI Services logs

### *subcomponent.level*

Sets the message level settings for the subcomponents. Use one of the subcomponents and message levels listed previously.

---

## Displaying log options settings

To display the current logging options, execute the following MODIFY (or F) console command:

```
F PKISERVD,DISPLAY
```

The result of this command is information message IKYP025I. **Sample output:**

```
10.37.39 STC00146: IKYP025I PKI SERVICES SETTINGS:

The PKI administrator can use this command to display the fingerprints of the PKI Services CA certificate in support of Simple Certificate Enrollment Protocol (SCEP) certificate requests. For more information, see “Checking certificate fingerprints” on page 306.

---

## Part 8. Reference information

This part provides reference information, including listings of code samples for certain important files.

**Note:** The listings in this part might not be identical to the code samples shipped with the product. For the most current sample, see the appropriate source directory.

- Chapter 24, “Messages,” on page 527 explains PKI Services messages.
- Chapter 25, “File directory structure,” on page 573 describes product and file system directories for PKI Services and files contained in them.
- Chapter 27, “Environment variables,” on page 585 explains the `pki.serv.envars` environment variables file and provides a code sample.
- Chapter 28, “The IKYSETUP REXX exec,” on page 589 explains the contents of the IKYSETUP REXX exec that performs RACF administration and provides a code sample.
- Chapter 29, “Other code samples,” on page 627 provides additional code samples. Table 99 summarizes information about these code samples and those in the preceding chapters, summarizing their use, directory location, and the page where the code sample begins.
- Chapter 30, “SMF recording,” on page 649 describes the content of the System Management Facility (SMF) record that is generated by PKI Services.

Table 99. Summary of information about important files

| IKYSETUP                                                                            | REXX exec to set up RACF profiles.                                                                                                                  | SYS1.SAMPLIB              | See Chapter 28, “The IKYSETUP REXX exec,” on page 589.                         |

Table 99. Summary of information about important files (continued)

| File           | Description                                                                                                                | Source location (default)                                                                               | For code sample...                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| IKYSGRNT       | Sample job to grant EXECUTE authority for the DB2 package to the PKI Services daemon user ID.                              | SYS1.SAMPLIB                                                                                            | See "IKYSGRNT" on page 644.                                               |
| IKYVBKUP       | Sample JCL to back up the PKI Services VSAM data sets using the DFSMSdss DUMP utility                                      |                                                                                                         | See "IKYVBKUP" on page 645.                                               |
| IKYVREST       | Sample JCL to restore the PKI Services VSAM data sets from a backup taken with the DFSMSdss DUMP utility                   |                                                                                                         | See "IKYVBKUP" on page 645.                                               |
| pkiserv.conf   | PKI Services configuration file.                                                                                           | /usr/lpp/pkiserv/samples/<br>(You copy this file to the runtime directory, /etc/pkiserv.)               | See Chapter 26, "The pkiserv.conf configuration file," on page 577.       |
| PKISERVD       | Sample procedure to start PKI Services daemon.                                                                             | SYS1.PROCLIB                                                                                            | See "PKISERVD sample procedure to start PKI Services daemon" on page 648. |
| pkiserv.envars | PKI Services environment variables file.                                                                                   | /usr/lpp/pkiserv/samples/<br>(You might need to copy this file to the runtime directory, /etc/pkiserv.) | See "The pkiserv.envars environment variables file" on page 587.          |
| pkiserv.tpl    | PKI Services certificate template file for REXX CGI execs.                                                                 | /usr/lpp/pkiserv/samples/<br>(You copy this file to the runtime directory, /etc/pkiserv.)               | Not provided.                                                             |
| pkitmpl.xml    | PKI Services certificate template file for JavaServer pages.                                                               | /usr/lpp/pkiserv/samples/<br>(You copy this file to the runtime directory, /etc/pkiserv.)               | Not provided.                                                             |
| pkixgen.tpl    | PKI Services certificate template file for the daemon's use when you implement the web application using JavaServer pages. | You create this file from pkitmpl.xml using the TemplateTool utility.                                   | Not provided.                                                             |

---

## Chapter 24. Messages

PKI Services message numbers begin with the three-character component prefix (IKY), followed by a fourth character that identifies the subcomponent. The following table lists the characters representing various subcomponents and describes where the messages appear.

Table 100. Meaning of fourth character in message number

| Character | Meaning   | Component producing messages                            | Where messages appear                                                                                                                         |
|-----------|-----------|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| C         | CORE      | Core subcomponent                                       | PKI Services log                                                                                                                              |
| D         | DB        | Database accessing subcomponent                         | PKI Services log                                                                                                                              |
| I         | INTERFACE | PKISERV CGIs or JSPs                                    | In the user's web browser window                                                                                                              |
| L         | LDAP      | LDAP bind subcomponent                                  | PKI Services log                                                                                                                              |
| O         | POLICY    | Certificate creation and revocation policy subcomponent | PKI Services log                                                                                                                              |
| P         | PKID      | PKI Services daemon address space controller            | <ul style="list-style-type: none"><li>• PKI Services log</li><li>• (For those with destination and routing codes) operators console</li></ul> |
| S         | SAF       | SAF interfacing subcomponent                            | PKI Services log                                                                                                                              |
| U         | UTILITY   | Utility programs                                        | UNIX standard error (stderr)                                                                                                                  |

Characters five through seven are numeric. The eighth character is the message type:

Table 101. Meaning of eighth character in message number

| Character | Meaning                        | Action required                                     |
|-----------|--------------------------------|-----------------------------------------------------|
| I         | Informational (status message) | No action required                                  |
| E         | Eventual action                | Possible problem that might require eventual action |
| A         | Action required                | Problem that requires immediate attention           |

For information about setting messages options using environment variables, see “\_PKISERV\_MSG\_LOGGING” on page 586.

---

**IKYC001I** Error *nnnn action-being-performed: error-code-description*

**Explanation:** PKI Services is processing a request and has encountered an internal error. The action being performed and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The request is not processed.

**User response:** Report the error to the IBM support center.

---

**IKYC002I** Error *nnnn* returned from CP\_NewCertCreate: *error-code-description*

**Explanation:** PKI Services is attempting to create a certificate and has encountered an internal error. The action being performed and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The certificate is not created.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC003I** Error *nnnn* registering the next CRL cutting job: *error-code-description*

**Explanation:** PKI Services finished creating the current CRL and is attempting to schedule the next CRL creation thread. An error was encountered. The error code encountered is displayed. A description of the error is also displayed, if known.

**System action:** Future CRLs are not created until the problem is corrected and PKI Services is restarted.

**System programmer response:** Look for other error messages that might be issued such as IKYC011I. If no other messages were issued, report the error to the IBM support center.

---

**IKYC004I** Error *nnnn* creating and sending CRLs: *error-code-description*

**Explanation:** PKI Services is attempting to create the current CRL and has encountered an error. The error code encountered is displayed. A description of the error is also displayed, if known. Note: If the error code is an LDAP return code, no error description is displayed. This would indicate a problem posting the CRL to the LDAP directory.

**System action:** If the CRL was created and the post to LDAP was unsuccessful, the post request remains in the PKI Services request database to be reattempted later. If posting continues to be unsuccessful for one week, the information is removed from the request database and deleted. For all other errors, PKI Services tries again to create the CRL during the next CRL interval.

**System programmer response:** If this is a problem with posting to LDAP, you should also see messages IKYC007I or IKYC008I or both. If so, follow the instructions for these messages. Otherwise, report the error to the IBM support center.

---

**IKYC005I** Error *nnnn* posting {User | CA} Certificate to LDAP for distinguished-name: *error-code-description*

**Explanation:** PKI Services is attempting to post a certificate to the LDAP directory and has encountered an error. The distinguished name for which the post was attempted and the error code encountered are displayed. A description of the error is also displayed, if known. If the error code is an LDAP return code, no error description is displayed.

**System action:** If the post is unsuccessful for a given certificate, retries the post at the next post interval. If the post continues to be unsuccessful after 3 attempts, the post frequency for the certificate is reduced to no more than once per hour. After 26 unsuccessful attempts, it is further reduced to no more than once per day. After 33 unsuccessful attempts, the post request for the certificate is deleted from the request database. PKI Services

**System programmer response:** Determine if the error occurred on the call to LDAP or within PKI Services, based on the presence of an error code description in the message. If no error code description is displayed in the message, the error occurred on the call to LDAP. If the error code is LDAP\_NO\_SUCH\_OBJECT, the LDAP entry could not be created because the required suffix does not exist. Check the message to determine the entry that could not be created. If the entry should be posted to LDAP, you need to define the suffix in the LDAP server configuration file, and then stop and restart the LDAP server. For all other LDAP errors, follow the instructions in *z/OS IBM Tivoli Directory Server Client Programming for z/OS*. If an error code description is displayed in the message, the error occurred within PKI Services.

If the error code description is Missing LDAP information, then the CreateOUValue directive is missing from the LDAP section of the PKI Services configuration file. Add the directive, then stop and restart PKI Services. See Chapter 8, "Tailoring the PKI Services configuration file for LDAP," on page 99 for more information.

Report any other PKI Services error to the IBM support center. If message IKYC009I is also displayed, report that information also.

---

---

**IKYC007I** Error *nnnn* posting {CRL | ARL} to LDAP: *error-code-description*

**Explanation:** PKI Services is attempting to post a CRL or ARL to the LDAP directory and has encountered an error. The error code encountered is displayed. A description of the error is also displayed, if known. Note: If the error code is an LDAP return code, no error description is displayed.

**System action:** The post request remains in the PKI Services request database to be reattempted later. If posting continues to be unsuccessful for one week, the information is removed from the request database and deleted.

**System programmer response:** If the error is LDAP\_NO\_SUCH\_OBJECT, the LDAP entry to contain the CRL or ARL does not yet exist. This is expected if you are starting PKI Services for the first time. For all other LDAP errors, follow the instructions in *z/OS IBM Tivoli Directory Server Client Programming for z/OS*. Report errors to the IBM support center. If message IKYC009I is also displayed, report that information also.

---

**IKYC008I** Error *nnnn* creating an entry for {CA Certificate | User Cert | CRL | ARL} to LDAP for distinguished-name: *error-code-description*

**Explanation:** PKI Services is attempting to post a certificate, CRL or ARL to the LDAP directory and has encountered an error. The distinguished name for which the post was attempted and the error code encountered are displayed. A description of the error is also displayed, if known. Note: If the error code is an LDAP return code, no error description is displayed.

**System action:** The post request remains in the PKI Services request database to be reattempted later. If posting continues to be unsuccessful for one week, the information is removed from the request database and deleted.

**System programmer response:** You might also see message IKYC005I or IKYC007I displayed. If so, follow the instructions for the message displayed. Follow related instructions in *z/OS IBM Tivoli Directory Server Client Programming for z/OS*. Report errors to the IBM support center. If message IKYC009I is also displayed, report that information also.

---

**IKYC009I** LDAP post unsuccessful for object id = *nnnn*, state = *nnnn*, status = *nnnn*: *status-code-description*

**Explanation:** This message appears as supplemental information for messages IKYC005I and IKYC008I.

**System programmer response:** If reporting message IKYC005I or IKYC008I to the IBM support center, report this information also.

---

**IKYC010I** Error *nnnn* returned from action-being-performed: *error-code-description*

**Explanation:** PKI Services is processing a request and has encountered an error. The action being performed and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The request is not processed.

**System programmer response:** Check the PKI Services logs for additional information about this error. You can use the `_PKISERV_MSG_LEVEL` environment variable to increase the messages that PKI Services generates. For more information about the logs and `_PKISERV_MSG_LEVEL`, see Chapter 23, "Using information from the PKI Services logs," on page 519.

If the error code description is not self-explanatory, and you cannot find additional information in the logs, report the error to the IBM support center.

---

**IKYC011I** Bad TimeBetweenCRLs value in pkiserv.conf file: *incorrect-value*

**Explanation:** PKI Services is reading its configuration file to locate the value specified for TimeBetweenCRLs in the CertPolicy section. The value specified has an incorrect syntax.

**System action:** CRL processing is suspended until the problem is corrected and PKI Services is restarted.

**System programmer response:** Correct the value and restart PKI Services. For more information, see "(Optional) Steps for updating the configuration file" on page 68.

**IKYC012I**    **Bad CRLDuration value in pkiserv.conf file:** *incorrect-value*

**Explanation:** PKI Services is reading its configuration file to locate the value specified for CRLDuration in the CertPolicy section. The value specified has an incorrect syntax.

**System action:** CRL processing is suspended until the problem is corrected and PKI Services is restarted.

**System programmer response:** Correct the value and restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC013I**    **Bad CreateInterval value in pkiserv.conf file**

**Explanation:** PKI Services is reading its configuration file to locate the value specified for CreateInterval in the CertPolicy section. The value specified has an incorrect syntax.

**System action:** PKI Services uses the default value of 3 minutes.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC014I**    **Bad RemoveCompletedReqs or RemoveInactiveReqs value in pkiserv.conf file**

**Explanation:** PKI Services is reading its configuration file to locate the value specified for either RemoveCompletedReqs or RemoveInactiveReqs in the ObjectStore section. The value specified has an incorrect syntax.

**System action:** Completed and inactive requests are not removed until the problem is corrected and PKI Services is restarted.

**System programmer response:** Correct the value and restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC015I**    **Bad PostInterval value in pkiserv.conf file**

**Explanation:** PKI Services is reading its configuration file to locate the value specified for PostInterval in the LDAP section. The value specified has an incorrect syntax.

**System action:** PKI Services uses the default value of 5 minutes.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “Steps for tailoring the LDAP section of the configuration file” on page 100.

---

**IKYC016I**    *action-being-performed* **returned nnnn in sub-function:** *error-code-description*

**Explanation:** PKI Services is processing a request and has encountered an internal error. The action being performed, the subfunction that returned the error, and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC017I**    **JNH\_inquire\_certreq\_startdate** (*object-id*) **found neither certificate request nor response** (*nnnn*): *error-code-description*

**Explanation:** PKI Services is processing the start date in a request and has encountered an internal error. The request's ID and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

---

**IKYC018I** {read | get\_value} of *certificate-or-CRL-extension-name* returned *nnnn*: *error-code-description*

**Explanation:** PKI Services is processing a CRL or certificate extension field and has encountered an internal error. The field name and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The CRL or certificate is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC020I** Retrieving CA value failed *nnnn*: *error-code-description*

**Explanation:** PKI Services is processing a certificate extension field in preparation of posting the certificate to the LDAP directory. The processing has encountered an internal error. The error code encountered is displayed. A description of the error is also displayed, if known.

**System action:** The certificate is not posted to the LDAP directory.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC021I** CRL claims to have only User and only CA certs

**Explanation:** PKI Services is processing a CRL extension field in preparation of posting the CRL to the LDAP directory. The processing has encountered an internal error. The error code encountered is displayed. A description of the error is also displayed, if known.

**System action:** The CRL is not posted to the LDAP directory.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC022I** Invalid type for object *object-id* in *JNH\_set\_revreq\_invalidDate*: *error-code-description*

**Explanation:** PKI Services is processing a revocation request and has encountered an internal error. The revocation request's ID and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The revocation request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC023I** Request index (*index-number*) greater than number of revocations (*nnnn*) in *JNH\_set\_revreq\_invalidDate*

**Explanation:** PKI Services is processing a revocation request and has encountered an internal error.

**System action:** The revocation request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC024I** Failed to schedule event in *nnnn* seconds, status = *nnnn*: *error-code-description*

**Explanation:** PKI Services is attempting to schedule a timed event and has encountered an internal error. The error code encountered is displayed. A description of the error is also displayed, if known.

**System action:** The event is not scheduled.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC025I** Failed to schedule event status = *nnnn*: *error-code-description*

**Explanation:** PKI Services is attempting to schedule a timed event and has encountered an internal error. The error code encountered is displayed. A description of the error is also displayed, if known.

**System action:** The event is not scheduled.

**System programmer response:** Report the error to the IBM support center.

---

---

**IKYC026I** Deleting {inactive | completed} object *object-id*. Last changed at *YYYY/MM/DD HH:MM:SS*

**Explanation:** PKI Services is attempting to purge the request database of inactive and completed requests. A request that has met the criteria for deletion has been found. The request's ID is displayed along with information about when it was last changed. This is an informational message only.

**System action:** The request is deleted. PKI Services continues normal processing.

---

**IKYC027I** Removing certificate post request after *nnnn* unsuccessful attempts

**Explanation:** PKI Services is attempting to purge the request database of unsuccessful LDAP post requests. A request that has met the criteria for deletion has been found. The number of unsuccessful attempts for this request is displayed. This is an informational message only.

**System action:** The request is deleted. PKI Services continues normal processing.

---

**IKYC028I** Export for CertId *certificate-id* unsuccessful. Request is still pending approval or yet to be issued

**Explanation:** A client has requested a certificate and is attempting to retrieve it. The retrieval was unsuccessful because the certificate is not yet available. The request either has yet to be approved by a PKI Services administrator or has been approved, but has not yet been issued by PKI Services. This is an informational message only.

**System action:** The state of the request is unchanged. PKI Services continues normal processing.

**PKI Services administrator response:** Use PKI Services administrative functions to query the request to check its state. If the request is still pending approval, determine whether the request should be approved or rejected and take action accordingly. For more information, see "Processing certificate requests" on page 392.

---

**IKYC029I** Error: certificate request type is invalid for certificate creation

**Explanation:** PKI Services is processing a certificate request and has encountered an internal error.

**System action:** The certificate request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYC030I** Error *nnnn* retrieving LDAP *attribute-name* attribute data from *distinguished-name: error-code-description*

**Explanation:** PKI Services is trying to retrieve some attribute data from an entry in the LDAP directory and has encountered an error. The attribute name and distinguished name for which the retrieve was attempted and the error code encountered are displayed. If known, a description of the error is also displayed.

**Note:** If the error code is an LDAP return code, no error description is displayed.

**System action:** If the attribute being retrieved is 'MAIL', PKI Services is trying to retrieve the client's email address to send the client a certificate expiration warning message or a renewed certificate. The warning message or the renewed certificate is not sent now but sending is tried later.

**System programmer response:** Follow related instructions in *z/OS IBM Tivoli Directory Server Client Programming for z/OS*. Report errors to the IBM support center.

---

**IKYC031I** Error *nnnn* invoking sendmail with email address *email-address* retrieved from LDAP entry *distinguished-name*

**Explanation:** PKI Services tried to call the sendmail utility to notify a client that the certificate is expiring or is renewed. The call was unsuccessful. This message displays the email address and distinguished name from which it was retrieved and the error code encountered.

**System action:** The warning message or the renewed certificate might or might not have been sent. If the email address appears to be genuine, PKI Services retries sending later.

**System programmer response:** Diagnose the problem by consulting *z/OS Communications Server: IP Diagnosis Guide* and related documents. Report non-Communications Server errors to the IBM support center.

---

---

**IKYC032I** Error *nnnn* invoking sendmail with email address *email-address* provided by *distinguished-name*

**Explanation:** PKI Services is trying to notify a client that the certificate is ready, rejected, or recovered. Notification is accomplished by calling the sendmail utility. The call was unsuccessful. This message displays the email address and the subject's distinguished name from the request. The error code encountered is also displayed.

**System action:** The message might or might not have been sent.

**System programmer response:** Diagnose the problem by consulting *z/OS Communications Server: IP Diagnosis Guide* and related documents. Report non-Communications Server errors to the IBM support center.

---

**IKYC033I** Error *nnnn* accessing {ReadyMessageForm | RejectMessageForm | ExpiringMessageForm | AdminNotifyForm | RenewCertForm} *form-value*

**Explanation:** PKI Services is attempting to notify a client that the certificate is ready, has been rejected, is expiring, is pending for approval, or has been renewed. The message to be sent is derived by reading the message form from a file or data set specified in the **General** section of the PKI Services configuration file. Either the file name was not specified correctly, or the file read was unsuccessful. The configuration file keyword in error is displayed. The name of the failing file or data set and the error code encountered are also displayed, if known. For ExpiringMessageForm, an error code of zero with no file or data set name displayed indicates that the keyword is required but is missing from the PKI Services configuration file.

**System action:** The message is not sent. If this is the expiring warning message, notify pending message or the renewed certificate message, it is attempted later.

**System programmer response:** Locate the failing *form-typeMessageForm* value in the `pkiserv.conf` file. Make sure that the value specifies the correct file or data set name and that the file or data set exists. If no errors are found, contact your RACF administrator to ensure that the user ID assigned to the PKI Services daemon has permission to open the file or data set for reading. After making a correction, restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC034I** Error issuing DEQ for resource *resource-name*, return code was *return-code*

**Explanation:** PKI Services background certificate processing encountered an internal error trying to release control of a resource using the DEQ service. The resource name and return code from the DEQ macro are displayed.

**System action:** PKI Services processing continues. However, further processing of certificate requests might fail until PKI Services is stopped and restarted.

**System programmer response:** Stop and restart PKI Services. If the problem occurs again, report the error to the IBM support center.

---

**IKYC035I** Bad ExpireWarningTime value in `pkiserv.conf` file

**Explanation:** PKI Services is reading its configuration file to locate the value specified for ExpireWarningTime in the **CertPolicy** section. The value specified has an incorrect syntax.

**System action:** PKI Services continues, but no expiration warning messages are issued.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC036I** Bad MaxSuspendDuration value in `pkiserv.conf` file

**Explanation:** PKI Services is reading its configuration file to locate the value specified for MaxSuspendDuration in the **CertPolicy** section. The value specified has an incorrect syntax.

**System action:** CRL processing continues. PKI Services processes as if the suspension grace period is unlimited.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

---

**IKYC037I** Bad RemoveExpiredCerts or RemoveExpiredCertsAndKeys value in pkiserv.conf file

**Explanation:** PKI Services is reading its configuration file to locate the value specified for RemoveExpiredCerts or RemoveExpiredCertsAndKeys in the **ObjectStore** section. The value specified has an incorrect syntax.

**System action:** PKI Services continues, but expired certificates are not removed from the issued certificate list (ICL).

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC038I** Deleting expired certificate with serial number *certificate-serial-number*

**Explanation:** PKI Services is attempting to purge the issued certificate list (ICL) of expired certificates. A certificate that has met the criteria for deletion has been found. The certificate's serial number is displayed. This is an informational message only.

**System action:** The request is deleted. PKI Services continues normal processing.

---

**IKYC039I** Bad CRLDistName value in pkiserv.conf file

**Explanation:** PKI Services is initializing and is reading its configuration file to locate the value specified for CRLDistName in the **CertPolicy** section. The value specified does not contain all alphanumeric characters.

**System action:** PKI Services stops.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC040I** Bad CRLDistURI*n* value in pkiserv.conf file: LdapServer*n*

**Explanation:** PKI Services is reading its configuration file to locate the LDAP server specified in the **LDAP** section of the PKI Services configuration file. The value is to be used to create the URI format for the CRLDistributionPoints extension for the LDAP protocol. The Server value specified by LdapServer*n* cannot be found or contains incorrect information.

**System action:** PKI Services continues, but the URI format for that protocol distribution point is not created.

**System programmer response:** Ensure that the CRLDistURI*n* value locates the correct LdapServer*n* or BindProfile*n* value in the **LDAP** section or the default FACILITY class profile, IRR.PROXY.DEFAULTS. For profile values, ensure that the profile exists and contains the correct information. Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC041I** Bad CRLDistURI*n* value in pkiserv.conf file, exceeds the number of LDAP servers: LdapServer*n*

**Explanation:** PKI Services is reading its configuration file to locate the LDAP server specified in the **LDAP** section of the PKI Services configuration file. The value is to be used to create the URI format for the CRLDistributionPoints extension for the LDAP protocol. The value *n* indicated in LdapServer*n* is greater than that specified by NumServers.

**System action:** PKI Services continues, but the URI format for that protocol distribution point is not created.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC042I** Bad CRLDistURI*n* format in pkiserv.conf file: CRLDistURI*n*

**Explanation:** PKI Services is reading its configuration file to create the URI format for the CRLDistributionPoints extension. The value specified has incorrect syntax.

**System action:** PKI Services continues, but the URI format for that protocol distribution point is not created.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

---

**IKYC043I** Error *nnnn* in creating HFS file *file name* to store distribution point CRL

**Explanation:** PKI Services is trying to store the distribution point CRL in a file system file. An I/O error occurred during the processing.

**System action:** PKI Services continues, but the distribution point CRL is not created.

**System programmer response:** Fix the I/O error and wait for the next distribution point CRL to be created.

---

**IKYC044I** Bad OCSPTYPE value in pkiserv.conf file: *value*

**Explanation:** PKI Services responder is reading its configuration file to check whether the OCSP responder is enabled when receiving an OCSP request. The expected value is either 'none' or 'basic'. The value specified is not one of these.

**System action:** The responder is not enabled. The client gets a response back with status 'Try later'.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC045I** Unknown section or keyword in pkiserv.conf file: Section: [*section*], Keyword *keyword*

**Explanation:** PKI Services is reading its configuration file during initialization. One of the following conditions occurred:

- An unknown section name was found.
- An unknown keyword was found.
- A valid keyword was placed in the wrong section.
- A keyword was placed before any sections were defined.

**System action:** The keyword is ignored and PKI Services continues.

**System programmer response:** Correct the section name or the keyword and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC046I** Incorrect encoding of SCEP {request | PKCS10}

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request from a SCEP client. The request for a PKI operation contains incorrect ASN.1 encoding.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Correct the SCEP client to produce a correctly encoded ASN.1 request. Report the error to the support center for the provider of your SCEP client.

---

**IKYC047I** Incorrect signature on SCEP {request | PKCS10}

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request from a SCEP client. The request for a PKI operation or its enclosed PKCS #10 certificate request is incorrectly signed or was altered.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Correct the SCEP client to produce a correctly signed request. Report the error to the support center for the provider of your SCEP client.

---

**IKYC048I** Unsupported algorithm in SCEP {request | PKCS10}

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request from a SCEP client. The request for a PKI operation or its enclosed PKCS #10 certificate request contains an algorithm identifier that is unsupported by PKI Services.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Correct the SCEP client to produce algorithms that are supported by PKI Services. Report the error to the support center for the provider of your SCEP client. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

---

**IKYC049I** SCEP signing certificate is {expired | revoked | not known to PKI Services}

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request from a SCEP client. The request for a PKI operation contains a signing certificate that is expired, revoked, or unknown to PKI Services. The signing certificate cannot be used to authenticate the SCEP client.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Determine whether the SCEP client should request certificates from PKI Services. If so, correct the SCEP client to use a valid signing certificate previously issued by PKI Services. If none exists, reconfigure the SCEP client to remove any existing certificates and start the certificate request from the beginning using a new key-pair and a new self-signed certificate. Report the error to the support center for the provider of your SCEP client. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

**IKYC050I** Requested SCEP certificate is {expired | revoked}

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request from a SCEP client. The request for a PKI operation requests a certificate that was previously issued by PKI Services but is revoked or expired, as indicated by the message displayed. The requested certificate cannot be used by the SCEP client.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Determine whether the SCEP client should request certificates from PKI Services. If so, reconfigure the SCEP client to remove any existing certificate request entries and start the certificate request from the beginning using a new key-pair and a new self-signed certificate. Report the error to the support center for the provider of your SCEP client. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

**IKYC051I** Error 0xnnnn decrypting SCEP request

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from a SCEP client. PKI Services is attempting to recover the encrypted portion of the request using System SSL services but is unable to do so. The error code that is returned by System SSL is displayed in the message.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Look up the 0xnnnn error code in *z/OS Cryptographic Services System SSL Programming*. Most likely, the SCEP client incorrectly encrypted the request, for example by encrypting it for a different host server. Report the error to the support center for the provider of your SCEP client. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

**IKYC052I** Unsupported SCEP message type: nn

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from a SCEP client. The message type that is displayed in the message is either unrecognized or unsupported by PKI Services. PKI Services supports only message types PKCSReq (19) and GetCertInitial (20).

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Reconfigure the SCEP client to produce message types that are supported by PKI Services. Report the error to the support center for the provider of your SCEP client. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

**IKYC053I** SCEP key or name mismatch. SCEP transaction ID: SCEP-transaction-ID

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from a SCEP client. While processing the displayed SCEP request transaction ID, PKI Services found one of the following inconsistencies:

- The signing certificate is self-signed but the public key within it does not match the key in the enclosed PKCS #10 request.
- The signing certificate's subject name does not match the subject name in the PKCS #10 request or the subject portion of the IssuerAndSubject field in the SCEP request.
- The signing certificate is not self-signed and not issued by PKI Services.

- The issuer portion of the IssuerAndSubject field in the SCEP request does not identify PKI Services.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Correct the SCEP client to remove the inconsistency. Report the error to the support center for the provider of your SCEP client. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

**IKYC054I Incorrect reuse of SCEP transaction ID by client name:** *client-name*

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from a SCEP client that is named in the message. The request contains a SCEP transaction ID that was previously used in a different request. Transaction IDs must uniquely identify a transaction and cannot be reused.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Determine whether the SCEP client should request certificates from PKI Services. If so, reconfigure the SCEP client to remove any existing certificate request entries and start the certificate request from the beginning using a new key-pair and a new self-signed certificate. Report the error to the support center for the provider of your SCEP client. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

**IKYC055I Bad PREREGISTER section in certificate template, nickname:** *template-nickname*

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from a SCEP client. The named certificate template that is used to preregister the SCEP client contains one of the following errors that are related to its PREREGISTER section:

- The PREREGISTER section does not exist.
- The PREREGISTER section is incorrectly terminated.
- A required directive is missing.
- A directive has an incorrect value.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Edit the PKI Services certificate templates file (`pkiserv.tmp1`) and correct the error. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

**IKYC056I Template missing from certificate templates file, nickname:** *template-nickname*

**Explanation:** PKI Services cannot find the template nickname in the templates file in one of the following circumstances:

1. PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from an SCEP client, and the named certificate template used to preregister the SCEP client no longer exists.
2. During the automatic renewal process, the named certificate template used to generate the original certificate no longer exists.
3. PKI Services is trying to construct a quick link which contains the transaction ID and the certificate template name in the email message (Ready message) to notify a requester that the certificate is ready to be picked up. The certificate template identified by the nickname indicated in the message cannot be found. If the indicated nickname is `<NONICK>`, the `<NICKNAME=>` directive was missing at the time the request was submitted; otherwise, it had been there at the time of submission but was removed later.

**System action:** For case 1, PKI Services rejects the SCEP request. For case 2, the certificate cannot be automatically renewed. For case 3, the constructed quick link in the Ready message does not work and the certificate requester needs to use the other link to pick up the certificate, which requires manual input of certificate type and transaction ID.

**System programmer response:** For case 1, edit the PKI Services certificate templates file (`pkiserv.tmp1`) and add the template. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303. For case 2, restore the nickname in the corresponding template and wait for the next automatic renewal processing. For case 3, make sure the template section has the `<NICKNAME=>` directive.

---

**IKYC057I** SCEP request for client name *client-name* rejected by {SemiauthenticatedClient | UnauthenticatedClient | SubsequentRequest | RenewalRequest} directive.

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from a SCEP client. The certificate template used to preregister the named SCEP client contains a directive in the PREREGISTER section indicating that the request should be rejected. The directive is displayed in the message.

**System action:** PKI Services rejects the SCEP request. The rejected certificate request is recorded in the request database.

**System programmer response:** Determine whether the SCEP client should request certificates from PKI Services. If so, reconfigure the SCEP client to remove any existing certificate request entries and start the certificate request from the beginning using a new key-pair and a new self-signed certificate. Create or re-create a PKI Services preregistration record as needed. Also, ensure that the SCEP client is using a subject name that is consistent with the preregistration record. Make corrections to the SCEP client or delete and re-create the preregistration record as needed. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

**IKYC058I** No preregistration record found for SCEP request, client name: *client-name*

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from the named SCEP client. No preregistration record matching the SCEP client was found.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Determine whether the SCEP client should request certificates from PKI Services. If so, ensure that a preregistration record exists for the SCEP client and that the client is using a client name that matches the preregistration record. Make corrections to the SCEP client, or delete and re-create the preregistration record as needed. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

**IKYC059I** No previous SCEP request found for SCEP GetCertInitial, client name: *client-name*

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request from the named SCEP client. The request is GetCertInitial (a polling operation to pick up a previously requested certificate). PKI Services is unable to locate the previous SCEP request.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Determine whether the SCEP client should request certificates from PKI Services. If so, reconfigure the SCEP client to remove any existing certificate request entries and start the certificate request from the beginning using a new a key-pair and new self-signed certificate. Make corrections to the SCEP client, or delete and re-create the preregistration record as needed. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

**IKYC060I** CONSTANT section of certificate template, nickname: *template-nickname* contains an incorrect value: *field-name=value*

**Explanation:** PKI Services is processing a Simple Certificate Enrollment Protocol (SCEP) request for a PKI operation from a SCEP client. The certificate template used to preregister the SCEP client is in error. A field found in the <CONSTANT> section of the template contains a missing or incorrect value. The nickname of the certificate template and the incorrect value are displayed in the message.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Edit the certificate templates file and correct the error. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303.

---

**IKYC061I** Can not generate a certificate or a request with automatic renewal

**Explanation:** PKI Services is trying to process a GENCERT/REQCERT or GENRENEW/REQRENEW request. The <AUTORENEW=Y or N>tag is specified at the right position in its template, but NotifyEmail has no input.

**System action:** PKI Services does not process the request.

**System programmer response:** Enforce the input of NotifyEmail.

---

**IKYC062I** Can not enable or set up automatic renewal service for this request or certificate

**Explanation:** PKI Services is trying to enable or set up automatic certificate renewal for this request or certificate. But NotifyEmail is not in the request, or in the case of a certificate, one of the following has occurred:

- The certificate was created without NotifyEmail specified.
- The certificate has already been renewed.
- The expiration warning notification has already been sent for this certificate.

**System action:** PKI Services does not process the request.

**System programmer response:** None

---

**IKYC063I** The list of the pending approval requests may not be complete

**Explanation:** PKI Services is trying to construct a list of requests that are pending administrator approval. An error occurred when attempting to add an entry to the list.

**System action:** The request is not added to the pending request list.

**System programmer response:** None.

---

**IKYC064I** Error *nnnn* invoking sendmail to notify the administrator with email address *email-address* of requests awaiting approval

**Explanation:** PKI Services is trying to notify an administrator that one or more certificate requests are waiting for approval, and called the sendmail utility, which failed with the return code indicated in the error message. This error code can indicate an improperly defined email address, a sendmail configuration error, or a network interruption.

**System action:** The message might or might not have been sent.

**System programmer response:** Diagnose the problem by consulting *z/OS Communications Server: IP Diagnosis Guide* and related documents. Report non-Communications Server errors to the IBM support center.

---

**IKYC065I** The value *value* specified for tag *tag* in template *template-nickname* is ignored

**Explanation:** PKI Services is processing a tag and its value in the templates file, and either the tag is not in the expected position or it does not contain an expected value. The message indicates problem tag, its value, and the template nickname.

**System action:** PKI Services ignores the tag.

**System programmer response:** None.

---

**IKYC066I** Can not find the template for GENRENEW or REQRENEW with nickname: *template-nickname*

**Explanation:** PKI Services is processing a GENRENEW or REQRENEW request and cannot find the template with the indicated nickname.

**System action:** PKI Services renews a certificate with no automatic renewal set up.

**System programmer response:** None

---

**IKYC067I** An attempt to check if the templates file has been updated failed

**Explanation:** PKI Services attempted to determine whether the templates file has been updated since it was last read, but encountered an error.

**System action:** PKI Services opens and reads the templates file again to ensure that it uses the current values in the file.

**System programmer response:** None.

---

---

**IKYC068I The templates file used may not be current**

**Explanation:** If the web application was implemented using REXX CGI execs, PKI Services determined that it needed to read the templates file, but was unable to either open or read the file.

If the web application was implemented using JavaServer Pages (JSPs), the XML template file `pkitmpl.xml` has been updated, but the file `pkixgen.tmp1` has not been regenerated.

**System action:** PKI Services uses the last updated version of the templates file.

**System programmer response:** If the web application was implemented using JavaServer Pages (JSPs), use the TemplateTool utility to create an updated copy of `pkixgen.tmp1`.

---

**IKYC069I The renewed certificate with transaction id *transaction-id* can not be sent to email address *email-address***

**Explanation:** PKI Services attempted to create or retrieve the note with the renewed certificate. An internal error occurred.

**System action:** None

**System programmer response:** Record the information from the message and manually send the transaction ID to the email address to tell the user to pick up the renewed certificate.

---

**IKYC070I The exit program *{exit-program}* was cancelled for *{pre | post}* processing**

**Explanation:** PKI Services is executing the specified exit program. The program did not return within the time limit specified by the ExitTimeout keyword in the configuration file for the PKI Services daemon (`pkiserv.conf`).

**System action:** PKI Services postpones the automatic renewal processing until the next day.

**System programmer response:** Check the exit program to see whether there are any problems. If you determine that it needs a longer time to run, adjust the ExitTimeout value in the `pkiserv.conf` file.

---

**IKYC071I Bad ExitTimeout value in pkiserv.conf file: *{value}***

**Explanation:** PKI Services is reading its configuration file to locate the value specified for ExitTimeout in the General section. The value specified is incorrect.

**System action:** PKI Services continues. If the value specified is greater than 1 hour, then PKI Services uses 1 hour for the ExitTimeout value when the automatic renewal exit is invoked, otherwise it uses the default value of 30 seconds.

**System programmer response:** Correct the ExitTimeout value and restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC072I Unexpected return value from automatic renewal exit program *{exit-program}*: *{unexpected-value}***

**Explanation:** PKI Services invoked the automatic certificate renewal preprocessing exit program specified, which returned an unexpected return value.

**System action:** PKI Services treats the unexpected return value as if a return value of 4 was returned. The automatic renewal of the certificate is deferred until the next time automatic renewal is performed.

**System programmer response:** Update the exit program to ensure that it returns only the documented expected values.

---

**IKYC073I A problem was encountered during automatic renewal *{pre | post}* exit processing in program *{exit program}***

**Explanation:** PKI Services has encountered an error during automatic renewal exit processing. For example, it cannot invoke the specified program or it cannot retrieve the status from the exit program.

**System action:** PKI Services postpones the automatic renewal processing until the next day.

**System programmer response:** If diagnostic level messages are enabled for the CORE component, additional diagnostic level messages are written to the log to help identifying the exact cause of this failure. If diagnostic level

messages were not enabled at the time of the error, enable diagnostic level messages for the CORE component and re-create the error. For information about enabling diagnostic level messages, see “\_PKISERV\_MSG\_LEVEL subcomponents and message levels” on page 523.

---

**IKYC074I** Error *nnnn* accessing the required {ReadyMessageForm | RecoverForm} form-value

**Explanation:** PKI Services is attempting to process a request or a certificate that involves a key generated by PKI Services. The processing requires the setup of email notification to notify a client of the transaction ID or the key ID so that the client can pick up the certificate through a provided link. The message to be sent is derived by reading the message form from a file or data set specified in the **General** section of the PKI Services configuration file. Either the file name was not specified correctly, or the file read was unsuccessful. The configuration file keyword in error is displayed. The name of the failing file or data set and the error code encountered are also displayed, if known.

**System action:** The request is not processed.

**System programmer response:** Locate the failing ReadyMessageForm or RecoverForm value in the `pkiserv.conf` file. Make sure that the value specifies the correct file or data set name and that the file or data set exists. If no errors are found, contact your RACF administrator to ensure that the user ID assigned to the PKI Services daemon has permission to open the file or data set for read. After making a correction, restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC075I** Bad MaintRunTime value in `pkiserv.conf` file: {value}

**Explanation:** PKI Services is reading its configuration file, `pkiserv.conf`, to locate the value specified for MaintRunTime in the **General** section. The value specified is incorrect.

**System action:** PKI Services continues processing, using the default value of midnight, 00:00.

**System programmer response:** Correct the value of MaintRunTime and restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC076I** Bad MaintRunDays value in `pkiserv.conf` file: {value}

**Explanation:** PKI Services is reading its configuration file, `pkiserv.conf`, to locate the value specified for MaintRunDays in the **General** section. The value specified is incorrect.

**System action:** PKI Services continues processing, using the default value of every day of the week, 0123456.

**System programmer response:** Correct the value of MaintRunDays and restart PKI Services. For more information about the MaintRunDays parameter, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC077I** Incorrect DBType value in `pkiserv.conf` file: value

**Explanation:** PKI Services is reading its configuration file, `pkiserv.conf`, to locate the value specified for DBType in the **ObjectStore** section. The value specified is incorrect. The value of DBType must be VSAM or DB2.

**System action:** PKI Services stops.

**System programmer response:** Correct the value of DBType and restart PKI Services. For more information about the DBType parameter, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC078I** Incorrect DBSubsystem value in `pkiserv.conf` file: value

**Explanation:** PKI Services is reading its configuration file, `pkiserv.conf`, to locate the value specified for DBSubsystem in the **ObjectStore** section. The value specified is incorrect. The value of DBSubsystem must be a 4-character DB2 subsystem name.

**System action:** PKI Services stops.

**System programmer response:** Correct the value of DBSubsystem and restart PKI Services. For more information about the DBSubsystem parameter, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC079I Incorrect DBPackage value in pkiserv.conf file: *value***

**Explanation:** PKI Services is reading its configuration file, `pkiserv.conf`, to locate the value specified for `DBPackage` in the `ObjectStore` section. The value specified is incorrect. The value of `DBPackage` must be the name of a DB2 package.

**System action:** PKI Services stops.

**System programmer response:** Correct the value of `DBPackage` and restart PKI Services. For more information about the `DBPackage` parameter, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYC080I Error *nnnn* in creating UNIX file *file\_name* to post CRL**

**Explanation:** PKI Services is trying to store a CRL in the z/OS UNIX file system file `file_name` for posting. An I/O error occurred during the processing.

**System action:** PKI Services continues, but the file is not created. The CRL is not posted.

Fix the I/O error and wait for the next CRL to be created.

---

**IKYC081I Error *nnnn* in reading UNIX file *file\_name* to post CRL**

**Explanation:** PKI Services is trying to read a CRL from the file that is named `file_name` in the z/OS UNIX file system. An I/O error occurred during the processing.

**System action:** PKI Services continues, but does not post the CRL.

**System programmer response:** Fix the I/O error and wait for the next posting interval. For information about the posting interval, see the description of the `PostInterval` configuration parameter in Table 25 on page 100.

---

**IKYC082I Bad URI CRL posting path and DP name value in pkiserv.conf file.**

**Explanation:** PKI Services is reading its configuration file to locate the values specified for `CRLDistDirPath` and `CRLDistName` to save CRLs in the z/OS UNIX file system. The combination of the values specified is not valid because it results in a path length greater than the maximum length of 240. The path length includes a trailing “/” character on `CRLDistDirPath` if it does not include one.

**System action:** PKI Services continues, but CRLs are not saved in the file system.

**System programmer response:** Correct the values of `CRLDistDirPath` and `CRLDistName` in the `pkiserv.conf` file, and ensure that the resulting path length (including a trailing “/” character on `CRLDistDirPath` if it does not include one) is not greater than 240. Then restart PKI Services.

---

**IKYC083I Bad Large CRL posting path and DP name value in pkiserv.conf file.**

**Explanation:** PKI Services is reading its configuration file to locate the values specified for `LargeCRLPostPath` and `CRLDistName` to save CRLs in the z/OS UNIX file system for LDAP posting. The combination of values specified is not valid because it results in a path length greater than the maximum length of 240. The path length includes a trailing “/” character on `LargeCRLPostPath` if it does not include one.

**System action:** PKI Services continues, but large CRL posting cannot be enabled. CRLs whose size is 32 KB or smaller are stored in the object store for posting. CRLs larger than 32 KB are not posted. (32 KB is an approximate value.)

**System programmer response:** Correct the values of `LargeCRLPostPath` and `CRLDistName` in the `pkiserv.conf` file. Ensure that the resulting path length (including a trailing “/” character on `LargeCRLPostPath` if it does not include one) is not greater than 240. Then, restart PKI Services.

---

**IKYC084I Large CRL posting object found while large CRL posting is not enabled.**

**Explanation:** During LDAP posting, PKI Services has found a CRL posting object larger than 32 KB, and `EnableLargeCRLPosting` has not been set to `T` in the `pkiserv.conf` file to enable posting of large CRLs. (32 KB is an approximate value.)

**System action:** PKI Services deletes the large CRL posting object from the object store and continues.

**System programmer response:** None.

**IKYC086I Requests for CA certificates are prohibited by path length constraint.**

**Explanation:** The CA certificate in use has a path length constraint value of zero, which prohibits the creation of subordinate or intermediate CA certificates when the `EnablePathLenConstraint` keyword is set to T in the `pkiserv.conf` file. Because the certificate request includes certificate authority key usage bits (`keyCertSign` or `cRLSign`, or both), it is considered to be a request for a CA certificate.

**System action:** The certificate request fails.

**System programmer response:** If this configuration was intended, restrict the requester from requesting the `keyCertSign` key usage. For example, remove the **keyusage** list from the PKI Services web page. If this configuration was not intended, perform one of the following actions and restart PKI Services:

- Disable path length constraint by removing the `EnablePathLenConstraint` keyword or setting its value to F.
- Reconfigure PKI Services to use a CA certificate that does not constrain the path length, or that has the path length greater than zero.

**IKYC087I Bad CRLWTONotification value in pkiserv.conf file: *value***

**Explanation:** PKI Services is reading its configuration file, `pkiserv.conf`, to locate the value specified for `CRLWTONotification` in the **CertPolicy** section, to determine when to issue a console message when the CRL is available. The expected value is either `none` or `file`. The value specified is not one of these values.

**System action:** No console message is issued to indicate the availability of the CRL.

**System programmer response:** Correct the value of `CRLWTONotification` and restart PKI Services. For more information about the `CRLWTONotification` keyword, see “(Optional) Steps for updating the configuration file” on page 68.

**IKYC088I CRL notification can not be enabled**

**Explanation:** The `CRLWTONotification` variable is specified in the `pkiserv.conf` file. But neither of the following actions have been taken:

- Setting up CRL distribution points using the HTTP protocol
- Enabling large CRL processing

Therefore, CRL notification cannot be enabled.

**System action:** No console message id issued to indicate the availability of the CRL.

**System programmer response:** Specify the HTTP protocol for `CRLDistURI1` or specify T for `EnableLargeCRLPosting` and restart PKI Services. For more information about these keywords, see “(Optional) Steps for updating the configuration file” on page 68. For information about setting up CRL distribution points, see “Customizing distribution point CRLs” on page 274. For information about enabling large CRL processing, see “Enabling support for large CRLs” on page 281.

**IKYC089I Invalid RSA key size value *key-size-value* specified for secure key generation.**

**Explanation:** The key size value specified in the `CertPlist` for secure key generation is not valid. The RSA key size value for secure key generation must be at least 1024 bits and a multiple of 256.

**System action:** The certificate request fails and this message is written to the PKI Services log. The request is removed from the object store.

**User response:** Correct the RSA key size and resubmit the request.

**IKYC090I The number of required approvals *value* specified is not valid in certificate template, nickname: *template-nickname*.**

**Explanation:** PKI Services is processing a certificate request or a Simple Certificate Enrollment Protocol (SCEP) request. The value for the required number of administrators in the named certificate template specified with

## IKYC801I • IKYC903I

| <ADMINNUM> in the ADMINAPPROVE section or PREREGISTER section in the pki serv.tmp1 file or in the  
| pkixgen.tmp1 file is not valid.

| **System action:** The system takes one of the following actions:

- | • If the value specified for the <ADMINNUM> tag is greater than the maximum allowed value, PKI Services uses  
| the maximum allowed value and continues.
- | • If the value specified for the <ADMINNUM> tag is less than 1, PKI Services uses a value of 1 and continues.
- | • If the value specified for the <ADMINNUM> tag is not numeric, PKI Services uses a value of 1 and continues.

| **System programmer response:** Correct the number and submit new requests, if you want. However, the requests  
| already created are not affected by the corrected value.

---

### IKYC801I *nnnn* bytes of unconsumed data transferring extensions to certificate template

**Explanation:** PKI Services is processing a certificate renewal request and has encountered an internal error. The error code encountered is displayed. A description of the error is also displayed, if known.

**System action:** The certificate renewal request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

### IKYC802I **Error** *nnnn* {getting certificate-section from old certificate | setting certificate-section in certificate template | removing unnecessary extension from certificate template}: *error-code-description*

**Explanation:** PKI Services is processing a certificate renewal request and has encountered an internal error. The error code encountered is displayed. A description of the error is also displayed, if known.

**System action:** The certificate renewal request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

### IKYC901I **Error** *nnnn* initializing *sub-function-name*: *error-code-description*

**Explanation:** PKI Services is initializing one of its sub-functions and has encountered an error. The sub-function name and error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** PKI Services stops.

**System programmer response:** This message might accompany a message more specific to the sub-function that failed. Check the log for other error messages issued before this one, and diagnose accordingly. Restart PKI Services after making corrections. If you are unable to diagnose the error, report the error to the IBM support center.

**Note:** If the message indicates an LDAP error, the error code might be an OCSF error code. If you cannot find the error code that is documented in *z/OS IBM Tivoli Directory Server Administration and Use for z/OS*, look in *z/OS Open Cryptographic Services Facility Application Programming*.

---

### IKYC902I **Error** initializing the configuration file

**Explanation:** PKI Services is reading its configuration file to locate the object identifiers defined in the **OIDs** section. Either the section is missing, or a value has an incorrect syntax.

**System action:** PKI Services stops.

**System programmer response:** The OID values must be defined in dotted decimal form, for example:

```
sha-1WithRSAEncryption=1.2.840.113549.1.1.5
```

Correct the configuration file, and restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

### IKYC903I **Error** *nnnn* adding CA certificate to ICL: *error-code-description*

**Explanation:** PKI Services is initializing and is attempting to store its own certificate authority certificate in the issued certificate list (ICL). The attempt was not successful. The error code encountered is displayed. A description of the error is also displayed, if known.

**System action:** PKI Services stops.

**System programmer response:** This message might accompany a more specific error message. Check the log for other error messages issued before this one and diagnose accordingly. Restart PKI Services after making corrections. If you are unable to diagnose the error, report the error to the IBM support center.

**IKYD001I    Unable to open VSAM data set *data-set-name***

**Explanation:** PKI Services is attempting to open one of the VSAM data sets specified in the **ObjectStore** section of the `pkiserv.conf` file or its default data set name. The open has failed. The data set name is displayed.

**System action:** PKI Services stops.

**System programmer response:** Locate the failing DSN value in the `pkiserv.conf` file. Make sure that the value specifies the correct VSAM data set name and that the data set has been created. If the data set name is not specified in the `pkiserv.conf` file, then PKI Services uses the default name for the data set. Make sure that this data set exists or add the appropriate DSN value to the `pkiserv.conf` file to specify the correct data set. If migrating from a previous release of PKI Services, make sure that the additional VSAM alternate index data sets have been created properly.

If no errors are found, contact your RACF administrator to ensure that the user ID assigned to the PKI Services daemon has permission to open the data set for update. Once corrected, restart PKI Services. For information about the values specified in the PKI Services configuration file (`pkiserv.conf`), including their defaults, see “(Optional) Steps for updating the configuration file” on page 68. See also “Steps for creating the VSAM object store and ICL data sets and indexes” on page 110.

**IKYD002I    DB2 RRSAB failure: Command *rrsaf\_cmd* failed with return code *0xxxxxx*, reason code *0xxxxxx***

**Explanation:** A failure condition was detected when PKI Services issued Resource Recovery Services Attachment Facility (RRSAF) commands to the DB2 for z/OS database service. *rrsaf\_cmd* is the RRSAB subcommand that detected the condition. This failure prevents PKI Services from using DB2 for z/OS as its storage mechanism.

**System action:** PKI Services stops.

**System programmer response:** Look up the return code and reason code that is given in this message in *DB2 for z/OS Codes* and perform any problem determination or problem resolution instructions.

**IKYD003I    DB2 SQL failure: Instruction *SQL\_instruction* failed with SQLCODE *sqlcode*, SQLSTATE *sqlstate***

**Explanation:** A failure condition was detected when PKI Services issued Structured Query Language (SQL) instructions to the DB2 for z/OS database service. *SQL\_instruction* is the SQL instruction that detected the condition.

**System action:** PKI Services stops.

**System programmer response:** Look up the SQLCODE and SQLSTATE values in this message in *DB2 for z/OS Codes* and perform any problem determination or problem resolution instructions.

**IKYI001I    Request denied by installation exit. RC = *nn***

**Explanation:** A user is requesting PKI Services. The PKIServ web application called an installation-provided exit program. The exit program has determined that the request should be denied. The return code from the exit program is displayed in the message.

**System action:** The request is not performed.

**User response:** Contact your web administrator.

**Web administrator response:** Determine why the exit program denied the request and correct the program if necessary.

**IKYI002I    SAF Service IRRSPX00 Returned SAF RC = *nn* RACF RC = *nn* RACF RSN = *nn*  
{*diagnostic-information*}**

**Explanation:** A user is requesting PKI Services. The PKIServ web application called the IRRSPX00 SAF callable service as requested. The service was unsuccessful. The diagnostic information that follows the message describes the problem in greater detail.

## IKYI002I

The text items listed here comprise all of the possible values for *diagnostic-information* in this message and in message IKYU002I.

- 1 Incorrect field name specified in CertPlist: *<field-name>*.
- 2 *<field-name>* has an incorrect value.
- 3 Required field *<field-name>* missing from the request.
- 4 Request denied, not authorized.
- 5 Certificate generation provider is not available [for CA domain *<CA-domain-name>*].
- 6 Certificate generation provider indicated the following error: *<provider-specific-error-msg>*.
- 7 Incorrect CertId PassPhrase specified.
- 8 Request has been rejected by the administrator.
- 9 Request is still pending approval or yet to be issued.
- 10 Incorrect certificate specified.
- 11 The certificate could not be {renewed | revoked} because of a state change.
- 12 Incorrect {CertId | Serial Number} specified.
- 13 The status of the {request | certificate} has been changed by another process.
- 14 {CertIds | SerialNums} has an incorrect length.
- 15 CertAnchor area missing.
- 16 CertAnchor area too small.
- 17 CertPlist has an incorrect length.
- 18 CertPlist DiagInfo field missing or has an incorrect length.
- 19 Conflicting field names specified in CertPlist : *field-name*.
- 20 Incorrect action specified.
- 21 Incorrect status criteria specified.
- 22 Incorrect transaction ID specified.
- 23 Incorrect reason specified.
- 24 Incorrect SerialNum specified.
- 25 SerialNums has an incorrect length.
- 26 Summary list or CertPlist area missing.
- 27 Summary list or CertPlist area too small.
- 28 A parameter list error has been detected.
- 29 An internal error has occurred during RACF processing.
- 30 Unable to establish recovery environment.
- 31 Function code specified is not defined.
- 32 Parameter list version specified is not supported.
- 33 RACF not installed.
- 34 Certificate generation provider internal error.
- 35 Unexpected error.
- 36 Incorrect value specified for CA domain.
- 37 Client already preregistered.

- 38 The ReadyMessageForm or the RecoverForm is not set up correctly. The ReadyMessageForm is required to request a certificate. The RecoverForm is required to recover a certificate whose keys were generated by PKI Services.
- 39 The email containing the transaction ID link to pick up the certificate was not sent successfully. The requester needs to contact the administrator.
- 40 The email containing the key ID link to recover the certificate was not sent successfully. The recovery process stops.
- 41 The requester's email address for the certificate could not be modified because the key is not generated by PKI Services.
- 42 The certificate could not be renewed because the requester's email address has been changed.
- 43 The certificate could not be deleted from the token data set (TKDS) although it was deleted from the issued certificate list (ICL).

**System action:** The request is not performed.

**User response:** Correct the problem if applicable. If you cannot correct the problem, contact your web administrator.

For problem 9, try to retrieve your certificate again later. The amount of time you need to wait depends on your PKI Services operating procedures and settings. If you continue to get this message, contact your PKI Services administrator.

**Web administrator response:** Problems 1, 2, and 3 probably indicate an error with the certificate template. Change the certificate template definition in the `pkiserv.tmp1` file to correct the error.

Problem 4 indicates the user ID assigned to the unit of work calling the IRRSPX00 callable service is not RACF-authorized to perform the request. Determine if the user should have access. If so, use RACF commands to permit the user ID to the required resources.

Problem 5 indicates the PKI Services daemon process has not been started. If PKI Services is configured for multiple-CA mode then the CA domain name is displayed as part of the diagnostic information. Start the correct instance of PKI Services; then retry the request.

For problems 6-13, 22, and 24, or for more information about any of the preceding problems, see earlier chapters in this document and *z/OS Security Server RACF Callable Services*.

For problems 14-21, 23, and 25-35, report the error to the IBM support center.

For problem 36, PKI Services is configured for multiple-CA mode, but the CA domain name as found in the URL contains characters that cannot be used as a CA domain name. Correct the value in the URL; then retry the request.

Problems 38, 39 and 40 probably indicate an error with the value specified in the ReadyMessageForm or the RecoverForm in the configuration file. Change the value in the `pkiserv.conf` file to correct the error.

For problem 43, you need to remove the orphaned TKDS objects yourself; for example, by using ICSF panels.

**PKI Services administrator response:** For problem 9, locate the pending certificate request using the PKI Services administration web pages, and approve or reject the request.

#### IKYI003I PKI Services CGI error in `cgi-program-name`: *diagnostic-error-information*

**Explanation:** A user is requesting PKI Services. The PKIServ web application CGI program processing the request detected a problem. The name of the CGI program and additional diagnostic information is displayed in the message.

**System action:** The request is not performed.

**User response:** Contact your web administrator.

**Web administrator response:** Locate the CGI program mentioned in the message. (Its default installation location is in a subdirectory under `/usr/lpp/pkiserv/PKIServ`.) Examine the CGI program's source code to determine the spot where it is failing and why. In most cases, the problem is caused by an error in the PKI Services template file (usually in `/etc/pkiserv/pkiserv.tmp1`). Correct the problem and retry the request. For more information, see Chapter 11, "Customizing the end-user web application if you use REXX CGI execs," on page 127 and Chapter 12, "Customizing the administration web pages if you use REXX CGI execs," on page 229.

---

**IKYI004I    Installation exit failed. RC = *nn***

**Explanation:** A user is requesting PKI Services. The PKIServ web application called an installation-provided exit program. The exit program either terminated abnormally or returned an unsupported return code value. The return code from the invocation of the exit program is displayed in the message.

**System action:** The request is not performed.

**User response:** Contact your web administrator.

**Web administrator response:** Determine why the exit program has failed and correct the program as necessary.

---

**IKYI005I    Invalid return type specified for certificate retrieval**

**Explanation:** A user is retrieving a certificate from the PKIServ web application. The result returned does not match the specified certificate type.

**System action:** The certificate is not returned through the web page.

**User response:** Specify the correct return type for certificate retrieval and try again. Make sure that the transaction ID specified corresponds to PKI/SAF Browser Certificate, PKI/SAF Server Certificate, or PKI Key Certificate.

---

**IKYI006I    PKI Services JSP error in *jsp-filename: diagnostic-information***

**Explanation:** A user made a request through the PKI Services web application. The PKIServ web application detected a problem. The name of the JSP file and additional diagnostic information is displayed in the message.

**System action:** The request is not performed.

**User response:** Contact your web administrator.

**Web administrator response:** If you cannot determine the error and have modified the failing JSP file, try temporarily replacing the modified JSP with a copy of the original JSP file that shipped with PKI Services to determine whether your change is causing the problem.

---

**IKYI007I    PKI Services web pages have not been configured for the client authentication needed for this function.**

**Explanation:** To renew or revoke a browser certificate, the WebSphere Application Server must be set up for client authentication. This step was not completed or client authentication is not working properly.

**System action:** The request is not performed.

**User response:** Contact your web administrator.

**Web administrator response:** Set up the WebSphere Application Server for client authentication. For instructions, see "Allowing WebSphere users to renew and revoke browser certificates" on page 244.

---

**IKYK001I    Unexpected PKCS#11 *function-name* return code 0x*nnnn*. The request is not processed.**

**Explanation:** PKI Services is calling the PKCS #11 function *function-name* to perform an action on a token. *function-name* returns an unexpected hexadecimal return code, *nnnn*.

**System action:** The request is not processed

**System programmer response:** For more information, see *z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*.

---

**IKYK002I    PKCS#11 token unavailable for *function-name* with return code 0x*nnnn* . The request is not processed.**

**Explanation:** PKI Services is calling the PKCS #11 function *function-name* to perform an action on a token. *function-name* returns a hexadecimal return code, *nnnn*. The possible return codes and reasons are:

**X'00e0'** ICSF is not active or is not configured for PKCS #11 services.

**X'00e1'** The PKI Services daemon has insufficient authority to access the token.

**System action:** PKI Services does not process the request.

**System programmer response:** Ensure that ICSF is properly configured and operational. If the return code is X'00e1', look for the ICH408I message that is issued for insufficient authority to the CRYPTOZ class resource and give the PKI Services daemon the required access. For more information, see *z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*.

---

**IKYK003I** {Certificate | key | PKCS12 package} with KEYID *keyid* is not deleted from TKDS object {Certificate object | Public key object | Private key object | Data object}.

**Explanation:** During certificate deletion processing, PKI Services is calling a PKCS #11 function to delete a certificate and its related objects from the token data set (TKDS). The deletion is completed in the issued certificate list (ICL) but not in the TKDS.

**System action:** The certificate is deleted from the ICL but the certificate and its related objects are not deleted from the TKDS.

**System programmer response:** Look at message IKYK001I to find out the return code. For information about deleting objects from the TKDS, see the PKCS #11 Cryptographic Token Interface Standard at <ftp://ftp.rsasecurity.com/pub/pkcs/pkcs-11/v2-20/pkcs-11v2-20.pdf>.

---

**IKYK004I** PKI Services can not generate certificates with secure keys.

**Explanation:** PKI Services has determined that secure key generation has been requested in one of these ways:

- The SecureKey field in the SAF section of the configuration file `pkiserv.conf` is set.
- The system in which PKI Services is running enforces secure key generation through the security product.

However, the system is not set up to generate secure PKCS #11 keys.

**System action:** The request fails.

**System programmer response:** Perform one of the following actions:

- Configure ICSF for secure PKCS #11 services.
- Set the SecureKey value to false and have your security administrator grant the PKI daemon the authority to generate clear keys.

For information about setting up secure and clear key generation on the TKDS, see *z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*.

---

**IKYL001I** Error *nnnn* {importing | converting} LDAP username *user's-distinguished-name*: *error-code-description*

**Explanation:** PKI Services is reading its configuration file to locate one of the values specified for AuthName in the LDAP section. The value specified has a syntax error. The incorrect value is displayed. A description of the error is also displayed, if known.

**System action:** PKI Services binds to the LDAP directory anonymously and continues processing. When PKI Services attempts to post certificates and CRLs to this directory, it might fail due to insufficient access. Look for message IKYC007I to determine this is happening. (RC = LDAP\_INSUFFICIENT\_ACCESS)

**System programmer response:** Locate the incorrect AuthName value in the `pkiserv.conf` file and correct it. The value must be specified as an LDAP distinguished name, for example, `CN=root,0=IBM`. Note: The OID qualifiers must be specified in uppercase and there cannot be any spaces surrounding the equal signs or commas separating the attribute value assertions (AVAs). Make corrections as needed, then stop and restart PKI Services. For more information, see "Steps for tailoring the LDAP section of the configuration file" on page 100.

---

**IKYL002I** LDAP bind to *LDAP-server-domain-name:port* failed, status = *nnnn*: *status-code-description*

**Explanation:** PKI Services is attempting to bind to one of the LDAP servers specified in the LDAP section of the `pkiserv.conf` file. The bind has failed. The failing server name is displayed. A description of the error is also displayed, if known. Note: If the error code is an LDAP return code, no error description is displayed.

**System action:** PKI Services attempts to bind to your other LDAP servers, if any. If PKI Services is unable to bind to any LDAP servers, the LDAP posting of certificates and CRLs is temporarily suspended. PKI Services attempts to bind again during the next posting interval. All post requests remain in the request database to be attempted later, subject to being deleted after one week of unsuccessful attempts.

**System programmer response:** Diagnose the problem indicated by the return code. For LDAP\_SERVER\_DOWN, ensure that your LDAP server is running. If so, you might have specified the server name incorrectly in the PKI Services configuration file. Locate the failing Server value in the pki serv.conf file. Correct the value if it does not specify the correct LDAP server domain name and port, then stop and restart PKI Services. For all other LDAP errors, follow the instructions in *z/OS IBM Tivoli Directory Server Client Programming for z/OS*. Report errors to the IBM support center. If message IKYC009I is also displayed, report that information also. For more information, see “Steps for tailoring the LDAP section of the configuration file” on page 100.

---

**IKYL003I Incorrect value specified for LDAPBIND or FACILITY Class profile** *profile-name*

**Explanation:** PKI Services LDAP bind processing is trying to retrieve its LDAP bind information in preparation for communicating with the LDAP server. The bind information is contained in either an LDAPBIND class profile or the IRR.PROXY.DEFAULTS profile in the FACILITY class. Either the profile does not exist or some of the information is missing or incorrect. The name of the profile in question is displayed.

**System action:** PKI Services attempts to bind to your other LDAP servers, if any. If PKI Services is unable to bind to any LDAP servers, the LDAP posting of certificates and CRLs is temporarily suspended. PKI Services attempts to bind again during the next posting interval. All post requests remain in the request database to be attempted later, subject to being deleted after one week of unsuccessful attempts.

**System programmer response:** Locate the profile name in the PKI Services configuration file and correct it if needed. If you make corrections, stop and restart PKI Services. If the profile name is already correct, contact your RACF administrator. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

**RACF administrator response:** Display the PROXY segment of the profile using the RLIST TSO command. Check the LDAPHOST for accuracy, and correct it if needed. If non-anonymous access is required, do the same for the BINDDN and BINDPW.

**Note:** The BINDPW value is not displayed. Respecify it to ensure that it is accurate. To alter the fields, use the RALTER TSO command. If the profile does not exist, create it using the RDEFINE TSO command. For more information, see *z/OS Security Server RACF Command Language Reference*.

---

**IKYL004I Bad LDAP Server value** *server-value* **in pkiserv.conf file**

**Explanation:** PKI Services LDAP bind processing is trying to retrieve its LDAP bind information in preparation for communicating with the LDAP server. (The *Server1*, *Server2*, and so forth keywords in the LDAP section of the PKI Services configuration file specifies the server host name information.) The host name has been specified incorrectly. Its value is displayed.

**System action:** PKI Services attempts to bind to your other LDAP servers, if any. If PKI Services is unable to bind to any LDAP servers, the LDAP posting of certificates and CRLs is temporarily suspended. PKI Services attempts to bind again during the next posting interval. All post requests remain in the request database to be attempted later, subject to being deleted after one week of unsuccessful attempts.

**System programmer response:** Locate the server name in the PKI Services configuration file, and correct it if needed. If you make corrections, stop and restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYO001I Error** *nnnn* {**setting** | **getting**} *certificate-field* {**in certificate** | **from template**}; *error-code-description*

**Explanation:** PKI Services is processing a certificate request field and has encountered an internal error. The field name and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The certificate request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYO002I** *nnnn* **bytes of unconsumed data transferring** *certificate-field* **to certificate**

**Explanation:** PKI Services is processing a certificate request field and has found that the field is larger than it should be. This is an internal error. The field name and the number of extra bytes are displayed.

**System action:** The certificate request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYO003I** The certificate request failed validity checks. Status is *nnnn: status-code-description*

**Explanation:** PKI Services is processing a certificate request field and has encountered an internal error. The field name and the status (error) code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The certificate request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYO004I** *action-being-performed* returned *nnnn: error-code-description*

**Explanation:** PKI Services is processing a request and has encountered an internal error. The action being performed and the error code encountered are displayed. A description of the error is also displayed, if known.

**System action:** The request is not processed.

**System programmer response:** Report the error to the IBM support center.

---

**IKYO005I** PKI CA certificate last used serial number was regressed.

**Explanation:** During certificate fulfillment, PKI Services has detected that the CA certificate's last serial number has regressed to a serial number below the next available PKI Services serial number.

**System action:** PKI Services calls the R\_DataLib callable service IncSerialNum function to increment the regressed serial number back to the next available PKI Services serial number or to one that was never used by PKI Services. If this is an asynchronous certificate request, the request is tried again with a new serial number.

---

**IKYO006I** Unsupported character(s) in the UserNoticeText*n* value in the pkiserv.conf file

**Explanation:** PKI Services is attempting to create the CertificatePolicies extension for a certificate with the specified UserNoticeText*n* value in the CertPolicy section of the pkiserv.conf file. The specified value contains one or more control characters.

**System action:** The request is not processed.

**System programmer response:** If you want the request to be processed, correct the value of UserNoticeText*n* and restart PKI Services. For more information about the UserNoticeText*n* keyword, see "Using certificate policies" on page 268.

---

**IKYP001E** ICSF UNAVAILABLE. CERTIFICATE PROCESSING SUSPENDED

**Explanation:** PKI Services background certificate processing is attempting to create a digital signature. ICSF manages the private key that is required for digital signing but it is not available for any of the following possible reasons:

- ICSF is inactive or incorrectly configured.
- The user ID of the PKI Services daemon has insufficient authority to use the ICSF private key.
- A system administrator inadvertently deleted the ICSF signing certificate and its private key.

After the ICSF problem has been corrected, PKI Services must be stopped and restarted.

**System action:** PKI Services background certificate processing is suspended. No certificates or CRLs are issued until the problem is corrected and PKI Services is stopped and restarted. However, certificate request management functions are still available through the R\_PKIServ callable service and the PKI Services web pages.

**System programmer response:** Ensure that ICSF and the PCI cryptographic coprocessor (if applicable) are properly configured and operational. Follow the documentation for any issued message with the CSF prefix.

If ICH408I messages are issued for insufficient authority to CSFKEYS or CSFSERV class resources, then the user ID of the PKI Services daemon has insufficient authority to use the key. Give the user ID the required access to the specified resource.

To determine if the key you are using requires the PCI cryptographic coprocessor, see Chapter 20, "RACF administration for PKI Services," on page 461.

For more information, see "Installing and configuring ICSF (optional)" on page 29, *z/OS Cryptographic Services ICSF*

## IKYP002I • IKYP006I

*System Programmer's Guide, and z/OS Cryptographic Services ICSF Administrator's Guide.*

If you make changes to ICSF to correct the problem, stop and restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

**Routing code:** 2

---

### IKYP002I PKI SERVICES INITIALIZATION COMPLETE

**Explanation:** PKI Services has just been started and has finished initializing.

**System action:** PKI Services processing continues.

**Routing code:** 2

**Descriptor code:** 6

---

### IKYP003I PKI SERVICES SHUTDOWN REQUESTED

**Explanation:** An operator command was issued to stop PKI Services.

**System action:** PKI Services stops.

**Routing code:** 2

**Descriptor code:** 5

---

### IKYP004I LOG OPTION PROCESSED: *log-option*

**Explanation:** A MODIFY operator command was issued to alter the current log setting for PKI Services.

**System action:** The log setting for PKI Services is changed as requested.

**Routing code:** 2

**Descriptor code:** 5

---

### IKYP005I INCORRECT LOG OPTION SPECIFIED

**Explanation:** A MODIFY operator command was issued to alter the current log setting for PKI Services. The log parameter syntax or value is incorrect.

**System action:** The MODIFY command is not processed. The log setting for PKI Services is unchanged.

**System programmer response:** Execute the MODIFY command specifying a correct log parameter. For more information, see “Changing logging options” on page 523.

**Routing code:** 2

**Descriptor code:** 5

---

### IKYP006I UNRECOGNIZED PKI SERVICES COMMAND: SPECIFY LOG, DISPLAY, OR STOP

**Explanation:** A MODIFY operator command was issued for PKI Services. The command specified is not a supported PKI Services command.

**System action:** The MODIFY command is not processed. PKI Services continues processing unchanged.

**System programmer response:** Execute the MODIFY command specifying a supported PKI Services command. For more information, see “Stopping the PKI Services daemon” on page 123 and “Changing logging options” on page 523.

**Routing code:** 2

**Descriptor code:** 5

---

---

**IKYP007E    INSUFFICIENT STORAGE AVAILABLE**

**Explanation:** PKI Services is attempting to allocate storage for processing a MODIFY operator command, but is unsuccessful because of a storage shortage.

**System action:** The console command is not processed. However, PKI Services might continue processing normally.

**Operator response:** Report the problem to your system programmer. After the problem is corrected, you can execute the command again.

**System programmer response:** Increase the region size for the PKI Services started procedure. Stop and restart PKI Services. For more information, see “Steps for starting the PKI Services daemon” on page 121 and “Stopping the PKI Services daemon” on page 123.

**Routing code:** 2

**Descriptor code:** 5

---

**IKYP008E    DIRECTORY POST UNSUCCESSFUL. LDAP DATA LIBRARY MODULE RC = *nnnn***

**Explanation:** PKI Services background certificate processing is attempting to post information (such as a certificate or CRL) to a directory. The post was unsuccessful. The OCSF Data Library Module (LDAPDL) return code is displayed in the message.

**System action:** The information is not posted now. The post request remains in the PKI Services request database to be reattempted later. If posting continues to be unsuccessful for one week, the information is removed from the request database.

**System programmer response:** Determine the cause of the failure from the return code displayed and take appropriate action. These return codes are documented in *z/OS Open Cryptographic Services Facility Application Programming*. If the error is LDAPDL\_NO\_SUCH\_OBJECT, the LDAP entry could not be created because the required suffix does not exist. Check the PKI Services log to determine the entry that could not be created, as indicated on messages IKYC005I and IKYC008I. If the entry should be posted to LDAP, you need to define the suffix in the LDAP server configuration file and recycle the LDAP server. For more information, see “Steps for installing and configuring LDAP” on page 27 and *z/OS IBM Tivoli Directory Server Administration and Use for z/OS*.

If you want PKI Services to bypass LDAP posting for certificates with missing suffixes, set `RetryMissingSuffix=F` in the PKI Services `pki serv.conf` configuration file. Then, stop and restart the PKI Services daemon. For more information, see “Steps for tailoring the LDAP section of the configuration file” on page 100.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP009I    PKI SERVICES IS STARTING, FMID *product-fmid***

**Explanation:** The START operator command was issued to start PKI Services. The START command could have been entered directly at the operator's console or indirectly through a COMMNDxx PARMLIB member.

**System action:** PKI Services initialization proceeds.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP010I    THE CONFIGURATION FILE NAME EXCEEDS THE MAXIMUM LENGTH OF *nnnn* CHARACTERS**

**Explanation:** The PKI Services daemon process is starting. Initialization processing is reading the `_PKISERV_CONFIG_PATH` environment variable. The value specified is too long.

**System action:** PKI Services stops.

**System programmer response:** Determine the location of your PKI Services environment variables file, and correct the value specified for `_PKISERV_CONFIG_PATH`. Then, restart PKI Services.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP011I** PKI SERVICES ADDRESS SPACE COULD NOT BE MADE NON-SWAPPABLE: ERROR *nnnn*

**Explanation:** The PKI Services daemon process is starting. Initialization processing is attempting to make the PKI Services address space non-swappable. The attempt was unsuccessful. The SYSEVENT TRANSWAP error code is displayed.

**System action:** PKI Services stops.

**System programmer response:** Look up the error code for SYSEVENT TRANSWAP in *z/OS MVS Programming: Authorized Assembler Services Reference SET-WTO* to determine what to do. Then, restart PKI Services.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP012I** SYSTEM FUNCTION *function-name* DETECTED ERROR - *error-string*

**Explanation:** PKI Services processing received an error when calling a system service. The service name and error message are displayed.

**System action:** PKI Services stops.

**System programmer response:** See documentation that is related to the service that failed. Make any necessary corrections. Then, restart PKI Services.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP013I** PKI SERVICES DETECTED AN ERROR DURING INITIALIZATION: ERROR *nnnn*, REASON *0xnnnn*

**Explanation:** PKI Services is starting. Initialization processing is attempting to set up the Program Call (PC) interface. The attempt was unsuccessful. The error and reason codes are displayed.

**System action:** PKI Services stops.

**System programmer response:** Determine the failing service by examining the error code. The values are as follows:

**Note:** This message is also issued after various C function calls. In these cases, ERROR is the value of `errno`, and REASON is the value of `__errno2()`.

- 1 The PKI Services daemon (IKYPKID) is not APF-authorized.
- 3 Unable to establish recovery. The reason code displayed is the ESTAEX macro return code.
- 5 Unable to create a PC linkage table index. The reason code displayed is the LXRES macro return code.
- 6 Unable to create a PC entry table. The reason code displayed is the ETCRE macro return code.
- 7 Unable to connect the PC entry table to the linkage table. The reason code displayed is the ETCRCON macro return code.
- 8, 10, or 11 Unable to create a name token entry. The reason code displayed is the IEANTCR callable service return code.

For error code 1, make the IKYPKID load module in SYS1.LINKLIB APF-authorized. For all other error codes, see the documentation that is associated with the MVS service that failed. Make corrections as necessary. Then, restart PKI Services.

**Routing code:** 2

**Descriptor code:** 6

---

---

**IKYP014I** PKI Services detected an error during termination: Error *nnnn*, Reason *nnnn*

**Explanation:** PKI Services is stopping. Termination processing is attempting to free resources allocated. The attempt was unsuccessful. The error and reason codes are displayed.

**System action:** PKI Services termination processing continues.

**System programmer response:** PKI Services should end normally. If so, no action is needed. However, you might want to diagnose the problem. Determine the failing service by examining the error code:

**16** Unable to establish recovery. The reason code displayed is the ESTAEX macro return code.

See associated documentation for the MVS service that failed. Make corrections as necessary.

---

**IKYP015I** A PKI Services program call request failed: Error *nnnn*

**Explanation:** PKI Services is processing a PC request. The PC request was canceled before PKI Services completed processing on it. The error code that was posted at the time of the cancel is displayed.

**System action:** PKI Services processing continues.

**System programmer response:** If the error code is 8, no action is required. This is an informational message only. For all other error codes, contact your IBM support center.

---

**IKYP016I** THE PKI SERVICES RUNTIME ENVIRONMENT COULD NOT BE INITIALIZED

**Explanation:** The PKI Services daemon process is starting. Initialization processing is trying to initialize the PKI Services runtime environment within the daemon address space. The attempt was unsuccessful.

**System action:** PKI Services stops.

**System programmer response:** Look for other PKI Services log messages related to this error. For more information, see Chapter 23, "Using information from the PKI Services logs," on page 519.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP017I** PKI SERVICES IS ALREADY RUNNING

**Explanation:** An attempt was made to start more than one instance of the PKI Services daemon.

**System action:** The first instance of PKI Services continues processing. The second instance stops.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP018I** PKI Services initialization failed because the program is not APF authorized

**Explanation:** PKI Services is starting. Initialization processing is attempting to initialize the PKI Services runtime environment within the daemon address space. The attempt was unsuccessful because the PKI Services daemon (IKYPKID) is not APF-authorized.

**System action:** PKI Services stops.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP019I** PKI Services dump created.

**Explanation:** PKI Services encountered a severe error during processing and has dumped the process (using the CEE3DMP callable service).

**System action:** PKI Services processing ends.

**Operator response:** Contact your system programmer.

## IKYP020I • IKYP024I

**System programmer response:** Examine the dump to determine the error. Contact the IBM support center if needed. After the error has been corrected, restart PKI Services. For more information, see “Steps for starting the PKI Services daemon” on page 121 and “Stopping the PKI Services daemon” on page 123.

---

### IKYP020I PKI SERVICES RESTART REGISTRATION COMPLETE ON *system-name*

**Explanation:** PKI Services is starting. Initialization processing has successfully registered PKI Services for automatic restart (ARM).

**System action:** PKI Services processing continues.

**Routing code:** 2

**Descriptor code:** 6

---

### IKYP021I PKI SERVICES RESTARTING ON *system-name*

**Explanation:** The PKI Services daemon stopped and is being restarted by the Automatic Restart Manager (ARM). The restart was successful.

**System action:** PKI Services processing continues.

**Routing code:** 2

**Descriptor code:** 6

---

### IKYP022I UNABLE TO REGISTER PKI SERVICES FOR RESTART: ERROR *nnnn*, REASON 0x*nnnn*

**Explanation:** PKI Services is starting. Initialization processing is attempting to register PKI Services for automatic restart (ARM), using the IXCARM macro service. The attempt was unsuccessful. The IXCARM return and reason codes are displayed. Note: The reason code is displayed in hexadecimal.

**System action:** PKI Services initialization continues without automatic restart capability.

**System programmer response:** Determine and correct the problem with IXCARM as indicated by the error codes displayed. Then, stop and restart PKI Services if you want automatic restart capability. For more information, see *z/OS MVS Programming: Sysplex Services Reference*.

**Routing code:** 2

**Descriptor code:** 6

---

### IKYP023I PKI Services failed to format the display message

**Explanation:** A MODIFY operator command was issued to display the current settings for PKI Services. Formatting of the display information failed.

**System action:** The settings are not displayed. PKI Services processing continues.

**System programmer response:** Report the error to the IBM support center.

---

### IKYP024I PKI SERVICES DUMPING FOR ABEND *abend-code* RC *nnnn*

**Explanation:** PKI Services has incurred an abend. The abend and reason codes are displayed.

**System action:** PKI Services stops.

**System programmer response:** Use IPCS to examine the dump and diagnose the problem. Contact the IBM support center if necessary. Restart PKI Services after the error has been corrected.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP025I PKI SERVICES SETTINGS:**

**Explanation:** A MODIFY operator command was issued to display the current settings for PKI Services.

**System action:** The settings are displayed.

IKYP025I PKI SERVICES SETTINGS:

```

CA DOMAIN NAME: {CA-domain-name-for-this-PKI-daemon}
SUBCOMPONENT      MESSAGE LEVEL
LDAP               {current-message-level}
SAF                {current-message-level}
DB                {current-message-level}
CORE              {current-message-level}
PKID              {current-message-level}
POLICY            {current-message-level}
TPOLICY           {current-message-level}
MESSAGE LOGGING SETTING: {STDERR_LOGGING | STDOUT_LOGGING}
CONFIGURATION FILE IN USE:
{full-UNIX-pathname-of-configuration-file-being-used}
TEMPLATE FILE IN USE:
{full-UNIX-pathname-of-template-file-being-used}
CA CERTIFICATE FINGERPRINTS:
SHA1:  {EBCDIC-representation-of-sha1-hash}
MD5:   {EBCDIC-representation-of-md5-hash}
SHA256: {EBCDIC-representation-of-sha256-hash}
SHA512: {EBCDIC-representation-of-sha512-hash}

```

**Restrictions:**

- The CA DOMAIN NAME: line is suppressed if the daemon is running in single CA mode.
- For long CA domain names, the *CA-domain-name-for-this-PKI-daemon* value is truncated to 50 characters.

The possible *current-message-level* values for each subcomponent are:

- SEVERE MESSAGES ONLY
- ERROR MESSAGES AND HIGHER
- WARNING MESSAGES AND HIGHER
- INFORMATIONAL MESSAGES AND HIGHER
- DIAGNOSTIC MESSAGES AND HIGHER
- VERBOSE DIAGNOSTIC MESSAGES AND HIGHER

**Operator response:** You can change the subcomponent message levels with the MODIFY operator command if you want. For more information, see “Changing logging options” on page 523.

**Routing code:** 2

**Descriptor code:** 5

---

**IKYP026E PKI SERVICES {CA | RA} CERTIFICATE EXPIRES ON *yyyy/mm/dd***

**Explanation:** The certificate that contains the PKI Services CA or RA public key expires on the date shown.

**System action:** If the certificate has not yet expired, processing continues as normal. After the CA certificate expires, certificates issued by PKI Services might be unusable depending on their usage.

**System programmer response:** You should renew the certificate before it expires. If your security product is RACF, your certificate is contained in a RACF profile established when you first configured PKI Services. Follow RACF documentation on how to renew a certificate. This is done using either the RACDCERT TSO command or RACF ISPF panels. For more information, see “Renewing your PKI Services CA and RA certificates” on page 468 and *z/OS Security Server RACF Security Administrator’s Guide*.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP027E ERROR ACCESSING PKI SERVICES CA CERTIFICATE**

**Explanation:** The PKI Services CA certificate is stored in the security product's database. PKI Services background certificate processing is attempting to access the certificate using the R\_data1ib SAF callable service. The attempt failed. Message IKYS015I should also appear in the PKI Services log.

**System action:** PKI Services background certificate processing is suspended. No certificates are issued until the problem is corrected. However, certificate request management functions are still available through the R\_PKIServ callable service and the PKI Services web pages.

**System programmer response:** You need to determine why the access failed. Look up the R\_data1ib return code displayed on message IKYS015I in *z/OS Security Server RACF Callable Services*. If your security product is RACF, your certificate is contained in a RACF profile that is established when you first configured PKI Services. That certificate must be connected as the default certificate to the key ring identified by the KeyRing keyword in the PKI Services configuration file. (The default location for this file is /etc/pkiserv/pkiserv.conf.) If you have only renewed your certificate and have not recycled PKI Services, stopping and restarting the PKI Services daemon might solve the problem. If not, use the RACF RACDCERT LIST and LISTRING commands to determine if the correct certificate is connected to the key ring. Also, use the RACF RLIST command to check that the PKI Services daemon user ID has proper authority to access the profile. Make any required changes. Then, stop and restart PKI Services. For more information, see Chapter 20, "RACF administration for PKI Services," on page 461 and *z/OS Security Server RACF Security Administrator's Guide*.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP028E PKI SERVICES DISTINGUISHED NAME OR KEY CHANGE ERROR**

**Explanation:** PKI Services is starting. Initialization processing has retrieved the PKI Services signing certificate from the key ring assigned to PKI Services. The certificate is incompatible with certificate processing that has previously transpired. The subject's distinguished name or the public key or both differ from the previous values used. The subject's distinguished name cannot be changed without reconfiguring PKI Services. The public key can be changed, but only if the key rollover process is performed.

**System action:** PKI Services stops.

**System programmer response:** Determine if PKI Services is processing the correct certificate. If your security product is RACF, your certificate is contained in a RACF profile that is established when you first configured PKI Services. That certificate must be connected as the default certificate to the key ring identified by the KeyRing keyword in the PKI Services configuration file. (The default location for this file is /etc/pkiserv/pkiserv.conf.) Use the RACF RACDCERT LIST and LISTRING commands to determine if the correct certificate is connected to the key ring. If you are attempting to rekey the PKI Services CA, you must follow the rollover process that is detailed in Chapter 20, "RACF administration for PKI Services," on page 461. Make any required changes. Then, restart PKI Services. For more information, see *z/OS Security Server RACF Security Administrator's Guide*.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP029I PKI Services can only be started from a started procedure**

**Explanation:** An attempt that is made at starting the PKI Services daemon was rejected because it was not made from a started procedure.

**System action:** The PKI Services daemon halts its initialization and stops after displaying this message to the standard output (STDOUT) of the process.

**System programmer response:** Use the started procedure that PKI Services supplies in SYS1.PROCLIB(PKISERVD). For more information, see "Steps for starting the PKI Services daemon" on page 121.

---

---

**IKYP030I CRL APPROACHING MAXIMUM SIZE**

**Explanation:** PKI Services is creating CRLs as part of CRL processing and has encountered at least one CRL that is approaching the maximum size for CRL posting objects in the object store. This can occur when large CRL posting has not been configured.

**System action:** PKI Services CRL processing continues. If the CRLs are all less than the record size limit of approximately 32 K bytes, CRL processing within PKI Services functions normally. However, CRL processing outside of PKI Services might be adversely affected due to the size of the CRL. If any CRL exceeds the record size limit, PKI Services CRL processing is unsuccessful, and the large CRLs are not published to the LDAP directory. When this happens you also receive message IKYC010I with the error code description, Record too long.

**System programmer response:** It is imperative that you correct the situation immediately. You can take either of these approaches:

- If you want to continue to use VSAM records or DB2 tables for LDAP posting, and if you are not yet using distribution point CRLs, start using them now. Edit the PKI Services configuration file and add the `CRLDistSize` directive to the **CertPolicy** section. If you are already using distribution point CRLs, decrease the value specified for the `CRLDistSize` directive. Make the appropriate changes and save the configuration file.

**Note:** These changes do not result in an immediate reduction in the size of the CRL. You continue to see this message until the revoked certificates on the CRL expire and are removed from the CRL.

- Alternatively, you can enable large CRL posting. If you do this, PKI Services stores CRLs in a z/OS UNIX file system instead of in a VSAM data set or DB2 table, and the record size limit of approximately 32 K bytes does not apply. Edit the PKI Services configuration file and add the `EnableLargeCRLPosting` and `LargeCRLPath` directives to the **CertPolicy** section. In addition, you need to configure a z/OS UNIX file system to hold CRLs. For more information, see “Enabling support for large CRLs” on page 281.

**Guideline:** Enable large CRL posting.

When the configuration file is saved, stop and restart PKI Services. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYP031E [RSA | DSA | ECC] signing key algorithm error**

**Explanation:** PKI Services is reading the **CertPolicy** section of its configuration file (`pkiserv.conf`) to find the signing algorithm. One of the following conditions occurred:

- The CA certificate key type does not match the signature algorithm you specified with the `SigAlg1` value in the **CertPolicy** section of the `pkiserv.conf` configuration file.
- The OID corresponding to the specified algorithm in the **OIDs** section is incorrect or is not specified at all.

**System action:** PKI Services stops.

**System programmer response:** Make sure the `SigAlg1` value in the **CertPolicy** section and its corresponding OID value in the **OIDs** section are correct and compatible with the CA certificate's key type.

If the CA certificate key type is RSA, specify the `SigAlg1` algorithm value as one of the following:

- `sha-1WithRSAEncryption` (OID value 1.2.840.113549.1.1.5)
- `sha-256WithRSAEncryption` (OID value 1.2.840.113549.1.1.11)
- `sha-384WithRSAEncryption` (OID value 1.2.840.113549.1.1.12)
- `sha-512WithRSAEncryption` (OID value 1.2.840.113549.1.1.13)
- `sha-224WithRSAEncryption` (OID value 1.2.840.113549.1.1.14)
- `md-5WithRSAEncryption` (OID value 1.2.840.113549.1.1.4)
- `md-2WithRSAEncryption` (OID value 1.2.840.113549.1.1.2)

If the CA certificate key type is DSA, specify the `SigAlg1` algorithm value as follows:

- `id-dsa-with-sha1` (OID value 1.2.840.10040.4.3)

If the CA certificate key type is ECC, specify the `SigAlg1` algorithm value as follows:

- `ecdsa-with-sha1` (OID value 1.2.840.10045.4.1)

## IKYP032I • IKYP034E

- ecdsa-with-sha224 (OID value 1.2.840.10045.4.3.1)
- ecdsa-with-sha256 (OID value 1.2.840.10045.4.3.2)
- ecdsa-with-sha384 (OID value 1.2.840.10045.4.3.3)
- ecdsa-with-sha512 (OID value 1.2.840.10045.4.3.4)

Correct the configuration values, and restart PKI Services. For more information, see “Updating the signature algorithm” on page 271.

---

### IKYP032I PKI SERVICES DOES NOT HAVE RA CAPABILITY. SCEP PROCESSING SUSPENDED

**Explanation:** The PKI Services daemon process is starting. Initialization processing determines that the SCEP interface should be enabled and it reads the contents of the key ring to locate the certificate and key to be used for the SCEP registration authority (RA) function. No RA-capable certificate and key was found.

**System action:** Initialization continues but PKI Services SCEP processing is suspended.

**System programmer response:** The RA function of PKI Services requires a certificate and a private key capable of creating general purpose digital signatures and enciphering session keys, with key usage, digitalSignature, and keyEncipherment (Handshaking). Either the PKI Services CA certificate must have this capability (which is atypical) or an additional, dedicated RA certificate for PKI Services must be established. In either case, the certificate must have the proper key usage and must have an RSA private key. If a dedicated RA certificate is used, specify its label using the RALabel directive in the SAF section of the PKI Services configuration file (pkiserv.conf). The RA certificate must be assigned to the user ID of the PKI Services daemon and must be connected to the PKI Services key ring with USAGE PERSONAL and DEFAULT NO. For more information, see “Enabling Simple Certificate Enrollment Protocol (SCEP)” on page 303. If you make changes to the PKI Services key ring to correct the problem, stop and restart PKI Services.

**Routing code:** 2

**Descriptor code:** 6

---

### IKYP033I Incorrect value specified for CA domain name

**Explanation:** The PKI Services daemon process is starting. Initialization processing has determined that the CA domain name value specified in the \_PKISERV\_CA\_DOMAIN environment variable in the pkiserv.envars file contains illegal characters.

**System action:** PKI Services stops.

**System programmer response:** The first eight characters of the CA domain name are limited to the following character set: alphanumeric characters (a-z, A-Z, 0-9) and the hyphen (-). In addition, the first character must not be a number or hyphen. Edit the PKI Services environment variables file pkiserv.envars for the CA instance in error and correct the value specified for \_PKISERV\_CA\_DOMAIN. Restart PKI Services. For more information, see “Adding a new CA domain” on page 287.

---

### IKYP034E ICSF UNAVAILABLE. SCEP PROCESSING SUSPENDED

**Explanation:** PKI Services is attempting to decrypt a Simple Certificate Enrollment Protocol (SCEP) request received from a SCEP client or to sign its response. ICSF manages the private key required for SCEP decryption and signing but ICSF is unavailable for any of the following possible reasons:

- ICSF is inactive or incorrectly configured.
- The user ID of the PKI Services daemon has insufficient authority to use the ICSF private key.
- A system administrator inadvertently deleted the certificate and its ICSF private key.

**System action:** PKI Services rejects the SCEP request.

**System programmer response:** Ensure that ICSF and the PCI cryptographic coprocessor (if applicable) are properly configured and operational. Follow the documentation pertaining to any issued messages having the CSF prefix. If you make changes to ICSF to correct the problem, stop and restart PKI Services.

If ICH408I messages are issued for insufficient authority to CSFKEYS or CSFSERV class resources, then the user ID of the PKI Services daemon has insufficient authority to use the private key. Give the user ID the required access to the specified resource.

To determine if your key still exists or requires the PCI cryptographic coprocessor, see Chapter 20, “RACF administration for PKI Services,” on page 461. To determine if your SCEP configuration requires a CA certificate or a CA/RA combination, see “Installing and configuring ICSF (optional)” on page 29.

**Routing code:** 2

**Descriptor code:** 6

**IKYP035I    Unsupported character(s) in CA's name**

**Explanation:** The PKI Services daemon process is starting. Initialization processing has determined that the CA's distinguished name contains one or more characters that have UTF-8 or BMP encoding that does not map to code page IBM-1047.

**System action:** PKI Services stops.

**System programmer response:** The characters in the distinguished name in the CA certificate must map to code page IBM-1047. Choose another CA certificate whose name has only characters that map to code page IBM-1047.

**IKYP036I    UNSUPPORTED CHARACTER(S) in RA'S NAME. SCEP PROCESSING SUSPENDED**

**Explanation:** The PKI Services daemon process is starting. Initialization processing has determined that the RA's distinguished name contains one or more characters that have UTF-8 or BMP encoding that does not map to code page IBM-1047.

**System action:** Initialization continues, but PKI Services SCEP processing is suspended.

**System programmer response:** If SCEP support is needed, choose another RA certificate in which the name has only characters that map to code page IBM-1047.

**Routing code:** 2

**Descriptor code:** 6

**IKYP037I    ONE OR MORE AUTOMATICALLY RENEWED CERTIFICATES CAN NOT BE SENT**

**Explanation:** PKI Services attempted to create or retrieve the notes with the renewed certificates. An internal error occurred.

**System action:** PKI Services continues with the automatic renewal processing.

**System programmer response:** Check for more details in IKYC069I messages in the PKI Services log file and manually send the transaction IDs to the email addresses to tell the users to pick up the renewed certificates.

**Routing code:** 2

**Descriptor code:** 6

**IKYP038I    THE DIRECTORY OR FILE SPECIFIED EXCEEDS THE MAXIMUM LENGTH OF *nnn* CHARACTERS**

**Explanation:** The PKI Services daemon process is starting. Initialization processing has determined that the value specified by the `_PKISERV_VARDIR` variable or the `_PKISERV_EXIT` variable in the `pkiserv.envars` file exceeds the limit indicated in the message.

**System action:** PKI Services stops.

**System programmer response:** Correct the name specified by `_PKISERV_VARDIR` or `_PKISERV_EXIT` and restart PKI Services.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP039E DIRECTORY POST UNSUCCESSFUL. ERROR CODE = *nnnn***

**Explanation:** PKI Services background certificate processing is attempting to post information (such as a certificate or CRL) to a directory. The post was unsuccessful. The return code from the associated LDAP client API is displayed in the message.

**System action:** The information is not posted now. The post request remains in the PKI Services request database to be reattempted later. If posting continues to be unsuccessful for one week, the information is removed from the request database.

**System programmer response:** Determine the cause of the failure from the return code displayed and take appropriate action. The return codes are documented in *z/OS IBM Tivoli Directory Server Client Programming for z/OS*. If the error is LDAP\_NO\_SUCH\_OBJECT, the LDAP entry could not be created because the required suffix does not exist. Check the PKI Services log to determine the entry that could not be created, as indicated by messages IKYC005I and IKYC008I. If the entry should be posted to LDAP, you need to define the suffix in the LDAP server configuration file and recycle the LDAP server.

For more information, see “Installing and configuring LDAP” on page 27 and *z/OS IBM Tivoli Directory Server Administration and Use for z/OS*. If you want PKI Services to bypass LDAP posting for certificates with missing suffixes, set `RetryMissingSuffix=F` in the PKI Services `pkiserv.conf` configuration file. Then, stop and restart the PKI Services daemon. For more information, see “Steps for tailoring the LDAP section of the configuration file” on page 100.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP040I PKI SERVICES DOES NOT HAVE KEY GENERATION CAPABILITY**

**Explanation:** The PKI Services daemon process is starting. Initialization processing has determined that key generation capability is required, but an error has occurred in locating or creating the token specified in the `TokenName` field of the **SAF section** of the configuration file `pkiserv.conf`.

**System action:** Initialization continues but PKI Services does not have key generation capability.

**System programmer response:** Make sure that the token data set (TKDS) has been set up and the system has the required hardware. For information about setting up the TKDS, see *z/OS Cryptographic Services ICSF Writing PKCS #11 Applications*.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP041E PKI SERVICES CA CERTIFICATE HAS *nnnn* SERIAL NUMBERS REMAINING.**

**Explanation:** The PKI Services CA certificate can sign a finite number of certificates before it exceeds the maximum unique serial number usable by PKI Services (X'FFFFFFFFE', or 4294967294). PKI Services has detected that the CA certificate soon runs out of unique serial numbers.

**System action:** PKI Services processing continues.

**System programmer response:** Add a new CA domain to continue certificate generation capability under a new CA certificate. For more information, see “Adding a new CA domain” on page 287.

**Routing code:** 2

**Descriptor code:** 6

---

**IKYP042E PKI SERVICES HAS NO REMAINING SERIAL NUMBERS FOR CERTIFICATE GENERATION.**

**Explanation:** The PKI Services CA certificate can sign a finite number of certificates before it exceeds the maximum unique serial number usable by PKI Services (X'FFFFFFFFE', or 4294967294). PKI Services has detected that the CA certificate has exceeded this maximum serial number.

**System action:** PKI Services background certificate processing is suspended. No certificates are issued until the problem is corrected. However, certificate request management functions are still available through the `R_PKIServ` callable service and the PKI Services web pages.

**System programmer response:** Add a new CA domain to continue certificate generation capability under a new CA certificate. For more information, see “Adding a new CA domain” on page 287.

**Routing code:** 2

**Descriptor code:** 6

**IKYP043I PKI Services CA certificate cannot be a Diffie-Hellman certificate.**

**Explanation:** An elliptic curve cryptography (ECC) certificate with only the keyAgreement keyUsage bit set, or with the keyAgreement bit set with either encipherOnly or decipherOnly set, is an ECC Diffie-Hellman certificate. Its intended usage is for key exchange, not for signing. Therefore, a CA certificate cannot be of this type.

**System action:** PKI Services stops.

**System programmer response:** Make sure that the key ring specified in the SAF section of the PKI Services configuration file (pkiserv.conf) contains a CA certificate that is not an ECC Diffie-Hellman certificate.

**IKYP044I CRL NUMBER *crl-serial-number* PROCESSING {FOR CA DOMAIN *cadomain*} COMPLETED SUCCESSFULLY**

**Explanation:** The certificate revocation list (CRL) processing completed successfully. This message is for notification purposes.

**System action:** None.

**System programmer response:** None.

**Routing code:** 2

**Descriptor code:** 6

**IKYP045I CRL NUMBER *crl-serial-number* PROCESSING {FOR CA DOMAIN *cadomain*} FAILED**

**Explanation:** The certificate revocation list (CRL) processing failed. This message is for notification purposes.

**System action:** None.

**System programmer response:** Look at the PKI Services job log to investigate why the CRL process failed.

**Routing code:** 2

**Descriptor code:** 6

**IKYP046I PERFORMANCE OF ADMINISTRATIVE FUNCTIONS MIGHT BE DEGRADED. SAF RC *nn*, RACF RC *nn*, RACF RSN *nn***

**Explanation:** During PKI Services initialization, a call to the SAF IRRSIA00 (initACEE) callable service attempted to establish a thread-level or task-level ACEE. The attempt failed with the specified return and reason codes, displayed in decimal. The call to IRRSIA00 is attempted only when the AdminGranularControl option is set in the pkiserv.conf file. The performance of administrative query and modification functions might be degraded.

**System action:** Initialization continues with granular administration enabled, but the administrative functions might require more time and system resources to complete than they require with granular administration disabled.

**Programmer response:** For more information about the indicated return and reason codes for IRRSIA00 (initACEE), see *z/OS Security Server RACF Callable Services*. Diagnose and correct the problem. Restart PKI Services.

**Routing code:** 9

**Descriptor code:** 6

**IKYS001I Error *nnnn* {attaching | detaching} OCSF-service-provider-description**

**Explanation:** PKI Services is attaching or detaching an OCSF or OCEP service provider module. The attach or detach failed. The service provider in error and the error code encountered are displayed.

**System action:** PKI Services stops.

## IKYS002I • IKYS006I

**System programmer response:** Look up the error code in either *z/OS Open Cryptographic Services Facility Application Programming* or *Integrated Security Services Open Cryptographic Enhanced Plug-ins Application Programming*. Diagnose the problem indicated by the return code. Restart PKI Services after corrections are made.

---

### IKYS002I Error *nnnn* in OCSF-API-name

**Explanation:** PKI Services is calling an OCSF or OCEP API. The invocation has failed. The API name and error code encountered are displayed.

**System action:** If the error occurs during PKI Services initialization, PKI Services stops. Otherwise, PKI Services continues processing. However, needed cryptographic services might not be available.

**System programmer response:** If you are using ICSF for your CA's private key operations and the failing service is either CSP\_CreateSignatureContext or CSSM\_SignData, check that ICSF is functioning and configured properly for PKA operations. For this problem, you also see console message IKYP001E. Follow the instructions for message IKYP001E. For all other errors, look up the error code in either *z/OS Open Cryptographic Services Facility Application Programming* or *Integrated Security Services Open Cryptographic Enhanced Plug-ins Application Programming*. Diagnose the problem indicated by the return code. Restart PKI Services after corrections are made, if needed.

---

### IKYS003I Error *nnnn* in getting {subject name | public key} from certificate: error-code-description

**Explanation:** PKI Services is retrieving its CA certificate from the SAF key ring. An error occurred while PKI Services was extracting the subject name or public key from the certificate. The error code encountered is displayed. A description of the error is also displayed, if known. This might indicate a problem with the certificate stored in the SAF key ring or it might be an internal error.

**System action:** PKI Services stops.

**System programmer response:** Ensure that the certificate stored in the SAF key ring is correct. If no problems are found, report the error to the IBM support center. For more information, see Chapter 20, "RACF administration for PKI Services," on page 461 and *z/OS Security Server RACF Security Administrator's Guide*.

---

### IKYS004I Error 0xnnnn in opening key ring *key-ring-name*

**Explanation:** PKI Services is initializing and is calling System SSL services to open the SAF key ring containing the CA certificate. The open failed. The key ring name and System SSL services error code encountered is displayed.

**System action:** PKI Services stops.

**System programmer response:** Look up the error code in *z/OS Cryptographic Services System SSL Programming*. Diagnose the problem indicated by the return code. Restart PKI Services once corrections are made.

---

### IKYS005I Error 0xnnnn in closing key ring

**Explanation:** PKI Services is terminating and is invoking System SSL services to close the SAF key ring containing the CA certificate. The close failed. The System SSL services error code encountered is displayed.

**System action:** PKI Services continues termination.

**System programmer response:** Look up the error code in *z/OS Cryptographic Services System SSL Programming*. Diagnose the problem indicated by the return code. Make corrections as indicated. Restart PKI Services if you want.

---

### IKYS006I Cannot delete the signing context

**Explanation:** PKI Services is attempting to sign a certificate or CRL and is invoking the OCSF API CSSM\_DeleteContext. The invocation failed.

**System action:** The certificate or CRL is not created.

**System programmer response:** Report the error to the IBM support center.

---

---

**IKYS007I** No KeyRing value specified under SAF section in pkiserv.conf file

**Explanation:** PKI Services is reading its configuration file to locate the value specified for KeyRing in the SAF section. The value is missing or has an incorrect syntax.

**System action:** PKI Services stops.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYS008I** Signing key is from unknown crypto service provider

**Explanation:** PKI Services is retrieving its private key from the SAF key ring. The private key type is not known to PKI Services. This might indicate a problem with the certificate and private key stored in the SAF key ring or it might be an internal error.

**System action:** PKI Services stops.

**System programmer response:** Ensure that the certificate and private key stored in the SAF key ring are correct. If no problems are found, report the error to the IBM support center. For more information, see Chapter 20, “RACF administration for PKI Services,” on page 461 and *z/OS Security Server RACF Security Administrator’s Guide*.

---

**IKYS009I** Profile for key ring *key-ring-name* not found

**Explanation:** PKI Services is reading its configuration file to locate the value specified for KeyRing in the SAF section. The key ring specified is incorrect. No such key ring exists.

**System action:** PKI Services stops.

**System programmer response:** Correct the value and restart PKI Services if you want. For more information, see “(Optional) Steps for updating the configuration file” on page 68.

---

**IKYS010I** Profile for key ring or default certificate or private key not found

**Explanation:** PKI Services is attempting to retrieve data from the SAF key ring specified by the KeyRing value in the SAF section of the pkiserv.conf file. The key ring specified does not appear to be set up properly. Possible problems are:

- Key ring is empty.
- CA certificate in the key ring not connected as PERSONAL DEFAULT.
- CA certificate in key ring has no private key.
- User ID assigned to the PKI Services daemon has insufficient authority to read the key ring or private key.

**System action:** PKI Services stops.

**System programmer response:** Ensure that the SAF key ring and the certificate stored in it are correct. For more information, see Chapter 4, “Running IKYSETUP to perform RACF administration,” on page 35 and *z/OS Security Server RACF Security Administrator’s Guide*.

---

**IKYS011I** Error *error-description* in pthread\_rwlock\_rdlock/wrlock

**Explanation:** PKI Services is retrieving its CA certificate from the SAF key ring. An internal error occurred while PKI Services was calling the pthread\_rwlock\_rdlock or pthread\_rwlock\_wrlock UNIX function. A description of the error is displayed.

**System action:** PKI Services stops.

**System programmer response:** Report the error to the IBM support center.

---

**IKYS012I** Error *error-description* in pthread\_rwlock\_unlock

**Explanation:** PKI Services is retrieving its CA certificate from the SAF key ring. An internal error occurred while PKI Services was invoking the pthread\_rwlock\_unlock UNIX function. A description of the error is displayed.

**System action:** PKI Services stops.

**System programmer response:** Report the error to the IBM support center.

---

**IKYS013I    Cannot find the private key associated with the {default | RA} certificate**

**Explanation:** PKI Services is attempting to retrieve data from the SAF key ring specified by the KeyRing value in the SAF section of the pkiserv.conf file. The key ring specified does not appear to be set up properly. The problem is related to either the CA (default) certificate or the RA certificate, as indicated in the message. Possible problems are:

- The certificate is not connected to the ring.
- The certificate is incorrectly connected to the key ring. Both must have USAGE PERSONAL and the CA certificate must be the DEFAULT.
- The certificate has no private key.
- The user ID assigned to the PKI Services daemon has insufficient authority to read the key ring or the private key.

**System action:** If the problem is with the default certificate, PKI Services stops. If the problem is with the RA certificate, PKI Services continues but the Simple Certificate Enrollment Protocol (SCEP) is disabled.

**System programmer response:** Ensure that the SAF key ring and the certificate stored in it are correct. For more information, see Chapter 4, "Running IKYSETUP to perform RACF administration," on page 35 and *z/OS Security Server RACF Security Administrator's Guide*.

---

**IKYS014I    Cannot find the {default | RA} certificate with private key associated in key ring**

**Explanation:** PKI Services is attempting to retrieve data from the SAF key ring specified by the KeyRing value in the SAF section of the pkiserv.conf file. The key ring specified does not appear to be set up properly. The problem is related to either the CA (default) certificate or the RA certificate, as indicated in the message. Possible problems are:

- The certificate is not connected to the ring.
- The certificate is incorrectly connected to the key ring. Both must have USAGE PERSONAL and the CA certificate must be the DEFAULT.
- The user ID assigned to the PKI Services daemon has insufficient authority to read the key ring or the private key.

**System action:** If the problem is with the default certificate, PKI Services stops. If the problem is with the RA certificate, PKI Services continues but the Simple Certificate Enrollment Protocol (SCEP) is disabled.

**System programmer response:** Ensure that the SAF key ring and the certificate stored in it are correct. For more information, see "Locating your PKI Services certificates and key ring" on page 464 and *z/OS Security Server RACF Security Administrator's Guide*.

---

**IKYS015I    RACF callable service, R\_datalib, with function code nnnn returns with SAF return code=nnnn, RACF return code=nnnn, RACF reason code=nnnn**

**Explanation:** PKI Services is attempting to retrieve data from the SAF key ring specified by the KeyRing value in the SAF section of the pkiserv.conf file. The key ring specified does not appear to be set up properly. Possible problems are:

- Key ring is empty.
- CA certificate in the key ring not connected as PERSONAL DEFAULT.
- CA certificate in key ring has no private key.
- User ID assigned to the PKI Services daemon has insufficient authority to read the key ring or private key.

**System action:** PKI Services stops.

**System programmer response:** Look up the return and reason code displayed in *z/OS Security Server RACF Callable Services*. Make corrections as needed. Ensure that the SAF key ring and the certificate stored in it are correct. For more information, see Chapter 20, "RACF administration for PKI Services," on page 461 and *z/OS Security Server RACF Security Administrator's Guide*.

---

**IKYS016I    Error 0xnmmmm getting the {default | RA | CA} key**

**Explanation:** PKI Services is initializing and calling System SSL services to get one of its private keys from the key ring. The obtain failed. The problem is related to one of the following, as indicated in the message:

- default - the CA certificate private key

- RA - the RA certificate private key
- CA - a former CA certificate that was re-keyed and rolled over

**System action:** If either the default or RA key cannot be obtained, PKI Services stops.

If issued for a former CA certificate, PKI Services continues initialization. However, SCEP processing might be disabled if the RA certificate cannot be signature verified.

**System programmer response:** Look up the error code in *z/OS Cryptographic Services System SSL Programming*. Diagnose the problem indicated by the return code. Restart PKI Services once corrections are made.

#### IKYS017I Error 0xnnnn exporting the {default | RA} key

**Explanation:** PKI Services is initializing and calling System SSL services to export one of its private keys from the key ring. The export failed. The problem is related to either the CA (default) certificate private key or the RA certificate private key, as indicated in the message.

**System action:** PKI Services stops.

**System programmer response:** Look up the error code in *z/OS Cryptographic Services System SSL Programming*. Diagnose the problem indicated by the return code. Restart PKI Services once corrections are made.

#### IKYS018I Error 0xnnnn signing Certificate/CRL

**Explanation:** PKI Services is attempting to sign a certificate or CRL. The signing failed.

**System action:** PKI Services continues processing. However, the needed cryptographic services might not be available.

**System programmer response:** If you are using ICSF for your CA's private key operations, check that ICSF is functioning and configured properly for PKA operations. For all other errors, look up the error code in *z/OS Cryptographic Services System SSL Programming*. Diagnose the problem indicated by the return code. Restart PKI Services once corrections are made.

#### IKYS019I The CA certificate does not have path length constraint capabilities

**Explanation:** The EnablePathLenConstraint keyword was specified in the `pki serv.conf` configuration file, but the PKI Services CA certificate does not meet the requirements for establishing path length constraint. One or more of the following conditions is true for the CA certificate:

- The key usage extension is present, but the `keyCertSign` bit is not set.
- The basic constraints extension is absent.
- The basic constraints extension is not set correctly in at least one of the following ways:
  - It is not marked critical.
  - The value of `cA` is not true.
  - The value of `pathLenConstraint` is not in the range 0 - 16.

**System action:** PKI Services stops.

**System programmer response:** Either choose another CA certificate that has the appropriate basic constraints extension, or turn off the `EnablePathLenConstraint` keyword in `pki serv.conf`. For more information about the `EnablePathLenConstraint` keyword, see “(Optional) Steps for updating the configuration file” on page 68.

#### IKYS020I The specified PathLength value {none | value1} conflicts with the CA path length constraint value value2.

**Explanation:** During PKI Services initialization, the value specified for `PathLength` in the `CertPolicy` section of the `pki serv.conf` file is validated against the path length constraint value in the basic constraints extension of the PKI Services CA certificate. The `PathLength` value must be positive and smaller than the path length constraint value of the CA certificate. If the `PathLength` value in the message is `none`, the CA certificate has a path length constraint value but the `PathLength` keyword was not specified in the `pki serv.conf` file.

**System action:** PKI Services stops.

**System programmer response:** Specify the value of the `PathLength` keyword in the `pki serv.conf` file, or correct it to

## IKYS021I • IKYU003I

a value smaller than the CA value shown in the message (*value2*), and restart PKI Services. For more information about the PathLength keyword, see “(Optional) Steps for updating the configuration file” on page 68.

---

### IKYS021I The value specified for the PathLength keyword is not allowed.

**Explanation:** The value specified for the PathLength keyword in the **CertPolicy** section of the `pkiserv.conf` file is not valid. The PathLength keyword value must be in the range 0 - 16, and must be less than the `pathLenConstraint` value in the CA certificate Basic Constraint extension, if present.

**System action:** PKI Services stops.

**System programmer response:** Correct the value specified for the PathLength keyword in the `pkiserv.conf` file.

---

### IKYS022I This CA is restricted from creating intermediate CA certificates.

**Explanation:** The CA certificate in use has a path length constraint value of zero, which prohibits the creation of subordinate or intermediate CA certificates when the `EnablePathLenConstraint` keyword is set to T in the `pkiserv.conf` file.

**System action:** None. This message is issued at initialization time to inform you that the CA certificate is restricted from creating CA certificates.

**System programmer response:** No action is necessary if this configuration is intended. If this configuration is not intended, perform one of the following actions and restart PKI Services:

- Disable path length constraint by removing the `EnablePathLenConstraint` keyword in the `pkiserv.conf` file or by setting its value to F.
- Reconfigure PKI Services to use a CA certificate that does not constrain the path length, or that has the path length greater than zero.

---

### IKYU001I Unable to open file *file-pathname* for {READ | WRITE}

**Explanation:** A user is running a PKI Services utility program. The program is unable to open the input file specified. The name of the file is displayed in the message.

**System action:** The program ends.

**User response:** Check that the specified file path name is correct and that the file exists. Also, check the file's permissions to ensure that the user is allowed to process the file. Make changes as necessary and retry the program.

---

### IKYU002I SAF Service IRRSPX00 Returned SAF RC = *nn* RACF RC = *nn* RACF RSN = *nn* {*diagnostic-information*}

**Explanation:** A user is running a PKI Services utility program. The program encountered an error while calling the `R_PKIServ` (IRRSPX00) callable service. The diagnostic information is displayed at the end of the message. For meanings of the diagnostic information, see message IKYI002I.

**System action:** The program ends.

**System programmer response:** See message IKYI002I for information. For more information, see Chapter 18, “Using PKI Services utilities,” on page 413.

**User response:** Correct the problem if applicable. If you cannot correct the problem, contact your web administrator.

**RACF administrator response:** Determine if the user should be permitted to perform the task. Make RACF authorization changes if necessary. For authorization information, see “Authorizing users for the PKI Services administration group” on page 461.

**Web administrator response:** See the web administrator responses listed for message IKYI002I.

---

### IKYU003I Unknown field name found in SCEP data file, *error-field-name*

**Explanation:** A user is running the `pkiprereg` PKI Services utility program. The program is reading the SCEP data file and has encountered a field name that it does not recognize. The erroneous field name is displayed.

**System action:** The program continues. If the user specified the `-I` option, the client is not preregistered.

**User response:** Correct the data file. Remove any entry that should not be reprocessed and rerun the program if you want. For more information, see “Using the pkiereg utility” on page 419.

**IKYU004I** Required field name {"ClientName" | "Template"} missing from input file at line *nnn*

**Explanation:** A user is running the pkiereg PKI Services utility program. The program is reading the SCEP data file and encountered a preregistration entry that is missing a required field name. The missing field name is displayed. The line number where the error was found is also displayed.

**System action:** The program continues. If the user specified the **-l** or **-r** option of the pkiereg utility, the current record is not processed.

**User response:** Correct the input file. Remove any entry that should not be reprocessed and rerun the program if you want. For more information, see “Using the pkiereg utility” on page 419.

**IKYU005I** Duplicate ClientName=*error-value* entry found in SCEP data file at line *nnn*

**Explanation:** A user is running the pkiereg PKI Services utility program. The program is reading the SCEP data file and encountered a preregistration entry with a ClientName value that is already in use. The value was either used earlier in the file or is already registered in PKI Services. The ClientName value and the line number where the error was found are displayed.

**System action:** The program continues. If the user specified the **-l** option of pkiereg utility, the client is not preregistered.

**User response:** Correct the input file. Remove any entry that should not be reprocessed and rerun the program if you want. For more information, see “Using the pkiereg utility” on page 419.

**IKYU006I** Preregistration record for ClientName=*error-value* not found in PKI Services

**Explanation:** A user is running the pkiereg PKI Services utility program with the **-r** (remove) option. The program is reading the SCEP data file and encountered a preregistration entry with a ClientName value that does not exist in PKI Services. The erroneous field name is displayed.

**System action:** The program continues. The current record is not processed.

**User response:** Correct the input file. Remove any entry that should not be reprocessed and rerun the program if you want. For more information, see “Using the pkiereg utility” on page 419.

**IKYU007I** Incorrect *field-name=error-value* entry found in SCEP data file

**Explanation:** A user is running the pkiereg PKI Services utility program. The program is reading the SCEP data file and encountered a field name that has an incorrect value. If the error is length-related, the field name and error value are displayed; otherwise, only the field name is displayed.

**System action:** The program continues. If the user specified the **-l** option of pkiereg utility, the current entry is not processed.

**User response:** Correct the input file. Remove any entry that should not be reprocessed and rerun the program if you want. For more information, see “Using the pkiereg utility” on page 419.

**IKYU008I** Template nickname *template* not found in certificate templates file

**Explanation:** A user is running the pkiereg PKI Services utility program. The program is reading the SCEP data file and encountered a value pair of *template=nickname* where the nickname is not found in the certificate templates file.

**System action:** The program continues. If the user specified the **-l** option of pkiereg utility, the client is not preregistered.

**User response:** Correct the input file. Remove any entry that should not be reprocessed and rerun the program if you want. For more information, see “Using the pkiereg utility” on page 419.

---

**IKYU009I** Out of memory

**Explanation:** A user is running a PKI Services utility program. The program is unable to allocate more memory.

**System action:** The program ends.

**System programmer response:** Increase the amount of REGION available to the user or adjust the Language Environment<sup>®</sup> runtime memory settings. (For instructions, see *z/OS Language Environment Programming Guide*.)

**User response:** Increase the amount of memory available to the program if possible. Otherwise, report the error to your system programmer.

---

**IKYU010I** Internal error occurred in function *function-name: diagnostic-information*

**Explanation:** A user is running a PKI Services utility program. The program has encountered an internal error. The function in error is displayed. Additional diagnostic information might also be displayed.

**System action:** The program ends.

**User response:** Report the error to the IBM support center.

---

**IKYU011I** System function *function-name* detected error -- *error-string*

**Explanation:** A user is running a PKI Services utility program. The program received an error calling a system service. The service name and error message are displayed.

**System action:** The program ends.

**User response:** See documentation related to the service that failed. Make any necessary corrections. Then, rerun the program.

---

**IKYU012I** Unable to open message catalog *message-catalog-filename -- error-string*

**Explanation:** A user is running a PKI Services utility program. The program is attempting to open an external message catalog using the default location for the message catalog as set by the NLSPATH environment variable.

**System action:** The program continues using default messages.

**System programmer response:** If the user requires an external message catalog, correct the indicated error. There are several reasons that could cause this error, such as file or directory permissions not allowing read access.

For information about updating the NLSPATH environment variable, see *z/OS UNIX System Services Programming Tools*. If default messages are acceptable, no action is necessary.

**User response:** If you require an external message catalog, correct the indicated error. Then, rerun the program. For system errors, report the problem to your system programmer. For more information, see Chapter 18, "Using PKI Services utilities," on page 413.

---

**IKYU013I** Incorrect command syntax. The *error-value* parameter is {unknown | missing | incorrectly specified}  
**Usage:** *command-usage*

**Explanation:** A user is running a PKI Services utility program. A command parameter was entered incorrectly. The correct command usage is displayed.

**System action:** The program ends.

**User response:** Execute the command with the correct syntax. For more information, see Chapter 18, "Using PKI Services utilities," on page 413.

---

**IKYU014I** pkiprereg complete. *nnn* preregistration records processed. *mmm* successful. *000* errors found

**Explanation:** A user is running the pkiprereg PKI Services utility program. The program completed and is reporting the results. The value of *nnn* is the total number of preregistration records (entry groups) found in the SCEP data file. The value of *mmm* is the number of preregistration records that were successfully processed. The value of *000* is the number of errors found. Because multiple errors can occur for each preregistration record, *mmm* plus *000* can exceed *nnn*.

**System action:** The program ends.

**User response:** If no errors were found, no action is required. If errors were found, correct the errors in the SCEP data file. (You can remove the entries that were successful.) Rerun the program with the corrected SCEP data file. For more information, see Chapter 18, “Using PKI Services utilities,” on page 413.

#### IKYU015I    **Template with nickname *template* cannot be used for preregistration**

**Explanation:** A user is running the pkiprereg PKI Services utility program. The program is reading the certificates template file and found the certificate template with the specified nickname.

- If you are using CGI web pages and pkiserv.tmpl, the template either has no <PREREGISTER> section or the <PREREGISTER> section is not properly terminated.
- If you are using JSP web pages and PKIServTemplate.xml, the certreq\_template tag for this nickname did not include a valid preregules element.

**System action:** The program continues. If the -I option was specified, the client is not preregistered.

**System programmer response:** Correct the certificate template. Edit the SCEP data file to remove any entry that should not be reprocessed and rerun the program if you want. For more information, see “Using the pkiprereg utility” on page 419.

#### IKYU016I    **pkiprereg complete. *nnn* passwords generated**

**Explanation:** A user is running the pkiprereg PKI Services utility program in **generate** mode (password generate mode). The program completes and reports the results. *nnn* is the total number of passwords generated.

**System action:** The program ends.

**User response:** No action is required.

#### IKYU017I    *program-name* **terminated abnormally**

**Explanation:** A user is running a PKI Services utility program. The program cannot complete due to a user or system error. The name of the utility program is displayed in the message.

**System action:** The program ends.

**User response:** Check for previously issued messages and their associated actions. Make changes as necessary and retry the program.

#### IKYU018I    **Conversion from VSAM to DB2 failed at record *record-key* in VSAM file *vsam-file-name***

**Explanation:** A user is running the PKI Services utility program vsam2db2 to convert the existing object store and ICL VSAM files to DB2 tables. An error occurred when processing the record from the VSAM file indicated in the message. This message should be preceded by one indicating whether the source of the problem is VSAM or DB2.

**System action:** The vsam2db2 utility program ends.

**User response:** Fix the error, drop the DB2 tables, and rerun the vsam2db2 utility. For more information, see “Using the vsam2db2 utility” on page 432.

If you cannot fix the error based on the information in the message, report it to the IBM support center.

## Messages

## Chapter 25. File directory structure

This topic contains information about the location of files in:

- z/OS product libraries
- File system directory `/usr/lpp/pkiserv/` and its subdirectories.

---

### Product libraries

SMP/E installs PKI Services into the following product libraries:

- SAMPLIB/ASAMPLIB
  - IKYALLOC
  - IKYCDB2
  - IKYCVSAM
  - IKYDDDEF
  - IKYISMKD
  - IKYMKDIR
  - IKYRVSAM
  - IKYSBIND
  - IKYSETUP
  - IKYSGRNT
  - IKYVBKUP
  - IKYVREST
- PROCLIB/APROCLIB
  - IKYSPROC with alias PKISERVD
- SIEALNKE/AIEALNKE
  - IKYPKID - The PKI Services daemon
  - IKYPRTM - The Resource Termination Manager for the daemon

### File system directory and subdirectories

Unless you change the default, SMP/E installs PKI Services into the file system directory `/usr/lpp/pki/serv`. Table 102 describes the directory structure and contents:

Table 102. Files contained in subdirectories

| Subdirectory | Contains...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| samples      | Various sample files, including: <ul style="list-style-type: none"><li>• <code>expiringmsg.form</code> - The email message sent to a user as notification about a certificate that expires</li><li>• IBM HTTP Server - Powered by Apache configuration files:<ul style="list-style-type: none"><li>• <code>httpd.conf</code> - HTTP Server configuration file</li><li>• <code>vhost80</code> - Virtual host configuration file for non-SSL requests.</li><li>• <code>vhost443</code> - Virtual host configuration file for SSL requests with server authentication.</li><li>• <code>vhost1443</code> - Virtual host configuration file for SSL requests with client authentication.</li></ul></li><li>• <code>Makefile.pkiexit</code> - The makefile for the PKI Services exit. (For more information, see Chapter 15, "Customizing with installation exit routines," on page 325.)</li><li>• <code>Makefile.pkitpsamp</code> - The makefile for <code>pkitpsamp.c</code>, which is a sample application to call the PKI Trust Policy plug-in. (For more information, see "Files for PKITP" on page 491.)</li><li>• <code>pendingmsg.form</code> - The email message sent to an administrator listing pending requests.</li><li>• <code>pendingmsg2.form</code> - The email message sent to an administrator listing pending requests that are modified.</li><li>• <code>pkiexit.c</code> - The sample PKI Services exit, which PKI Services provides. (For more information, see Chapter 15, "Customizing with installation exit routines," on page 325.)</li><li>• <code>pkiserv.envars</code> - The PKI Services environment variables file. (For more information, see "Optionally updating PKI Services environment variables" on page 64 and "The <code>pkiserv.envars</code> environment variables file" on page 587.)</li><li>• <code>pkiserv.tmp1</code> - The PKI Services certificate templates file used with the REXX CGI execs. (For more information, see Chapter 11, "Customizing the end-user web application if you use REXX CGI execs," on page 127.)</li><li>• <code>pkiserv.conf</code> - The PKI Services configuration file. (For more information, see "(Optional) Steps for updating the configuration file" on page 68 and Chapter 26, "The <code>pkiserv.conf</code> configuration file," on page 577.)</li><li>• <code>PKIServ.xsd</code> - The XML schema for the PKI Services XML template, <code>pkitmp1.xml</code>. (For more information, see Chapter 13, "Implementing the web application using JavaServer pages," on page 233.)</li><li>• <code>pkitmp1.xml</code> - The PKI Services XML template file used with JavaServer pages (JSPs). (For more information, see Chapter 13, "Implementing the web application using JavaServer pages," on page 233.)</li><li>• <code>pkitpsamp.c</code> - Sample application to call the PKI Trust Policy plug-in. (For more information, see "Files for PKITP" on page 491 and "Building the sample application to invoke the certificate validation service" on page 496.)</li><li>• <code>readymsg.form</code> - The email message sent to a user as notification a certificate is ready for retrieval</li><li>• <code>recoverymsg.form</code> - The email message sent to a user who has requested that PKI Services recover a certificate for which PKI Services generated the keys</li><li>• <code>rejectmsg.form</code> - The email message sent to a user as notification a request for a certificate has been rejected</li><li>• <code>renewcertmsg.form</code> - The email message sent to a user as notification that PKI Services has automatically renewed an expiring certificate</li></ul> |

---

## Chapter 26. The pkiserv.conf configuration file

This topic includes a code sample of the pkiserv.conf configuration file.

The pkiserv.conf file is the configuration file for the PKI Services daemon. By default, you can find this file in the /usr/lpp/pkiserv/samples/ directory. For more information about the sections of the pkiserv.conf configuration file and the parameters, see “(Optional) Steps for updating the configuration file” on page 68 and Table 21 on page 68.

The following listing might not be identical to the code sample shipped with the product. For the most current sample, see the pkiserv.conf file in the source directory /usr/lpp/pkiserv/samples/.

# If your organization will be using CertificatePolicies extensions
# on certificates that are created by this CA, the following
# entry assigns a symbolic name to a registered OID that identifies
# your organization's certificate usage policy. This symbolic name
# is used later in the [CertPolicy] section of this configuration
# file to specify the certificate policy information.
#
MyPolicy=1.2.3.4

[ObjectStore]
# Database implementation, either VSAM or DB2. Default is VSAM.
# Specify
# DBType=VSAM
# or
```

```

# DBType=DB2

# If DBType is DB2, configure the following additional keywords:
#   DBPackage           DBSubsystem
# These keywords will be ignored if DBType is set to VSAM.
#
# If DBType is VSAM, configure the following additional keywords:
#   ObjectDSN           ObjectTidDSN   ObjectStatusDSN
#   ObjectRequestorDSN ICLDSN        ICLStatusDSN
#   ICLRequestorDSN
# These keywords will be ignored if DBType is set to DB2.
#
# Regardless of the setting for DBType, verify the setting of
# the following keywords in this ObjectStore section:
#   SharedPLEX           RemoveCompletedReqs
#   RemoveInactiveReqs  RemoveExpiredCerts
#   RemoveExpiredCertsAndKeys

# Is the database implementation, whether it be VSAM datasets
# or DB2, shared in a sysplex with other instances of PKI
# Services? True (T) or False (F).
# Note: The SharedPLEX keyword below replaces the SharedVSAM
#       keyword in PKI Services V1R13. This keyword has the
#       same meaning as the SharedVSAM keyword has in prior
#       version of PKI Services.
#
SharedPLEX=F

# Name of the DB2 Package this instance of PKI will be using in
# in the DB2 sub system specified by the DBSubsystem keyword. If
# DBSubsystem is missing or not specified, this keyword will be
# ignored.
#
DBPackage=MasterCA

# Name of the DB2 Sub system. If DBPackage is missing or not
# specified, this keyword will be ignored.
#
DBSubsystem=DSN9

# Data set name of the VSAM request (object store) base CLUSTER
#
ObjectDSN='pkisrvd.vsam.ost'

# Data set name of the VSAM object store PATH for the transaction ID
# (TID) alternate index.
#
ObjectTidDSN='pkisrvd.vsam.ost.path'

# Data set name of the VSAM object store PATH for the status alternate
# index
#
ObjectStatusDSN='pkisrvd.vsam.ost.status'

# Data set name of the VSAM object store PATH for the requestor
# alternate index
#
ObjectRequestorDSN='pkisrvd.vsam.ost.requestr'

# Data set name of the VSAM issued certificate list (ICL) base CLUSTER
#
ICLDSN='pkisrvd.vsam.icl'

# Data set name of the VSAM ICL PATH for the status alternate index
#
ICLStatusDSN='pkisrvd.vsam.icl.status'

# Data set name of the VSAM ICL PATH for the requestor alternate index
#
ICLRequestorDSN='pkisrvd.vsam.icl.requestr'

# How many days (d) or weeks (w) should completed requests remain in
# the object store before being removed?
# Specify 0d to indicate completed requests should not be removed
#
RemoveCompletedReqs=1w

# How many days (d) or weeks (w) should inactive requests remain in the
# object store before being removed?
# Specify 0d to indicate inactive requests should not be removed
#
RemoveInactiveReqs=4w

# How many days (d) or weeks (w) should expired certificates remain in
# the ICL before being removed?
# Specify 0d to indicate expired certificates should not be removed
#
#RemoveExpiredCerts=26w

# How many days (d) or weeks (w) should expired certificates and Keys
# remain in the ICL and TKDS? Specify 0d to indicate expired

```

```

# certificates and keys should not be removed
#
#RemoveExpiredCertsAndKeys=520w

[CertPolicy]
# What signature algorithm should be used to sign certificates that are
# created? The name of the signature algorithm must match one of the
# Signature Algorithm OIDs listed in the [OIDs] section of this
# configuration file.
#
SigAlg1=sha-256WithRSAEncryption

# How often should the certificate creation thread scan the database
# for approved certificate requests?
#
CreateInterval=3m

# How many days or weeks prior to the expiration of a certificate should
# the expiration warning be sent. If not specified, expiration warning
# will not be sent.
#
ExpireWarningTime=4w

# How often should certificate revocation lists (CRL) be created?
#
TimeBetweenCRLs=1d

# How long is a certificate revocation list (CRL) valid?
#
CRLDuration=2d

# Specify the number of certificates that each CRL distribution point
# will represent. The default is 0 which indicates distribution point
# CRLs should not be created.
#
CRLDistSize=500

# Specify the constant portion of the CRL distribution point relative
# distinguished name. The distribution point number is appended to this
# value to form the common name. The default value is "CRL".
#
CRLDistName=CRL

# Should an Authority Revocation List(ARL) Distribution Point be
# created? 'F' (default) indicates an ARL DP will not be created.
# 'T' indicates an ARL DP will be created if the CRLDistSize is
# greater than zero.
#
ARLDist=F

# Full path of the directory where CRL distribution point files are to
# be stored for http protocol URI CRL distribution points.
# Defaults to "/var/pkiserv/"
# Ignored if no http protocol CRLDistURIn are defined
#
CRLDistDirPath=/var/pkiserv/

# Values for the CRL distribution point extension URI fields for the
# protocols(ldap, http) you choose. This is repeatable. The first one
# always starts with CRLDistURI1, followed by CRLDistURI2, 3, ..n,
# if necessary. Uncomment and update the desired directive to enable
# URI CRL distribution point that you need. If more than one URI field
# is needed, remember to increase the field number sequentially by the
# order of one, e.g. CRLDistURI2, CRLDistURI3...

# For ldap protocol, you may specify the LDAP server indicated in the LDAP
# section below, e.g.,
#
#CRLDistURI1=LdapServer1

# or specify a skeleton URL which contains the protocol type, the domain
# name and the port, if needed, e.g.,
#
#CRLDistURI1=ldap://myotherldapservers.mycompany.com:389/

# For http protocol, specify the complete URL minus the file name of the
# distribution point CRL file, e.g.,
#
#CRLDistURI1=http://www.mycompany.com/PKIServ/cacerts/

# Do you want to enable performance enhancements for CRL processing?
# (This option is most relevant when EnableLargeCRLPosting is set to
# T and there are thousands of revoked certificates represented in
# a given CRL. Defaults to F.)
# T - True, CRL performance enhancements are enabled
# F - False, CRL performance enhancements are not enabled, and CRL
# processing will be performed as it has in previous
# releases of PKI Services. (This is the Default)
#
#CRLEnhancements=F

```

```

# Enable large (>32KB) CRL posting support which will store CRLs in
# a local directory prior to being posting to LDAP.
# T - True, CRLs are stored in a local file system directory before
# being posted to LDAP
# F - False, CRLs are stored in Object Store posting object record(s)
# before being posted to LDAP. Warning, a CRL (distribution
# point or master) larger than 32KB will fail to be created
# and not be posted to LDAP. (This is the Default)
#
#EnableLargeCRLPosting=F

# Full path of the local directory where CRLs are saved prior to
# posting to LDAP.
# Defaults to /var/pkiserv/.
# This keyword is ignored if large CRL posting is not enabled.
#
#LargeCRLPostPath=/var/pkiserv/

# Should this CA create CRLs that contain a critical Issuing
# Distribution Point extension?
# T = True, CRLs will be created with a critical Issuing Distribution
# Point extension. (This is the default value if not
# specified.)
# F = False, CRLs will be created with no Issuing Distribution Point
# extension.
#
#CRLIDPExt=T

# What type of OCSP request is desired?
# 'none' - No OCSP responder support (This is the default)
# or
# 'basic' - The OCSP responder is enabled, but will not verify the
# optional request signature.
#
OCSPType=none

# Enable the Simple Certificate Enrollment Protocol (SCEP)
# T = True, SCEP is enabled
# F = False, SCEP is disabled (default if not specified)
#
EnableSCEP=F

# Enable the Certificate Management Protocol (CMP)
# T = True, CMP is enabled
# F = False, CMP is disabled (default if not specified)
#
EnableCMP=F

# Should the CA restrict certificate requests to a validity period
# that does not exceed the CA certificate life time?
# T = True, requests with a validity period that exceeds the CA's
# will fail.
# F = False, requests are not constrained to the CA's validity
# period(this is the default value if not specified)
#
#CertValidityConstraint=F

#
# Should certificate path length constraints be enabled/enforced
# by this CA?
# T = True, The CA certificate will be examined at initialization
# to verify it meets path length constraint requirements
# and enables the setting of the pathLenConstraint
# field in the Basic Constraint extension of intermediate
# CA certificates created by this CA.
# F = False, Certificate path length constraints will not be
# enforced in the CA certificate used by this CA, and
# intermediate CA certificates created by this CA will
# not include a pathLenConstraint field in the Basic
# Constraint extension. (this is the default value if
# not specified)
#
#EnablePathLenConstraint=F

#
# Specify the certification path length constraint value to be
# included in the Basic Constraints extension of intermediate
# CA certificates created by this CA.
# - The EnablePathLenConstraint keyword must be set to T, otherwise
# the PathLength keyword will be ignored.
# - The valid value range for this keyword is 0 to 16, however the
# value specified must be less than the pathLenConstraint value
# in the PKI CA certificate if it is present.
#
#PathLength=1

# CertificatePolicies certificate extension information, indicating the
# policy under which the certificate has been issued and the purposes
# for which the certificate may be used. This extension contains a
# sequence of one or more policy information terms, each term comprised
# of an OID and an optional qualifier.

```

```

# Should the CA require that the CertificatePolicies extension be
# included on all certificates that are created?
# T = True, the CertificatePolicies extension will be added to all
# certificates, and will include all PolicyName<n> entries
# specified in this file. Any policies that are
# specified in the CertPolicies input parameter or listed
# in the CONSTANT section of the template used to
# generate the certificate are ignored.
# F = False, the CertificatePolicies extension will only be added
# to certificates when a certificate policy is specified
# in the CertPolicies input parameter or in the
# CONSTANT section of the template when a certificate is
# requested. (This is the default value)
#
PolicyRequired=F

# Should the CertificatePolicies certificate extension be made a
# critical extension?
# T = True, the extension will be marked Critical
# F = False, the extension will not be marked Critical (This is the
# default)
#
PolicyCritical=F

# List of CertificatePolicies extensions identifiers that may be added
# to certificates created by this CA.
# The policy name is the symbolic name for a certificate policy OID
# and must match the name of a policy that is listed in the [OIDs]
# section of this configuration file.
#
PolicyName1=MyPolicy

# Should the CertificatePolicies certificate extension include
# any optional qualifiers? Qualifiers may be Certification
# Practice Statement (CPS) Pointer and User Notice. User Notice
# may have two optional fields: Notice Reference and Explicit Text.
# To include these optional qualifiers for certificates created
# using the certificate policy <n>, uncomment the appropriate
# entries below and tailor them to suit your purpose. Note that
# for the CA to conform with current standards, Notice Reference
# should not be used.
#
# CPS<n> = Specifies the URI for the CPS associated with PolicyName<n>.
# Policy<n>Org = Names the organization that has prepared the User
# Notice Reference information associated
# with PolicyName<n>.
# Policy<n>Notice<m> = Identifies the number of a textual
# statement, prepared by Policy<n>Org,
# for the User Notice Reference associated
# with PolicyName<n>. More than one
# textual statement may apply.
# UserNoticeText<n> = Specifies the User Notice Explicit Text
# information associated with PolicyName<n>.
# For the CA to conform with current standards,
# this textual statement must not exceed 200
# characters.
#
#Policy1Org=MyOrganization
#Policy1Notice1=3
#Policy1Notice2=17
UserNoticeText1=This is some very lawyerly statement for the relying party to read and make decisions based on.
CPS1=http://www.mycompany.com/cps.html

# Length of certificate suspension grace period in day or weeks (d,w).
# Certificates which remained suspended for longer than this period are
# automatically revoked.
# The default value is 0d which indicates the grace period is unlimited.
#
MaxSuspendDuration=120d

# Specify the email address of an administrator who will receive an
# email notification when a certificate request state becomes pending
# approval. Repeat for each administrator to receive pending approval
# notifications. The first one always starts AdminNotifyNew1, followed
# by AdminNotifyNew2, 3, ...n, if necessary. The field number increases
# sequentially by the order of one. Uncomment and update the desired
# email address to enable the notification.
#
#AdminNotifyNew1=adminA@abc.com

# Specify the email address of an administrator who will receive an
# email notification containing a list of requests that are pending
# approval when the maintenance processing is run. Repeat for each
# administrator to receive an email reminder. The first one always
# starts AdminNotifyReminder1, followed by AdminNotifyReminder2, 3,
# ...n, if necessary. The field number increases sequentially by the
# order of one. Uncomment and update the desired email address to
# enable the notification.
#
#AdminNotifyReminder1=adminA@abc.com

```

```

# Enable granular authority control for the administrative functions on
# different templates. If enabled, appropriate RACF(or equivalent
# product) protection profiles must be set up accordingly.
# T = True, granular authority control is enabled
# F = False, granular authority control is disabled (default if not
# specified)
#
#AdminGranularControl=F

# Should a console message be issued when the CRL processing finishes?
# none - No console message will be issued
# (this is the default value if not specified)
# file - A console message will be issued after the CRLs are available
# in the file system
# This keyword will be ignored unless large CRL posting support is
# enabled (EnableLargeCRLPosting=T) or at least one http protocol CRL
# distribution point URI is defined.
#
#CRLWTONotification=none

#
# Which certificates should be included in the PKCS#12 package when
# PKI Services has generated the public/private key pair?
# I = The issuing CA certificate is included with the end-entity
# and private key. (This is the default behavior if not specified)
# E = Only the end-entity certificate and private key will be included
# in the PKCS#12 package.
# C = The complete chain up to the Root that is connected to the CA
# keyring is included with the end-entity certificate and private
# key in the PKCS#12 package.
#
#PKCS12Content=I

## Chapter 27. Environment variables

This topic describes the environment variables that PKI Services uses and their possible values. It also includes a code sample of the environment variables file, `pkiserv.envars`. (See “The `pkiserv.envars` environment variables file” on page 587.) For information about the PKISERV procedure, which specifies the path name of the environment variables file, see “PKISERV sample procedure to start PKI Services daemon” on page 648.

---

### Environment variables in the environment variables file

The environment variables contained in `pkiserv.envars` and their values are:

#### **`_PKISERV_CA_DOMAIN`**

Specifies the CA domain. The first eight characters must be unique. The first eight characters of the CA domain name are limited to the following character set: alphanumeric characters (a-z, A-Z, 0-9) and the hyphen (-). In addition, the first character must not be a number or hyphen.

#### **Example:**

```
_PKISERV_CA_DOMAIN=WebAppCA
```

#### **`_PKISERV_CONFIG_PATH`**

Specifies the path name for the directory containing the configuration file, `pkiserv.conf`, and the certificate template file, `pkiserv.tmpl` for this CA domain. The default value (if you do not set the environment variable) is `/etc/pkiserv`.

**Guideline:** Copy both of these files from the install directory, `/usr/lpp/pkiserv/samples`, before making any changes.

**Note:** Because the PKISERV CGIs run in an IBM HTTP Server address space, if the `pkiserv.tmpl` file is not in its default location of `/etc/pkiserv/pkiserv.tmpl`, you need to add the `_PKISERV_CONFIG_PATH` variable to the IBM HTTP Server environment variable file.

- If you are using IBM HTTP Server - Powered by Apache, the environment variables are added to the configuration files using the `SetEnv` directive.

#### **`_PKISERV_EXIT`**

Specifies the full path name for the installation-provided PKI exit program that the PKI Services daemon invokes to perform autorenew preprocessing or postprocessing. (This exit is a UNIX-executable program or shell script.) If you do not define this variable or if it contains a null value, the PKI autorenew exit processing is disabled.

**Note:** The `_PKISERV_EXIT` environment variable is also used by the PKI Services CGI scripts to specify an exit program to be used by the web application. The PKI Services CGI scripts run in an IBM HTTP Server address space, so you must specify the `_PKISERV_EXIT` environment variable in the IBM HTTP Server environment variables file.

- If you are using IBM HTTP Server, the environment variables are added to the configuration files using the `SetEnv` Directive.

## Environment variables

### \_PKISERV\_MSG\_LOGGING

Values include:

#### STDOUT\_LOGGING

Indicates writing all messages (verbose, diagnostic, informational, warning, error, and severe) to STDOUT and additionally writing the error and severe messages to STDERR. This is the default if the environment variable is not set.

#### STDERR\_LOGGING

Indicates writing verbose, diagnostic, informational, and warning messages to STDOUT and writing error and severe messages to STDERR.

### \_PKISERV\_MSG\_LEVEL

Specifies the subcomponent and message level to log. Messages for a particular subcomponent are logged only if the message level is greater than or equal to the specified level for that subcomponent. You can use an asterisk (\*) to indicate all subcomponents. The subcomponent list consists of a subcomponent name and a message level separated by a period (.).

For example, the following sets the message level for all subcomponents to log warning messages or higher. (This is the default setting.)

#### **Example:**

```
_PKISERV_MSG_LEVEL=*.W
```

You can specify multiple subcomponents by separating entries with a comma (,). For example, the following indicates that all subcomponents are set to message level **W** (warning) and that the PKID subcomponent is set to message level **D** (diagnostic).

#### **Example:**

```
_PKISERV_MSG_LEVEL=*.W,PKID.D
```

The subcomponents are:

| <b>Subcomponent</b> | <b>Meaning</b>                                                                      |
|---------------------|-------------------------------------------------------------------------------------|
| *                   | The wildcard character (represents all subcomponents)                               |
| CORE                | The core functions of PKI Services that are not specific to the other subcomponents |
| DB                  | Activity related to the object store or issued certificate list repositories        |
| LDAP                | LDAP posting operations                                                             |
| PKID                | The PKI Services daemon address setup and infrastructure                            |
| POLICY              | Certificate creation and revocation policy processing                               |
| SAF                 | SAF key ring, OCEP, and R_data lib calls                                            |
| TPOLICY             | Trust policy plug-in processing                                                     |

The message levels are listed hierarchically:

| <b>Debug level</b> | <b>Meaning</b>                                    |
|--------------------|---------------------------------------------------|
| <b>S</b>           | This indicates logging only severe messages.      |
| <b>E</b>           | This indicates logging severe and error messages. |

| Debug level | Meaning                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| W           | This indicates logging severe, error, and warning messages. This is the <i>default</i> message level for all subcomponents if you do not set the environment variable. |
| I           | This indicates logging severe, error, warning, and informational messages.                                                                                             |
| D           | This indicates logging severe, error, warning, informational, and diagnostic messages.                                                                                 |
| V           | This indicates logging <i>all</i> messages, including verbose diagnostic messages. This is very verbose.                                                               |

**Guideline:** Do not use V level unless IBM support personnel instruct you to do so.

**\_PKISERV\_VARDIR**

Specifies the path name for a directory in which PKI Services will write persistent data. The maximum length of the path name is 256 characters, including the trailing /. The default value (if you do not set the environment variable) is /var/pkiserv.

**\_PKISERV\_ENABLE\_JSP**

Specifies whether you use the JSP interface and XML templates for PKI Services web pages, or the REXX CGI execs and text templates. Set to TRUE to use the JSP interface. The default (if you do not set the environment variable) is to use the REXX CGI exec interface.

---

## The pkiserv.envars environment variables file

The following code sample is for the pkiserv.envars environment variables file. (For information about updating the environment variables file, see “Optionally updating PKI Services environment variables” on page 64.) The following listing might not be identical to the code sample shipped with the product. For the most current sample, see the pkiserv.envars file in the source directory /usr/lpp/pkiserv/samples/.

```
#-----#
#
# PKI Services sample environment variable file
#
# Licensed Materials - Property of IBM
# 5694-A01
# Copyright IBM Corp. 2001, 2010
# Status = HKY7770
#
#-----#
#
# Language and Path configurations
#
# Note: The PATH statement should be set to ensure the PKI Services
# daemon uses the correct version of sendmail command based
# on your configuration of sendmail/smtp. When running the
# smtp server, the PATH should be set to find sendmail in the
# /bin directory. When sendmail is configured to not use an
# smtp server, the PATH should be set to find sendmail in the
# /usr/sbin directory.
#
LANG=En_US.IBM-1047
PATH=/bin
LIBPATH=/usr/lpp/pkiserv/lib:/usr/lib
NLSPATH=/usr/lib/nls/msg/%L/%N:/usr/lpp/pkiserv/lib/nls/msg/%L/%N
```

## Environment variables

```
#
# When running as a CA Domain, set the CA Domain name by assigning
# desired value to the _PKISERV_CA_DOMAIN variable.
# Note: The first eight characters must be unique.
#
# example: _PKISERV_CA_DOMAIN=WebAppCA

#
# Configuration File location and Message configuration Options
#
_PKISERV_CONFIG_PATH=/etc/pkiserv
_PKISERV_MSG_LOGGING=stdout_logging
_PKISERV_MSG_LEVEL=*.w

#
# Set up a directory for PKI Services to write persistent data. The
# maximum length is 256 characters including the trailing /.
# The default is /var/pkiserv/.
#
# example: _PKISERV_VARDIR=/var/pkiserv/

#
# Set up an exit program for autorenew. The maximum length is 256
# characters including the program name.
#
# example: _PKISERV_EXIT=/mydir/renewexit

#
# Enable the JSP Webpages and XML Template.
#
#_PKISERV_ENABLE_JSP=TRUE
```

---

## Chapter 28. The IKYSETUP REXX exec

IKYSETUP is a REXX exec that issues RACF commands to perform RACF administration. This topic describes the actions IKYSETUP performs and provides a code sample of IKYSETUP.

---

### Actions IKYSETUP performs by issuing RACF commands

In broad terms, the actions that IKYSETUP performs are as follows:

- Sets up the PKI Services daemon user ID
- Sets up the access control to protect PKI Services
  - Protects end-user functions
  - Protects administrative functions
- Defines one or more CA domains with associated administrative domains
- Creates the CA and RA certificates, their private keys, and key ring
- Creates the IBM HTTP Server certificate, private key, and key ring
- Enables surrogate operation for the IBM HTTP Server
- Allows PKI Services to generate key pairs for certificate requests

### Setting up the PKI Services daemon user ID

Create the daemon user ID (by default, PKISRVD) using the RACF ADDUSER TSO command. Give it an OMVS segment because it needs access to z/OS UNIX. If you implement the object store and issued certificate list (ICL) using VSAM data sets, this user ID also needs update access to the VSAM data sets identified in the **ObjectStore** section of the `pkiserv.conf` file. If necessary, use the RACF ADDSD and PERMIT TSO commands to give this user ID UPDATE access to the VSAM data sets. If you implement the object store and ICL using DB2 tables, this user ID also needs access to the Resource Recovery Services Access Facility (RRSAF). If necessary, use the RACF RDEFINE and PERMIT commands to define the profile for RRSAF in the DSNR class and give this user ID READ access.

**Guideline:** Define the daemon user ID with the NOPASSWORD attribute.

To associate this user ID to the PKI Services started procedure, use the following RACF TSO commands:

```
RDEFINE  STARTED PKISRVD.* STDATA(USER(PKISRVD))
SETROPTS CLASSACT(STARTED) RACLIST(STARTED)
SETROPTS RACLIST(STARTED) REFRESH
```

### Setting up access control to protect PKI Services

This task can be divided into two steps:

1. Protecting end-user functions
2. Protecting administrative functions.

#### Protecting end-user functions

You must first determine who your end-users are and how they are using their certificates. In general there are two categories of end-users:

- Internal clients, such as employees who have SAF user IDs on the host system and who might be using their certificates to access resources on the host

- External clients, who have no access to the host system.

When PKI Services is called, the unit of work has some identity (user ID) associated with it. For external customers, a surrogate user ID is necessary.

**Guideline:** Although under certain circumstances it might be beneficial for internal clients to access PKI Services under their own identities, your implementation is simpler if you use surrogate user IDs for internal clients also.

Use the RACF ADDUSER command to create the surrogate user ID (PKISERV). Give it an OMVS segment because it needs access to z/OS UNIX. **Guideline:** Define the surrogate user ID with the PROTECTED and RESTRICTED attributes.

The R\_PKIServ SAF callable service is protected by FACILITY class resources of the form IRR.RPKISERV,function[.ca\_domain], where function is one of the following and ca\_domain specifies an optional CA domain name. (Specify ca\_domain when your installation has established multiple PKI Services CAs.)

The R\_PKIServ functions are:

### EXPORT

Retrieves (exports) a previously requested certificate, or retrieves (exports) the PKI Services registration authority (RA) certificate or the certificate authority (CA) certificate.

### GENCERT

Generates an auto-approved certificate.

### GENRENEW

Generates an auto-approved renewal certificate. (The request submitted is automatically approved.)

### QRECOVER

Lists certificates whose key pairs were generated by PKI Services under a requestor's email address and passphrase.

### REQCERT

Requests a certificate that an administrator must approve before it is created.

### REQRENEW

Requests certificate renewal. The administrator needs to approve the request before the certificate is renewed.

### RESPOND

Invokes the PKI OCSP responder.

### REVOKE

Revokes a certificate that was previously issued.

### SCEPREQ

Generates a certificate request using Simple Certificate Enrollment Protocol (SCEP).

### VERIFY

Confirms that a given user certificate was issued by this certificate authority and, if so, returns the certificate fields.

Create these resources and give the PKISERV user ID either READ or CONTROL access to them. CONTROL bypasses subsequent resource checks.

Additional FACILITY class resources of the form IRR.DIGTCERT.*function* protect the actual certificate generation and retrieval functions. If subsequent resource checks are not being bypassed, define these resources and their access.

There are two ways to handle certificate approval:

- An administrator can review certificate requests
- Requests can be auto-approved without administrator action (this should probably be reserved for internal clients only).

If you plan to have an administrator approve certificate requests before issuing certificates, PKISERV needs the following access:

Table 103. Access required if you plan to have an administrator approve certificate requests

| Resource              | Access |
|-----------------------|--------|
| IRR.DIGTCERT.REQCERT  | READ   |
| IRR.DIGTCERT.REQRENEW | READ   |

If your clients can request certificates that are auto-approved without action by an administrator, PKISERV needs the following access:

Table 104. Access required if you plan to use auto-approval

| Resource              | Access  |
|-----------------------|---------|
| IRR.DIGTCERT.ADD      | UPDATE  |
| IRR.DIGTCERT.GENCERT  | CONTROL |
| IRR.DIGTCERT.GENRENEW | READ    |

Finally, because the web server is switching identities to PKISERV, you must give it surrogate permission. This is done by creating another resource in the SURROGAT class (BPX.SRV.PKISERV) and giving the web server daemon user ID READ access to it.

### Protecting administrative functions

PKI Services administrators must have SAF user IDs on the host system. When PKI Services is called for administrative functions, the unit of work is tagged with the identity of the authenticated administrator.

At a minimum, all PKI Services administrators require READ or UPDATE access to the profile IRR.RPKISERV.PKIADMIN[.ca\_domain] in the FACILITY class. Table 105 shows how the level of access to this profile controls authorization to general administrative functions.

Table 105. FACILITY class access needed for administrative functions

| Resource                          | Access | Purpose                                                                           |
|-----------------------------------|--------|-----------------------------------------------------------------------------------|
| IRR.RPKISERV.PKIADMIN[.ca_domain] | READ   | For list and query operations                                                     |
|                                   | UPDATE | To act on certificate requests, preregistration requests, and issued certificates |

In addition, you can use profiles in the PKISERV class to restrict PKI Services administrator access to specific operations. For information, see “Using the PKISERV class to control access to administrative functions” on page 479. By

default this additional capability is not enabled. The AdminGranularControl keyword in the pkiserv.conf configuration file controls whether it is enabled.

**Example:** To grant user ID ADMID authority to administer the PKI Services CUSTOMER domain, and to grant that same user the ability to query information about PKI Services certificates issued using the '1-Year PKI SSL Browser Certificate' template, issue the following RACF TSO commands:

```
RDEFINE FACILITY (IRR.RPKISERV.PKIADMIN.CUSTOMER) UACC(NONE)
PERMIT IRR.RPKISERV.PKIADMIN.CUSTOMER CLASS(FACILITY) ACCESS(UPDATE) ID(ADMID)
RDEFINE PKISERV CUSTOMER.QUERYCERTS.1YBSSL UACC(NONE)
PERMIT CUSTOMER.QUERYCERTS.1YBSSL ACCESS(READ) CLASS(PKISERV) ID(ADMID)
SETROPTS RACLIST (FACILITY) REFRESH
SETROPTS CLASSACT(PKISERV) RACLIST(PKISERV)
SETROPTS RACLIST (PKISERV) REFRESH
```

## Establishing your CA and RA certificates

To create and sign digital certificates for others, you need to establish a CA certificate, and optional RA certificate, and their associated private keys using the RACDCERT command.

### Steps for establishing your CA and RA certificates

Perform the following steps to create your CA certificate, RA certificate, and their associated keys, back up the keys, connect them to a key ring and authorize PKI Services to use them.

#### Before you begin

Determine the CA or RA's distinguished name and where it will be located (under CERTAUTH for the CA and under the PKI Services daemon user ID for the RA). Typically, CAs and RAs have distinguished names in the following form:

*OU=your-CA-or-RA's-friendly-name.O=your-organization.C=your-two-letter-country-abbreviation*

#### Procedure

1. Create your CA certificate, and optional RA certificate, and their associated private keys using the RACDCERT GENCERT command. If you create an optional RA certificate, it must be signed by the CA certificate.
  - a. This example creates a 20-year CERTAUTH certificate with a distinguished name of OU=Human Resources Certificate Authority.O=Your Company, Inc.C=US.

```
RACDCERT CERTAUTH GENCERT SUBJECTSDN(
  OU('Human Resources Certificate Authority')
  O('Your Company, Inc') C('US')) WITHLABEL('Local PKI CA') HIGHTRUST
  NOTAFTER(DATE(2026/05/06))
  SIZE(1024) KEYUSAGE(HANDSHAKE)
  SIGNWITH(CERTAUTH LABEL('Local Root CA'))
```

- b. This example creates a 20-year RA certificate signed by the CA certificate created in Example 1a.

```
RACDCERT GENCERT ID(PKISERVD) SUBJECTSDN(
  CN('Registration Authority')
  OU('Human Resources Certificate Authority')
  O('Your Company, Inc') C('US')) WITHLABEL('Local PKI RA')
  NOTAFTER(DATE(2026/05/06))
  SIZE(1024) KEYUSAGE(HANDSHAKE)
  SIGNWITH(CERTAUTH LABEL('Local PKI CA'))
```

2. Back up your CA certificate, RA certificate (if created), and their associated private keys to password-protected data sets using the RACDCERT EXPORT command.

```
RACDCERT CERTAUTH EXPORT(LABEL('Local PKI CA'))
      DSN('PKISRVD.PRIVATE.KEY.P12BIN')
      FORMAT(PKCS12DER) PASSWORD('your-passphrase')
```

```
RACDCERT ID(PKISRVD) EXPORT(LABEL('Local PKI RA'))
      DSN('PKISRVD.PRIVATE.RAKEY.P12BIN')
      FORMAT(PKCS12DER) PASSWORD('your-passphrase')
```

3. (Optional) If you want to use ICSF for private key protection and signing, migrate the private keys to ICSF using the RACDCERT ADD command. For this step to be successful, ICSF must be operational and configured for RSA operations. (For additional information about ICSF, see *z/OS Cryptographic Services ICSF Administrator's Guide*.)

```
RACDCERT CERTAUTH ADD('PKISRVD.PRIVATE.KEY.P12BIN') PASSWORD('your-passphrase') ICSF
```

```
RACDCERT CERTAUTH ADD('PKISRVD.PRIVATE.RAKEY.P12BIN') PASSWORD('your-passphrase') ICSF
```

4. Create a key ring for the PKI Services daemon and add the CA certificate and RA certificate (if created) to it so that PKI Services can use the certificates. The example creates a key ring that is called CAring for user ID PKISRVD and connects the CA and RA certificates to it.

Important: Make sure that your CA certificate is marked with the TRUST or HIGHTRUST attribute in RACF. (Otherwise, PKI Services cannot use the certificate.) Check this by issuing the RACDCERT LIST command and execute the RACDCERT ALTER command to change it if needed.

```
RACDCERT ADDRING(CAring) ID(PKISRVD)
```

```
RACDCERT ID(PKISRVD) CONNECT(CERTAUTH LABEL('Local PKI CA') RING(CAring)
      USAGE(PERSONAL) DEFAULT)
```

```
RACDCERT ID(PKISRVD) CONNECT(ID(PKISRVD) LABEL('Local PKI RA') RING(CAring)
      USAGE(PERSONAL))
```

5. Authorize the PKI Services daemon to use RACF certificates and act as the CA. The daemon user ID (PKISRVD) needs access to the FACILITY class resources listed in Table 106. RACLIST the FACILITY class if it is not already RACLISTed. Define the FACILITY class resources. When the definitions are complete, refresh the FACILITY class.

```
SETROPTS RACLIST(FACILITY)
```

```
RDEFINE FACILITY IRR.DIGTCERT.GENCERT
RDEFINE FACILITY IRR.DIGTCERT.LISTRING
```

```
PERMIT IRR.DIGTCERT.GENCERT CLASS(FACILITY) ID(PKISRVD) ACCESS(CONTROL)
PERMIT IRR.DIGTCERT.LISTRING CLASS(FACILITY) ID(PKISRVD) ACCESS(READ)
```

```
SETROPTS RACLIST(FACILITY) REFRESH
```

Table 106. Access PKISRVD needs to use RACF certificates

| Resource              | Access                                                                                                                                                                                                |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IRR.DIGTCERT.GENCERT  | <ul style="list-style-type: none"> <li>• CONTROL (if the CA certificate was created under CERTAUTH)</li> <li>• READ (if the certificate was created under the PKI Services daemon user ID)</li> </ul> |
| IRR.DIGTCERT.LISTRING | READ                                                                                                                                                                                                  |

## Configuring the IBM HTTP Server - Powered by Apache for SSL mode

The PKISERV application requires the IBM HTTP Server - Powered by Apache to operate in three modes. The modes are:

- Normal
- SSL without client authentication
- SSL with client authentication.

For SSL, your server needs to obtain a digital certificate. You can:

- Purchase one from an external source
- Create one using RACF

**Note:** If your server is already operating in SSL mode, you can skip the following section, "Using RACF to obtain a certificate for the web server."

### Using RACF to obtain a certificate for the web server

The IBM HTTP Server supports using either gskkyman key databases (.kdb files) or RACF (SAF) key rings for the server's certificate store. You are expected to use SAF key rings if setting up their web server for the first time.

**Note:** If you have already set up your web server using gskkyman, you can continue to use it.

Use RACDCERT to generate the server certificate signed by the new Certificate Authority.

#### Example:

```
RACDCERT GENCERT ID(WEBSRV) SIGNWITH(CERTAUTH LABEL('Local PKI CA'))
        WITHLABEL('SSL Cert') SUBJECTSDN(CN('www.YourCompany.com') O('Your Company Inc')
        L('Millbrook') SP('New York') C('US'))
```

The web server needs a key ring containing its new certificate and any trusted CA certificate. The RACDCERT command with operands ADDRING and CONNECT also sets this up. For example, the RACDCERT commands to create a key ring that is called SSLring for user ID WEBSRV and to connect the web server and CA certificates to it are:

#### Example:

```
RACDCERT ADDRING(SSLring) ID(websrv)
RACDCERT ID(websrv) CONNECT(CERTAUTH LABEL('Local PKI CA')) RING(SSLring)
        USAGE(PERSONAL) DEFAULT)
RACDCERT ID(websrv) CONNECT(ID(websrv) LABEL('SSL Cert') RING(SSLring)
        USAGE(PERSONAL) DEFAULT)
```

Export the CA certificate to an MVS data set. Then OPUT it to a file system file so that it can be made available to your clients.

#### Example:

```
RACDCERT EXPORT(LABEL('Local PKI CA'))
        CERTAUTH DSN('pkisrvd.webroot.derbin') FORMAT(CERTDER)
```

## Enabling the IBM HTTP Server - Powered by Apache for surrogate operation

Your server must be able to act as a surrogate for clients requesting certificates. To enable this, create:

- Profile BPX.SERVER in the FACILITY class
- Profile BPX.SRV.PKISERV in the SURROGAT class.

Give the IBM HTTP Server - Powered by Apache daemon user ID READ access to both of these profiles.

## Allowing PKI Services to generate key pairs for certificate requests

You can choose to allow PKI Services to generate key pairs (public and private key) for certificate requests. The PKI Services daemon does this using the PKCS #11 API provided by ICSF. Set up profiles in the CRYPTOZ class to allow the PKI Services daemon to use the PKCS #11 API:

- Activate the CRYPTOZ class.
- Define the profile *SO.daemon\_id.\** in the CRYPTOZ class.
- Give the daemon user ID UPDATE access to the profile
- Define the profile *USER.daemon\_id.\** in the CRYPTOZ class.
- Give the daemon user ID CONTROL access to the profile.

---

## IKYSETUP sample

IKYSETUP contains the commands to perform the RACF administrator tasks of adding groups and user IDs, setting up access control, creating CA, RA, and SSL certificates, and setting up daemon security. The following listing might not be identical to the code sample shipped with the product. For the most current sample, see SYS1.SAMPLIB member IKYSETUP.

```

/* REXX */
/*****
/*
/* DESCRIPTIVE NAME:  PKI Services RACF setup CLIST

/* Question 3 - Use ICSF? */
/* */
/* There are several possible choices for generation and @LBC*/
/* protection of your CA's private key: */
/* */
/* - Generate the RSA key using software and retain it as a */
/* software key. This is the default. (Option 0) */
/* */
/* - Generate the RSA key using software then store the key in */
/* ICSF. (Option 1) @LAC*/
/* */
/* - Generate the RSA key through ICSF using the PCI */

```

## IKYSETUP

```
| /* cryptographic coprocessor (PCICC) then store the key in */
| /* ICSF. (Option 2) @LAC*/
| /* */
| /* - Generate the DSA key using software and retain it as a */
| /* software key. This key cannot be saved in ICSF. (Option 3) */
| /* */
| /* - Generate the NIST Elliptic Curve Cryptography (ECC) key */
| /* using software and retain it as a software key. */
| /* (Option 4) @LAA*/
| /* */
| /* - Generate the Brainpool ECC key using software and retain */
| /* it as a software key. (Option 5) @LAA*/
| /* */
| /* - Generate the NIST Elliptic Curve Cryptography (ECC) */
| /* key using the Crypto Express 3 cryptographic coprocessor */
| /* and store the key in the ICSF PKA data set (PKDS). */
| /* (Option 6) @LBA*/
| /* */
| /* - Generate the Brainpool Elliptic Curve Cryptography (ECC) */
| /* key using the Crypto Express 3 cryptographic coprocessor */
| /* and store the key in the ICSF PKA data set (PKDS). */
| /* (Option 7) @LBA*/
| /* */
| /* - Generate the RSA key using the Enterprise PKCS#11 */
| /* Cryptographic Coprocessor and store the key in the ICSF */
| /* Token Key Data set(TKDS). */
| /* (Option 8) @LEA*/
| /* */

## Chapter 29. Other code samples

This topic provides code samples for the following files:

- `httpd.conf`, `vhost80.conf`, `vhost443.conf`, and `vhost1443.conf`, which contain IBM HTTP Server directives. (See “IBM HTTP Server - Powered by Apache configuration directives.”)
- `IKYCDB2`, which is a sample to build DB2 objects for the PKI Services object store and issued certificate list (ICL). (See “IKYCDB2” on page 631.)
- `IKYCVSAM`, which is sample IDCAMS JCL to create VSAM data sets (regardless of whether you are using a sysplex or non-sysplex). (See “IKYCVSAM” on page 635.)
- `IKYRVSAM`, which is sample IDCAMS JCL to add VSAM record-level sharing (RLS) support. `IKYRVSAM` reallocates your VSAM data sets in preparation for sharing in a sysplex. (See “IKYRVSAM” on page 639.)
- `IKYSBIND`, which is a sample job to build the DB2 package and plan for the PKI Services object store and issued certificate list (ICL). (See “IKYSBIND” on page 643.)
- `IKYSGRNT`, which is a sample job to grant execute privilege on the DB2 package for PKI Services to the PKI Services daemon user ID. (See “IKYSGRNT” on page 644.)
- `IKYVBKUP`, which is sample JCL to back up the PKI Services VSAM data sets using the DFSMSdss DUMP utility. (See “IKYVBKUP” on page 645.)
- `IKYVREST`, which is sample JCL to restore the PKI Services VSAM data sets from a backup taken with the DFSMSdss DUMP utility. (See “IKYVREST” on page 647.)
- `PKISERVD`, which is a sample procedure to start PKI Services daemon. (See “PKISERVD sample procedure to start PKI Services daemon” on page 648.)

**Note:** Other important programs are contained in other chapters:

- `IKYSETUP` (a REXX exec to set up RACF profiles). See Chapter 28, “The IKYSETUP REXX exec,” on page 589.
- `pkiserv.envars` (the PKI Services environment variables file). See “The pkiserv.envars environment variables file” on page 587.
- `pkiserv.conf` (the PKI Services configuration file). See Chapter 26, “The pkiserv.conf configuration file,” on page 577.

---

### IBM HTTP Server - Powered by Apache configuration directives

The sample configuration directives for IBM HTTP Server - Powered by Apache are located in the source directory `/usr/lpp/pkiserv/samples/`. The following listings might not be identical to the code samples shipped with the product.

#### `httpd.conf`

`httpd.conf` is the main configuration file for IBM HTTP Server - Powered by Apache.

```
#-----#  
# Licensed Materials - Property of IBM          #  
# 5650-Z0S                                     #  
# Copyright IBM Corp. 2015                     #  
# Status = HKY77A0                             #  
#
```

## Other code samples

```
# Change-Activity: #
# $LO=PKIS22S, HKY77A0, 140918, SSD: PKI Services #
# #
# Change Descriptions: #
# A - IBM HTTP Server Support @LOA #
#-----#
# Update the ihs-install-dir/conf/httpd.conf file with the following
# directives that might not be present in your httpd.conf file and that
# might be unique to the PKI Services CGI scripts and programs.

#Provides a rule-based rewriting engine to rewrite one URL to another
#URL
LoadModule rewrite_module modules/mod_rewrite.so
#Authenticating with SAF on IBM HTTP Server (z/OS systems)
LoadModule authnz_saf_module modules/mod_authnz_saf.so
LoadModule ibm_ssl_module modules/mod_ibm_ssl.so

# AddType allows you to add to or override the MIME configuration
# file mime.types for specific file types.
# AddType directive is added to the httpd.conf file
# after the TypesConfig Directive
AddType application/x-x509-user-cert .cer
AddType application/x-x509-ca-cert .der
AddType application/octet-stream .msi
AddType application/pkix-crl .crl

#Include other configuration files
#vhost80 - Virtual Host file for non SSL requests
#vhost443 - Virtual Host file for SSL requests with server authentication
#vhost1443 - Virtual Host file for SSL requests with client authentication
Include conf/vhost80.conf
Include conf/vhost443.conf
Include conf/vhost1443.conf
```

### vhost80.conf

vhost80.conf is the configuration file for non-SSL processing.

## IKYCDB2

IKYCDB2 is a sample to create DB2 objects for the object store and issued certificate list (ICL). IKYCDB2 is a member of SYS1.SAMPLIB.

**Note:** The following listing might not be identical to the code sample shipped with the product. For the most current sample, see SYS1.SAMPLIB member IKYCDB2.

```

--*****
--* SAMPLE: IKYCDB2
--*
--* Licensed Materials - Property of IBM
--* 5650-ZOS
--* Copyright IBM Corp. 2011, 2013
--* Status = HKY7790
--*
--*****
--
-- This sample may be used to create the DB2 database using SPUFI that
-- PKI Services utilizes to store certificate requests and issued
-- certificates.
--

```

## Other code samples

```
--*****
--
-- Before using this sample, you may need to make the following
-- modifications:
--
-- 1) Change all the occurrences of 'SYSDEFLT' to the storage group you
--    want to contain the PKI Services DB2 tablespaces if SYSDEFLT
--    if SYSDEFLT is not suitable for your installation.
--
-- 2) Change all the occurrences of 'MASTERCA' to the package name.
--    The package name should match the first eight characters of
--    the CA domain name.
--
-- 3) Change all the occurrences of 'IKYPKIDB' to the database name of
--    your choosing. If you are running multiple PKI CA domains, each
--    domain must have a unique database name.
--
-- You will also need certain DB2 privileges to use this sample.
-- These privileges are indicated in the comments preceding each
-- set of SQL instructions.
--
--*****
-- Change Activity:
--
--   $L0=PKIS13      HKY7780   100706   PDWFC1: DB2 support
--   $L1=PKIS21D    HKY7790   120612   PDRRG1: DB2 Enhancements
--
-- Change Description:
--
--   A: Initial code                                     @LOA
--   C: Remove GRANT DBADM for PKISRVD.  Move GRANT EXECUTE for
--       PKISRVD to IKYSGRNT sample.                     @L1A
--
--*****
--

## IKYCVSAM

IKYCVSAM contains sample IDCAMS JCL to create VSAM data sets. IKYCVSAM is installed as a member of SYS1.SAMPLIB.

Use IKYCVSAM if you are creating VSAM data sets for the first time, regardless of whether you intend to use Parallel Sysplex support. However, if you intend to use Parallel Sysplex support, execute the IKYRVSAM job *after* this job to add VSAM record-level sharing (RLS) support. (See “IKYRVSAM” on page 639.)

**Note:** The following listing might not be identical to the code sample shipped with the product. For the most current sample, see SYS1.SAMPLIB member IKYCVSAM.

```

//IKYCVSAM JOB <job card parameters>
//*****
//* SAMP:      IKYCVSAM                               *

## IKYRVSAM

IKYRVSAM contains sample IDCAMS JCL to migrate the PKI Services VSAM data sets to support VSAM record-level sharing (RLS) when you intend to use Parallel Sysplex support. IKYRVSAM is installed as a member of SYS1.SAMPLIB.

Execute this job *after* executing the IKYCVSAM job. This job renames the VSAM data sets created by IKYCVSAM and copies their contents to newly allocated RLS data sets.

**Note:** The following listing might not be identical to the code sample shipped with the product. For the most current sample, see SYS1.SAMPLIB member IKYRVSAM.

```

//IKYRVSAM JOB <job card parameters>
//*****
//* SAMP:      IKYRVSAM *
//* *
//* Licensed Materials - Property of IBM *
//* 5694-A01 *
//* (C) Copyright IBM Corp. 2002, 2006 *
//* Status = HKY7730 *
//* *
//*****
//* This sample JCL may be used to reallocate the VSAM data sets *
//* in a storage class acceptable to VSAM record level sharing (RLS). *
//* This is a prerequisite to using PKI Services SYSPLEX support. *
//* *
//*****
//* Caution: This is neither a JCL procedure nor a complete job. *

```

## Other code samples

```
/** Before using this job step, you will have to make the following *
/** modifications: *
/** *
/** 1) Change the job card to meet your system requirements. *
/** *
/** 2) Change the STORCLAS statements to provide the name of the *
/** storage class defined for use with VSAM RLS. *
/** *
/** 3) This job assumes you are using the default VSAM data set *
/** names (all have high level qualifiers "PKISRVD.VSAM"). If *
/** you have changed these data set names, you will need to *
/** modify the source data set names in the ALTER *
/** statements of the RENAMEDS step. If you are using *
/** multiple CA Domains, IBM recommends using the first eight *
/** characters of the CA Domain as one of the data set *
/** qualifiers. *
/** *
/** 4) This job creates destination data sets with the same default *
/** names as the source data sets. (The source data sets are *
/** renamed.) If you wish to use different destination data set *
/** names, you will need to modify the data set names in all *
/** steps except the RENAMEDS step. If you modify these names, *
/** be sure to also modify your configuration file *
/** appropriately(/etc/pkiserv/pkiserv.conf). If you are using *
/** multiple CA Domains, IBM recommends using the first eight *
/** characters of the CA Domain as one of the data set *
/** qualifiers. *
/** *
/** 5) This job renames the source data sets to begin with high *
/** level qualifiers "PKISRVD.OLDVSAM". If you wish to change *
/** these names, you will need to do so in the RENAMEDS and *
/** and REPROCL steps. If you are using multiple CA Domains, *
/** IBM recommends using the first eight characters of the CA *
/** Domain as one of the data set qualifiers. *
/** *
/** 6) If you wish to change either the primary or secondary space *
/** allocation sizes for either the OST or ICL datasets from the *
/** default value, update the CYL or TRK operands on the *
/** DEFINE CLUSTER or DEFINE ALTERNATE INDEX commands. *
/** *
/** **Note, do not change any of the numeric values other than *
/** CYL or TRK *

## IKYSBIND

IKYSBIND is a sample job to create the DB2 package and plan for the object store and issued certificate list (ICL). IKYSBIND is a member of SYS1.SAMPLIB.

**Note:** The following listing might not be identical to the code sample shipped with the product. For the most current sample, see SYS1.SAMPLIB member IKYSBIND.

```

//IKYSBIND JOB <job parameters>
//*****
/* SAMPLE: IKYSBIND
/*
/* Licensed Materials - Property of IBM
/* 5650-ZOS
/* Copyright IBM Corp. 2011, 2013
/* Status = HKY7790
/*
//*****
/*
/* This sample job may be used to build the DB2 package for
/* PKI Services.
/*
//*****
/*
/* Before running this job, you may need to make the following
/* modifications:
/*
/* 1) Change all the occurrences of 'MASTERCA' to the package name.
/* The package name should match the first eight characters of
/* the associated CA domain name and match the value used when
/* creating the DB2 database, tablespaces, tables, and indexes.
/*
/* 2) Change 'DSN9' to the DB2 subsystem name which PKI Services

```

## Other code samples

```
/** will be running under.
/**
/** 3) Change 'PKISRVD' to the ID you would like to be the owner of
/** the package.
/**
/** To issue the following BIND instruction, the user must have at
/** least one of the following DB2 privileges:
/** - BIND privilege WITH GRANT OPTION on the PACKAGE
/** specified in the following BIND instruction
/** - Ownership of the PACKAGE specified in the following
/** BIND instruction
/** - SYSADM authority

## IKYSGRNT

IKYSGRNT is a sample that grants execute privilege on the DB2 package for PKI Services to the PKI Services daemon user ID.

**Note:** The following listing might not be identical to the code sample shipped with the product. For the most current sample, see SYS1.SAMPLIB member IKYSGRNT.

```
--*****
--* SAMPLE: IKYSGRNT
--*
--* Licensed Materials - Property of IBM
--* 5650-ZOS
--* Copyright IBM Corp. 2013
--* Status = HKY7790
--*
--*****
```

```

--
-- This sample may be used to grant execute privilege through SPUFI
-- on the DB2 package for PKI Services to the PKI Services daemon
-- user ID.
--
--*****
--
-- Before using this sample, you may need to make the following
-- modifications:
--
-- 1) Change 'MASTERCA' to the package name that was used in the
-- IKYSBIND sample JCL file. The package name should match the
-- first eight characters of the associated CA domain name and
-- match the value used when creating the DB2 database,
-- tablespaces, tables, and indexes in the IKYCDB2 sample file.
--
-- 2) Change 'PKISRVD' to match the value for the PKI Services daemon
-- user ID name. The value to use should match the value used for
-- the variable 'daemon' in the IKYSETUP sample file.
--
-- You will also need certain DB2 privileges to use this sample. To
-- use this sample, you will need at least one of the following DB2
-- privileges:
--   - EXECUTE privilege WITH GRANT OPTION on the
--     package named in the GRANT instruction below
--   - Ownership of the package named in the GRANT
--     instruction below
--   - SYSADM authority
--
--*****
-- Change Activity:

## PKISERVD sample procedure to start PKI Services daemon

PKISERVD is the sample procedure to start PKI Services daemon. The PKI Services daemon runs as a started task. The procedure for this can be found in 'SYS1.PROCLIB' member PKISERVD. (PKISERVD is an alias for IKYSPROC.)

PKISERVD contains the TZ (time zone) environment variable, which is the environment variable most likely to change. You need to specify any other environment variables that PKI Services needs in an environment variables file, by default pkiserv.envars. PKISERVD contains FN (file name) and DIR (directory) parameters to specify the path name of the environment variables file. You can make any needed changes in PKISERVD, such as updating this path name.

**Guideline:** By default, the path name for the pkiserv.envars environment variables file is /usr/lpp/pkiserv/samples/pkiserv.envars. If you need to make changes in the environment variables file, you need to copy it from the samples directory to another directory. Specify your environment variables using an environment variables file under the /etc directory, for example /etc/pkiserv/pkiserv.envars.

The following listing might not be identical to the code sample shipped with the product. For the most current sample, see SYS1.PROCLIB member PKISERVD.

```

```

---

## Chapter 30. SMF recording

PKI Services produces one SMF record type - type 80. The first 18 bytes of type 80 records represent the standard SMF header without subtypes.

### For more information:

1. See *z/OS MVS System Management Facilities (SMF)* for information about how to use SMF.
2. See *z/OS Security Server RACF Macros and Interfaces* and *z/OS Security Server RACF Auditor's Guide* for information about using the RACF SMF data unload utility (IRRADU00) to prepare reports with the RACF report writer.

---

## PKI Services event code

Table 107 describes the SMF80EVT (event code) and SMF80EVQ (event code qualifier) fields for the PKI Services event code. It also lists the SMF80DTP and SMF80DA2 values for the relocate type sections.

Table 107. SMF event code and event code qualifier for PKI Services

Event Dec(Hex)	Command	Code qualifier Dec(Hex)	Description	Relocate type sections
79(4F)	CRL publication	0(0)	Successful publication of revocation information	318, 319, 366, 379, 380, 381, 382, 383, 384, 385, 387
85(55)	SUCCRNEW	0(0)	Successful AutoRenew	318, 319, 341, 342, 346, 358, 363, 373, 391, 408

---

## Relocate section variable data

Table 108 describes the variable data elements of the extended-length relocate section.

Table 108. SMF data elements of the extended-length relocate section for PKI Services

Data type (SMF80TP2) Dec(Hex)	Data length (SMF80DL2)	Format	Audited by event code	Description (SMF80DA2)
318(13E)	1-255	EBCDIC	66, 67, 69, 72, 74, 79	Certificate or CRL serial number
319(13F)	1-255	EBCDIC	66, 67, 69, 72, 74, 79	Certificate or CRL issuer's distinguished name
366(16E)	4	Binary	74	Certificate revocation reason
379(17B)	1-255	EBCDIC	79	CRL issuing distribution point DN
380(17C)	10	EBCDIC	79	CRL's date of issue
381(17D)	8	EBCDIC	79	CRL's time of issue
382(17E)	10	EBCDIC	79	CRL's expiration date
383(17F)	8	EBCDIC	79	CRL's expiration time
384(180)	10	EBCDIC	79	CRL's date of publish
385(181)	8	EBCDIC	79	CRL's time of publish
387(183)	1-1024	EBCDIC	79	CRL's issuing distribution point URI
408(198)	256	EBCDIC	85	AutoRenew Exit path name

---

## Part 9. Appendixes

## Appendix A. LDAP directory server requirements

PKI Services typically requires access to an LDAP directory server to store issued certificates and certificate revocation lists. The z/OS LDAP server provided by IBM Tivoli Directory Server for z/OS is preferred but not required. You can use a non-z/OS LDAP server if it can support the objectclasses and attributes PKI Services uses. These are listed in the following table:

Table 109. LDAP objectclasses and attributes that PKI Services sets

End-entity or branch node?	Visible RDN attribute	Objectclasses used	Additional attributes set (other than visible RDN attribute)
Creating a branch node	C=	country	—
Creating a branch node	L=	locality	—
Creating a branch node	O=	organization	—
Creating a branch node	OU=	organizationalUnit	—
Creating a branch node	DC=	domain	none
Creating a branch node	Any supported value other than the preceding	organizationalUnit, and extensibleObject	ou (the ou value from CreateOUValue in the LDAP section of pkiserv.conf file)
Creating a user end-entity	unstructuredName or unstructAddress	account, pkiUser, cEPDevice, and extensibleObject	userCertificate, and uid (hardcoded to NoUid)
Creating a user end-entity	serialNumber	account, pkiUser, pKCS10Device, and extensibleObject	userCertificate, and uid (hardcoded to NoUid)
Creating a user end-entity	DC	domain pkiUser, , and extensibleObject	userCertificate
Creating a user end-entity	dnQualifier	account, pkiUser, uniquelyQualifiedObject, and extensibleObject	userCertificate, and uid (hardcoded to NoUid)
Creating a user end-entity	UID	account, pkiUser, and extensibleObject	userCertificate
Creating a user end-entity	Any supported value other than unstructuredName, unstructAddress, serialNumber, DC, dnQualifier and UID	account, pkiUser, and extensibleObject	userCertificate, and uid (hardcoded to NoUid)
Creating a CA end-entity	O=	organization, and pkiCA	cACertificate, certificaterevocationlist, and authorityrevocationlist
Creating a CA end-entity	OU=	organizationalUnit, and pkiCA	cACertificate, certificaterevocationlist, and authorityrevocationlist
Creating a CA end-entity	DC	domain, pkiCA and extensibleObject	cACertificate, certificaterevocationlist, and authorityrevocationlist

## LDAP directory server requirements

Table 109. LDAP objectclasses and attributes that PKI Services sets (continued)

End-entity or branch node?	Visible RDN attribute	Objectclasses used	Additional attributes set (other than visible RDN attribute)
Creating a CA end-entity	dnQualifier	account, uniquelyQualifiedObject, pkiCA, and extensibleObject	cACertificate, certificaterevocationlist, authorityrevocationlist, and uid (hardcoded to NoUid)
Creating a CA end-entity	UID	account, pkiCA, and extensibleObject	cACertificate, certificaterevocationlist, and authorityrevocationlist
Creating a CA end-entity	Any supported value other than O, OU, DC, dnQualifier and UID	account, pkiCA, and extensibleObject	cACertificate, certificaterevocationlist, authorityrevocationlist and uid (hardcoded to NoUid)
User end-entity that already exists	unstructuredName or unstructAddress	pkiUser, cEPDevice	userCertificate
User end-entity that already exists	serialNumber	pkiUser, pKCS10Device	userCertificate
User end-entity that already exists	Any supported value other than unstructuredName, unstructAddress, and serialNumber	pkiUser	userCertificate
CA end-entity that already exists	Any supported value	pkiCA	cACertificate, certificaterevocationlist, and authorityrevocationlist
Creating a distribution point CRL end-entity	CN=	commonName and cRLDistributionPoint	certificateRevocationList
Distribution point CRL end-entity that already exists	Any supported value	cRLDistributionPoint	certificateRevocationList

The R\_PKIServ SAF callable service supports specifying the subject's DN through named fields in the CertPlist. The CGIs invoke the R\_PKIServ SAF callable service. For more information, see *z/OS Security Server RACF Callable Services*. PKI Services supports the subject's DN fields, plus some additional ones: postal code, street, and mail. They are mapped to LDAP attributes as Table 110 indicates.

Table 110. Relationship of named fields to LDAP attributes and object identifiers

Named field	Visible RDN attribute	OID
CommonName	CN	2.5.4.3
Title	TITLE	2.5.4.12
OrgUnit	OU	2.5.4.11
Org	O	2.5.4.10
Locality	L	2.5.4.7
StateProv	ST	2.5.4.8
Country	C	2.5.4.6
PostalCode	POSTALCODE	2.5.4.17
Street	STREET	2.5.4.9
Email <sup>1</sup>	MAIL	0.9.2342.19200300.100.1.3

## LDAP directory server requirements

Table 110. Relationship of named fields to LDAP attributes and object identifiers (continued)

Named field	Visible RDN attribute	OID
Mail	MAIL <sup>2</sup>	0.9.2342.19200300.100.1.3
EmailAddr	EMAIL	1.2.840.113549.1.9.1
UnstructName	UNSTRUCTUREDNAME	1.2.840.113549.1.9.2
UnstructAddr	UNSTRUCTUREDADDRESS	1.2.840.113549.1.9.8
SerialNumber	SERIALNUMBER	2.5.4.5
DNQualifier	DNQUALIFIER	2.5.4.46
DomainName	DC	0.9.2342.19200300.100.1.25
Uid	UID	0.9.2342.19200300.100.1.1
BusinessCat	BUSINESSCATEGORY	2.5.4.15
JurLocality	JURISDICTIONLOCALITY	1.3.6.1.4.1.311.60.2.1.1
JurStateProv	JURISDICTIONSTATEPROV	1.3.6.1.4.1.311.60.2.1.2
JurCountry	JURISDICTIONCOUNTRY	1.3.6.1.4.1.311.60.2.1.3

<sup>1</sup> The use of the field name Email is deprecated; use Mail instead. <sup>2</sup> When a certificate is created and posted to LDAP, the NotifyEmail value, if specified, is posted as the MAIL attribute. (This replaces any MAIL attribute for the directory entry and for certificate renewals replaces the original NotifyEmail value).

---

## Appendix B. Using a gskkyman key database for your certificate store

This topic lists the steps the RACF programmer performs to use a gskkyman key database.

---

### Steps for using a gskkyman key database for your certificate store

Perform the following steps to use a gskkyman key database for your server's certificate store:

**Note:** If the IBM HTTP Server is installed and configured for SSL using gskkyman, you need to perform only steps 9 on page 658, 10 on page 658, 11 on page 658, and 15 on page 658.

1. From the UNIX shell, **cd** to `/etc` and enter `/usr/lpp/gskssl/bin/gskkyman`.

2. Choose option **1** to create a key database. Type in a name or let it default to key `.kdb` and enter a password you want to use. When asked "Work with the database now?", enter **1** for yes.

3. Choose option **3** to create new key pair and certificate request. Answer the prompts for file name, label, key size (1024 is suggested), and subject name fields.

**Note:** Common Name should be your server's symbolic IP address (for example, `www.YourCompany.com`).

4. Exit gskkyman when you are done.

5. From TSO, use the OGET command to put the certificate request in an MVS data set.

**Example:**

```
OGET '/etc/certreq.arm' certreq.arm
```

6. Use the RACDCERT command to read the request and generate the server certificate.

**Example:**

```
RACDCERT GENCERT(certreq.arm) ID(WEBSRV) SIGNWITH(CERTAUTH LABEL('Local PKI CA')) WITHLABEL('SSL Cert')
```

7. Export both the new server certificate and the CA certificate to MVS data sets, and OPUT these to file system files.

**Example:**

```
RACDCERT EXPORT(LABEL('SSL Cert')) ID(WEBSRV) DSN(cert.arm) FORMAT(CERTB64) OPUT cacert.der '/var/pkiserv/cacert.der' BINARY
```

---

## Using gskkyman

8. You can optionally delete both certificate TSO data sets (but not the file system files).  
\_\_\_\_\_
9. In the UNIX shell, `cd` to `/etc` and invoke `/usr/lpp/gskssl/bin/gskkyman`.  
\_\_\_\_\_
10. Choose option **2** to open the key database (created earlier). Reply to the name and password prompts.  
\_\_\_\_\_
11. Choose option **6** to store a CA certificate and specify the `'/var/pkiserv/cacert.der'` file.  
\_\_\_\_\_
12. When asked to “Exit gskkyman?”, enter **0** for No.  
\_\_\_\_\_
13. Choose option **4** to receive a certificate issued for your request and specify the `'/etc/cert.arm'` file. Again enter **0** when asked to “Exit gskkyman?”.  
\_\_\_\_\_
14. Choose option **11** to store encrypted database password.  
\_\_\_\_\_
15. Exit gskkyman.  
\_\_\_\_\_
16. You can optionally remove the `/etc/cert.arm` file.  
\_\_\_\_\_

---

## Appendix C. Configuring PKI Services as an IdenTrust certificate authority

This topic describes the configuration required to allow your z/OS installations to participate in the IdenTrust infrastructure. By performing the task described here, you can configure z/OS Cryptographic Services PKI Services to operate as an IdenTrust compliant certificate authority (CA). This allows you to use z/OS to manage the life cycle of digital certificates on behalf of your organization and in accordance with your security policy. You can then issue and revoke digital certificates as needed.

This topic contains an overview, a task roadmap, a set of procedures you need to perform, and a set of code samples that you can customize as you complete the procedures.

z/OS Cryptographic Services PKI Services is the component of the IBM z/OS operating system that provides support for the Public Key Infrastructure (PKI) infrastructure. Beginning with z/OS Version 1 Release 5, PKI Services was certified at the IdenTrust 3.1 specification level as an IdenTrust compliant CA software program.

For more overview information about z/OS support for IdenTrust, see <http://www.ibm.com/servers/eserver/zseries/security/identrus/>.

---

### Who should use this information

This information should be used by personnel who support member institutions of the IdenTrust network. It instructs the UNIX programmer or web server programmer to configure PKI Services to operate as an IdenTrust compliant CA.

This information assumes that you have experience installing and configuring software in a network environment. You should be knowledgeable about PKI technology. Previous experience with PKI Services is helpful.

---

### Related information from IdenTrust

You should be familiar with the certificate profiles defined by IdenTrust in the following IdenTrust document. As an IdenTrust compliant CA using z/OS, you implement these policies using PKI Services.

- *Identrus Public Key Infrastructure and Certificate Profiles [IT-PKI]*, Operating Rules and System Documentation.

---

### Overview of configuring z/OS PKI Services as a CA

This topic describes the configuration required to operate z/OS Cryptographic Services PKI Services as an IdenTrust compliant certificate authority (CA). It instructs member institutions of the IdenTrust network to configure their z/OS installations to participate in the IdenTrust infrastructure.

By following the task that is outlined in this topic, you can use your z/OS systems to establish CAs within the IdenTrust infrastructure. This allows you to use z/OS to manage the lifecycle of digital certificates on behalf of your organization in

accordance with your security policy, while issuing and revoking digital certificates as needed. See <http://www.ibm.com/servers/eserver/zseries/security/identrus/> for additional overview information.

## System prerequisites

To use your z/OS system to establish a CA within the IdenTrust infrastructure, the following requirements apply:

1. You must operate PKI Services with z/OS Version 1 Release 5, or higher.
2. Your PKI Services installation must be completed, with PKI Services established as a certificate authority (CA) and configured as a self-signed CA. (See “Configuring z/OS PKI Services as a CA” on page 661.)
3. You must supply your own (or OEM) online certificate status protocol (OCSP) responder.

## Task overview

The topic “Configuring z/OS PKI Services as a CA” on page 661 leads you through subtasks and associated procedures that are needed to configure your z/OS PKI Services system as a CA. The procedures configure PKI Services to accomplish the following objectives:

- “Establish PKI Services as an intermediate CA under the IdenTrust root”
- “Adjust your PKI Services general settings.”
- “Define PKI Services certificate templates for IdenTrust certificate types” on page 661

### Establish PKI Services as an intermediate CA under the IdenTrust root

In the IdenTrust infrastructure, IdenTrust operates the *root* or top certificate authority (CA). All financial institutions are subordinate CAs that are certified by the root. Therefore, you must acquire a certificate for PKI Services that is signed by IdenTrust. You might need additional certificates issued by IdenTrust, such as for your OCSP responder. Request these certificates directly from IdenTrust following the operational requirements of IdenTrust.

### Adjust your PKI Services general settings

Some of your current PKI Services configuration settings might require adjusting to operate PKI Services within the parameters identified by IdenTrust. In particular, your settings related to the following certificate policy items:

- CRL processing time
- Distribution point CRLs

**CRL processing time:** Processing time for an authenticated revocation request must not exceed 60 minutes. (Your OCSP responder usually provides revocation information by reading the CRLs issued by PKI Services to determine revocation status.) Therefore, the CRLs in LDAP must be refreshed with sufficient time to meet the 60-minute window.

- **Applicable PKI Services settings:** TimeBetweenCRLs and CRLDuration.

**Distribution point CRLs:** Depending on how your OCSP responder operates, you might have to disable creation of distribution point CRLs.

- **Applicable PKI Services setting:** CRLDistSize.

## Define PKI Services certificate templates for IdenTrust certificate types

The IdenTrust document *Identrus Public Key Infrastructure and Certificate Profiles [IT-PKI]* identifies and details the various certificate types used within the IdenTrust infrastructure. Using PKI Services, you create your IdenTrust compliant certificates. You decide which IdenTrust certificate types your CA creates and then define certificate templates for them. You can use the sample certificate templates provided to create your IdenTrust compliant certificates.

IdenTrust compliant certificates must include the following:

- IdenTrust certificate policy information (needed to build the CertificatePolicies extension)
- The location of your OCSP responder (needed to build the AuthorityInformationAccess extension)
- Other IdenTrust required fields and extensions.

The following sample PKI Services certificate templates are provided to help you create IdenTrust compliant certificates:

- “Sample browser certificate template for IdenTrust compliance” on page 665
- “Sample server certificate template for IdenTrust compliance” on page 667.

---

## Configuring z/OS PKI Services as a CA

The following table contains a task roadmap to lead you through the subtasks and associated procedures to configure your z/OS PKI Services system as a CA. Where needed, some notes are included to provide reminders about additional activities that are not described in this document. (For background information about the subtasks and reasons they are required, see “Task overview” on page 660.)

The following procedures are provided in this topic:

- “Steps to modify pkiserv.conf for different certificate types” on page 662
- “Steps to modify pkiserv.conf general settings” on page 663
- “Steps to create IdenTrust specific certificate templates” on page 663.

Subtask	Associated instructions (see ...)	Notes
If you have not already done so, install and configure PKI Services as a self-signed certificate authority (CA).	Follow the instructions in Part 1, “Planning,” on page 1, Part 2, “Configuring your system for PKI Services,” on page 33, and Part 3, “Customizing PKI Services,” on page 125.	Remember to store your PKI Services CA signing key in Integrated Cryptographic Service Facility (ICSF).
Establish PKI Services as an intermediate certificate authority under the IdenTrust root.	Follow the instructions in “Establishing PKI Services as an intermediate CA” on page 466 and in Part 5, “Administering security for PKI Services,” on page 459.	Send your certificate request to IdenTrust for signing. To do this, follow the IdenTrust instructions in <i>IT-PKI</i> to request a certificate for a “Participant CA Key Signing and CRL Signing Certificate Profile”.
Modify the PKI Services configuration file (pkiserv.conf).	“Steps to modify pkiserv.conf for different certificate types” on page 662	Make sure your certificate policies are in accordance with <i>IT-PKI</i> .

Subtask	Associated instructions (see ...)	Notes
	“Steps to modify pkiserv.conf general settings” on page 663	Make sure your changes are in accordance with <i>IT-PKI</i> .
Create IdenTrust specific certificate templates in the PKI Services certificate templates file (pkiserv.tpl).	“Steps to create IdenTrust specific certificate templates” on page 663	Make sure your certificate templates are in accordance with <i>IT-PKI</i> .
Stop and restart PKI Services to activate your changes.	Follow the instructions in Chapter 10, “Starting and stopping PKI Services,” on page 121.	

## Steps to modify pkiserv.conf for different certificate types

### Before you begin

Refer to the sample configuration file directives in “Sample PKI Services configuration file directives for IdenTrust compliance” on page 664.

### Procedure

Perform the following steps to modify the PKI Services configuration file (pkiserv.conf) to add a certificate policy for each type of IdenTrust certificate you intend to issue:

1. Copy the sample **OIDs** directives to the **OIDs** section.

---

2. Copy the sample **CertPolicy** directives to the **CertPolicy** section.

---

3. For each IdenTrust certificate policy you add, replicate one of the **OIDs** directives copied in Step 1.

---

4. Change the name and value of the directive as needed for the particular certificate profile. The name you choose is arbitrary, but must be unique.

---

5. Replicate one pair of **PolicyNamenn** and **UserNoticeTextnn** (the **CertPolicy** directives) copied in Step 2.

---

6. Change the value of the **PolicyNamenn** directive to match the name defined in Step 4.

---

7. Change the value of the **UserNoticeTextnn** directive as needed for this policy.

---

8. Change the policy number in the directives' name (the *nn* in **PolicyNamenn** and **UserNoticeTextnn**) as needed for the particular policy being defined. The number you choose is arbitrary, but must be unique. Use the same number for both directives.

---

9. For each IdenTrust certificate policy you add, repeat Step 3 through Step 8.

---

**When you are done:** You have defined a certificate policy for each type of IdenTrust certificate you intend to issue.

## Steps to modify pkiserv.conf general settings

### Before you begin

- Refer to the sample configuration file directives in “Sample PKI Services configuration file directives for IdenTrust compliance” on page 664.
- For more information about creating directives for certificate policies, see “Using certificate policies” on page 268 in Part 3, “Customizing PKI Services,” on page 125.

### Procedure

Perform the following steps to modify the PKI Services configuration file (pkiserv.conf) to configure certain general settings for IdenTrust compliance:

1. Change your current setting to `TimeBetweenCRLs=30m`.

---
2. Change your current setting to `CRLDuration=60m`.

---
3. Optionally, change your current setting to `CRLDistSize=0`. This change is required only if your OCSP responder does not support distribution point CRLs.

---

**When you are done:** You have configured your general PKI Services settings for IdenTrust compliance.

## Steps to create IdenTrust specific certificate templates

### Before you begin

- Refer to the sample browser certificate template in “Sample browser certificate template for IdenTrust compliance” on page 665 and the sample server certificate template in “Sample server certificate template for IdenTrust compliance” on page 667.
- For details about creating certificate templates, see Chapter 11, “Customizing the end-user web application if you use REXX CGI execs,” on page 127.

### Procedure

For each IdenTrust certificate profile you need, perform the following steps to create an IdenTrust specific certificate template in the PKI Services certificate templates file (pkiserv.tpl):

1. Determine if you need to define a certificate profile for a browser certificate or a server certificate.

---
2. Copy the appropriate sample browser or server certificate template to the PKI Services certificate templates file.

---
3. Change the name of the template.

---
4. Change the nickname of the template.

---

5. Change the <CONTENT> section to add or remove name fields and matching JavaScript as required for the IdenTrust profile you want. For example, if the subject's alternate name email address is not required, remove it or make it optional.
- 
6. Change the <CONSTANT> section as follows:
    - a. Change the AuthInfoAcc values to provide the URLs required by your OCSP responder.
    - b. Change the CertPolicies value to provide the policy numbers that are needed for the IdenTrust profile you want. (See Step 3 on page 663.)
- 

**When you are done:** You have created an IdenTrust specific certificate template for each IdenTrust certificate profile you need. Stop and restart PKI Services to activate all of your changes.

---

## Code samples

This topic contains code samples to help you complete the task of configuring PKI Services as a CA.

- “Sample PKI Services configuration file directives for IdenTrust compliance”  
This sample from the PKI Services configuration file (pkiserv.conf) contains sample file directives that are IdenTrust compliant. The sample defines two IdenTrust policies (IdentrusPolicy4 and IdentrusPolicy16). It also shows sample general settings that meet the requirements for IdenTrust compliance (TimeBetweenCRLs and CRLDuration), and an optional setting (CRLDistSize).
- “Sample browser certificate template for IdenTrust compliance” on page 665  
This sample from the PKI Services template file (pkiserv.tpl) defines a certificate template for an IdenTrust compliant browser certificate.
- “Sample server certificate template for IdenTrust compliance” on page 667  
This sample from the PKI Services template file (pkiserv.tpl) defines a certificate template for an IdenTrust compliant server certificate.

## Sample PKI Services configuration file directives for IdenTrust compliance

```
[OIDs]
IdentrusPolicy4=1.2.840.114021.1.4.1
IdentrusPolicy16=1.2.840.114021.1.16.2

[CertPolicy]
PolicyName4=IdentrusPolicy4
UserNoticeText4=This certificate may be relied upon only by either: (1) a Relying Customer of an Identrus Participant, or (2) a party bound to the alternative policy regime specified elsewhere in this Certificate

PolicyName16=IdentrusPolicy16
UserNoticeText16=This certificate may be relied upon only by either: (1) a Relying Customer of an Identrus Participant, or (2) a party bound to the alternative policy regime specified elsewhere in this Certificate

TimeBetweenCRLs=30m
CRLDuration=60m
CRLDistSize=0
```

## Appendix D. Using the PKI Services web application with Internet Explorer on Windows systems

To use the PKI Services end-user web application through the Internet Explorer browser on a Microsoft Windows system, a user must first set up the Windows system and Internet Explorer to work with PKI Services. This topic describes the tasks that a user needs to perform.

**Note:** Users do not need to perform these tasks for browsers other than Internet Explorer.

To avoid loss of function, PKI Services provides ActiveX programs that can be used to provide the function that PKI Services requires to renew a certificate. One ActiveX program is for Windows XP and earlier versions of Windows, and one is for Windows Vista and later versions of Windows. The PKI Services administrator must decide whether to provide signed or unsigned versions of the ActiveX programs, and in which directory the ActiveX programs are stored on the PKI Services server. These administrator tasks are described in “Administrator tasks for setting up a Windows system and Internet Explorer to work with the PKI Services web application” on page 677.

The script that is used in the template and JavaServer page (JSP) to renew and install a certificate from Internet Explorer calls the PKI Services ActiveX program for the required functions.

---

### User tasks for setting up a Windows system and Internet Explorer to work with the PKI Services web application

*Table 111. Tasks to perform to set up a Windows system and the Internet Explorer browser to work with PKI Services*

Task	Associated instructions
Install the PKI Services ActiveX program for your version of Microsoft Windows.	“Installing the PKI Services ActiveX program”
Configure Internet Explorer to trust PKI Services. (Windows Vista and later versions of Windows.)	“Configuring Internet Explorer to trust PKI Services on a Windows system” on page 675
Install the z/OS PKI Services certificate authority (CA) certificate on the Microsoft Windows system.	“Installing the PKI Services CA certificate on a Microsoft Windows system” on page 676

#### Installing the PKI Services ActiveX program

There are two ways to install the PKI Services ActiveX program for your version of Windows:

- From the PKI Services home page (see “Steps for installing the PKI Services ActiveX program from the PKI Services home page” on page 672).
- From the certificate renewal page when you renew a certificate (see “Steps for installing the PKI Services ActiveX program when you renew a certificate” on page 674). If you do not have the PKI Services ActiveX program for your version of Microsoft Windows installed, PKI Services prompts you to install it.

## Steps for installing the PKI Services ActiveX program from the PKI Services home page

Perform the following steps to install the PKI Services ActiveX program for your version of Windows from the PKI Services home page.

### Before you begin

You must run as the system administrator on the Microsoft Windows system on which you are installing the PKI Services ActiveX program, and you must be using the Internet Explorer browser.

### Procedure

1. On the PKI Services home page (Figure 37 on page 363), click **Install the PKI ActiveX Control to renew certificates**

---

2. A file download window opens.

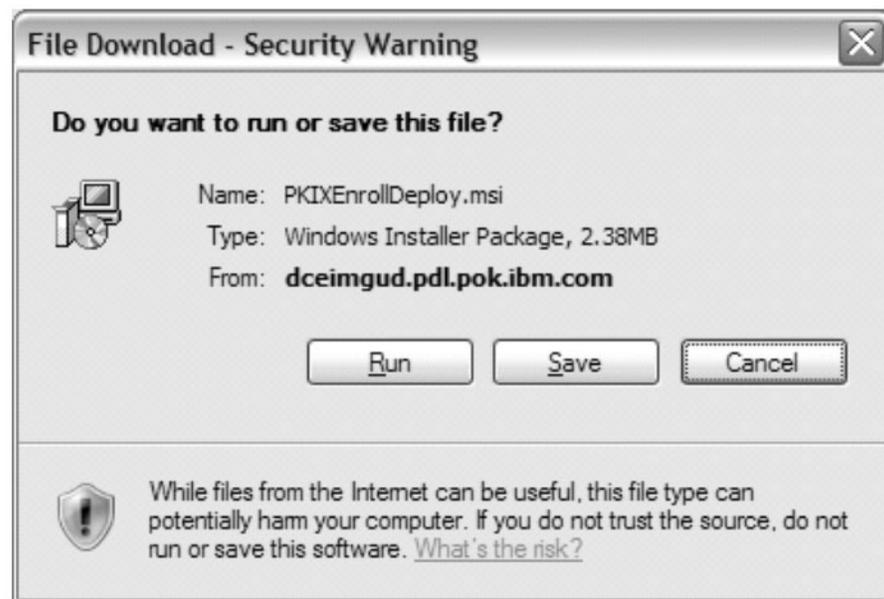

Figure 83. File download window

Click **Run**.

3. A security warning window opens. If the ActiveX program is signed, the name of the signer appears in the **Publisher** field. Figure 84 on page 673 shows the security warning window for an unsigned ActiveX program. (The PKI Services administrator decides whether or not to sign the ActiveX program.)

Figure 84. Security warning window

Click **Run**.

4. The setup wizard for the PKI ActiveX control opens.

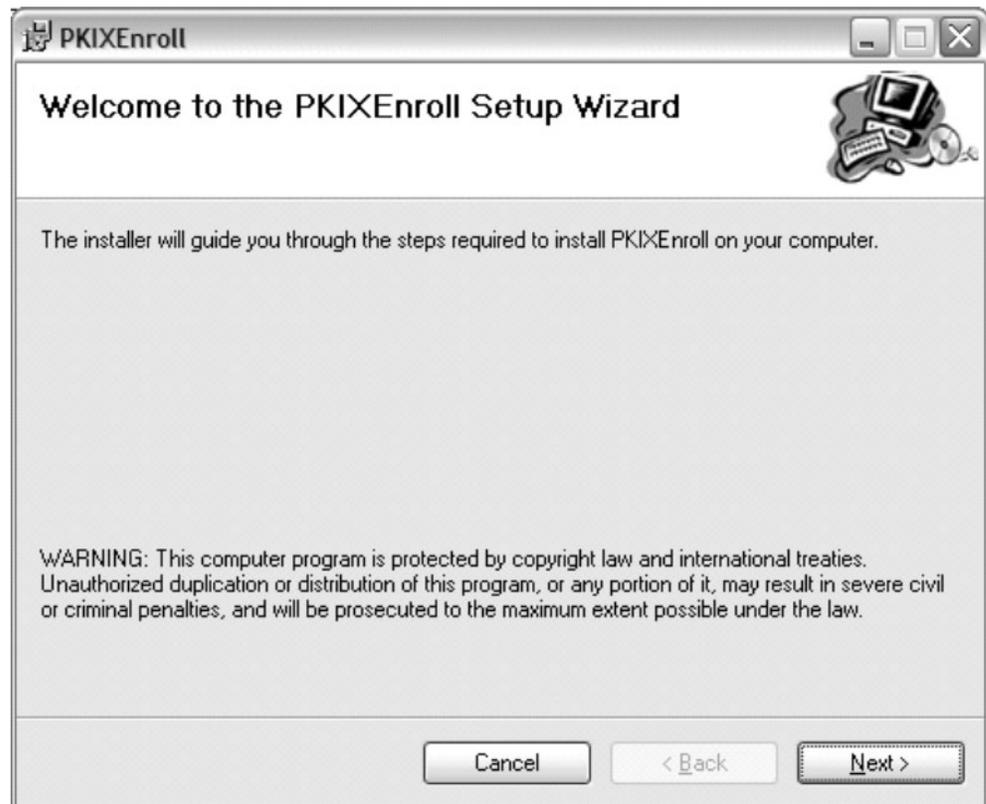

Figure 85. ActiveX control setup wizard

Click **Next**, and continue clicking **Next** on the windows that follow until you reach **Finish**. Click **Finish** to complete the installation.

---

## Results

When you are done, you have installed the PKI Services ActiveX program on a Microsoft Windows system. Continue to the next task, “Configuring Internet Explorer to trust PKI Services on a Windows system” on page 675.

### Steps for installing the PKI Services ActiveX program when you renew a certificate

Perform the following steps to install the PKI Services ActiveX program for your version of Windows from the certificate renewal page.

#### Before you begin

You must run as the system administrator on the Microsoft Windows system on which you are installing the PKI Services ActiveX program.

#### Procedure

1. On the certificate renewal page (Figure 50 on page 380), click **Renew**.
2. If PKI Services determines that the PKI Services ActiveX program is not installed:
  - a. A message window opens.

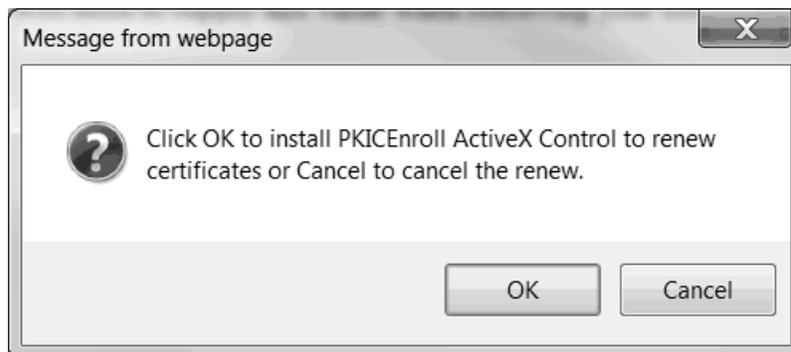

Figure 86. Message window

- Click **OK** to install the ActiveX program.
  - b. Continue with the steps for installing the ActiveX control from the PKI Services home page, beginning with step 2 on page 672.
3. Refresh the certificate renewal web page to load the ActiveX control on the browser.

---

## Results

When you are done, you have installed the PKI Services ActiveX program on a Microsoft Windows system from the certificate renewal web page, and loaded it on the Internet Explorer browser. PKI Services continues with the renewal of your certificate, using the ActiveX program that you just installed.

## Configuring Internet Explorer to trust PKI Services on a Windows system

To request or administer certificates using the PKI Services end-user web application through Internet Explorer on a system running Windows Vista or later versions of Windows, you must add the PKI Services system to the list of trusted sites recognized by Internet Explorer. You do not need to perform this task on systems running earlier versions of Windows.

### Steps for configuring Internet Explorer to trust PKI Services

Perform the following steps to configure Internet Explorer to trust PKI Services on a system running Windows Vista or later versions of Windows.

#### Procedure

1. From the Microsoft Windows system, start the Internet Explorer browser.

---
2. Click **Tools->Internet Options** to see the "Internet Options" panel, and select the "Security" tab.

---
3. Select the "Trusted sites" icon in the window labeled "Select a zone to view or change security settings". The "Trusted sites" icon is usually represented as a green check mark.

---
4. If necessary, click "Custom Level..." to change the settings for the zone. Set "Security level" to Medium and ensure that "Enable protected mode (requires restarting Internet Explorer)" is not selected.

---
5. Click **Sites** to see the "Trusted Sites" panel.

---
6. In the area labeled "Add this website to the zone:" enter the URL for the PKI Services system. Use https as the protocol, not http. For example, if the URL for the PKI Services system is alps4049.pok.ibm.com, enter https://alps4049.pok.ibm.com. Click **Add** to add this site to the list of trusted sites.

---
7. Leave the box labeled "Require server verification (https:) for all sites in this zone" checked. Click **Close** to close the "Trusted Sites" panel and return to the "Security" tab of the "Internet Options" panel.

---
8. Click **Apply** on the "Internet Options" panel to confirm the configuration changes. Then click **OK** to close the "Internet Options" panel.

---
9. Shut down the Internet Explorer browser to allow the modifications to take effect.

---

#### Results

When you are done, you have configured Internet Explorer to trust PKI Services on a system running Windows Vista or later versions of Windows. Continue to the next task, "Installing the PKI Services CA certificate on a Microsoft Windows system" on page 676.

## Installing the PKI Services CA certificate on a Microsoft Windows system

Any system using Microsoft Windows to request or administer certificates using the PKI Services end-user web application through Internet Explorer must install the z/OS PKI Services certificate authority (CA) certificate to enable SSL-protected sessions. Although the Internet Explorer browser can import the z/OS PKI Services CA certificate, the browser does not correctly install the certificate in the proper location by default.

### Steps for installing the PKI Services CA certificate on a Microsoft Windows system

Perform the following steps to install the z/OS PKI Services CA certificate in the correct location using Internet Explorer.

#### Before you begin

You need to know what version of Windows is running on your system.

#### Procedure

1. On the Microsoft Windows system, start the Internet Explorer browser. In the address field, enter the URL for the PKI Services home page.

---
2. Click the link labeled "Install the CA Certificate to enable SSL sessions for PKI Services". Internet Explorer presents a "File Download - Security Warning" pop-up panel, asking whether to open or save the file, and indicating that the file is from the PKI Services system. For example, if the PKI Services system is alps4049.pok.ibm.com, the following information should be displayed in this pop-up panel:  
Type: Security Certificate, *number* bytes  
From: alps4049.pok.ibm.com  
  
Click **Open**.

---
3. Internet Explorer might display a pop-up panel to warn that a website wants to open web content using the browser. If it does, click **Allow**.

---
4. Internet Explorer presents a "Certificate" pop-up panel indicating that this CA Root certificate is not trusted, and to enable the trust, the certificate must be installed in the Trusted Root Certification Authorities store. Click **Install Certificate**.

---
5. Internet Explorer presents a "Certificate Import Wizard" welcome panel. Click **Next >**.

---
6. Internet Explorer displays the certificate store selections.
  - a. If you are using Windows Vista and later versions of Windows, you *must* select Place all certificates in the following store and continue to step 7 on page 677.
  - b. If you are using Windows XP you can follow the instructions in step 6a. Alternatively, you can select Automatically select the certificate store based on the type of certificate and click **Next** to have the wizard automatically select the certificate store. Then skip to step 8 on page 677.

---

7. Internet Explorer presents a “Select Certificate Store” pop-up panel, allowing you to select the proper certificate store. Select the “Trusted Root Certification Authorities” item in the scrolled selection window, and click **OK**. Then click **Next >**.

---

8. Internet Explorer displays the “Completing the Certificate Import Wizard” panel. In the area labeled “You have specified the following settings:” the following information should be displayed:

Certificate Store Selected By User	Trusted Root Certification Authorities
Content	Certificate

Click **Finish**.

---

9. Internet Explorer presents a “Security Warning” pop-up panel, indicating that a certificate is about to be installed, and asking you to verify that this is the intended action to take. Click **Yes**. Internet Explorer presents a confirmation pop-up, indicating that the certificate was successfully imported.

---

## Results

When you are done, you have successfully installed the PKI Services CA certificate, and your Windows system and Internet Explorer browser are ready to use the PKI Services web application.

---

## Administrator tasks for setting up a Windows system and Internet Explorer to work with the PKI Services web application

PKI Services provides ActiveX programs to provide function that PKI Services requires to install a renewed certificate. These programs are:

- PKIXEnroll, for Windows XP and earlier versions of Windows
- PKICEnroll, for Windows Vista and later versions of Windows

Both ActiveX programs require the Microsoft C Runtime Library and the Microsoft Active Template Library. PKI Services provides a Microsoft installer program for each of the ActiveX programs that is packaged with the ActiveX program and the required Microsoft libraries. You can use these programs in one of two ways:

- If you choose not to sign the ActiveX programs, you can use the installer programs as they are shipped.
- For greater security, you can sign the ActiveX programs, but if you do this you must repackage the installer programs. PKI Services provides the related registry files, type library files, and the license file that you need to sign and repackage the programs. After signing and repackaging the programs, you must put the .exe and .msi files in a directory on the PKI Services server that is accessible to PKI Services users so that they can install the ActiveX programs.

**Guideline:** For maximum security, sign the ActiveX programs with a certificate issued by your PKI Services CA. The ability of ActiveX programs to modify your system makes them a security risk. Signing your ActiveX programs helps to ensure that users are running unchanged versions free of viruses.

## Signing the PKI Services ActiveX programs

To sign a PKI Services ActiveX program, you must sign the unsigned version that PKI Services provides, rebuild the install program for it, and sign the rebuilt install program. To make the signed programs available to PKI Services users, you must put the signed files in directories that are accessible to PKI Services users, and update the HTTP Server configuration files to specify those directories.

### Steps for signing the PKI Services ActiveX programs

Perform the following steps to sign the ActiveX programs that PKI Services provides and make them available to PKI Services users.

#### Before you begin

- You need to have a tool such as Microsoft Visual Studio that builds an installer program.
- You need a code signing certificate with an Extended Key Usage of Code Signing and its private key. If you do not have one, you can request one from PKI Services using the 2-year Authenticode template. Follow the instructions for requesting a server certificate in “Steps for requesting a new certificate” on page 369. Then export the certificate and its private key to a PKCS #12 file and download it to the Windows platform. In step 2a, Microsoft Sign Tool uses the certificate to sign PKIXEnroll.dll and PKICEnroll.dll.

#### Procedure

1. Create directories on the PKI Services server for the .exe and .msi programs that you build in step 2a. Create one directory for Windows XP and earlier versions of Windows, and one for Windows Vista and later versions of Windows.

---

2. Sign each of the ActiveX programs. Perform the following steps twice, once for PKIXEnroll.dll and once for PKICEnroll.dll.
  - a. Use Microsoft Sign Tool (signtool.exe) to sign the ActiveX program (PKIXEnroll.dll or PKICEnroll.dll) with the code signing certificate. You can download Microsoft Sign Tool at [http://msdn.microsoft.com/en-us/library/aa387764\(VS.85\).aspx](http://msdn.microsoft.com/en-us/library/aa387764(VS.85).aspx).
  - b. Build the installer programs. You need to use a tool such as Microsoft Visual Studio. For Windows XP and below, use PKIXEnrollDeploy for the project name, and the outputs for the installer program are:
    - setup.exe
    - PKIXEnrollDeploy.msiFor Windows Vista and above, use PKICEnrollDeploy as the project name, and the outputs for the installer program are:
    - setup.exe
    - PKICEnrollDeploy.msiFor detailed instructions, see “Steps for building the installer programs using Microsoft Visual Studio” on page 679.
  - c. Use Microsoft Sign Tool and the code signing certificate that you used in step 2a to sign the installer programs.

---

3. Upload the signed installer programs to the directories you created on the PKI Services server in step 1.

**Note:** Be sure that you upload the programs in binary so that the files are not altered during the transfer.

- 
4. Update the HTTP configuration files.
    - a. Update `httpd.conf`. Change the following statements to specify the directories you created in step 1 on page 678.
 

```
Pass /PKIServ/PKIXEnroll/* /usr/lpp/pkiserv/ActiveX/PKIXEnroll/*
Pass /PKIServ/PKICEEnroll/* /usr/lpp/pkiserv/ActiveX/PKICEEnroll/*
```
    - b. Update `httpd2.conf`. Change the following statements to specify the directories you created in step 1 on page 678.
 

```
Pass /PKIServ/PKIXEnroll/* /usr/lpp/pkiserv/ActiveX/PKIXEnroll/*
Pass /PKIServ/PKICEEnroll/* /usr/lpp/pkiserv/ActiveX/PKICEEnroll/*
```
- 

## Results

When you are done, you have signed the ActiveX programs provided by PKI Services, and made them available to PKI Services users

## Steps for building the installer programs using Microsoft Visual Studio

### Before you begin

You need to have a tool such as Microsoft Visual Studio that builds an installer program.

### About this task

These instructions describe how to use Microsoft Visual Studio Software Application Version 2010 to create a setup and deployment Visual Studio project. The project creates a directory to save the project setup files along with the output files. If you select `C:` as the location where the setup project is to be created, and `PKIXEnrollDeploy` as the project name, the directory structure created would be as shown in Table 112.

*Table 112. Directory structure for a sample project named PKIXEnrollDeploy created in the C: directory*

Directory or file	Description
<code>C:\PKIXEnrollDeploy</code>	solution directory
<code>C:\PKIXEnrollDeploy\PKIXEnrollDeploy.suo</code>	solution property file
<code>C:\PKIXEnrollDeploy\PKIXEnrollDeploy.sln</code>	solution file
<code>C:\PKIXEnrollDeploy\PKIXEnrollDeploy</code>	root project directory
<code>C:\PKIXEnrollDeploy\PKIXEnrollDeploy\PKIXEnrollDeploy.vdproj</code>	project property file
<code>C:\PKIXEnrollDeploy\PKIXEnrollDeploy\Debug</code>	Build on debug version
<code>C:\PKIXEnrollDeploy\PKIXEnrollDeploy\Debug\PKIXEnrollDeploy.msi</code>	
<code>C:\PKIXEnrollDeploy\PKIXEnrollDeploy\Debug\setup.exe</code>	

Table 112. Directory structure for a sample project named PKIXEnrollDeploy created in the C: directory (continued)

Directory or file	Description
C:\PKIXEnrollDeploy\PKIXEnrollDeploy\Release	Build on release version
C:\PKIXEnrollDeploy\PKIXEnrollDeploy\Release\PKIXEnrollDeploy.msi	
C:\PKIXEnrollDeploy\PKIXEnrollDeploy\Release\setup.exe	

Perform the following steps to build the installer programs for a PKI Services ActiveX program.

### Procedure

1. For Windows XP and earlier versions of windows, download the following files from the directory /usr/lpp/pkiserv/ActiveX/signsrc on the z/OS system to a working directory on your workstation:

- PKIXEnroll.dll
- PKIXEnroll.tlb
- PKIXEnroll.reg
- PKIActiveX.lic

For Windows Vista and later versions of windows, download the following files from the directory /usr/lpp/pkiserv/ActiveX/signsrc on the z/OS system to a working directory on your workstation:

- PKICEenroll.dll
- PKICEenroll.tlb
- PKICEenroll.reg
- PKIActiveX.lic

**Note:** Ensure that the files are transferred in binary format so that they are not modified in transit.

- 
2. Open Microsoft Visual Studio Software Application Version 2010 from the Windows Start menu, and create a new setup and deployment project.
    - a. Click **File > New Project**.
    - b. In the New Project panel, under **Other Project Types** select **Setup and Deployment**.
    - c. In the “Visual Studio installed templates” pane (on the right) click **Setup Project**.
    - d. In the **Name** field, enter the name of the project, for example PKIXEnrollDeploy.
    - e. In the **Location** field, enter the directory where you want the project created, or click **Browse** to select a directory.
    - f. Select **Create directory for solution**.
    - g. Click **OK**. A new project directory is created in a separate file directory in the path that is given in the **Location** field.
-

3. Add the required ActiveX Dynamic link library, the ActiveX Type library file, and the ActiveX license file (PKIActiveX.lic) to the current project to create the installer program.
  - a. Click **View > Solution Explorer**.
  - b. Right click the name of the project that you just created, (for example, PKIXEnrollDeploy).
  - c. Click **Add > File**.
  - d. On the AddFiles window, navigate to the directory where the files were stored on the workstation in step 1 on page 680. For PKIXEnroll select these files:
    - PKIXEnroll.dll
    - PKIXEnroll.tlb
    - PKIActiveX.licFor PKICEnroll select these files:
    - PKICEnroll.dll
    - PKICEnroll.tlb
    - PKIActiveX.licClick **Open**. The files you selected are listed under the project on Solution Explorer. The DLL file has a dependency on Microsoft .NET Framework. Microsoft Visual Studio automatically lists the dependency under the project.

---

4. Add the Microsoft C Runtime Library and Microsoft Active Template Library merge modules to be packaged in the installer program.
  - a. On the Solution Explorer pane, right click the project name (for example, PKIXEnrollDeploy).
  - b. Click **Add > Merge Module**. A window opens listing all the merge modules that were installed when Microsoft Visual Studio was installed.
  - c. Click Microsoft\_VC100\_CRT\_x86.msm and Microsoft\_VC100\_ATL\_x86.msm and click **Open** to add these files to the project.

---

5. Modify the project properties.
  - a. From the Solution Explorer pane, click the project name (for example, PKIXEnrollDeploy).
  - b. On the toolbar click **View > Other Windows > Property Window**. A list of properties with default values is displayed.
  - c. For the Author property, enter IBM.
  - d. For the InstallAllUsers property, enter True.
  - e. For the Manufacturer property, enter IBM.
  - f. For the ProductName property, enter PKIXEnroll or PKICEnroll.
  - g. For the RemovePreviousVersions property, enter True.

---

6. Determine the default location where the ActiveX program is going to be installed.
  - a. Click **View > Solution Explorer**.
  - b. Right click the project (for example, PKIXEnrollDeploy).
  - c. Click **View > File System**. A file system pane opens on the right side.

- d. In the File System pane, right click **Application Folder**.
- e. Click **Properties Window**.
- f. Note the value listed in the **Default Location** field. This is the location where the ActiveX program is going to be installed. The default value is *[ProgramFilesFolder][Manufacturer]\[ProductName]*. The value of *ProgramFilesFolder* has been set by Microsoft Visual Studio to the Program Files folder for the operating system: C:\Program Files for a 32-bit Windows system and C:\Program Files(x86) for a 64-bit operating system. You set the value of *Manufacturer* to IBM and the value of *ProductName* to PKIXEnroll or PKICEnroll when you set the project properties in step 5 on page 681. Do not modify any of these values. The ActiveX DLL looks for the license file (PKIActive.lic) in this directory. If it cannot find it there, the ActiveX program is not instantiated on the browser and certificate renewal processing might not work properly.

- 
- 7. The User Interface command provides the interface for the user during installation. It allows the user installing the ActiveX program to select a directory for installation. Disable the folder selection step, so that the location listed in step 6f is used.
    - a. Click **View > Solution Explorer**.
    - b. Right click the project (for example, PKIXEnrollDeploy).
    - c. Click **View > User Interface**. A User Interface pane opens on the right side.
    - d. Under **Install**, click **Installation Folder** and click **Delete**.
    - e. Under **Install**, under **End** right click **Finished** and click **Properties**. Modify the UpdateText property to include instructions to be displayed to the user after the installation of the ActiveX program: Please refresh the PKI Certificate Renewal web page to use the newly installed PKI ActiveX Control.
    - f. Under **Administrative Install**, click **Installation Folder** and click **Delete**.
    - g. Under **Administrative Install**, under **End** right click **Finished** and click **Properties**.

- 
- 8. The setup and deployment project (for example, PKIXEnrollDeploy) can create registry entries for the ActiveX program. Once the ActiveX program is installed on the target machine the ActiveX program is registered and the browsers accessing this ActiveX program instantiates looking at the windows registry. The registry entries are created using the Registry setup interface.
    - a. Click **View > Solution Explorer**.
    - b. Right click the project (for example, PKIXEnrollDeploy).
    - c. Click **View > Registry**. A Registry pane opens on the right side.
    - d. Right click **Registry on Target machine**.
    - e. Click **Import**. The Import Registry File window opens.
    - f. Click PKIXEnroll.reg or PKICEnroll.reg and click **Open**.

- 
- 9. Set the ActiveX dynamic link library (PKIXEnroll.dll or PKICEnroll.dll) to be registered during installation.
    - a. Click **View > Solution Explorer**.
    - b. Right click PKIXEnroll.dll or PKICEnroll.dll.
    - c. Click **Properties**.

d. Set the **Register** field to vsdraCOM.

---

10. Set the ActiveX type library (PKIXEnroll.tlb or PKICEenroll.tlb) to be registered during install.
- Click **View > Solution Explorer**.
  - Right click PKIXEnroll.tlb or PKICEenroll.tlb.
  - Click **Properties**.
  - Set the **Register** field to vsdrfCOM.
- 

11. Build the setup and deployment project.

- Click **View > Solution Explorer**.
  - Right-click the project name from the Solution Explorer (for example, PKIXEnrollDeploy).
  - Select Properties. The **Property Pages** window opens.
  - Select Release in the Configuration list.
  - On the right pane of the window that opens, click **Prerequisites**.
  - Select the **Create setup program to install prerequisite components** check box.
  - In the list of prerequisites, select the **.NET Framework 4.0 Client Profile (x86 and x64)** check box if it is not already selected.
  - Select the **Visual C++ 2010 Runtime Libraries (x86)** check box.
  - Click **OK**. The **Prerequisites** window closes.
  - Click **OK**. The **Property Pages** window closes.
  - Right-click the project (for example, PKIXEnrollDeploy) and select **Build**.  
If the build is successful, the application creates an output directory under the root project directory that is under the main solution directory. If PKIXEnrollDeploy is the project name:
    - C:\PKIXEnrollDeploy is the solution name.
    - C:\PKIXEnrollDeploy\PKIXEnrollDeploy is the root project directory.
    - C:\PKIXEnrollDeploy\PKIXEnrollDeploy\Release is the output directory.
    - There are two output files: PKIXEnrollDeploy.msi and setup.exe.
- 

## Results

When you are done, you have built the installer program for a PKI Services ActiveX program. Continue with step 2c on page 678 to sign the installer program.

---

## Appendix E. Accessibility

Accessible publications for this product are offered through IBM Knowledge Center (<http://www.ibm.com/support/knowledgecenter/SSLTBW/welcome>).

If you experience difficulty with the accessibility of any z/OS information, send a detailed message to the "Contact us" web page for z/OS (<http://www.ibm.com/systems/z/os/zos/webqs.html>) or use the following mailing address.

IBM Corporation  
Attention: MHVRCFS Reader Comments  
Department H6MA, Building 707  
2455 South Road  
Poughkeepsie, NY 12601-5400  
United States

---

### Accessibility features

Accessibility features help users who have physical disabilities such as restricted mobility or limited vision use software products successfully. The accessibility features in z/OS can help users do the following tasks:

- Run assistive technology such as screen readers and screen magnifier software.
- Operate specific or equivalent features by using the keyboard.
- Customize display attributes such as color, contrast, and font size.

---

### Consult assistive technologies

Assistive technology products such as screen readers function with the user interfaces found in z/OS. Consult the product information for the specific assistive technology product that is used to access z/OS interfaces.

---

### Keyboard navigation of the user interface

You can access z/OS user interfaces with TSO/E or ISPF. The following information describes how to use TSO/E and ISPF, including the use of keyboard shortcuts and function keys (PF keys). Each guide includes the default settings for the PF keys.

- *z/OS TSO/E Primer*
- *z/OS TSO/E User's Guide*
- *z/OS V2R2 ISPF User's Guide Vol I*

---

### Dotted decimal syntax diagrams

Syntax diagrams are provided in dotted decimal format for users who access IBM Knowledge Center with a screen reader. In dotted decimal format, each syntax element is written on a separate line. If two or more syntax elements are always present together (or always absent together), they can appear on the same line because they are considered a single compound syntax element.

Each line starts with a dotted decimal number; for example, 3 or 3.1 or 3.1.1. To hear these numbers correctly, make sure that the screen reader is set to read out

punctuation. All the syntax elements that have the same dotted decimal number (for example, all the syntax elements that have the number 3.1) are mutually exclusive alternatives. If you hear the lines 3.1 USERID and 3.1 SYSTEMID, your syntax can include either USERID or SYSTEMID, but not both.

The dotted decimal numbering level denotes the level of nesting. For example, if a syntax element with dotted decimal number 3 is followed by a series of syntax elements with dotted decimal number 3.1, all the syntax elements numbered 3.1 are subordinate to the syntax element numbered 3.

Certain words and symbols are used next to the dotted decimal numbers to add information about the syntax elements. Occasionally, these words and symbols might occur at the beginning of the element itself. For ease of identification, if the word or symbol is a part of the syntax element, it is preceded by the backslash (\) character. The \* symbol is placed next to a dotted decimal number to indicate that the syntax element repeats. For example, syntax element \*FILE with dotted decimal number 3 is given the format 3 \\* FILE. Format 3\* FILE indicates that syntax element FILE repeats. Format 3\* \\* FILE indicates that syntax element \* FILE repeats.

Characters such as commas, which are used to separate a string of syntax elements, are shown in the syntax just before the items they separate. These characters can appear on the same line as each item, or on a separate line with the same dotted decimal number as the relevant items. The line can also show another symbol to provide information about the syntax elements. For example, the lines 5.1\*, 5.1 LASTRUN, and 5.1 DELETE mean that if you use more than one of the LASTRUN and DELETE syntax elements, the elements must be separated by a comma. If no separator is given, assume that you use a blank to separate each syntax element.

If a syntax element is preceded by the % symbol, it indicates a reference that is defined elsewhere. The string that follows the % symbol is the name of a syntax fragment rather than a literal. For example, the line 2.1 %OP1 means that you must refer to separate syntax fragment OP1.

The following symbols are used next to the dotted decimal numbers.

**? indicates an optional syntax element**

The question mark (?) symbol indicates an optional syntax element. A dotted decimal number followed by the question mark symbol (?) indicates that all the syntax elements with a corresponding dotted decimal number, and any subordinate syntax elements, are optional. If there is only one syntax element with a dotted decimal number, the ? symbol is displayed on the same line as the syntax element, (for example 5? NOTIFY). If there is more than one syntax element with a dotted decimal number, the ? symbol is displayed on a line by itself, followed by the syntax elements that are optional. For example, if you hear the lines 5 ?, 5 NOTIFY, and 5 UPDATE, you know that the syntax elements NOTIFY and UPDATE are optional. That is, you can choose one or none of them. The ? symbol is equivalent to a bypass line in a railroad diagram.

**! indicates a default syntax element**

The exclamation mark (!) symbol indicates a default syntax element. A dotted decimal number followed by the ! symbol and a syntax element indicate that the syntax element is the default option for all syntax elements that share the same dotted decimal number. Only one of the syntax elements that share the dotted decimal number can specify the ! symbol. For example, if you hear the lines 2? FILE, 2.1! (KEEP), and 2.1 (DELETE), you know that (KEEP) is the

default option for the FILE keyword. In the example, if you include the FILE keyword, but do not specify an option, the default option KEEP is applied. A default option also applies to the next higher dotted decimal number. In this example, if the FILE keyword is omitted, the default FILE(KEEP) is used. However, if you hear the lines 2? FILE, 2.1, 2.1.1! (KEEP), and 2.1.1 (DELETE), the default option KEEP applies only to the next higher dotted decimal number, 2.1 (which does not have an associated keyword), and does not apply to 2? FILE. Nothing is used if the keyword FILE is omitted.

**\* indicates an optional syntax element that is repeatable**

The asterisk or glyph (\*) symbol indicates a syntax element that can be repeated zero or more times. A dotted decimal number followed by the \* symbol indicates that this syntax element can be used zero or more times; that is, it is optional and can be repeated. For example, if you hear the line 5.1\* data area, you know that you can include one data area, more than one data area, or no data area. If you hear the lines 3\* , 3 HOST, 3 STATE, you know that you can include HOST, STATE, both together, or nothing.

**Notes:**

1. If a dotted decimal number has an asterisk (\*) next to it and there is only one item with that dotted decimal number, you can repeat that same item more than once.
2. If a dotted decimal number has an asterisk next to it and several items have that dotted decimal number, you can use more than one item from the list, but you cannot use the items more than once each. In the previous example, you can write HOST STATE, but you cannot write HOST HOST.
3. The \* symbol is equivalent to a loopback line in a railroad syntax diagram.

**+ indicates a syntax element that must be included**

The plus (+) symbol indicates a syntax element that must be included at least once. A dotted decimal number followed by the + symbol indicates that the syntax element must be included one or more times. That is, it must be included at least once and can be repeated. For example, if you hear the line 6.1+ data area, you must include at least one data area. If you hear the lines 2+, 2 HOST, and 2 STATE, you know that you must include HOST, STATE, or both. Similar to the \* symbol, the + symbol can repeat a particular item if it is the only item with that dotted decimal number. The + symbol, like the \* symbol, is equivalent to a loopback line in a railroad syntax diagram.

#### COPYRIGHT LICENSE:

This information might contain sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

---

## Policy for unsupported hardware

Various z/OS elements, such as DFSMS, HCD, JES2, JES3, and MVS, contain code that supports specific hardware servers or devices. In some cases, this device-related element support remains in the product even after the hardware devices pass their announced End of Service date. z/OS may continue to service element code; however, it will not provide service related to unsupported hardware devices. Software problems related to these devices will not be accepted

for service, and current service activity will cease if a problem is determined to be associated with out-of-support devices. In such cases, fixes will not be issued.

---

## Minimum supported hardware

The minimum supported hardware for z/OS releases identified in z/OS announcements can subsequently change when service for particular servers or devices is withdrawn. Likewise, the levels of other software products supported on a particular release of z/OS are subject to the service support lifecycle of those products. Therefore, z/OS and its product publications (for example, panels, samples, messages, and product documentation) can include references to hardware and software that is no longer supported.

- For information about software support lifecycle, see: IBM Lifecycle Support for z/OS (<http://www.ibm.com/software/support/systemsz/lifecycle/>)
- For information about currently-supported IBM hardware, contact your IBM representative.

---

## Programming interface information

This document primarily documents information that is NOT intended to be used as Programming Interfaces of PKI Services.

This document also documents intended Programming Interfaces that allow the customer to write programs to obtain the services of PKI Services. This information is identified where it occurs, either by an introductory statement to a topic or section or by the following marking:

————— **Programming Interface Information** —————

————— **End Programming Interface Information** —————

---

## Trademarks

IBM, the IBM logo, and [ibm.com](http://www.ibm.com) are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available at Copyright and Trademark information (<http://www.ibm.com/legal/copytrade.shtml>).

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle, its affiliates, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

## T

- task roadmaps
  - configuring PKI Services for IdenTrust compliance 661
  - for implementing PKI Services 22
- tasks
  - (noun, gerund phrase)
    - steps 674
  - allowing WebSphere users to renew
    - and revoke browser certificates
      - steps 245
  - application domain, creating
    - steps 286
  - authorization to PKI Services
    - functions, giving to users
      - steps 240
  - automatic certificate renewal, setting
    - up
      - steps 315
  - backing up the VSAM data sets
    - steps 114
  - CA certificate, setting the expiration
    - date
      - steps 50
  - certificate for CMP requester, setting
    - up in RACF database
      - steps 445
  - configuring Internet Explorer to trust
    - PKI Services
      - steps 675
  - CRL, enabling support for large
    - steps 282
  - custom extension, adding to a
    - certificate template
      - steps 320, 321
  - EAR file, updating
    - steps 256
  - encryption of keys on CMP requests
    - using key ring, setting up PKI
      - Services for
        - steps 446
  - ICL, converting from VSAM to DB2
    - steps 118

- tasks (continued)
  - ICL, creating DB2 objects for
    - steps 115
  - installer program for ActiveX controls,
    - building
      - steps 679
  - installing PKI Services ActiveX
    - program
      - steps 672
